I am now twenty-five years old. I have reached the time of life which I have dreamed, nay even ventured to hope, might be the limit of the sentence which was pronounced upon me in my infancy. I can assign no good reason for this anticipation. But in writing this paper I feel as if I were preparing to begin a renewed existence. There is nothing for me to be ashamed of in the story I have told. There is no man living who would not have yielded to the sense of instantly impending death which seized upon me under the conditions I have mentioned. Martyrs have gone singing to their flaming shrouds, but never a man could hold his breath long enough to kill himself; he must have rope or water, or some mechanical help, or nature will make him draw in a breath of air, and would make him do so though he knew the salvation of the human race would be forfeited by that one gasp.

This paper may never reach the eye of any one afflicted in the same way that I have been. It probably never will; but for all that, there are many shy natures which will recognize tendencies in themselves in the direction of my unhappy susceptibility. Others, to whom such weakness seems inconceivable, will find their scepticism shaken, if not removed, by the calm, judicial statement of the Report drawn up for the Royal Academy. It will make little difference to me whether my story is accepted unhesitatingly or looked upon as

largely a product of the imagination. I am but a bird of passage that lights on the boughs of different nationalities. I belong to no flock; my home may be among the palms of Syria, the olives of Italy, the oaks of England, the elms that shadow the Hudson or the Connecticut; I build no nest; to-day I am here, to-morrow on the wing.

If I quit my native land before the trees have dropped their leaves I shall place this manuscript in the safe hands of one whom I feel sure that I can trust; to do with it as he shall see fit. If it is only curious and has no bearing on human welfare, he may think it well to let it remain unread until I shall have passed away. If in his judgment it throws any light on one of the deeper mysteries of our nature,—the repulsions which play such a formidable part in social life, and which must be recognized as the correlatives of the affinities that distribute the individuals governed by them in the face of impediments which seem to be impossibilities,—then it may be freely given to the world.

But if I am here when the leaves are all fallen, the programme of my life will have changed, and this story of the dead past will be illuminated by the light of a living present which will irradiate all its saddening features. Who would not pray that my last gleam of light and hope may be that of dawn and not of departing day?

The reader who finds it hard to accept the reality of a story so far from the common range of experience is once more requested to suspend his judgment until he has read the paper which will next be offered for his consideration.

XIX. THE REPORT OF THE BIOLOGICAL COMMITTEE.

Perhaps it is too much to expect a reader who wishes to be entertained, excited, amused, and does not want to work his passage through pages which he cannot understand without some effort of his own, to read the paper which follows and Dr. Butts's reflections upon it. If he has no curiosity in the direction of these chapters, he can afford to leave them to such as relish a slight flavor of science. But if he does so leave them he will very probably remain sceptical as to the truth of the story to which they are meant to furnish him with a key.

Of course the case of Maurice Kirkwood is a remarkable and exceptional one, and it is hardly probable that any reader's experience will furnish him with its parallel. But let him look back over all his acquaintances, if he has reached middle life, and see if he cannot recall more than one who, for some reason or other, shunned the society of young women, as if they had a deadly fear of their company. If he remembers any such, he can understand the simple statements and natural reflections which are laid before him.

One of the most singular facts connected with the history of Maurice Kirkwood was the philosophical equanimity with which he submitted to the fate which had fallen upon him. He did not choose to be pumped by the Interviewer, who would show him up in the sensational columns of his prying newspaper. He lived chiefly by himself, as the easiest mode of avoiding those meetings to which he would be exposed in almost every society into which he might venture. But he had learned to look upon himself very much as he would upon an intimate not himself,—upon a different personality. A young man will naturally enough be ashamed of his shyness. It is something which others believe, and perhaps he himself thinks, he might overcome. But in the case of Maurice Kirkwood there was no room for doubt as to the reality and gravity of the long enduring effects of his first convulsive terror. He had accepted the fact as he would have accepted the calamity of losing his sight or his hearing. When he was questioned by the experts to whom his case was submitted, he told them all that he knew about it almost without a sign of emotion. Nature was so peremptory with him,—saying in language that had no double meaning: "If you violate the condition on which you hold my gift of existence I slay you on the spot,"—that he became as decisive in his obedience as she was in her command, and accepted his fate without repining.

Yet it must not be thought for a moment,—it cannot be supposed,—that he was insensible because he looked upon himself with the coolness of an enforced philosophy. He bore his burden manfully, hard as it was to live under it, for he lived, as we have seen, in hope. The thought of throwing it off with his life, as too grievous to be borne, was familiar to his lonely hours, but he rejected it as unworthy of his manhood. How he had speculated and dreamed about it is plain enough from the paper the reader may remember on Ocean, River, and Lake.

With these preliminary hints the paper promised is submitted to such as may find any interest in them.

ACCOUNT OF A CASE OF GYNOPHOBIA.

WITH REMARKS.

Being the Substance of a Report to the Royal Academy of the Biological Sciences by a Committee of that Institution.

"The singular nature of the case we are about to narrate and comment upon will, we feel confident, arrest the attention of those who have learned the great fact that Nature often throws the strongest light upon her laws by the apparent exceptions and anomalies which from time to time are observed. We have done with the *lusus naturae* of earlier generations. We pay little attention to the stories of 'miracles,' except so far as we receive them ready-made at the hands of the churches which still hold to them. Not the less do we meet with strange and surprising facts, which a century or two ago would have been handled by the clergy and the courts, but today are calmly recorded and judged by the best light our knowledge of the laws of life can throw upon them. It must be owned that there are stories which we can hardly dispute, so clear and full is the evidence in their support, which do, notwithstanding, tax our faith and sometimes leave us sceptical in spite of all the testimony which supports them.

"In this category many will be disposed to place the case we commend to the candid attention of the Academy. If one were told that a young man, a gentleman by birth and training, well formed, in apparently perfect health, of agreeable physiognomy and manners, could not endure the presence of the most attractive young woman, but was seized with deadly terror and sudden collapse of all the powers of life, if he came into her immediate presence; if it were added that this same young man did not shrink from the presence of an old withered crone; that he had a certain timid liking for little maidens who had not yet outgrown the company of their dolls, the listener would be apt to smile, if he did not laugh, at the absurdity of the fable. Surely, he would say, this must be the fiction of some fanciful brain, the whim of some romancer, the trick of some playwright. It would make a capital farce, this idea, carried out. A young man slighting the lovely heroine of the little comedy and making love to her grandmother! This would, of course, be overstating the truth of the story, but to such a misinterpretation the plain facts lend themselves too easily. We will relate the leading circumstances of the case, as they were told us with perfect simplicity and frankness by the subject of an affection which, if classified, would come under the general head of Antipathy, but to which, if we give it a name, we shall have to apply the term Gynophobia, or Fear of Woman."

Here follows the account furnished to the writer of the paper, which is in all essentials identical with that already laid before the reader.

"Such is the case offered to our consideration. Assuming its truthfulness in all its particulars, it remains to see in the first place whether or not it is as entirely exceptional and anomalous as it seems at first sight, or whether it is only the last term of a series of cases which in their less formidable aspect are well known to us in literature, in the records of science, and even in our common experience.

"To most of those among us the explanations we are now about to give are entirely superfluous. But there are some whose chief studies have been in different directions, and who will not complain if certain facts are mentioned which to the expert will seem rudimentary, and which hardly require recapitulation to those who are familiarly acquainted with the common text-books.

"The heart is the centre of every living movement in the higher animals, and in man, furnishing in varying amount, or withholding to a greater or less extent, the needful supplies to all parts of the system. If its action is diminished to a certain degree, faintness is the immediate consequence; if it is arrested, loss of consciousness; if its action is not soon restored, death, of which fainting plants the white flag, remains in possession of the system.

"How closely the heart is under the influence of the emotions we need not go to science to learn, for all human experience and all literature are overflowing with evidence that shows the extent of this relation. Scripture is full of it; the heart in Hebrew poetry represents the entire life, we might almost say. Not less forcible is the language of Shakespeare, as for instance, in 'Measure for Measure:'

*"Why does my blood thus muster to my heart,
Making it both unable for itself
And dispossessing all my other parts
Of necessary fitness?"*

"More especially is the heart associated in every literature with the passion of love. A famous old story is that of Galen, who was called to the case of a young lady long ailing, and wasting away from some cause the physicians who had already seen her were unable to make out. The shrewd old practitioner suspected that love was at the bottom of the young lady's malady. Many relatives and friends of both sexes, all of them ready with their sympathy, came to see her. The physician sat by her bedside during one of these visits, and in an easy, natural way took her hand and placed a finger on her pulse. It beat quietly enough until a certain comely young gentleman entered the apartment, when it suddenly rose in frequency, and at the same moment her hurried breathing, her changing color, pale and flushed by turns, betrayed the profound agitation his presence excited. This was enough for the sagacious Greek; love was the disease, the cure of which by its like may be claimed as an anticipation of homoeopathy. In the frontispiece to the fine old 'Junta' edition of the works of Galen, you may find among the wood-cuts a representation of the interesting scene, with the title Amantas Dignotio,—the diagnosis, or recognition, of the lover.

"Love has many languages, but the heart talks through all of them. The pallid or burning cheek tells of the failing or leaping fountain which gives it color. The lovers at the 'Brookside' could hear each other's hearts beating. When Genevieve, in Coleridge's poem, forgot herself, and was beforehand with her suitor in her sudden embrace,

*"'T was partly love and partly fear,
And partly 't was a bashful art,
That I might rather feel than see
The swelling of her heart'*

"Always the heart, whether its hurried action is seen, or heard, or felt. But it is not always in this way that the 'deceitful' organ treats the lover.

"'Faint heart never won fair lady.'

"This saying was not meant, perhaps, to be taken literally, but it has its literal truth. Many a lover has found his heart sink within him,—lose all its force, and leave him weak as a child in his emotion at the sight of the object of his affections. When Porphyro looked upon Madeline at her prayers in the chapel, it was too much for him:

*"'She seemed a splendid angel, newly drest,
Save wings, for heaven:—Porphyro grew faint,
She knelt, so pure a thing, so free from earthly taint.'*

"And in Balzac's novel, 'Cesar Birotteau,' the hero of the story 'fainted away for-joy at the moment when, under a linden-tree, at Sceaux, Constance-Barbe-Josephine accepted him as her future husband.'

"One who faints is dead if he does not 'come to,' and nothing is more likely than that too susceptible lovers have actually gone off in this way. Everything depends on how the heart behaves itself in these and similar

trying moments. The mechanism of its actions becomes an interesting subject, therefore, to lovers of both sexes, and to all who are capable of intense emotions.

"The heart is a great reservoir, which distributes food, drink, air, and heat to every part of the system, in exchange for its waste material. It knocks at the gate of every organ seventy or eighty times in a minute, calling upon it to receive its supplies and unload its refuse. Between it and the brain there is the closest relation. The emotions, which act upon it as we have seen, govern it by a mechanism only of late years thoroughly understood. This mechanism can be made plain enough to the reader who is not afraid to believe that he can understand it.

"The brain, as all know, is the seat of ideas, emotions, volition. It is the great central telegraphic station with which many lesser centres are in close relation, from which they receive, and to which they transmit, their messages. The heart has its own little brains, so to speak,—small collections of nervous substance which govern its rhythmical motions under ordinary conditions. But these lesser nervous centres are to a large extent dominated by influences transmitted from certain groups of nerve-cells in the brain and its immediate dependencies.

"There are two among the special groups of nerve-cells which produce directly opposite effects. One of these has the power of accelerating the action of the heart, while the other has the power of retarding or arresting this action. One acts as the spur, the other as the bridle. According as one or the other predominates, the action of the heart will be stimulated or restrained. Among the great modern discoveries in physiology is that of the existence of a distinct centre of inhibition, as the restraining influence over the heart is called.

"The centre of inhibition plays a terrible part in the history of cowardice and of unsuccessful love. No man can be brave without blood to sustain his courage, any more than he can think, as the German materialist says, not absurdly, without phosphorus. The fainting lover must recover his circulation, or his lady will lend him her smelling-salts and take a gallant with blood in his cheeks. Porphyro got over his faintness before he ran away with Madeline, and Cesar Birotteau was an accepted lover when he swooned with happiness: but many an officer has been cashiered, and many a suitor has been rejected, because the centre of inhibition has got the upper hand of the centre of stimulation.

"In the well-known cases of deadly antipathy which have been recorded, the most frequent cause has been the disturbed and depressing influence of the centre of inhibition. Fainting at the sight of blood is one of the commonest examples of this influence. A single impression, in a very early period of atmospheric existence,—perhaps, indirectly, before that period, as was said to have happened in the case of James the First of England,—may establish a communication between this centre and the heart which will remain open ever afterwards. How does a footpath across a field establish itself? Its curves are arbitrary, and what we call accidental, but one after another follows it as if he were guided by a chart on which it was laid down. So it is with this dangerous transit between the centre of inhibition and the great organ of life. If once the path is opened by the track of some profound impression, that same impression, if repeated, or a similar one, is likely to find the old footmarks and follow them. Habit only makes the path easier to traverse, and thus the unreasoning terror of a child, of an infant, may perpetuate itself in a timidity which shames the manhood of its subject.

"The case before us is an exceptional and most remarkable example of the effect of inhibition on the heart.

"We will not say that we believe it to be unique in the history of the human race; on the contrary, we do not doubt that there have been similar cases, and that in some rare instances sudden death has been the consequence of seizures like that of the subject of this Report. The case most like it is that of Colone Townsend, which is too well known to require any lengthened description in this paper. It is enough to recall the main facts. He could by a voluntary effort suspend the action of his heart for a considerable period, during which he lay like one dead, pulseless, and without motion. After a time the circulation returned, and he does not seem to have been the worse for his dangerous, or seemingly dangerous, experiment. But in his case it was by an act of the will that the heart's action was suspended. In the case before us it is an involuntary impulse transmitted from the brain to the inhibiting centre, which arrests the cardiac movements.

"What is like to be the further history of the case?

"The subject of this anomalous affliction is now more than twenty years old. The chain of nervous actions has become firmly established. It might have been hoped that the changes of adolescence would have effected a transformation of the perverted instinct. On the contrary, the whole force of this instinct throws itself on the centre of inhibition, instead of quickening the heart-beats, and sending the rush of youthful blood with fresh life through the entire system to the throbbing finger-tips.

"Is it probable that time and circumstances will alter a habit of nervous interactions so long established? We are disposed to think that there is a chance of its being broken up. And we are not afraid to say that we suspect the old gypsy woman, whose prophecy took such hold of the patient's imagination, has hit upon the way in which the 'spell,' as she called it, is to be dissolved. She must, in all probability, have had a hint of the 'antipatia' to which the youth before her was a victim, and its cause, and if so, her guess as to the probable mode in which the young man would obtain relief from his unfortunate condition was the one which would naturally suggest itself.

"If once the nervous impression which falls on the centre of inhibition can be made to change its course, so as to follow its natural channel, it will probably keep to that channel ever afterwards. And this will, it is most likely, be effected by some sudden, unexpected impression. If he were drowning, and a young woman should rescue him, it is by no means impossible that the change in the nervous current we have referred to might be brought about as rapidly, as easily, as the reversal of the poles in a magnet, which is effected in an instant. But he cannot be expected to throw himself into the water just at the right moment when the 'fair lady' of the gitana's prophecy is passing on the shore. Accident may effect the cure which art seems incompetent to perform. It would not be strange if in some future seizure he should never come back to consciousness. But it is quite conceivable, on the other hand, that a happier event may occur, that in a single moment the nervous polarity may be reversed, the whole course of his life changed, and his past terrible experiences be to him

like a scarce-remembered dream.

"This is one, of those cases in which it is very hard to determine the wisest course to be pursued. The question is not unlike that which arises in certain cases of dislocation of the bones of the neck. Shall the unfortunate sufferer go all his days with his face turned far round to the right or the left, or shall an attempt be made to replace the dislocated bones? an attempt which may succeed, or may cause instant death. The patient must be consulted as to whether he will take the chance. The practitioner may be unwilling to risk it, if the patient consents. Each case must be judged on its own special grounds. We cannot think that this young man is doomed to perpetual separation from the society of womanhood during the period of its bloom and attraction. But to provoke another seizure after his past experiences would be too much like committing suicide. We fear that we must trust to the chapter of accidents. The strange malady—for such it is—has become a second nature, and may require as energetic a shock to displace it as it did to bring it into existence. Time alone can solve this question, on which depends the well-being and, it may be, the existence of a young man every way fitted to be happy, and to give happiness, if restored to his true nature."

XX. DR. BUTTS REFLECTS.

Dr. Butts sat up late at night reading these papers and reflecting upon them. He was profoundly impressed and tenderly affected by the entire frankness, the absence of all attempt at concealment, which Maurice showed in placing these papers at his disposal. He believed that his patient would recover from this illness for which he had been taking care of him. He thought deeply and earnestly of what he could do for him after he should have regained his health and strength.

There were references, in Maurice's own account of himself, which the doctor called to mind with great interest after reading his brief autobiography. Some one person—some young woman, it must be—had produced a singular impression upon him since those earlier perilous experiences through which he had passed. The doctor could not help thinking of that meeting with Euthymia of which she had spoken to him. Maurice, as she said, turned pale,—he clapped his hand to his breast. He might have done so if he had met her chambermaid, or any straggling damsel of the village. But Euthymia was not a young woman to be looked upon with indifference. She held herself like a queen, and walked like one, not a stage queen, but one born and bred to self-reliance, and command of herself as well as others. One could not pass her without being struck with her noble bearing and spirited features. If she had known how Maurice trembled as he looked upon her, in that conflict of attraction and uncontrollable dread,—if she had known it! But what, even then, could she have done? Nothing but get away from him as fast as she could. As it was, it was a long time before his agitation subsided, and his heart beat with its common force and frequency.

Dr. Butts was not a male gossip nor a matchmaking go-between. But he could not help thinking what a pity it was that these two young persons could not come together as other young people do in the pairing season, and find out whether they cared for and were fitted for each other. He did not pretend to settle this question in his own mind, but the thought was a natural one. And here was a gulf between them as deep and wide as that between Lazarus and Dives. Would it ever be bridged over? This thought took possession of the doctor's mind, and he imagined all sorts of ways of effecting some experimental approximation between Maurice and Euthymia. From this delicate subject he glanced off to certain general considerations suggested by the extraordinary history he had been reading. He began by speculating as to the possibility of the personal presence of an individual making itself perceived by some channel other than any of the five senses. The study of the natural sciences teaches those who are devoted to them that the most insignificant facts may lead the way to the discovery of the most important, all-pervading laws of the universe. From the kick of a frog's hind leg to the amazing triumphs which began with that seemingly trivial incident is a long, a very long stride if Madam Galvani had not been in delicate health, which was the occasion of her having some frog-broth prepared for her, the world of to-day might not be in possession of the electric telegraph and the light which blazes like the sun at high noon. A common-looking occurrence, one seemingly unimportant, which had hitherto passed unnoticed with the ordinary course of things, was the means of introducing us to a new and vast realm of closely related phenomena. It was like a key that we might have picked up, looking so simple that it could hardly fit any lock but one of like simplicity, but which should all at once throw back the bolts of the one lock which had defied the most ingenious of our complex implements and open our way into a hitherto unexplored territory.

It certainly was not through the eye alone that Maurice felt the paralyzing influence. He could contemplate Euthymia from a distance, as he did on the day of the boat-race, without any nervous disturbance. A certain proximity was necessary for the influence to be felt, as in the case of magnetism and electricity. An atmosphere of danger surrounded every woman he approached during the period when her sex exercises its most powerful attractions. How far did that atmosphere extend, and through what channel did it act?

The key to the phenomena of this case, he believed, was to be found in a fact as humble as that which gave birth to the science of galvanism and its practical applications. The circumstances connected with the very common antipathy to cats were as remarkable in many points of view as the similar circumstances in the case of Maurice Kirkwood. The subjects of that antipathy could not tell what it was which disturbed their nervous system. All they knew was that a sense of uneasiness, restlessness, oppression, came over them in the presence of one of these animals. He remembered the fact already mentioned, that persons sensitive to this impression can tell by their feelings if a cat is concealed in the apartment in which they may happen to be. It may be through some emanation. It may be through the medium of some electrical disturbance. What if the nerve-thrills passing through the whole system of the animal propagate themselves to a certain distance without any more regard to intervening solids than is shown by magnetism? A sieve lets sand pass through it; a filter arrests sand, but lets fluids pass, glass holds fluids, but lets light through; wood shuts out light, but

magnetic attraction goes through it as sand went through the sieve. No good reasons can be given why the presence of a cat should not betray itself to certain organizations, at a distance, through the walls of a box in which the animal is shut up. We need not disbelieve the stories which allege such an occurrence as a fact and a not very infrequent one.

If the presence of a cat can produce its effects under these circumstances, why should not that of a human being under similar conditions, acting on certain constitutions, exercise its specific influence? The doctor recalled a story told him by one of his friends, a story which the friend himself heard from the lips of the distinguished actor, the late Mr. Fechter. The actor maintained that Rachel had no genius as an actress. It was all Samson's training and study, according to him, which explained the secret of her wonderful effectiveness on the stage. But magnetism, he said,—magnetism, she was full of. He declared that he was made aware of her presence on the stage, when he could not see her or know of her presence otherwise, by this magnetic emanation. The doctor took the story for what it was worth. There might very probably be exaggeration, perhaps high imaginative coloring about it, but it was not a whit more unlikely than the cat-stories, accepted as authentic. He continued this train of thought into further developments. Into this series of reflections we will try to follow him.

What is the meaning of the halo with which artists have surrounded the heads of their pictured saints, of the aureoles which wraps them like a luminous cloud? Is it not a recognition of the fact that these holy personages diffuse their personality in the form of a visible emanation, which reminds us of Milton's definition of light:

"Bright effluence of bright essence increate"?

The common use of the term influence would seem to imply the existence of its correlative, effluence. There is no good reason that I can see, the doctor said to himself, why among the forces which work upon the nervous centres there should not be one which acts at various distances from its source. It may not be visible like the "glory" of the painters, it may not be appreciable by any one of the five senses, and yet it may be felt by the person reached by it as much as if it were a palpable presence,—more powerfully, perhaps, from the mystery which belongs to its mode of action.

Why should not Maurice have been rendered restless and anxious by the unseen nearness of a young woman who was in the next room to him, just as the persons who have the dread of cats are made conscious of their presence through some unknown channel? Is it anything strange that the larger and more powerful organism should diffuse a consciousness of its presence to some distance as well as the slighter and feebler one? Is it strange that this mysterious influence or effluence should belong especially or exclusively to the period of complete womanhood in distinction from that of immaturity or decadence? On the contrary, it seems to be in accordance with all the analogies of nature,—analogies too often cruel in the sentence they pass upon the human female.

Among the many curious thoughts which came up in the doctor's mind was this, which made him smile as if it were a jest, but which he felt very strongly had its serious side, and was involved with the happiness or suffering of multitudes of youthful persons who die without telling their secret:

How many young men have a mortal fear of woman, as woman, which they never overcome, and in consequence of which the attraction which draws man towards her, as strong in them as in others,—oftentimes, in virtue of their peculiarly sensitive organizations, more potent in them than in others of like age and conditions,—in consequence of which fear, this attraction is completely neutralized, and all the possibilities of doubled and indefinitely extended life depending upon it are left unrealized! Think what numbers of young men in Catholic countries devote themselves to lives of celibacy. Think how many young men lose all their confidence in the presence of the young woman to whom they are most attracted, and at last steal away from a companionship which it is rapture to dream of and torture to endure, so does the presence of the beloved object paralyze all the powers of expression. Sorcerers have in all time and countries played on the hopes and terrors of lovers. Once let loose a strong impulse on the centre of inhibition, and the warrior who had faced bayonets and batteries becomes a coward whom the well-dressed hero of the ball-room and leader of the German will put to ignominious flight in five minutes of easy, audacious familiarity with his lady-love.

Yes, the doctor went on with his reflections, I do not know that I have seen the term Gynophobia before I opened this manuscript, but I have seen the malady many times. Only one word has stood between many a pair of young people and their lifelong happiness, and that word has got as far as the lips, but the lips trembled and would not, could not, shape that little word. All young women are not like Coleridge's Genevieve, who knew how to help her lover out of his difficulty, and said yes before he had asked for an answer. So the wave which was to have wafted them on to the shore of Elysium has just failed of landing them, and back they have been drawn into the desolate ocean to meet no more on earth.

Love is the master-key, he went on thinking, love is the master-key that opens the gates of happiness, of hatred, of jealousy, and, most easily of all, the gate of fear. How terrible is the one fact of beauty!—not only the historic wonder of beauty, that "burnt the topless towers of Ilium" for the smile of Helen, and fired the palaces of Babylon by the hand of Thais, but the beauty which springs up in all times and places, and carries a torch and wears a serpent for a wreath as truly as any of the Eumenides. Paint Beauty with her foot upon a skull and a dragon coiled around her.

The doctor smiled at his own imposing classical allusions and pictorial imagery. Drifting along from thought to thought, he reflected on the probable consequences of the general knowledge of Maurice Kirkwood's story, if it came before the public.

What a piece of work it would make among the lively youths of the village, to be sure! What scoffing, what ridicule, what embellishments, what fables, would follow in the trail of the story! If the Interviewer got hold of it, how "The People's Perennial and Household Inquisitor" would blaze with capitals in its next issue! The young fellows of the place would be disposed to make fun of the whole matter. The young girls—the doctor hardly dared to think what would happen when the story got about among them. "The Sachem" of the solitary canoe, the bold horseman, the handsome hermit,—handsome so far as the glimpses they had got of him went,

—must needs be an object of tender interest among them, now that he was ailing, suffering, in danger of his life, away from friends,—poor fellow! Little tokens of their regard had reached his sick-chamber; bunches of flowers with dainty little notes, some of them pinkish, some three-cornered, some of them with brief messages, others “criss-crossed,” were growing more frequent as it was understood that the patient was likely to be convalescent before many days had passed. If it should come to be understood that there was a deadly obstacle to their coming into any personal relations with him, the doctor had his doubts whether there were not those who would subject him to the risk; for there were coquettes in the village,—strangers, visitors, let us hope,—who would sacrifice anything or anybody to their vanity and love of conquest.

XXI. AN INTIMATE CONVERSATION.

The illness from which Maurice had suffered left him in a state of profound prostration. The doctor, who remembered the extreme danger of any overexertion in such cases, hardly allowed him to lift his head from the pillow. But his mind was gradually recovering its balance, and he was able to hold some conversation with those about him. His faithful Paolo had grown so thin in waiting upon him and watching with him that the village children had to take a second look at his face when they passed him to make sure that it was indeed their old friend and no other. But as his master advanced towards convalescence and the doctor assured him that he was going in all probability to get well, Paolo's face began to recover something of its old look and expression, and once more his pockets filled themselves with comfits for his little circle of worshipping three and four year old followers.

“How is Mr. Kirkwood?” was the question with which he was always greeted. In the worst periods of the fever he rarely left his master. When he did, and the question was put to him, he would shake his head sadly, sometimes without a word, sometimes with tears and sobs and faltering words,—more like a brokenhearted child than a stalwart man as he was, such a man as soldiers are made of in the great Continental armies.

“He very bad,—he no eat nothing,—he—no say nothing,—he never be no better,” and all his Southern nature betrayed itself in a passionate burst of lamentation. But now that he began to feel easy about his master, his ready optimism declared itself no less transparently.

“He better every day now. He get well in few weeks, sure. You see him on hoss in little while.” The kind-hearted creature's life was bound up in that of his “master,” as he loved to call him, in sovereign disregard of the comments of the natives, who held themselves too high for any such recognition of another as their better. They could not understand how he, so much their superior in bodily presence, in air and manner, could speak of the man who employed him in any other way than as “Kirkwood,” without even demeaning himself so far as to prefix a “Mr.” to it. But “my master” Maurice remained for Paolo in spite of the fact that all men are born free and equal. And never was a servant more devoted to a master than was Paolo to Maurice during the days of doubt and danger. Since his improvement Maurice insisted upon his leaving his chamber and getting out of the house, so as to breathe the fresh air of which he was in so much need. It worried him to see his servant returning after too short an absence. The attendant who had helped him in the care of the patient was within call, and Paolo was almost driven out of the house by the urgency of his master's command that he should take plenty of exercise in the open air.

Notwithstanding the fact of Maurice's improved condition, although the force of the disease had spent itself, the state of weakness to which he had been reduced was a cause of some anxiety, and required great precautions to be taken. He lay in bed, wasted, enfeebled to such a degree that he had to be cared for very much as a child is tended. Gradually his voice was coming back to him, so that he could hold some conversation, as was before mentioned, with those about him. The doctor waited for the right moment to make mention of the manuscript which Maurice had submitted to him. Up to this time, although it had been alluded to and the doctor had told him of the intense interest with which he had read it, he had never ventured to make it the subject of any long talk, such as would be liable to fatigue his patient. But now he thought the time had come.

“I have been thinking,” the doctor said, “of the singular seizures to which you are liable, and as it is my business not merely to think about such cases, but to do what I can to help any who may be capable of receiving aid from my art, I wish to have some additional facts about your history. And in the first place, will you allow me to ask what led you to this particular place? It is so much less known to the public at large than many other resorts that we naturally ask, What brings this or that new visitor among us? We have no ill-tasting, natural spring of bad water to be analyzed by the state chemist and proclaimed as a specific. We have no great gambling-houses, no racecourse (except that for boats on the lake); we have no coaching-club, no great balls, few lions of any kind, so we ask, What brings this or that stranger here? And I think I may venture to ask you whether any, special motive brought you among us, or whether it was accident that determined your coming to this place.”

“Certainly, doctor,” Maurice answered, “I will tell you with great pleasure. Last year I passed on the border of a great river. The year before I lived in a lonely cottage at the side of the ocean. I wanted this year to be by a lake. You heard the paper read at the meeting of your society, or at least you heard of it,—for such matters are always talked over in a village like this. You can judge by that paper, or could, if it were before you, of the frame of mind in which I came here. I was tired of the sullen indifference of the ocean and the babbling egotism of the river, always hurrying along on its own private business. I wanted the dreamy stillness of a large, tranquil sheet of water that had nothing in particular to do, and would leave me to myself and my thoughts. I had read somewhere about the place, and the old Anchor Tavern, with its paternal landlord and motherly landlady and old-fashioned household, and that, though it was no longer open as a tavern, I could find a resting-place there early in the season, at least for a few days, while I looked about me for a quiet place in which I might pass my summer. I have found this a pleasant residence. By being up early and out late I

have kept myself mainly in the solitude which has become my enforced habit of life. The season has gone by too swiftly for me since my dream has become a vision."

The doctor was sitting with his hand round Maurice's wrist, three fingers on his pulse. As he spoke these last words he noticed that the pulse fluttered a little,—beat irregularly a few times; intermitted; became feeble and thready; while his cheek grew whiter than the pallid bloodlessness of his long illness had left it.

"No more talk, now," he said. "You are too tired to be using your voice. I will hear all the rest another time."

The doctor had interrupted Maurice at an interesting point. What did he mean by saying that his dream had become a vision? This is what the doctor was naturally curious, and professionally anxious, to know. But his hand was still on his patient's pulse, which told him unmistakably that the heart had taken the alarm and was losing its energy under the depressing nervous influence. Presently, however, it recovered its natural force and rhythm, and a faint flush came back to the pale cheek. The doctor remembered the story of Galen, and the young maiden whose complaint had puzzled the physicians.

The next day his patient was well enough to enter once more into conversation.

"You said something about a dream of yours which had become a vision," said the doctor, with his fingers on his patient's wrist, as before. He felt the artery leap, under his pressure, falter a little, stop, then begin again, growing fuller in its beat. The heart had felt the pull of the bridle, but the spur had roused it to swift reaction.

"You know the story of my past life, doctor," Maurice answered; "and, I will tell you what is the vision which has taken the place of my dreams. You remember the boat-race? I watched it from a distance, but I held a powerful opera-glass in my hand, which brought the whole crew of the young ladies' boat so close to me that I could see the features, the figures, the movements, of every one of the rowers. I saw the little coxswain fling her bouquet in the track of the other boat,—you remember how the race was lost and won,—but I saw one face among those young girls which drew me away from all the rest. It was that of the young lady who pulled the bow oar, the captain of the boat's crew. I have since learned her name, you know it well,—I need not name her. Since that day I have had many distant glimpses of her; and once I met her so squarely that the deadly sensation came over me, and I felt that in another moment I should fall senseless at her feet. But she passed on her way and I on mine, and the spasm which had clutched my heart gradually left it, and I was as well as before. You know that young lady, doctor?"

"I do; and she is a very noble creature. You are not the first young man who has been fascinated, almost at a glance, by Miss Euthymia Tower. And she is well worth knowing more intimately."

The doctor gave him a full account of the young lady, of her early days, her character, her accomplishments. To all this he listened devoutly, and when the doctor left him he said to himself, "I will see her and speak with her, if it costs me my life."

XXII. EUTHYMIA.

"The Wonder" of the Corinna Institute had never willingly made a show of her gymnastic accomplishments. Her feats, which were so much admired, were only her natural exercise. Gradually the dumb-bells others used became too light for her, the ropes she climbed too short, the clubs she exercised with seemed as if they were made of cork instead of being heavy wood, and all the tests and meters of strength and agility had been strained beyond the standards which the records of the school had marked as their historic maxima. It was not her fault that she broke a dynamometer one day; she apologized for it, but the teacher said he wished he could have a dozen broken every year in the same way. The consciousness of her bodily strength had made her very careful in her movements. The pressure of her hand was never too hard for the tenderest little maiden whose palm was against her own. So far from priding herself on her special gifts, she was disposed to be ashamed of them. There were times and places in which she could give full play to her muscles without fear or reproach. She had her special costume for the boat and for the woods. She would climb the rugged old hemlocks now and then for the sake of a wide outlook, or to peep into the large nest where a hawk, or it may be an eagle, was raising her little brood of air-pirates.

There were those who spoke of her wanderings in lonely places as an unsafe exposure. One sometimes met doubtful characters about the neighborhood, and stories were told of occurrences which might well frighten a young girl, and make her cautious of trusting herself alone in the wild solitudes which surrounded the little village. Those who knew Euthymia thought her quite equal to taking care of herself. Her very look was enough to ensure the respect of any vagabond who might cross her path, and if matters came to the worst she would prove as dangerous as a panther.

But it was a pity to associate this class of thoughts with a noble specimen of true womanhood. Health, beauty, strength, were fine qualities, and in all these she was rich. She enjoyed all her natural gifts, and thought little about them. Unwillingly, but over-persuaded by some of her friends, she had allowed her arm and hand to be modelled. The artists who saw the cast wondered if it would be possible to get the bust of the maiden from whom it was taken. Nobody would have dared to suggest such an idea to her except Lurida. For Lurida sex was a trifling accident, to be disregarded not only in the interests of humanity, but for the sake of art.

"It is a shame," she said to Euthymia, "that you will not let your exquisitely moulded form be perpetuated in marble. You have no right to withhold such a model from the contemplation of your fellow-creatures. Think how rare it is to see a woman who truly represents the divine idea! You belong to your race, and not to yourself,—at least, your beauty is a gift not to be considered as a piece of private property. Look at the so-called Venus of Milo. Do you suppose the noble woman who was the original of that divinely chaste statue felt

any scruple about allowing the sculptor to reproduce her pure, unblemished perfections?"

Euthymia was always patient with her imaginative friend. She listened to her eloquent discourse, but she could not help blushing, used as she was to Lurida's audacities. "The Terror's" brain had run away with a large share of the blood which ought to have gone to the nourishment of her general system. She could not help admiring, almost worshipping, a companion whose being was rich in the womanly developments with which nature had so economically endowed herself. An impoverished organization carries with it certain neutral qualities which make its subject appear, in the presence of complete manhood and womanhood, like a deaf-mute among speaking persons. The deep blush which crimsoned Euthymia's cheek at Lurida's suggestion was in a strange contrast to her own undisturbed expression. There was a range of sensibilities of which Lurida knew far less than she did of those many and difficult studies which had absorbed her vital forces. She was startled to see what an effect her proposal had produced, for Euthymia was not only blushing, but there was a flame in her eyes which she had hardly ever seen before.

"Is this only your own suggestion?" Euthymia said, "or has some one been putting the idea into your head?" The truth was that she had happened to meet the Interviewer at the Library, one day, and she was offended by the long, searching stare with which that individual had honored her. It occurred to her that he, or some such visitor to the place, might have spoken of her to Lurida, or to some other person who had repeated what was said to Lurida, as a good subject for the art of the sculptor, and she felt all her maiden sensibilities offended by the proposition. Lurida could not understand her excitement, but she was startled by it. Natures which are complementary of each other are liable to these accidental collisions of feeling. They get along very well together, none the worse for their differences, until all at once the tender spot of one or the other is carelessly handled in utter unconsciousness on the part of the aggressor, and the exclamation, the outcry, or the explosion explains the situation altogether too emphatically. Such scenes did not frequently occur between the two friends, and this little flurry was soon over; but it served to warn Lurida that Miss Euthymia Tower was not of that class of self-conscious beauties who would be ready to dispute the empire of the Venus of Milo on her own ground, in defences as scanty and insufficient as those of the marble divinity.

Euthymia had had admirers enough, at a distance, while at school, and in the long vacations, near enough to find out that she was anything but easy to make love to. She fairly frightened more than one rash youth who was disposed to be too sentimental in her company. They overdid flattery, which she was used to and tolerated, but which cheapened the admirer in her estimation, and now and then betrayed her into an expression which made him aware of the fact, and was a discouragement to aggressive amiability. The real difficulty was that not one of her adorers had ever greatly interested her. It could not be that nature had made her insensible. It must have been because the man who was made for her had never yet shown himself. She was not easy to please, that was certain; and she was one of those young women who will not accept as a lover one who but half pleases them. She could not pick up the first stick that fell in her way and take it to shape her ideal out of. Many of the good people of the village doubted whether Euthymia would ever be married.

"There 's nothing good enough for her in this village," said the old landlord of what had been the Anchor Tavern.

"She must wait till a prince comes along," the old landlady said in reply. "She'd make as pretty a queen as any of them that's born to it. Wouldn't she be splendid with a gold crown on her head, and di'monds a glitterin' all over her! D' you remember how handsome she looked in the tableau, when the fair was held for the Dorcas Society? She had on an old dress of her grandma's,—they don't make anything half so handsome nowadays,—and she was just as pretty as a pictur'. But what's the use of good looks if they scare away folks? The young fellows think that such a handsome girl as that would cost ten times as much to keep as a plain one. She must be dressed up like an empress,—so they seem to think. It ain't so with Euthymy: she'd look like a great lady dressed anyhow, and she has n't got any more notions than the homeliest girl that ever stood before a glass to look at herself."

In the humbler walks of Arrowhead Village society, similar opinions were entertained of Miss Euthymia. The fresh-water fisherman represented pretty well the average estimate of the class to which he belonged. "I tell ye," said he to another gentleman of leisure, whose chief occupation was to watch the coming and going of the visitors to Arrowhead Village,— "I tell ye that girl ain't a gon to put up with any o' them slab-sided fellahs that you see hangin' raound to look at her every Sunday when she comes aout o' meetin'. It's one o' them big gents from Boston or New York that'll step up an' kerry her off."

In the mean time nothing could be further from the thoughts of Euthymia than the prospect of an ambitious worldly alliance. The ideals of young women cost them many and great disappointments, but they save them very often from those lifelong companionships which accident is constantly trying to force upon them, in spite of their obvious unfitness. The higher the ideal, the less likely is the commonplace neighbor who has the great advantage of easy access, or the boarding-house acquaintance who can profit by those vacant hours when the least interesting of visitors is better than absolute loneliness,—the less likely are these undesirable personages to be endured, pitied, and, if not embraced, accepted, for want of something better. Euthymia found so much pleasure in the intellectual companionship of Lurida, and felt her own prudence and reserve so necessary to that independent young lady, that she had been contented, so far, with friendship, and thought of love only in an abstract sort of way. Beneath her abstractions there was a capacity of loving which might have been inferred from the expression of her features, the light that shone in her eyes, the tones of her voice, all of which were full of the language which belongs to susceptible natures. How many women never say to themselves that they were born to love, until all at once the discovery opens upon them, as the sense that he was born a painter is said to have dawned suddenly upon Correggio!

Like all the rest of the village and its visitors, she could not help thinking a good deal about the young man lying ill amongst strangers. She was not one of those who had sent him the three-cornered notes or even a bunch of flowers. She knew that he was receiving abounding tokens of kindness and sympathy from different quarters, and a certain inward feeling restrained her from joining in these demonstrations. If he had been suffering from some deadly and contagious malady she would have risked her life to help him, without a thought that there was any wonderful heroism in such self-devotion. Her friend Lurida might have been

capable of the same sacrifice, but it would be after reasoning with herself as to the obligations which her sense of human rights and duties laid upon her, and fortifying her courage with the memory of noble deeds recorded of women in ancient and modern history. With Euthymia the primary human instincts took precedence of all reasoning or reflection about them. All her sympathies were excited by the thought of this forlorn stranger in his solitude, but she felt the impossibility of giving any complete expression to them. She thought of Mungo Park in the African desert, and she envied the poor negress who not only pitied him, but had the blessed opportunity of helping and consoling him. How near were these two human creatures, each needing the other! How near in bodily presence, how far apart in their lives, with a barrier seemingly impassable between them!

XXIII. THE MEETING OF MAURICE AND EUTHYMIA.

These autumnal fevers, which carry off a large number of our young people every year, are treacherous and deceptive diseases. Not only are they liable, as has been mentioned, to various accidental complications which may prove suddenly fatal, but too often, after convalescence seems to be established, relapses occur which are more serious than the disease had appeared to be in its previous course. One morning Dr. Butts found Maurice worse instead of better, as he had hoped and expected to find him. Weak as he was, there was every reason to fear the issue of this return of his threatening symptoms. There was not much to do besides keeping up the little strength which still remained. It was all needed.

Does the reader of these pages ever think of the work a sick man as much as a well one has to perform while he is lying on his back and taking what we call his "rest"? More than a thousand times an hour, between a hundred and fifty and two hundred thousand times a week, he has to lift the bars of the cage in which his breathing organs are confined, to save himself from asphyxia. Rest! There is no rest until the last long sigh tells those who look upon the dying that the ceaseless daily task, to rest from which is death, is at last finished. We are all galley-slaves, pulling at the levers of respiration,—which, rising and falling like so many oars, drive us across an unfathomable ocean from one unknown shore to another. No! Never was a galley-slave so chained as we are to these four and twenty oars, at which we must tug day and night all our life long.

The doctor could not find any accidental cause to account for this relapse. It presently occurred to him that there might be some local source of infection which had brought on the complaint, and was still keeping up the symptoms which were the ground of alarm. He determined to remove Maurice to his own house, where he could be sure of pure air, and where he himself could give more constant attention to his patient during this critical period of his disease. It was a risk to take, but he could be carried on a litter by careful men, and remain wholly passive during the removal. Maurice signified his assent, as he could hardly help doing,—for the doctor's suggestion took pretty nearly the form of a command. He thought it a matter of life and death, and was gently urgent for his patient's immediate change of residence. The doctor insisted on having Maurice's books and other movable articles carried to his own house, so that he should be surrounded by familiar sights, and not worry himself about what might happen to objects which he valued, if they were left behind him.

All these dispositions were quickly and quietly made, and everything was ready for the transfer of the patient to the house of the hospitable physician. Paolo was at the doctor's, superintending the arrangement of Maurice's effects and making all ready for his master. The nurse in attendance, a trustworthy man enough in the main, finding his patient in a tranquil sleep, left his bedside for a little fresh air. While he was at the door he heard a shouting which excited his curiosity, and he followed the sound until he found himself at the border of the lake. It was nothing very wonderful which had caused the shouting. A Newfoundland dog had been showing off his accomplishments, and some of the idlers were betting as to the time it would take him to bring back to his master the various floating objects which had been thrown as far from the shore as possible. He watched the dog a few minutes, when his attention was drawn to a light wherry, pulled by one young lady and steered by another. It was making for the shore, which it would soon reach. The attendant remembered all at once, that he had left his charge, and just before the boat came to land he turned and hurried back to the patient. Exactly how long he had been absent he could not have said,—perhaps a quarter of an hour, perhaps longer; the time appeared short to him, wearied with long sitting and watching.

It had seemed, when he stole away from Maurice's bedside, that he was not in the least needed. The patient was lying perfectly quiet, and to all appearance wanted nothing more than letting alone. It was such a comfort to look at something besides the worn features of a sick man, to hear something besides his labored breathing and faint, half-whispered words, that the temptation to indulge in these luxuries for a few minutes had proved irresistible.

Unfortunately, Maurice's slumbers did not remain tranquil during the absence of the nurse. He very soon fell into a dream, which began quietly enough, but in the course of the sudden transitions which dreams are in the habit of undergoing became successively anxious, distressing, terrifying. His earlier and later experiences came up before him, fragmentary, incoherent, chaotic even, but vivid as reality. He was at the bottom of a coal-mine in one of those long, narrow galleries, or rather worm-holes, in which human beings pass a large part of their lives, like so many larvae boring their way into the beams and rafters of some old building. How close the air was in the stifling passage through which he was crawling! The scene changed, and he was climbing a slippery sheet of ice with desperate effort, his foot on the floor of a shallow niche, his hold an icicle ready to snap in an instant, an abyss below him waiting for his foot to slip or the icicle to break. How thin the air seemed, how desperately hard to breathe! He was thinking of Mont Blanc, it may be, and the fearfully rarefied atmosphere which he remembered well as one of the great trials in his mountain ascents.

No, it was not Mont Blanc,—it was not any one of the frozen Alpine summits; it was Hecla that he was climbing.

The smoke of the burning mountain was wrapping itself around him; he was choking with its dense fumes; he heard the flames roaring around him, he felt the hot lava beneath his feet, he uttered a faint cry, and awoke.

The room was full of smoke. He was gasping for breath, strangling in the smothering oven which his chamber had become.

The house was on fire!

He tried to call for help, but his voice failed him, and died away in a whisper. He made a desperate effort, and rose so as to sit up in the bed for an instant, but the effort was too much for him, and he sank back upon his pillow, helpless. He felt that his hour had come, for he could not live in this dreadful atmosphere, and he was left alone. He could hear the crackle of fire as the flame crept along from one partition to another. It was a cruel fate to be left to perish in that way,—the fate that many a martyr had had to face,—to be first strangled and then burned. Death had not the terror for him that it has for most young persons. He was accustomed to thinking of it calmly, sometimes wistfully, even to such a degree that the thought of self-destruction had come upon him as a temptation. But here was death in an unexpected and appalling shape. He did not know before how much he cared to live. All his old recollections came before him as it were in one long, vivid flash. The closed vista of memory opened to its far horizon-line, and past and present were pictured in a single instant of clear vision. The dread moment which had blighted his life returned in all its terror. He felt the convulsive spring in the form of a faint, impotent spasm,—the rush of air,—the thorns of the stinging and lacerating cradle into which he was precipitated. One after another those paralyzing seizures which had been like deadening blows on the naked heart seemed to repeat themselves, as real as at the moment of their occurrence. The pictures passed in succession with such rapidity that they appeared almost as if simultaneous. The vision of the "inward eye" was so intensified in this moment of peril that an instant was like an hour of common existence. Those who have been very near drowning know well what this description means. The development of a photograph may not explain it, but it illustrates the curious and familiar fact of the revived recollections of the drowning man's experience. The sensitive plate has taken one look at a scene, and remembers it all,

Every little circumstance is there,—the hoof in air, the wing in flight, the leaf as it falls, the wave as it breaks. All there, but invisible; potentially present, but impalpable, inappreciable, as if not existing at all. A wash is poured over it, and the whole scene comes out in all its perfection of detail. In those supreme moments when death stares a man suddenly in the face the rush of unwonted emotion floods the undeveloped pictures of vanished years, stored away in the memory, the vast panorama of a lifetime, and in one swift instant the past comes out as vividly as if it were again the present. So it was at this moment with the sick man, as he lay helpless and felt that he was left to die. For he saw no hope of relief: the smoke was drifting in clouds into the room; the flames were very near; if he was not reached and rescued immediately it was all over with him.

His past life had flashed before him. Then all at once rose the thought of his future,—of all its possibilities, of the vague hopes which he had cherished of late that his mysterious doom would be lifted from him. There was something, then, to be lived for, something! There was a new life, it might be, in store for him, and such a new life! He thought of all he was losing. Oh, could he but have lived to know the meaning of love! And the passionate desire of life came over him,—not the dread of death, but the longing for what the future might yet have of happiness for him.

All this took place in the course of a very few moments. Dreams and visions have little to do with measured time, and ten minutes, possibly fifteen or twenty, were all that had passed since the beginning of those nightmare terrors which were evidently suggested by the suffocating air he was breathing.

What had happened? In the confusion of moving books and other articles to the doctor's house, doors and windows had been forgotten. Among the rest a window opening into the cellar, where some old furniture had been left by a former occupant, had been left unclosed. One of the lazy natives, who had lounged by the house smoking a bad cigar, had thrown the burning stump in at this open window. He had no particular intention of doing mischief, but he had that indifference to consequences which is the next step above the inclination to crime. The burning stump happened to fall among the straw of an old mattress which had been ripped open. The smoker went his way without looking behind him, and it so chanced that no other person passed the house for some time. Presently the straw was in a blaze, and from this the fire extended to the furniture, to the stairway leading up from the cellar, and was working its way along the entry under the stairs leading up to the apartment where Maurice was lying.

The blaze was fierce and swift, as it could not help being with such a mass of combustibles,—loose straw from the mattress, dry old furniture, and old warped floors which had been parching and shrinking for a score or two of years. The whole house was, in the common language of the newspaper reports, "a perfect tinder-box," and would probably be a heap of ashes in half an hour. And there was this unfortunate deserted sick man lying between life and death, beyond all help unless some unexpected assistance should come to his rescue.

As the attendant drew near the house where Maurice was lying, he was horror-struck to see dense volumes of smoke pouring out of the lower windows. It was beginning to make its way through the upper windows, also, and presently a tongue of fire shot out and streamed upward along the side of the house. The man shrieked Fire! Fire! with all his might, and rushed to the door of the building to make his way to Maurice's room and save him. He penetrated but a short distance when, blinded and choking with the smoke, he rushed headlong down the stairs with a cry of despair that roused every man, woman, and child within reach of a human voice. Out they came from their houses in every quarter of the village. The shout of Fire! Fire! was the chief aid lent by many of the young and old. Some caught up pails and buckets: the more thoughtful ones filling them; the hastier snatching them up empty, trusting to find water nearer the burning building.

Is the sick man moved?

This was the awful question first asked,—for in the little village all knew that Maurice was about being transferred to the doctor's house. The attendant, white as death, pointed to the chamber where he had left him, and gasped out,

“He is there!”

A ladder! A ladder! was the general cry, and men and boys rushed off in search of one. But a single minute was an age now, and there was no ladder to be had without a delay of many minutes. The sick man was going to be swallowed up in the flames before it could possibly arrive. Some were going for a blanket or a coverlet, in the hope that the young man might have strength enough to leap from the window and be safely caught in it. The attendant shook his head, and said faintly,

“He cannot move from his bed.”

One of the visitors at the village,—a millionaire, it was said,—a kind-hearted man, spoke in hoarse, broken tones:

“A thousand dollars to the man that will bring him from his chamber!”

The fresh-water fisherman muttered, “I should like to save the man and to see the money, but it ain't a thaousan' dollars, nor ten thaousan' dollars, that'll pay a fellah for burnin' to death,—or even chokin' to death, anyhaow.”

The carpenter, who knew the framework of every house in the village, recent or old, shook his head.

“The stairs have been shored up,” he said, “and when the fists that holds 'em up goes, down they'll come. It ain't safe for no man to go over them stairs. Hurry along your ladder,—that's your only chance.”

All was wild confusion around the burning house. The ladder they had gone for was missing from its case,—a neighbor had carried it off for the workmen who were shingling his roof. It would never get there in time. There was a fire-engine, but it was nearly half a mile from the lakeside settlement. Some were throwing on water in an aimless, useless way; one was sending a thin stream through a garden syringe: it seemed like doing something, at least. But all hope of saving Maurice was fast giving way, so rapid was the progress of the flames, so thick the cloud of smoke that filled the house and poured from the windows. Nothing was heard but confused cries, shrieks of women, all sorts of orders to do this and that, no one knowing what was to be done. The ladder! The ladder! Five minutes more and it will be too late!

In the mean time the alarm of fire had reached Paolo, and he had stopped his work of arranging Maurice's books in the same way as that in which they had stood in his apartment, and followed in the direction of the sound, little thinking that his master was lying helpless in the burning house. “Some chimney afire,” he said to himself; but he would go and take a look, at any rate.

Before Paolo had reached the scene of destruction and impending death, two young women, in boating dresses of decidedly Bloomerish aspect, had suddenly joined the throng. “The Wonder” and “The Terror” of their school-days—Miss Euthymia rower and Miss Lurida Vincent had just come from the shore, where they had left their wherry. A few hurried words told them the fearful story. Maurice Kirkwood was lying in the chamber to which every eye was turned, unable to move, doomed to a dreadful death. All that could be hoped was that he would perish by suffocation rather than by the flames, which would soon be upon him. The man who had attended him had just tried to reach his chamber, but had reeled back out of the door, almost strangled by the smoke. A thousand dollars had been offered to any one who would rescue the sick man, but no one had dared to make the attempt; for the stairs might fall at any moment, if the smoke did not blind and smother the man who passed them before they fell.

The two young women looked each other in the face for one swift moment.

“How can he be reached?” asked Lurida. “Is there nobody that will venture his life to save a brother like that?”

“I will venture mine,” said Euthymia.

“No! no!” shrieked Lurida,—“not you! not you! It is a man's work, not yours! You shall not go!” Poor Lurida had forgotten all her theories in this supreme moment. But Euthymia was not to be held back. Taking a handkerchief from her neck, she dipped it in a pail of water and bound it about her head. Then she took several deep breaths of air, and filled her lungs as full as they would hold. She knew she must not take a single breath in the choking atmosphere if she could possibly help it, and Euthymia was noted for her power of staying under water so long that more than once those who saw her dive thought she would never come up again. So rapid were her movements that they paralyzed the bystanders, who would forcibly have prevented her from carrying out her purpose. Her imperious determination was not to be resisted. And so Euthymia, a willing martyr, if martyr she was to be, and not saviour, passed within the veil that hid the sufferer.

Lurida turned deadly pale, and sank fainting to the ground. She was the first, but not the only one, of her sex that fainted as Euthymia disappeared in the smoke of the burning building. Even the rector grew very white in the face,—so white that one of his vestry-men begged him to sit down at once, and sprinkled a few drops of water on his forehead, to his great disgust and manifest advantage. The old landlady was crying and moaning, and her husband was wiping his eyes and shaking his head sadly.

“She will never come out alive,” he said solemnly.

“Nor dead, neither,” added the carpenter. “Ther' won't be nothing left of neither of 'em but ashes.” And the carpenter hid his face in his hands.

The fresh-water fisherman had pulled out a rag which he called a “hangkercher,”—it had served to carry bait that morning,—and was making use of its best corner to dry the tears which were running down his cheeks. The whole village was proud of Euthymia, and with these more quiet signs of grief were mingled loud lamentations, coming alike from old and young.

All this was not so much like a succession of events as it was like a tableau. The lookers-on were stunned with its suddenness, and before they had time to recover their bewildered senses all was lost, or seemed lost. They felt that they should never look again on either of those young faces.

The rector, not unfeeling by nature, but inveterately professional by habit, had already recovered enough to

be thinking of a text for the funeral sermon. The first that occurred to him was this,—vaguely, of course, in the background of consciousness:

“Then Shadrach, Meshach, and Abed-nego came forth of the midst of the fire.”

The village undertaker was of naturally sober aspect and reflective disposition. He had always been opposed to cremation, and here was a funeral pile blazing before his eyes. He, too, had his human sympathies, but in the distance his imagination pictured the final ceremony, and how he himself should figure in a spectacle where the usual centre piece of attraction would be wanting,—perhaps his own services uncalled for.

Blame him not, you whose garden-patch is not watered with the tears of mourners. The string of self-interest answers with its chord to every sound; it vibrates with the funeral-bell, it finds itself trembling to the wail of the *De Profundis*. Not always,—not always; let us not be cynical in our judgments, but common human nature, we may safely say, is subject to those secondary vibrations under the most solemn and soul-subduing influences.

It seems as if we were doing great wrong to the scene we are contemplating in delaying it by the description of little circumstances and individual thoughts and feelings. But linger as we may, we cannot compress into a chapter—we could not crowd into a volume—all that passed through the minds and stirred the emotions of the awe-struck company which was gathered about the scene of danger and of terror. We are dealing with an impossibility: consciousness is a surface; narrative is a line.

Maurice had given himself up for lost. His breathing was becoming every moment more difficult, and he felt that his strength could hold out but a few minutes longer.

“Robert!” he called in faint accents. But the attendant was not there to answer.

“Paolo! Paolo!” But the faithful servant, who would have given his life for his master, had not yet reached the place where the crowd was gathered.

“Oh, for a breath of air! Oh, for an arm to lift me from this bed! Too late! Too late!” he gasped, with what might have seemed his dying expiration.

“Not too late!” The soft voice reached his obscured consciousness as if it had come down to him from heaven.

In a single instant he found himself rolled in a blanket and in the arms of—a woman!

Out of the stifling chamber,—over the burning stairs,—close by the tongues of fire that were lapping up all they could reach,—out into the open air, he was borne swiftly and safely,—carried as easily as if he had been a babe, in the strong arms of “The Wonder” of the gymnasium, the captain of the *Atalanta*, who had little dreamed of the use she was to make of her natural gifts and her school-girl accomplishments.

Such a cry as arose from the crowd of on-lookers! It was a sound that none of them had ever heard before or could expect ever to hear again, unless he should be one of the last boat-load rescued from a sinking vessel. Then, those who had resisted the overflow of their emotion, who had stood in white despair as they thought of these two young lives soon to be wrapped in their burning shroud,—those stern men—the old sea-captain, the hard-faced, moneymaking, cast-iron tradesmen of the city counting-room—sobbed like hysteric women; it was like a convulsion that overcame natures unused to those deeper emotions which many who are capable of experiencing die without ever knowing.

This was the scene upon which the doctor and Paolo suddenly appeared at the same moment.

As the fresh breeze passed over the face of the rescued patient, his eyes opened wide, and his consciousness returned in almost supernatural lucidity. Euthymia had sat down upon a bank, and was still supporting him. His head was resting on her bosom. Through his awakening senses stole the murmurs of the living cradle which rocked him with the wavelike movements of respiration, the soft susurrus of the air that entered with every breath, the double beat of the heart which throbbed close to his ear. And every sense, and every instinct, and every reviving pulse told him in language like a revelation from another world that a woman's arms were around him, and that it was life, and not death, which her embrace had brought him.

She would have disengaged him from her protecting hold, but the doctor made her a peremptory sign, which he followed by a sharp command:—

“Do not move him a hair's breadth,” he said. “Wait until the litter comes. Any sudden movement might be dangerous. Has anybody a brandy flask about him?”

One or two members of the local temperance society looked rather awkward, but did not come forward.

The fresh-water fisherman was the first who spoke.

“I han't got no brandy,” he said, “but there's a drop or two of old Medford rum in this here that you're welcome to, if it'll be of any help. I alliz kerry a little on 't in case o' gettin' wet 'n' chilled.”

So saying he held forth a flat bottle with the word *Sarsaparilla* stamped on the green glass, but which contained half a pint or more of the specific on which he relied in those very frequent exposures which happen to persons of his calling.

The doctor motioned back Paolo, who would have rushed at once to the aid of Maurice, and who was not wanted at that moment. So poor Paolo, in an agony of fear for his master, was kept as quiet as possible, and had to content himself with asking all sorts of questions and repeating all the prayers he could think of to Our Lady and to his holy namesake the Apostle.

The doctor wiped the mouth of the fisherman's bottle very carefully. “Take a few drops of this cordial,” he said, as he held it to his patient's lips. “Hold him just so, Euthymia, without stirring. I will watch him, and say when he is ready to be moved. The litter is near by, waiting.” Dr. Butts watched Maurice's pulse and color. The “Old Medford” knew its business. It had knocked over its tens of thousands; it had its redeeming virtue, and helped to set up a poor fellow now and then. It did this for Maurice very effectively. When he seemed somewhat restored, the doctor had the litter brought to his side, and Euthymia softly resigned her helpless burden, which Paolo and the attendant Robert lifted with the aid of the doctor, who walked by the patient as he was borne to the home where Mrs. Butts had made all ready for his reception.

As for poor Lurida, who had thought herself equal to the sanguinary duties of the surgeon, she was left lying on the grass with an old woman over her, working hard with fan and smelling-salts to bring her back from her long fainting fit.

XXIV. THE INEVITABLE.

Why should not human nature be the same in Arrowhead Village as elsewhere? It could not seem strange to the good people of that place and their visitors that these two young persons, brought together under circumstances that stirred up the deepest emotions of which the human soul is capable, should become attached to each other. But the bond between them was stronger than any knew, except the good doctor, who had learned the great secret of Maurice's life. For the first time since his infancy he had fully felt the charm which the immediate presence of youthful womanhood carries with it. He could hardly believe the fact when he found himself no longer the subject of the terrifying seizures of which he had had many and threatening experiences.

It was the doctor's business to save his patient's life, if he could possibly do it. Maurice had been reduced to the most perilous state of debility by the relapse which had interrupted his convalescence. Only by what seemed almost a miracle had he survived the exposure to suffocation and the mental anguish through which he had passed. It was perfectly clear to Dr. Butts that if Maurice could see the young woman to whom he owed his life, and, as the doctor felt assured, the revolution in his nervous system which would be the beginning of a new existence, it would be of far more value as a restorative agency than any or all of the drugs in the pharmacopoeia. He told this to Euthymia, and explained the matter to her parents and friends. She must go with him on some of his visits. Her mother should go with her, or her sister; but this was a case of life and death, and no maidenly scruples must keep her from doing her duty.

The first of her visits to the sick, perhaps dying, man presented a scene not unlike the picture before spoken of on the title-page of the old edition of Galen. The doctor was perhaps the most agitated of the little group. He went before the others, took his seat by the bedside, and held the patient's wrist with his finger on the pulse. As Euthymia entered it gave a single bound, fluttered for an instant as if with a faint memory of its old habit, then throbbed full and strong, comparatively, as if under the spur of some powerful stimulus. Euthymia's task was a delicate one, but she knew how to disguise its difficulty.

"Here is a flower I have brought you, Mr. Kirkwood," she said, and handed him a white chrysanthemum. He took it from her hand, and before she knew it he took her hand into his own, and held it with a gentle constraint. What could she do? Here was the young man whose life she had saved, at least for the moment, and who was yet in danger from the disease which had almost worn out his powers of resistance.

"Sit down by Mr. Kirkwood's side," said the doctor. "He wants to thank you, if he has strength to do it, for saving him from the death which seemed inevitable."

Not many words could Maurice command. He was weak enough for womanly tears, but their fountains no longer flowed; it was with him as with the dying, whose eyes may light up, but rarely shed a tear.

The river which has found a new channel widens and deepens it; it lets the old water-course fill up, and never returns to its forsaken bed. The tyrannous habit was broken. The prophecy of the gitana had verified itself, and the ill a fair woman had wrought a fairer woman had conquered and abolished.

The history of Maurice Kirkwood loses its exceptional character from the time of his restoration to his natural conditions. His convalescence was very slow and gradual, but no further accident interrupted its even progress. The season was over, the summer visitors had left Arrowhead Village; the chrysanthemums were going out of flower, the frosts had come, and Maurice was still beneath the roof of the kind physician. The relation between him and his preserver was so entirely apart from all common acquaintances and friendships that no ordinary rules could apply to it. Euthymia visited him often during the period of his extreme prostration.

"You must come every day," the doctor said. "He gains with every visit you make him; he pines if you miss him for a single day." So she came and sat by him, the doctor or good Mrs. Butts keeping her company in his presence. He grew stronger,—began to sit up in bed; and at last Euthymia found him dressed as in health, and beginning to walk about the room. She was startled. She had thought of herself as a kind of nurse, but the young gentleman could hardly be said to need a nurse any longer. She had scruples about making any further visits. She asked Lurida what she thought about it.

"Think about it?" said Lurida. "Why should n't you go to see a brother as well as a sister, I should like to know? If you are afraid to go to see Maurice Kirkwood, I am not afraid, at any rate. If you would rather have me go than go yourself, I will do it, and let people talk just as much as they want to. Shall I go instead of you?"

Euthymia was not quite sure that this would be the best thing for the patient. The doctor had told her he thought there were special reasons for her own course in coming daily to see him. "I am afraid," she said, "you are too bright to be safe for him in his weak state. Your mind is such a stimulating one, you know. A dull sort of person like myself is better for him just now. I will continue visiting him as long as the doctor says it is important that I should; but you must defend me, Lurida,—I know you can explain it all so that people will not blame me."

Euthymia knew full well what the effect of Lurida's penetrating head-voice would be in a convalescent's chamber. She knew how that active mind of hers would set the young man's thoughts at work, when what he wanted was rest of every faculty. Were not these good and sufficient reasons for her decision? What others could there be?

So Euthymia kept on with her visits, until she blushed to see that she was continuing her charitable office

for one who was beginning to look too well to be called an invalid. It was a dangerous condition of affairs, and the busy tongues of the village gossips were free in their comments. Free, but kindly, for the story of the rescue had melted every heart; and what could be more natural than that these two young people whom God had brought together in the dread moment of peril should find it hard to tear themselves asunder after the hour of danger was past? When gratitude is a bankrupt, love only can pay his debts; and if Maurice gave his heart to Euthymia, would not she receive it as payment in full?

The change which had taken place in the vital currents of Maurice Kirkwood's system was as simple and solid a fact as the change in a magnetic needle when the boreal becomes the austral pole, and the austral the boreal. It was well, perhaps, that this change took place while he was enfeebled by the wasting effects of long illness. For all the long-defeated, disturbed, perverted instincts had found their natural channel from the centre of consciousness to the organ which throbs in response to every profound emotion. As his health gradually returned, Euthymia could not help perceiving a flush in his cheek, a glitter in his eyes, a something in the tone of his voice, which altogether were a warning to the young maiden that the highway of friendly intercourse was fast narrowing to a lane, at the head of which her woman's eye could read plainly enough, "Dangerous passing."

"You look so much better to-day, Mr. Kirkwood," she said, "that I think I had better not play Sister of Charity any longer. The next time we meet I hope you will be strong enough to call on me."

She was frightened to see how pale he turned,—he was weaker than she thought. There was a silence so profound and so long that Mrs. Butts looked up from the stocking she was knitting. They had forgotten the good woman's presence.

Presently Maurice spoke,—very faintly, but Mrs. Butts dropped a stitch at the first word, and her knitting fell into her lap as she listened to what followed.

"No! you must not leave me. You must never leave me. You saved my life. But you have done more than that,—more than you know or can ever know. To you I owe it that I am living; with you I live henceforth, if I am to live at all. All I am, all I hope,—will you take this poor offering from one who owes you everything, whose lips never touched those of woman or breathed a word of love before you?"

What could Euthymia reply to this question, uttered with all the depth of a passion which had never before found expression.

Not one syllable of answer did listening Mrs. Butts overhear. But she told her husband afterwards that there was nothing in the tableaux they had had in September to compare with what she then saw. It was indeed a pleasing picture which those two young heads presented as Euthymia gave her inarticulate but infinitely expressive answer to the question of Maurice Kirkwood. The good-hearted woman thought it time to leave the young people. Down went the stocking with the needles in it; out of her lap tumbled the ball of worsted, rolling along the floor with its yarn trailing after it, like some village matron who goes about circulating from hearth to hearth, leaving all along her track the story of the new engagement or of the arrival of the last "little stranger."

Not many suns had set before it was told all through Arrowhead Village that Maurice Kirkwood was the accepted lover of Euthymia Tower.

POSTSCRIPT: AFTER-GLIMPSES.

MISS LURIDA VINCENT TO MRS. EUTHYMIA KIRKWOOD. ARROWHEAD VILLAGE, May 18.

MY DEAREST EUTHYMIA,—Who would have thought, when you broke your oar as the Atalanta flashed by the Algonquin, last June, that before the roses came again you would find yourself the wife of a fine scholar and grand gentleman, and the head of a household such as that of which you are the mistress? You must not forget your old Arrowhead Village friends. What am I saying?—you forget them! No, dearest, I know your heart too well for that! You are not one of those who lay aside their old friendships as they do last years bonnet when they get a new one. You have told me all about yourself and your happiness, and now you want me to tell you about myself and what is going on in our little place.

And first about myself. I have given up the idea of becoming a doctor. I have studied mathematics so much that I have grown fond of certainties, of demonstrations, and medicine deals chiefly in probabilities. The practice of the art is so mixed up with the deepest human interests that it is hard to pursue it with that even poise of the intellect which is demanded by science. I want knowledge pure and simple,—I do not fancy having it mixed. Neither do I like the thought of passing my life in going from one scene of suffering to another; I am not saintly enough for such a daily martyrdom, nor callous enough to make it an easy occupation. I fainted at the first operation I saw, and I have never wanted to see another. I don't say that I wouldn't marry a physician, if the right one asked me, but the young doctor is not forthcoming at present. Yes, I think I might make a pretty good doctor's wife. I could teach him a good deal about headaches and backaches and all sorts of nervous revolutions, as the doctor says the French women call their tantrums. I don't know but I should be willing to let him try his new medicines on me. If he were a homeopath, I know I should; for if a billionth of a grain of sugar won't begin to sweeten my tea or coffee, I don't feel afraid that a billionth of a grain of anything would poison me,—no, not if it were snake-venom; and if it were not disgusting, I would swallow a handful of his lachesis globules, to please my husband. But if I ever become a doctor's wife, my husband will not be one of that kind of practitioners, you may be sure of that, nor an "eclectic," nor a "faith-cure man." On the whole, I don't think I want to be married at all. I don't like the male animal very well (except such noble specimens as your husband). They are all tyrants,—almost all,—so far as our sex is concerned, and I often think we could get on better without them.

However, the creatures are useful in the Society. They send us papers, some of them well worth reading.

You have told me so often that you would like to know how the Society is getting on, and to read some of the papers sent to it if they happened to be interesting, that I have laid aside one or two manuscripts expressly for your perusal. You will get them by and by.

I am delighted to know that you keep Paolo with you. Arrowhead Village misses him dreadfully, I can tell you. That is the reason people become so attached to these servants with Southern sunlight in their natures? I suppose life is not long enough to cool their blood down to our Northern standard. Then they are so child-like, whereas the native of these latitudes is never young after he is ten or twelve years old. Mother says,—you know mother's old-fashioned notions, and how shrewd and sensible she is in spite of them,—mother says that when she was a girl families used to import young men and young women from the country towns, who called themselves "helps," not servants,—no, that was Scriptural; "but they did n't know everything down in Judée," and it is not good American language. She says that these people would live in the same household until they were married, and the women often remain in the same service until they died or were old and worn out, and then, what with the money they had saved and the care and assistance they got from their former employers, would pass a decent and comfortable old age, and be buried in the family lot. Mother has made up her mind to the change, but grandmother is bitter about it. She says there never was a country yet where the population was made up of "ladies" and "gentlemen," and she does n't believe there can be; nor that putting a spread eagle on a copper makes a gold dollar of it. She is a pessimist after her own fashion. She thinks all sentiment is dying out of our people. No loyalty for the sovereign, the king-post of the political edifice, she says; no deep attachment between employer and employed; no reverence of the humbler members of a household for its heads; and to make sure of continued corruption and misery, what she calls "universal suffrage" emptying all the sewers into the great aqueduct we all must drink from. "Universal suffrage!" I suppose we women don't belong to the universe! Wait until we get a chance at the ballot-box, I tell grandma, and see if we don't wash out the sewers before they reach the aqueduct! But my pen has run away with me. I was thinking of Paolo, and what a pleasant thing it is to have one of those child-like, warm-hearted, attachable, cheerful, contented, humble, faithful, companionable, but never presuming grownup children of the South waiting on one, as if everything he could do for one was a pleasure, and carrying a look of content in his face which makes every one who meets him happier for a glimpse of his features.

It does seem a shame that the charming relation of master and servant, intelligent authority and cheerful obedience, mutual interest in each other's welfare, thankful recognition of all the advantages which belong to domestic service in the better class of families, should be almost wholly confined to aliens and their immediate descendants. Why should Hannah think herself so much better than Bridget? When they meet at the polls together, as they will before long, they will begin to feel more of an equality than is recognized at present. The native female turns her nose up at the idea of "living out;" does she think herself so much superior to the women of other nationalities? Our women will have to come to it,—so grandmother says,—in another generation or two, and in a hundred years, according to her prophecy, there will be a new set of old "Miss Pollys" and "Miss Betseys" who have lived half a century in the same families, respectful and respected, cherished, cared for in time of need (citizens as well as servants, holding a ballot as well as a broom, I tell her), and bringing back to us the lowly, underfoot virtues of contentment and humility, which we do so need to carpet the barren and hungry thoroughfare of our unstratified existence.

There, I have got a-going, and am forgetting all the news I have to tell you. There is an engagement you will want to know all about. It came to pass through our famous boat-race, which you and I remember, and shall never forget as long as we live. It seems that the young fellow who pulled the bow oar of that men's college boat which we had the pleasure of beating got some glimpses of Georgina, our handsome stroke oar. I believe he took it into his head that it was she who threw the bouquet that won the race for us. He was, as you know, greatly mistaken, and ought to have made love to me, only he did n't. Well, it seems he came posting down to the Institute just before the vacation was over, and there got a sight of Georgina. I wonder whether she told him she didn't fling the bouquet! Anyhow, the acquaintance began in that way, and now it seems that this young fellow, good-looking and a bright scholar, but with a good many months more to pass in college, is her captive. It was too bad. Just think of my bouquet's going to another girl's credit! No matter, the old Atalanta story was paid off, at any rate.

You want to know all about dear Dr. Butts. They say he has just been offered a Professorship in one of the great medical colleges. I asked him about it, and he did not say that he had or had not. "But," said he, "suppose that I had been offered such a place; do you think I ought to accept it and leave Arrowhead Village? Let us talk it over," said he, "just as if I had had such an offer." I told him he ought to stay. There are plenty of men that can get into a Professor's chair, I said, and talk like Solomons to a class of wondering pupils: but once get a really good doctor in a place, a man who knows all about everybody, whether they have this or that tendency, whether when they are sick they have a way of dying or a way of getting well, what medicines agree with them and what drugs they cannot take, whether they are of the sort that think nothing is the matter with them until they are dead as smoked herring, or of the sort that send for the minister if they get a stomach-ache from eating too many cucumbers,—who knows all about all the people within half a dozen miles (all the sensible ones, that is, who employ a regular practitioner),—such a man as that, I say, is not to be replaced like a missing piece out of a Springfield musket or a Waltham watch. Don't go! said I. Stay here and save our precious lives, if you can, or at least put us through in the proper way, so that we needn't be ashamed of ourselves for dying, if we must die. Well, Dr. Butts is not going to leave us. I hope you will have no unwelcome occasion for his services,—you are never ill, you know,—but, anyhow, he is going to be here, and no matter what happens he will be on hand.

The village news is not of a very exciting character. Item 1. A new house is put up over the ashes of the one in which your husband lived while he was here. It was planned by one of the autochthonous inhabitants with the most ingenious combination of inconveniences that the natural man could educe from his original perversity of intellect. To get at any one room you must pass through every other. It is blind, or nearly so, on the only side which has a good prospect, and commands a fine view of the barn and pigsty through numerous windows. Item 2. We have a small fire-engine near the new house which can be worked by a man or two, and would be equal to the emergency of putting out a bunch of fire-crackers. Item 3. We have a new ladder, in a bog, close to the new fire-engine, so if the new house catches fire, like its predecessor, and there should

happen to, be a sick man on an upper floor, he can be got out without running the risk of going up and down a burning staircase. What a blessed thing it was that there was no fire-engine near by and no ladder at hand on the day of the great rescue! If there had been, what a change in your programme of life! You remember that "cup of tea spilt on Mrs. Masham's apron," which we used to read of in one of Everett's Orations, and all its wide-reaching consequences in the affairs of Europe. I hunted up that cup of tea as diligently as ever a Boston matron sought for the last leaves in her old caddy after the tea-chests had been flung overboard at Griffin's wharf,—but no matter about that, now. That is the way things come about in this world. I must write a lecture on lucky mishaps, or, more elegantly, fortunate calamities. It will be just the converse of that odd essay of Swift's we read together, the awkward and stupid things done with the best intentions. Perhaps I shall deliver the lecture in your city: you will come and hear it, and bring him, won't you, dearest? Always, your loving

LURIDA.

MISS LURIDA VINCENT TO MRS. EUTHYMIA KIRKWOOD.

It seems forever since you left us, dearest Euthymia! And are you, and is your husband, and Paolo,—good Paolo,—are you all as well and happy as you have been and as you ought to be? I suppose our small village seems a very quiet sort of place to pass the winter in, now that you have become accustomed to the noise and gayety of a great city. For all that, it is a pretty busy place this winter, I can tell you. We have sleighing parties,—I never go to them, myself, because I can't keep warm, and my mind freezes up when my blood cools down below 95 or 96 deg. Fahrenheit. I had a great deal rather sit by a good fire and read about Arctic discoveries. But I like very well to hear the bells' jingling and to see the young people trying to have a good time as hard as they do at a picnic. It may be that they do, but to me a picnic is purgatory and a sleigh-ride that other place, where, as my favorite Milton says, "frost performs the effect of fire." I believe I have quoted him correctly; I ought to, for I could repeat half his poems from memory once, if I cannot now.

You must have plenty of excitement in your city life. I suppose you recognized yourself in one of the society columns of the "Household Inquisitor:" "Mrs. E. K., very beautiful, in an elegant," etc., etc., "with pearls," etc., etc.,—as if you were not the ornament of all that you wear, no matter what it is!

I am so glad that you have married a scholar! Why should not Maurice—you both tell me to call him so—take the diplomatic office which has been offered him? It seems to me that he would find himself in exactly the right place. He can talk in two or three languages, has good manners, and a wife who—well, what shall I say of Mrs. Kirkwood but that "she would be good company for a queen," as our old friend the quondam landlady of the Anchor Tavern used to say? I should so like to see you presented at Court! It seems to me that I should be willing to hold your train for the sake of seeing you in your court feathers and things.

As for myself, I have been thinking of late that I would become either a professional lecturer or head mistress of a great school or college for girls. I have tried the first business a little. Last month I delivered a lecture on Quaternions. I got three for my audience; two came over from the Institute, and one from that men's college which they try to make out to be a university, and where no female is admitted unless she belongs among the quadrupeds. I enjoyed lecturing, but the subject is a difficult one, and I don't think any one of them had any very clear notion of what I was talking about, except Rhodora,—and I know she did n't. To tell the truth, I was lecturing to instruct myself. I mean to try something easier next time. I have thought of the Basque language and literature. What do you say to that?

The Society goes on famously. We have had a paper presented and read lately which has greatly amused some of us and provoked a few of the weaker sort. The writer is that crabbed old Professor of Belles-Lettres at that men's college over there. He is dreadfully hard on the poor "poets," as they call themselves. It seems that a great many young persons, and more especially a great many young girls, of whom the Institute has furnished a considerable proportion, have taken to sending him their rhymed productions to be criticised,—expecting to be praised, no doubt, every one of them. I must give you one of the sauciest extracts from his paper in his own words:

"It takes half my time to read the 'poems' sent me by young people of both sexes. They would be more shy of doing it if they knew that I recognize a tendency to rhyming as a common form of mental weakness, and the publication of a thin volume of verse as prima facie evidence of ambitious mediocrity, if not inferiority. Of course there are exceptions to this rule of judgment, but I maintain that the presumption is always against the rhymester as compared with the less pretentious persons about him or her, busy with some useful calling,—too busy to be tagging rhymed commonplaces together. Just now there seems to be an epidemic of rhyming as bad as the dancing mania, or the sweating sickness. After reading a certain amount of manuscript verse one is disposed to anathematize the inventor of homophonous syllabification. [This phrase made a great laugh when it was read.] This, that is rhyming, must have been found out very early,

"Where are you, Adam?"

"Here am I, Madam;"

"but it can never have been habitually practised until after the Fall. The intrusion of tintinnabulating terminations into the conversational intercourse of men and angels would have spoiled Paradise itself. Milton would not have them even in Paradise Lost, you remember. For my own part, I wish certain rhymes could be declared contraband of written or printed language. Nothing should be allowed to be hurled at the world or whirled with it, or furled upon it or curled over it; all eyes should be kept away from the skies, in spite of os homini sublime dedit; youth should be coupled with all the virtues except truth; earth should never be reminded of her birth; death should never be allowed to stop a mortal's breath, nor the bell to sound his knell, nor flowers from blossoming bowers to wave over his grave or show their bloom upon his tomb. We have rhyming dictionaries,—let us have one from which all rhymes are rigorously excluded. The sight of a poor creature grubbing for rhymes to fill up his sonnet, or to cram one of those voracious, rhyme-swallowing

rigmaroles which some of our drudging poetical operatives have been exhausting themselves of late to satiate with jingles, makes my head ache and my stomach rebel. Work, work of some kind, is the business of men and women, not the making of jingles! No,—no,—no! I want to see the young people in our schools and academies and colleges, and the graduates of these institutions, lifted up out of the little Dismal Swamp of self-contemplating and self-indulging and self-commiserating emotionalism which is surfeiting the land with those literary sandwiches,—thin slices of tinkling sentimentality between two covers looking like hard-baked gilt gingerbread. But what faces these young folks make up at my good advice! They get tipsy on their rhymes. Nothing intoxicates one like his—or her—own verses, and they hold on to their metre-ballad-mongering as the fellows that inhale nitrous oxide hold on to the gas-bag.”

We laughed over this essay of the old Professor; though it hit us pretty hard. The best part of the joke is that the old man himself published a thin volume of poems when he was young, which there is good reason to think he is not very proud of, as they say he buys up all the copies he can find in the shops. No matter what they say, I can't help agreeing with him about this great flood of “poetry,” as it calls itself, and looking at the rhyming mania much as he does.

How I do love real poetry! That is the reason hate rhymes which have not a particle of it in them. The foolish scribblers that deal in them are like bad workmen in a carpenter's shop. They not only turn out bad jobs of work, but they spoil the tools for better workmen. There is hardly a pair of rhymes in the English language that is not so dulled and hacked and gapped by these 'prentice hands that a master of the craft hates to touch them, and yet he cannot very well do without them. I have not been besieged as the old Professor has been with such multitudes of would-be-poetical aspirants that he could not even read their manuscripts, but I have had a good many letters containing verses, and I have warned the writers of the delusion under which they were laboring.

You may like to know that I have just been translating some extracts from the Greek Anthology. I send you a few specimens of my work, with a Dedication to the Shade of Sappho. I hope you will find something of the Greek rhythm in my versions, and that I have caught a spark of inspiration from the impassioned Lesbian. I have found great delight in this work, at any rate, and am never so happy as when I read from my manuscript or repeat from memory the lines into which I have transferred the thought of the men and women of two thousand years ago, or given rhythmical expression to my own rapturous feelings with regard to them. I must read you my Dedication to the Shade of Sappho. I cannot help thinking that you will like it better than either of my last two, *The Song of the Roses*, or *The Wail of the Weeds*.

How I do miss you, dearest! I want you: I want you to listen to what I have written; I want you to hear all about my plans for the future; I want to look at you, and think how grand it must be to feel one's self to be such a noble and beautiful-creature; I want to wander in the woods with you, to float on the lake, to share your life and talk over every day's doings with you. Alas! I feel that we have parted as two friends part at a port of embarkation: they embrace, they kiss each other's cheeks, they cover their faces and weep, they try to speak good-by to each other, they watch from the pier and from the deck; the two forms grow less and less, fainter and fainter in the distance, two white handkerchiefs flutter once and again, and yet once more, and the last visible MORTlink of the chain which binds them has parted. Dear, dear, dearest Euthymia, my eyes are running over with tears when I think that we may never, never meet again.

Don't you want some more items of village news? We are threatened with an influx of stylish people: “Buttons” to answer the door-bell, in place of the chamber-maid; “butler,” in place of the “hired man;” footman in top-boots and breeches, cockade on hat, arms folded a la Napoleon; tandems, “drags,” dogcarts, and go-carts of all sorts. It is rather amusing to look at their ambitious displays, but it takes away the good old country flavor of the place.

I don't believe you mean to try to astonish us when you come back to spend your summers here. I suppose you must have a large house, and I am sure you will have a beautiful one. I suppose you will have some fine horses, and who would n't be glad to? But I do not believe you will try to make your old Arrowhead Village friends stare their eyes out of their heads with a display meant to outshine everybody else that comes here. You can have a yacht on the lake, if you like, but I hope you will pull a pair of oars in our old boat once in a while, with me to steer you. I know you will be just the same dear Euthymia you always were and always must be. How happy you must make such a man as Maurice Kirkwood! And how happy you ought to be with him!—a man who knows what is in books, and who has seen for himself, what is in men. If he has not seen so much of women, where could he study all that is best in womanhood as he can in his own wife? Only one thing that dear Euthymia lacks. She is not quite pronounced enough in her views as to the rights and the wrongs of the sex. When I visit you, as you say I shall, I mean to indoctrinate Maurice with sound views on that subject. I have written an essay for the Society, which I hope will go a good way towards answering all the objections to female suffrage. I mean to read it to your husband, if you will let me, as I know you will, and perhaps you would like to hear it,—only you know my thoughts on the subject pretty well already.

With all sorts of kind messages to your dear husband, and love to your precious self, I am ever your
LURIDA.

DR. BUTTS TO MRS. EUTHYMIA KIRKWOOD.

MY DEAR EUTHYMIA,—My pen refuses to call you by any other name. Sweet-souled you are, and your Latinized Greek name is—the one which truly designates you. I cannot tell you how we have followed you, with what interest and delight through your travels, as you have told their story in your letters to your mother. She has let us have the privilege of reading them, and we have been with you in steamer, yacht, felucca, gondola, Nile-boat; in all sorts of places, from crowded capitals to “deserts where no men abide,”—everywhere keeping company with you in your natural and pleasant descriptions of your experiences. And now that you have returned to your home in the great city I must write you a few lines of welcome, if nothing more.

You will find Arrowhead Village a good deal changed since you left it. We are discovered by some of those over-rich people who make the little place upon which they swarm a kind of rural city. When this happens the consequences are striking,—some of them desirable and some far otherwise. The effect of well-built, well-furnished, well-kept houses and of handsome grounds always maintained in good order about them shows itself in a large circuit around the fashionable centre. Houses get on a new coat of paint, fences are kept in better order, little plots of flowers show themselves where only ragged weeds had rioted, the inhabitants present themselves in more comely attire and drive in handsomer vehicles with more carefully groomed horses. On the other hand, there is a natural jealousy on the part of the natives of the region suddenly become fashionable. They have seen the land they sold at farm prices by the acre coming to be valued by the foot, like the corner lots in a city. Their simple and humble modes of life look almost poverty-stricken in the glare of wealth and luxury which so outshines their plain way of living. It is true that many of them have found them selves richer than in former days, when the neighborhood lived on its own resources. They know how to avail themselves of their altered position, and soon learn to charge city prices for country products; but nothing can make people feel rich who see themselves surrounded by men whose yearly income is many times their own whole capital. I think it would be better if our rich men scattered themselves more than they do,—buying large country estates, building houses and stables which will make it easy to entertain their friends, and depending for society on chosen guests rather than on the mob of millionaires who come together for social rivalry. But I do not fret myself about it. Society will stratify itself according to the laws of social gravitation. It will take a generation or two more, perhaps, to arrange the strata by precipitation and settlement, but we can always depend on one principle to govern the arrangement of the layers. People interested in the same things will naturally come together. The youthful heirs of fortunes who keep splendid yachts have little to talk about with the oarsman who pulls about on the lake or the river. What does young Dives, who drives his four-in-hand and keeps a stable full of horses, care about Lazarus, who feels rich in the possession of a horse-railroad ticket? You know how we live at our house, plainly, but with a certain degree of cultivated propriety. We make no pretensions to what is called “style.” We are still in that social stratum where the article called “a napkin-ring” is recognized as admissible at the dinner-table. That fact sufficiently defines our modest pretensions. The napkin-ring is the boundary mark between certain classes. But one evening Mrs. Butts and I went out to a party given by the lady of a worthy family, where the napkin itself was a newly introduced luxury. The conversation of the hostess and her guests turned upon details of the kitchen and the laundry; upon the best mode of raising bread, whether with “emptins” (emptyings, yeast) or baking powder; about “bluing” and starching and crimping, and similar matters. Poor Mrs. Butts! She knew nothing more about such things than her hostess did about Shakespeare and the musical glasses. What was the use of trying to enforce social intercourse under such conditions? Incompatibility of temper has been considered ground for a divorce; incompatibility of interests is a sufficient warrant for social separation. The multimillionaires have so much that is common among themselves, and so little that they share with us of moderate means, that they will naturally form a specialized class, and in virtue of their palaces, their picture-galleries, their equipages, their yachts, their large hospitality, constitute a kind of exclusive aristocracy. Religion, which ought to be the great leveller, cannot reduce these elements to the same grade. You may read in the parable, “Friend, how camest thou in hither not having a wedding garment?” The modern version would be, “How came you at Mrs. Billion’s ball not having a dress on your back which came from Paris?”

The little church has got a new stained window, a saint who reminds me of Hamlet’s uncle,—a thing “of shreds and patches,” but rather pretty to look at, with an inscription under it which is supposed to be the name of the person in whose honor the window was placed in the church. Smith was a worthy man and a faithful churchwarden, and I hope posterity will be able to spell out his name on his monumental window; but that old English lettering would puzzle Mephistopheles himself, if he found himself before this memorial tribute, on the inside,—you know he goes to church sometimes, if you remember your Faust.

The rector has come out, in a quiet way, as an evolutionist. He has always been rather “broad” in his views, but cautious in their expression. You can tell the three branches of the mother-island church by the way they carry their heads. The low-church clergy look down, as if they felt themselves to be worms of the dust; the high-church priest drops his head on one side, after the pattern of the mediaeval saints; the broad-church preacher looks forward and round about him, as if he felt himself the heir of creation. Our rector carries his head in the broad-church aspect, which I suppose is the least open to the charge of affectation,—in fact, is the natural and manly way of carrying it.

The Society has justified its name of Pansophian of late as never before. Lurida has stirred up our little community and its neighbors, so that we get essays on all sorts of subjects, poems and stories in large numbers. I know all about it, for she often consults me as to the merits of a particular contribution.

What is to be the fate of Lurida? I often think, with no little interest and some degree of anxiety, about her future. Her body is so frail and her mind so excessively and constantly active that I am afraid one or the other will give way. I do not suppose she thinks seriously of ever being married. She grows more and more zealous in behalf of her own sex, and sterner in her judgment of the other. She declares that she never would marry any man who was not an advocate of female suffrage, and as these gentlemen are not very common hereabouts the chance is against her capturing any one of the hostile sex.

What do you think? I happened, just as I was writing the last sentence, to look out of my window, and whom should I see but Lurida, with a young man in tow, listening very eagerly to her conversation, according to all appearance! I think he must be a friend of the rector, as I have seen a young man like this one in his company. Who knows?

Affectionately yours, etc.

DR. BUTTS TO MRS. BUTTS.

MY BELOVED WIFE,—This letter will tell you more news than you would have thought could have been got

together in this little village during the short time you have been staying away from it.

Lurida Vincent is engaged! He is a clergyman with a mathematical turn. The story is that he put a difficult problem into one of the mathematical journals, and that Lurida presented such a neat solution that the young man fell in love with her on the strength of it. I don't think the story is literally true, nor do I believe that other report that he offered himself to her in the form of an equation chalked on the blackboard; but that it was an intellectual rather than a sentimental courtship I do not doubt. Lurida has given up the idea of becoming a professional lecturer,—so she tells me,—thinking that her future husband's parish will find her work enough to do. A certain amount of daily domestic drudgery and unexciting intercourse with simple-minded people will be the best thing in the world for that brain of hers, always simmering with some new project in its least fervid condition.

All our summer visitors have arrived. Euthymia Mrs. Maurice Kirkwood and her husband and little Maurice are here in their beautiful house looking out on the lake. They gave a grand party the other evening. You ought to have been there, but I suppose you could not very well have left your sister in the middle of your visit: All the grand folks were there, of course. Lurida and her young man—Gabriel is what she calls him—were naturally the objects of special attention. Paolo acted as major-domo, and looked as if he ought to be a major-general. Nothing could be pleasanter than the way in which Mr. and Mrs. Kirkwood received their plain country neighbors; that is, just as they did the others of more pretensions, as if they were really glad to see them, as I am sure they were. The old landlord and his wife had two arm-chairs to themselves, and I saw Miranda with the servants of the household looking in at the dancers and out at the little groups in the garden, and evidently enjoying it as much as her old employers. It was a most charming and successful party. We had two sensations in the course of the evening. One was pleasant and somewhat exciting, the other was thrilling and of strange and startling interest.

You remember how emaciated poor Maurice Kirkwood was left after his fever, in that first season when he was among us. He was out in a boat one day, when a ring slipped off his thin finger and sunk in a place where the water was rather shallow. "Jake"—you know Jake,—everybody knows Jake—was rowing him. He promised to come to the spot and fish up the ring if he could possibly find it. He was seen poking about with fish-hooks at the end of a pole, but nothing was ever heard from him about the ring. It was an antique intaglio stone in an Etruscan setting,—a wild goose flying over the Campagna. Mr. Kirkwood valued it highly, and regretted its loss very much.

While we were in the garden, who should appear at the gate but Jake, with a great basket, inquiring for Mr. Kirkwood. "Come," said Maurice to me, "let us see what our old friend the fisherman has brought us. What have you got there, Jake?"

"What I 've got? Wall, I 'll tell y' what I've got: I 've got the biggest pickerel that's been ketched in this pond for these ten year. An' I 've got somethin' else besides the pickerel. When I come to cut him open, what do you think I faound in his insides but this here ring o' yourn,"—and he showed the one Maurice had lost so long before. There it was, as good as new, after having tried Jonah's style of housekeeping for all that time. There are those who discredit Jake's story about finding the ring in the fish; anyhow, there was the ring and there was the pickerel. I need not say that Jake went off well paid for his pickerel and the precious contents of its stomach. Now comes the chief event of the evening. I went early by special invitation. Maurice took me into his library, and we sat down together.

"I have something of great importance," he said, "to say to you. I learned within a few days that my cousin Laura is staying with a friend in the next town to this. You know, doctor, that we have never met since the last, almost fatal, experience of my early years. I have determined to defy the strength of that deadly chain of associations connected with her presence, and I have begged her to come this evening with the friends with whom she is staying. Several letters passed between us, for it was hard to persuade her that there was no longer any risk in my meeting her. Her imagination was almost as deeply impressed as mine had been at those alarming interviews, and I had to explain to her fully that I had become quite indifferent to the disturbing impressions of former years. So, as the result of our correspondence, Laura is coming this evening, and I wish you to be present at our meeting. There is another reason why I wish you to be here. My little boy is not far from the age at which I received my terrifying, almost disorganizing shock. I mean to have little Maurice brought into the presence of Laura, who is said to be still a very handsome woman, and see if he betrays any hint of that peculiar sensitiveness which showed itself in my threatening seizure. It seemed to me not impossible that he might inherit some tendency of that nature, and I wanted you to be at hand if any sign of danger should declare itself. For myself I have no fear. Some radical change has taken place in my nervous system. I have been born again, as it were, in my susceptibilities, and am in certain respects a new man. But I must know how it is with my little Maurice."

Imagine with what interest I looked forward to this experiment; for experiment it was, and not without its sources of anxiety, as it seemed to me. The evening wore along; friends and neighbors came in, but no Laura as yet. At last I heard the sound of wheels, and a carriage stopped at the door. Two ladies and a gentleman got out, and soon entered the drawing room.

"My cousin Laura!" whispered Maurice to me, and went forward to meet her. A very handsome woman, who might well have been in the thirties,—one of those women so thoroughly constituted that they cannot help being handsome at every period of life. I watched them both as they approached each other. Both looked pale at first, but Maurice soon recovered his usual color, and Laura's natural, rich bloom came back by degrees. Their emotion at meeting was not to be wondered at, but there was no trace in it of the paralyzing influence on the great centres of life which had once acted upon its fated victim like the fabled head which turned the looker-on into a stone.

"Is the boy still awake?" said Maurice to Paolo, who, as they used to say of Pushee at the old Anchor Tavern, was everywhere at once on that gay and busy evening.

"What! Mahser Maurice asleep an' all this racket going on? I hear him crowing like young cockerel when he fus' smell daylight."

"Tell the nurse to bring him down quietly to the little room that leads out of the library."

The child was brought down in his night-clothes, wide awake, wondering apparently at the noise he heard, which he seemed to think was for his special amusement.

"See if he will go to that lady," said his father. Both of us held our breath as Laura stretched her arms towards little Maurice.

The child looked for an instant searchingly, but fearlessly, at her glowing cheeks, her bright eyes, her welcoming smile, and met her embrace as she clasped him to her bosom as if he had known her all his days.

The mortal antipathy had died out of the soul and the blood of Maurice Kirkwood at that supreme moment when he found himself snatched from the grasp of death and cradled in the arms of Euthymia.

In closing the New Portfolio I remember that it began with a prefix which the reader may by this time have forgotten, namely, the First Opening. It was perhaps presumptuous to thus imply the probability of a second opening.

I am reminded from time to time by the correspondents who ask a certain small favor of me that, as I can only expect to be with my surviving contemporaries a very little while longer, they would be much obliged if I would hurry up my answer before it is too late. They are right, these delicious unknown friends of mine, in reminding me of a fact which I cannot gainsay and might suffer to pass from my recollection. I thank them for recalling my attention to a truth which I shall be wiser, if not more hilarious, for remembering.

No, I had no right to say the First Opening. How do I know that I shall have a chance to open it again? How do I know that anybody will want it to be opened a second time? How do I know that I shall feel like opening it? It is safest neither to promise to open the New Portfolio once more, nor yet to pledge myself to keep it closed hereafter. There are many papers potentially existent in it, some of which might interest a reader here and there. The Records of the Pansophian Society contain a considerable number of essays, poems, stories, and hints capable of being expanded into presentable dimensions. In the mean time I will say with Prospero, addressing my old readers, and my new ones, if such I have,

*"If you be pleased, retire into my cell
And there repose: a turn or two I'll walk,
To still my beating mind."*

When it has got quiet I may take up the New Portfolio again, and consider whether it is worth while to open it consider whether it is worth while to open it.

BREAD AND THE NEWSPAPER.

(September, 1861.)

This is the new version of the Panem et Circenses of the Roman populace. It is our ultimatum, as that was theirs. They must have something to eat, and the circus-shows to look at. We must have something to eat, and the papers to read.

Everything else we can give up. If we are rich, we can lay down our carriages, stay away from Newport or Saratoga, and adjourn the trip to Europe sine die. If we live in a small way, there are at least new dresses and bonnets and every-day luxuries which we can dispense with. If the young Zouave of the family looks smart in his new uniform, its respectable head is content, though he himself grow seedy as a caraway-umbel late in the season. He will cheerfully calm the perturbed nap of his old beaver by patient brushing in place of buying a new one, if only the Lieutenant's jaunty cap is what it should be. We all take a pride in sharing the epidemic economy of the time. Only bread and the newspaper we must have, whatever else we do without.

How this war is simplifying our mode of being! We live on our emotions, as the sick man is said in the common speech to be nourished by his fever. Our ordinary mental food has become distasteful, and what would have been intellectual luxuries at other times, are now absolutely repulsive.

All this change in our manner of existence implies that we have experienced some very profound impression, which will sooner or later betray itself in permanent effects on the minds and bodies of many among us. We cannot forget Corvisart's observation of the frequency with which diseases of the heart were noticed as the consequence of the terrible emotions produced by the scenes of the great French Revolution. Laennec tells the story of a convent, of which he was the medical director, where all the nuns were subjected to the severest penances and schooled in the most painful doctrines. They all became consumptive soon after their entrance, so that, in the course of his ten years' attendance, all the inmates died out two or three times, and were replaced by new ones. He does not hesitate to attribute the disease from which they suffered to those depressing moral influences to which they were subjected.

So far we have noticed little more than disturbances of the nervous system as a consequence of the war excitement in non-combatants. Take the first trifling example which comes to our recollection. A sad disaster to the Federal army was told the other day in the presence of two gentlemen and a lady. Both the gentlemen complained of a sudden feeling at the epigastrium, or, less learnedly, the pit of the stomach, changed color, and confessed to a slight tremor about the knees. The lady had a "grande revolution," as French patients say,—went home, and kept her bed for the rest of the day. Perhaps the reader may smile at the mention of such trivial indispositions, but in more sensitive natures death itself follows in some cases from no more serious cause. An old gentleman fell senseless in fatal apoplexy, on hearing of Napoleon's return from Elba. One of our early friends, who recently died of the same complaint, was thought to have had his attack mainly in consequence of the excitements of the time.

We all know what the war fever is in our young men,—what a devouring passion it becomes in those whom it assails. Patriotism is the fire of it, no doubt, but this is fed with fuel of all sorts. The love of adventure, the contagion of example, the fear of losing the chance of participating in the great events of the time, the desire of personal distinction, all help to produce those singular transformations which we often witness, turning the most peaceful of our youth into the most ardent of our soldiers. But something of the same fever in a different form reaches a good many non-combatants, who have no thought of losing a drop of precious blood belonging to themselves or their families. Some of the symptoms we shall mention are almost universal; they are as plain in the people we meet everywhere as the marks of an influenza, when that is prevailing.

The first is a nervous restlessness of a very peculiar character. Men cannot think, or write, or attend to their ordinary business. They stroll up and down the streets, or saunter out upon the public places. We confessed to an illustrious author that we laid down the volume of his work which we were reading when the war broke out. It was as interesting as a romance, but the romance of the past grew pale before the red light of the terrible present. Meeting the same author not long afterwards, he confessed that he had laid down his pen at the same time that we had closed his book. He could not write about the sixteenth century any more than we could read about it, while the nineteenth was in the very agony and bloody sweat of its great sacrifice.

Another most eminent scholar told us in all simplicity that he had fallen into such a state that he would read the same telegraphic dispatches over and over again in different papers, as if they were new, until he felt as if he were an idiot. Who did not do just the same thing, and does not often do it still, now that the first flush of the fever is over? Another person always goes through the side streets on his way for the noon extra,—he is so afraid somebody will meet him and tell the news he wishes to read, first on the bulletin-board, and then in the great capitals and leaded type of the newspaper.

When any startling piece of war-news comes, it keeps repeating itself in our minds in spite of all we can do. The same trains of thought go tramping round in circle through the brain, like the supernumeraries that make up the grand army of a stage-show. Now, if a thought goes round through the brain a thousand times in a day, it will have worn as deep a track as one which has passed through it once a week for twenty years. This accounts for the ages we seem to have lived since the twelfth of April last, and, to state it more generally, for that ex post facto operation of a great calamity, or any very powerful impression, which we once illustrated by the image of a stain spreading backwards from the leaf of life open before as through all those which we have already turned.

Blessed are those who can sleep quietly in times like these! Yet, not wholly blessed, either; for what is more painful than the awaking from peaceful unconsciousness to a sense that there is something wrong, we cannot at first think what,—and then groping our way about through the twilight of our thoughts until we come full upon the misery, which, like some evil bird, seemed to have flown away, but which sits waiting for us on its perch by our pillow in the gray of the morning?

The converse of this is perhaps still more painful. Many have the feeling in their waking hours that the

trouble they are aching with is, after all, only a dream,—if they will rub their eyes briskly enough and shake themselves, they will awake out of it, and find all their supposed grief is unreal. This attempt to cajole ourselves out of an ugly fact always reminds us of those unhappy flies who have been indulging in the dangerous sweets of the paper prepared for their especial use.

Watch one of them. He does not feel quite well,—at least, he suspects himself of indisposition. Nothing serious,—let us just rub our fore-feet together, as the enormous creature who provides for us rubs his hands, and all will be right. He rubs them with that peculiar twisting movement of his, and pauses for the effect. No! all is not quite right yet. Ah! it is our head that is not set on just as it ought to be. Let us settle that where it should be, and then we shall certainly be in good trim again. So he pulls his head about as an old lady adjusts her cap, and passes his fore-paw over it like a kitten washing herself. Poor fellow! It is not a fancy, but a fact, that he has to deal with. If he could read the letters at the head of the sheet, he would see they were Fly-Paper.—So with us, when, in our waking misery, we try to think we dream! Perhaps very young persons may not understand this; as we grow older, our waking and dreaming life run more and more into each other.

Another symptom of our excited condition is seen in the breaking up of old habits. The newspaper is as imperious as a Russian Ukase; it will be had, and it will be read. To this all else must give place. If we must go out at unusual hours to get it, we shall go, in spite of after-dinner nap or evening somnolence. If it finds us in company, it will not stand on ceremony, but cuts short the compliment and the story by the divine right of its telegraphic dispatches.

War is a very old story, but it is a new one to this generation of Americans. Our own nearest relation in the ascending line remembers the Revolution well. How should she forget it? Did she not lose her doll, which was left behind, when she was carried out of Boston, about that time growing uncomfortable by reason of cannon-balls dropping in from the neighboring heights at all hours,—in token of which see the tower of Brattle Street Church at this very day? War in her memory means '76. As for the brush of 1812, "we did not think much about that"; and everybody knows that the Mexican business did not concern us much, except in its political relations. No! war is a new thing to all of us who are not in the last quarter of their century. We are learning many strange matters from our fresh experience. And besides, there are new conditions of existence which make war as it is with us very different from war as it has been.

The first and obvious difference consists in the fact that the whole nation is now penetrated by the ramifications of a network of iron nerves which flash sensation and volition backward and forward to and from towns and provinces as if they were organs and limbs of a single living body. The second is the vast system of iron muscles which, as it were, move the limbs of the mighty organism one upon another. What was the railroad-force which put the Sixth Regiment in Baltimore on the 19th of April but a contraction and extension of the arm of Massachusetts with a clenched fist full of bayonets at the end of it?

This perpetual intercommunication, joined to the power of instantaneous action, keeps us always alive with excitement. It is not a breathless courier who comes back with the report from an army we have lost sight of for a month, nor a single bulletin which tells us all we are to know for a week of some great engagement, but almost hourly paragraphs, laden with truth or falsehood as the case may be, making us restless always for the last fact or rumor they are telling. And so of the movements of our armies. To-night the stout lumbermen of Maine are encamped under their own fragrant pines. In a score or two of hours they are among the tobacco-fields and the slave-pens of Virginia. The war passion burned like scattered coals of fire in the households of Revolutionary times; now it rushes all through the land like a flame over the prairie. And this instant diffusion of every fact and feeling produces another singular effect in the equalizing and steadying of public opinion. We may not be able to see a month ahead of us; but as to what has passed a week afterwards it is as thoroughly talked out and judged as it would have been in a whole season before our national nervous system was organized.

*"As the wild tempest wakes the slumbering sea,
Thou only teachest all that man can be!"*

We indulged in the above apostrophe to War in a Phi Beta Kappa poem of long ago, which we liked better before we read Mr. Cutler's beautiful prolonged lyric delivered at the recent anniversary of that Society.

Oftentimes, in paroxysms of peace and good-will towards all mankind, we have felt twinges of conscience about the passage,—especially when one of our orators showed us that a ship of war costs as much to build and keep as a college, and that every port-hole we could stop would give us a new professor. Now we begin to think that there was some meaning in our poor couplet. War has taught us, as nothing else could, what we can be and are. It has exalted our manhood and our womanhood, and driven us all back upon our substantial human qualities, for a long time more or less kept out of sight by the spirit of commerce, the love of art, science, or literature, or other qualities not belonging to all of us as men and women.

It is at this very moment doing more to melt away the petty social distinctions which keep generous souls apart from each other, than the preaching of the Beloved Disciple himself would do. We are finding out that not only "patriotism is eloquence," but that heroism is gentility. All ranks are wonderfully equalized under the fire of a masked battery. The plain artisan or the rough fireman, who faces the lead and iron like a man, is the truest representative we can show of the heroes of Crecy and Agincourt. And if one of our fine gentlemen puts off his straw-colored kids and stands by the other, shoulder to shoulder, or leads him on to the attack, he is as honorable in our eyes and in theirs as if he were ill-dressed and his hands were soiled with labor.

Even our poor "Brahmins,"—whom a critic in ground-glass spectacles (the same who grasps his statistics by the blade and strikes at his supposed antagonist with the handle) oddly confounds with the "bloated aristocracy;" whereas they are very commonly pallid, undervitalized, shy, sensitive creatures, whose only birthright is an aptitude for learning,—even these poor New England Brahmins of ours, subvirates of an organizable base as they often are, count as full men, if their courage is big enough for the uniform which hangs so loosely about their slender figures.

A young man was drowned not very long ago in the river running under our windows. A few days afterwards a field piece was dragged to the water's edge, and fired many times over the river. We asked a

bystander, who looked like a fisherman, what that was for. It was to "break the gall," he said, and so bring the drowned person to the surface. A strange physiological fancy and a very odd non sequitur; but that is not our present point. A good many extraordinary objects do really come to the surface when the great guns of war shake the waters, as when they roared over Charleston harbor.

Treason came up, hideous, fit only to be huddled into its dishonorable grave. But the wrecks of precious virtues, which had been covered with the waves of prosperity, came up also. And all sorts of unexpected and unheard-of things, which had lain unseen during our national life of fourscore years, came up and are coming up daily, shaken from their bed by the concussions of the artillery bellowing around us.

It is a shame to own it, but there were persons otherwise respectable not unwilling to say that they believed the old valor of Revolutionary times had died out from among us. They talked about our own Northern people as the English in the last centuries used to talk about the French,—Goldsmith's old soldier, it may be remembered, called one Englishman good for five of them. As Napoleon spoke of the English, again, as a nation of shopkeepers, so these persons affected to consider the multitude of their countrymen as unwarlike artisans,—forgetting that Paul Revere taught himself the value of liberty in working upon gold, and Nathaniel Greene fitted himself to shape armies in the labor of forging iron. These persons have learned better now. The bravery of our free working-people was overlaid, but not smothered; sunken, but not drowned. The hands which had been busy conquering the elements had only to change their weapons and their adversaries, and they were as ready to conquer the masses of living force opposed to them as they had been to build towns, to dam rivers, to hunt whales, to harvest ice, to hammer brute matter into every shape civilization can ask for.

Another great fact came to the surface, and is coming up every day in new shapes,—that we are one people. It is easy to say that a man is a man in Maine or Minnesota, but not so easy to feel it, all through our bones and marrow. The camp is deprovincializing us very fast. Brave Winthrop, marching with the city elegants, seems to have been a little startled to find how wonderfully human were the hard-handed men of the Eighth Massachusetts. It takes all the nonsense out of everybody, or ought to do it, to see how fairly the real manhood of a country is distributed over its surface. And then, just as we are beginning to think our own soil has a monopoly of heroes as well as of cotton, up turns a regiment of gallant Irishmen, like the Sixty-ninth, to show us that continental provincialism is as bad as that of Coos County, New Hampshire, or of Broadway, New York.

Here, too, side by side in the same great camp, are half a dozen chaplains, representing half a dozen modes of religious belief. When the masked battery opens, does the "Baptist" Lieutenant believe in his heart that God takes better care of him than of his "Congregationalist" Colonel? Does any man really suppose, that, of a score of noble young fellows who have just laid down their lives for their country, the Homoousians are received to the mansions of bliss, and the Homoousians translated from the battle-field to the abodes of everlasting woe? War not only teaches what man can be, but it teaches also what he must not be. He must not be a bigot and a fool in the presence of that day of judgment proclaimed by the trumpet which calls to battle, and where a man should have but two thoughts: to do his duty, and trust his Maker. Let our brave dead come back from the fields where they have fallen for law and liberty, and if you will follow them to their graves, you will find out what the Broad Church means; the narrow church is sparing of its exclusive formulæ over the coffins wrapped in the flag which the fallen heroes had defended! Very little comparatively do we hear at such times of the dogmas on which men differ; very much of the faith and trust in which all sincere Christians can agree. It is a noble lesson, and nothing less noisy than the voice of cannon can teach it so that it shall be heard over all the angry cries of theological disputants.

Now, too, we have a chance to test the sagacity of our friends, and to get at their principles of judgment. Perhaps most, of us, will agree that our faith in domestic prophets has been diminished by the experience of the last six months. We had the notable predictions attributed to the Secretary of State, which so unpleasantly refused to fulfil themselves. We were infested at one time with a set of ominous-looking seers, who shook their heads and muttered obscurely about some mighty preparations that were making to substitute the rule of the minority for that of the majority. Organizations were darkly hinted at; some thought our armories would be seized; and there are not wanting ancient women in the neighboring University town who consider that the country was saved by the intrepid band of students who stood guard, night after night, over the G. R. cannon and the pile of balls in the Cambridge Arsenal.

As a general rule, it is safe to say that the best prophecies are those which the sages remember after the event prophesied of has come to pass, and remind us that they have made long ago. Those who, are rash enough to predict publicly beforehand commonly give us what they hope, or what they fear, or some conclusion from an abstraction of their own, or some guess founded on private information not half so good as what everybody gets who reads the papers,—never by any possibility a word that we can depend on, simply because there are cobwebs of contingency between every to-day and to-morrow that no field-glass can penetrate when fifty of them lie woven one over another. Prophecy as much as you like, but always hedge. Say that you think the rebels are weaker than is commonly supposed, but, on the other hand, that they may prove to be even stronger than is anticipated. Say what you like,—only don't be too peremptory and dogmatic; we know that wiser men than you have been notoriously deceived in their predictions in this very matter.

Ibis et redibis nunquam in bello peribis.

Let that be your model; and remember, on peril of your reputation as a prophet, not to put a stop before or after the nunquam.

There are two or three facts connected with time, besides that already referred to, which strike us very forcibly in their relation to the great events passing around us. We spoke of the long period seeming to have elapsed since this war began. The buds were then swelling which held the leaves that are still green. It seems as old as Time himself. We cannot fail to observe how the mind brings together the scenes of to-day and those of the old Revolution. We shut up eighty years into each other like the joints of a pocket-telescope. When the young men from Middlesex dropped in Baltimore the other day, it seemed to bring Lexington and the other Nineteenth of April close to us. War has always been the mint in which the world's history has been coined, and now every day or week or month has a new medal for us. It was Warren that the first impression bore in

the last great coinage; if it is Ellsworth now, the new face hardly seems fresher than the old. All battle-fields are alike in their main features. The young fellows who fell in our earlier struggle seemed like old men to us until within these few months; now we remember they were like these fiery youth we are cheering as they go to the fight; it seems as if the grass of our bloody hillside was crimsoned but yesterday, and the cannon-ball imbedded in the church-tower would feel warm, if we laid our hand upon it.

Nay, in this our quickened life we feel that all the battles from earliest time to our own day, where Right and Wrong have grappled, are but one great battle, varied with brief pauses or hasty bivouacs upon the field of conflict. The issues seem to vary, but it is always a right against a claim, and, however the struggle of the hour may go, a movement onward of the campaign, which uses defeat as well as victory to serve its mighty ends. The very implements of our warfare change less than we think. Our bullets and cannonballs have lengthened into bolts like those which whistled out of old arbalests. Our soldiers fight with weapons, such as are pictured on the walls of Theban tombs, wearing a newly invented head-gear as old as the days of the Pyramids.

Whatever miseries this war brings upon us, it is making us wiser, and, we trust, better. Wiser, for we are learning our weakness, our narrowness, our selfishness, our ignorance, in lessons of sorrow and shame. Better, because all that is noble in men and women is demanded by the time, and our people are rising to the standard the time calls for. For this is the question the hour is putting to each of us: Are you ready, if need be, to sacrifice all that you have and hope for in this world, that the generations to follow you may inherit a whole country whose natural condition shall be peace, and not a broken province which must live under the perpetual threat, if not in the constant presence, of war and all that war brings with it? If we are all ready for this sacrifice, battles may be lost, but the campaign and its grand object must be won.

Heaven is very kind in its way of putting questions to mortals. We are not abruptly asked to give up all that we most care for, in view of the momentous issues before us. Perhaps we shall never be asked to give up all, but we have already been called upon to part with much that is dear to us, and should be ready to yield the rest as it is called for. The time may come when even the cheap public print shall be a burden our means cannot support, and we can only listen in the square that was once the marketplace to the voices of those who proclaim defeat or victory. Then there will be only our daily food left. When we have nothing to read and nothing to eat, it will be a favorable moment to offer a compromise. At present we have all that nature absolutely demands,—we can live on bread and the newspaper.

MY HUNT AFTER "THE CAPTAIN."

In the dead of the night which closed upon the bloody field of Antietam, my household was startled from its slumbers by the loud summons of a telegraphic messenger. The air had been heavy all day with rumors of battle, and thousands and tens of thousands had walked the streets with throbbing hearts, in dread anticipation of the tidings any hour might bring.

We rose hastily, and presently the messenger was admitted. I took the envelope from his hand, opened it, and read:

HAGERSTOWN 17th

To _____ H _____

Capt H _____ wounded shot through the neck thought not mortal at Keedysville WILLIAM G. LEDUC

Through the neck,—no bullet left in wound. Windpipe, food-pipe, carotid, jugular, half a dozen smaller, but still formidable vessels, a great braid of nerves, each as big as a lamp-wick, spinal cord,—ought to kill at once, if at all. Thought not mortal, or not thought mortal,—which was it? The first; that is better than the second would be.—"Keedysville, a post-office, Washington Co., Maryland." Leduc? Leduc? Don't remember that name. The boy is waiting for his money. A dollar and thirteen cents. Has nobody got thirteen cents? Don't keep that boy waiting,—how do we know what messages he has got to carry?

The boy had another message to carry. It was to the father of Lieutenant-Colonel Wilder Dwight, informing him that his son was grievously wounded in the same battle, and was lying at Boonsborough, a town a few miles this side of Keedysville. This I learned the next morning from the civil and attentive officials at the Central Telegraph Office.

Calling upon this gentleman, I found that he meant to leave in the quarter past two o'clock train, taking with him Dr. George H. Gay, an accomplished and energetic surgeon, equal to any difficult question or pressing emergency. I agreed to accompany them, and we met in the cars. I felt myself peculiarly fortunate in having companions whose society would be a pleasure, whose feelings would harmonize with my own, and whose assistance I might, in case of need, be glad to claim.

It is of the journey which we began together, and which I finished apart, that I mean to give my "Atlantic" readers an account. They must let me tell my story in my own way, speaking of many little matters that interested or amused me, and which a certain leisurely class of elderly persons, who sit at their firesides and never travel, will, I hope, follow with a kind of interest. For, besides the main object of my excursion, I could not help being excited by the incidental sights and occurrences of a trip which to a commercial traveller or a newspaper-reporter would seem quite commonplace and undeserving of record. There are periods in which all places and people seem to be in a conspiracy to impress us with their individuality, in which every ordinary locality seems to assume a special significance and to claim a particular notice, in which every person we meet is either an old acquaintance or a character; days in which the strangest coincidences are continually happening, so that they get to be the rule, and not the exception. Some might naturally think that anxiety and the weariness of a prolonged search after a near relative would have prevented my taking any interest in or paying any regard to the little matters around me. Perhaps it had just the contrary effect, and

acted like a diffused stimulus upon the attention. When all the faculties are wide-awake in pursuit of a single object, or fixed in the spasm of an absorbing emotion, they are oftentimes clairvoyant in a marvellous degree in respect to many collateral things, as Wordsworth has so forcibly illustrated in his sonnet on the Boy of Windermere, and as Hawthorne has developed with such metaphysical accuracy in that chapter of his wondrous story where Hester walks forth to meet her punishment.

Be that as it may,—though I set out with a full and heavy heart, though many times my blood chilled with what were perhaps needless and unwise fears, though I broke through all my habits without thinking about them, which is almost as hard in certain circumstances as for one of our young fellows to leave his sweetheart and go into a Peninsular campaign, though I did not always know when I was hungry nor discover that I was thirsting, though I had a worrying ache and inward tremor underlying all the outward play of the senses and the mind, yet it is the simple truth that I did look out of the car-windows with an eye for all that passed, that I did take cognizance of strange sights and singular people, that I did act much as persons act from the ordinary promptings of curiosity, and from time to time even laugh very much as others do who are attacked with a convulsive sense of the ridiculous, the epilepsy of the diaphragm.

By a mutual compact, we talked little in the cars. A communicative friend is the greatest nuisance to have at one's side during a railroad journey, especially if his conversation is stimulating and in itself agreeable. "A fast train and a 'slow' neighbor," is my motto. Many times, when I have got upon the cars, expecting to be magnetized into an hour or two of blissful reverie, my thoughts shaken up by the vibrations into all sorts of new and pleasing patterns, arranging themselves in curves and nodal points, like the grains of sand in Chladni's famous experiment,—fresh ideas coming up to the surface, as the kernels do when a measure of corn is jolted in a farmer's wagon,—all this without volition, the mechanical impulse alone keeping the thoughts in motion, as the mere act of carrying certain watches in the pocket keeps them wound up,—many times, I say, just as my brain was beginning to creep and hum with this delicious locomotive intoxication, some dear detestable friend, cordial, intelligent, social, radiant, has come up and sat down by me and opened a conversation which has broken my day-dream, unharnessed the flying horses that were whirling along my fancies and hitched on the old weary omnibus-team of every-day associations, fatigued my hearing and attention, exhausted my voice, and milked the breasts of my thought dry during the hour when they should have been filling themselves full of fresh juices. My friends spared me this trial.

So, then, I sat by the window and enjoyed the slight tipsiness produced by short, limited, rapid oscillations, which I take to be the exhilarating stage of that condition which reaches hopeless inebriety in what we know as sea-sickness. Where the horizon opened widely, it pleased me to watch the curious effect of the rapid movement of near objects contrasted with the slow motion of distant ones. Looking from a right-hand window, for instance, the fences close by glide swiftly backward, or to the right, while the distant hills not only do not appear to move backward, but look by contrast with the fences near at hand as if they were moving forward, or to the left; and thus the whole landscape becomes a mighty wheel revolving about an imaginary axis somewhere in the middle-distance.

My companions proposed to stay at one of the best-known and longest-established of the New-York caravansaries, and I accompanied them. We were particularly well lodged, and not uncivilly treated. The traveller who supposes that he is to repeat the melancholy experience of Shenstone, and have to sigh over the reflection that he has found "his warmest welcome at an inn," has something to learn at the offices of the great city hotels. The unheralded guest who is honored by mere indifference may think himself blessed with singular good-fortune. If the despot of the Patent-Annunciator is only mildly contemptuous in his manner, let the victim look upon it as a personal favor. The coldest welcome that a threadbare curate ever got at the door of a bishop's palace, the most icy reception that a country cousin ever received at the city mansion of a mushroom millionaire, is agreeably tepid, compared to that which the Rhadamanthus who dooms you to the more or less elevated circle of his inverted Inferno vouchsafes, as you step up to enter your name on his dog's-eared register. I have less hesitation in unburdening myself of this uncomfortable statement, as on this particular trip I met with more than one exception to the rule. Officials become brutalized, I suppose, as a matter of course. One cannot expect an office clerk to embrace tenderly every stranger who comes in with a carpet-bag, or a telegraph operator to burst into tears over every unpleasant message he receives for transmission. Still, humanity is not always totally extinguished in these persons. I discovered a youth in a telegraph office of the Continental Hotel, in Philadelphia, who was as pleasant in conversation, and as graciously responsive to inoffensive questions, as if I had been his childless opulent uncle and my will not made.

On the road again the next morning, over the ferry, into the cars with sliding panels and fixed windows, so that in summer the whole side of the car may be made transparent. New Jersey is, to the apprehension of a traveller, a double-headed suburb rather than a State. Its dull red dust looks like the dried and powdered mud of a battle-field. Peach-trees are common, and champagne-orchards. Canal-boats, drawn by mules, swim by, feeling their way along like blind men led by dogs. I had a mighty passion come over me to be the captain of one,—to glide back and forward upon a sea never roughened by storms,—to float where I could not sink,—to navigate where there is no shipwreck,—to lie languidly on the deck and govern the huge craft by a word or the movement of a finger: there was something of railroad intoxication in the fancy: but who has not often envied a cobbler in his stall?

The boys cry the "N'-York Heddle," instead of "Herald"; I remember that years ago in Philadelphia; we must be getting near the farther end of the dumb-bell suburb. A bridge has been swept away by a rise of the waters, so we must approach Philadelphia by the river. Her physiognomy is not distinguished; nez camus, as a Frenchman would say; no illustrious steeple, no imposing tower; the water-edge of the town looking bedraggled, like the flounce of a vulgar rich woman's dress that trails on the sidewalk. The New Ironsides lies at one of the wharves, elephantine in bulk and color, her sides narrowing as they rise, like the walls of a hock-glass.

I went straight to the house in Walnut Street where the Captain would be heard of, if anywhere in this region. His lieutenant-colonel was there, gravely wounded; his college-friend and comrade in arms, a son of the house, was there, injured in a similar way; another soldier, brother of the last, was there, prostrate with

fever. A fourth bed was waiting ready for the Captain, but not one word had been heard of him, though inquiries had been made in the towns from and through which the father had brought his two sons and the lieutenant-colonel. And so my search is, like a "Ledger" story, to be continued.

I rejoined my companions in time to take the noon-train for Baltimore. Our company was gaining in number as it moved onwards. We had found upon the train from New York a lovely, lonely lady, the wife of one of our most spirited Massachusetts officers, the brave Colonel of the __th Regiment, going to seek her wounded husband at Middletown, a place lying directly in our track. She was the light of our party while we were together on our pilgrimage, a fair, gracious woman, gentle, but courageous,

*—"ful plesant and amiable of port,
-estatelich of manere,
And to ben holden digne of reverence."*

On the road from Philadelphia, I found in the same car with our party Dr. William Hunt of Philadelphia, who had most kindly and faithfully attended the Captain, then the Lieutenant, after a wound received at Ball's Bluff, which came very near being mortal. He was going upon an errand of mercy to the wounded, and found he had in his memorandum-book the name of our lady's husband, the Colonel, who had been commended to his particular attention.

Not long after leaving Philadelphia, we passed a solitary sentry keeping guard over a short railroad bridge. It was the first evidence that we were approaching the perilous borders, the marches where the North and the South mingle their angry hosts, where the extremes of our so-called civilization meet in conflict, and the fierce slave-driver of the Lower Mississippi stares into the stern eyes of the forest-feller from the banks of the Aroostook. All the way along, the bridges were guarded more or less strongly. In a vast country like ours, communications play a far more complex part than in Europe, where the whole territory available for strategic purposes is so comparatively limited. Belgium, for instance, has long been the bowling-alley where kings roll cannon-balls at each other's armies; but here we are playing the game of live ninepins without any alley.

We were obliged to stay in Baltimore over night, as we were too late for the train to Frederick. At the Eutaw House, where we found both comfort and courtesy, we met a number of friends, who beguiled the evening hours for us in the most agreeable manner. We devoted some time to procuring surgical and other articles, such as might be useful to our friends, or to others, if our friends should not need them. In the morning, I found myself seated at the breakfast-table next to General Wool. It did not surprise me to find the General very far from expansive. With Fort McHenry on his shoulders and Baltimore in his breeches-pocket, and the weight of a military department loading down his social safety-valves, I thought it a great deal for an officer in his trying position to select so very obliging and affable an aid as the gentleman who relieved him of the burden of attending to strangers.

We left the Eutaw House, to take the cars for Frederick. As we stood waiting on the platform, a telegraphic message was handed in silence to my companion. Sad news: the lifeless body of the son he was hastening to see was even now on its way to him in Baltimore. It was no time for empty words of consolation: I knew what he had lost, and that now was not the time to intrude upon a grief borne as men bear it, felt as women feel it.

Colonel Wilder Dwight was first made known to me as the friend of a beloved relative of my own, who was with him during a severe illness in Switzerland; and for whom while living, and for whose memory when dead, he retained the warmest affection. Since that the story of his noble deeds of daring, of his capture and escape, and a brief visit home before he was able to rejoin his regiment, had made his name familiar to many among us, myself among the number. His memory has been honored by those who had the largest opportunity of knowing his rare promise, as a man of talents and energy of nature. His abounding vitality must have produced its impression on all who met him; there was a still fire about him which any one could see would blaze up to melt all difficulties and recast obstacles into implements in the mould of an heroic will. These elements of his character many had the chance of knowing; but I shall always associate him with the memory of that pure and noble friendship which made me feel that I knew him before I looked upon his face, and added a personal tenderness to the sense of loss which I share with the whole community.

Here, then, I parted, sorrowfully, from the companions with whom I set out on my journey.

In one of the cars, at the same station, we met General Shriver of Frederick, a most loyal Unionist, whose name is synonymous with a hearty welcome to all whom he can aid by his counsel and his hospitality. He took great pains to give us all the information we needed, and expressed the hope, which was afterwards fulfilled, to the great gratification of some of us, that we should meet again when he should return to his home.

There was nothing worthy of special note in the trip to Frederick, except our passing a squad of Rebel prisoners, whom I missed seeing, as they flashed by, but who were said to be a most forlorn-looking crowd of scarecrows. Arrived at the Monocacy River, about three miles this side of Frederick, we came to a halt, for the railroad bridge had been blown up by the Rebels, and its iron pillars and arches were lying in the bed of the river. The unfortunate wretch who fired the train was killed by the explosion, and lay buried hard by, his hands sticking out of the shallow grave into which he had been huddled. This was the story they told us, but whether true or not I must leave to the correspondents of "Notes and Queries" to settle.

There was a great confusion of carriages and wagons at the stopping-place of the train, so that it was a long time before I could get anything that would carry us. At last I was lucky enough to light on a sturdy wagon, drawn by a pair of serviceable bays, and driven by James Grayden, with whom I was destined to have a somewhat continued acquaintance. We took up a little girl who had been in Baltimore during the late Rebel inroad. It made me think of the time when my own mother, at that time six years old, was hurried off from Boston, then occupied by the British soldiers, to Newburyport, and heard the people saying that "the redcoats were coming, killing and murdering everybody as they went along." Frederick looked cheerful for a place that had so recently been in an enemy's hands. Here and there a house or shop was shut up, but the national colors were waving in all directions, and the general aspect was peaceful and contented. I saw no bullet-marks or other sign of the fighting which had gone on in the streets. The Colonel's lady was taken in charge

by a daughter of that hospitable family to which we had been commended by its head, and I proceeded to inquire for wounded officers at the various temporary hospitals.

At the United States Hotel, where many were lying, I heard mention of an officer in an upper chamber, and, going there, found Lieutenant Abbott, of the Twentieth Massachusetts Volunteers, lying ill with what looked like typhoid fever. While there, who should come in but the almost ubiquitous Lieutenant Wilkins, of the same Twentieth, whom I had met repeatedly before on errands of kindness or duty, and who was just from the battle-ground. He was going to Boston in charge of the body of the lamented Dr. Revere, the Assistant Surgeon of the regiment, killed on the field. From his lips I learned something of the mishaps of the regiment. My Captain's wound he spoke of as less grave than at first thought; but he mentioned incidentally having heard a story recently that he was killed,—a fiction, doubtless,—a mistake,—a palpable absurdity,—not to be remembered or made any account of. Oh no! but what dull ache is this in that obscurely sensitive region, somewhere below the heart, where the nervous centre called the semilunar ganglion lies unconscious of itself until a great grief or a mastering anxiety reaches it through all the non-conductors which isolate it from ordinary impressions? I talked awhile with Lieutenant Abbott, who lay prostrate, feeble, but soldier-like and uncomplaining, carefully waited upon by a most excellent lady, a captain's wife, New England born, loyal as the Liberty on a golden ten-dollar piece, and of lofty bearing enough to have sat for that goddess's portrait. She had stayed in Frederick through the Rebel inroad, and kept the star-spangled banner where it would be safe, to unroll it as the last Rebel hoofs clattered off from the pavement of the town.

Near by Lieutenant Abbott was an unhappy gentleman, occupying a small chamber, and filling it with his troubles. When he gets well and plump, I know he will forgive me if I confess that I could not help smiling in the midst of my sympathy for him. He had been a well-favored man, he said, sweeping his hand in a semicircle, which implied that his acute-angled countenance had once filled the goodly curve he described. He was now a perfect Don Quixote to look upon. Weakness had made him querulous, as it does all of us, and he piped his grievances to me in a thin voice, with that finish of detail which chronic invalidism alone can command. He was starving,—he could not get what he wanted to eat. He was in need of stimulants, and he held up a pitiful two-ounce phial containing three thimblefuls—of brandy,—his whole stock of that encouraging article. Him I consoled to the best of my ability, and afterwards, in some slight measure, supplied his wants. Feed this poor gentleman up, as these good people soon will, and I should not know him, nor he himself. We are all egotists in sickness and debility. An animal has been defined as “a stomach ministered to by organs;” and the greatest man comes very near this simple formula after a month or two of fever and starvation.

James Grayden and his team pleased me well enough, and so I made a bargain with him to take us, the lady and myself, on our further journey as far as Middletown. As we were about starting from the front of the United States Hotel, two gentlemen presented themselves and expressed a wish to be allowed to share our conveyance. I looked at them and convinced myself that they were neither Rebels in disguise, nor deserters, nor camp-followers, nor miscreants, but plain, honest men on a proper errand. The first of them I will pass over briefly. He was a young man of mild and modest demeanor, chaplain to a Pennsylvania regiment, which he was going to rejoin. He belonged to the Moravian Church, of which I had the misfortune to know little more than what I had learned from Southey's “Life of Wesley.” and from the exquisite hymns we have borrowed from its rhapsodists. The other stranger was a New Englander of respectable appearance, with a grave, hard, honest, hay-bearded face, who had come to serve the sick and wounded on the battle-field and in its immediate neighborhood. There is no reason why I should not mention his name, but I shall content myself with calling him the Philanthropist.

So we set forth, the sturdy wagon, the serviceable bays, with James Grayden their driver, the gentle lady, whose serene patience bore up through all delays and discomforts, the Chaplain, the Philanthropist, and myself, the teller of this story.

And now, as we emerged from Frederick, we struck at once upon the trail from the great battle-field. The road was filled with straggling and wounded soldiers. All who could travel on foot,—multitudes with slight wounds of the upper limbs, the head, or face,—were told to take up their beds,—a light burden or none at all,—and walk. Just as the battle-field sucks everything into its red vortex for the conflict, so does it drive everything off in long, diverging rays after the fierce centripetal forces have met and neutralized each other. For more than a week there had been sharp fighting all along this road. Through the streets of Frederick, through Crampton's Gap, over South Mountain, sweeping at last the hills and the woods that skirt the windings of the Antietam, the long battle had travelled, like one of those tornadoes which tear their path through our fields and villages. The slain of higher condition, “embalmed” and iron-cased, were sliding off on the railways to their far homes; the dead of the rank and file were being gathered up and committed hastily to the earth; the gravely wounded were cared for hard by the scene of conflict, or pushed a little way along to the neighboring villages; while those who could walk were meeting us, as I have said, at every step in the road. It was a pitiable sight, truly pitiable, yet so vast, so far beyond the possibility of relief, that many single sorrows of small dimensions have wrought upon my feelings more than the sight of this great caravan of maimed pilgrims. The companionship of so many seemed to make a joint-stock of their suffering; it was next to impossible to individualize it, and so bring it home, as one can do with a single broken limb or aching wound. Then they were all of the male sex, and in the freshness or the prime of their strength. Though they tramped so wearily along, yet there was rest and kind nursing in store for them. These wounds they bore would be the medals they would show their children and grandchildren by and by. Who would not rather wear his decorations beneath his uniform than on it?

Yet among them were figures which arrested our attention and sympathy. Delicate boys, with more spirit than strength, flushed with fever or pale with exhaustion or haggard with suffering, dragged their weary limbs along as if each step would exhaust their slender store of strength. At the roadside sat or lay others, quite spent with their journey. Here and there was a house at which the wayfarers would stop, in the hope, I fear often vain, of getting refreshment; and in one place was a clear, cool spring, where the little bands of the long procession halted for a few moments, as the trains that traverse the desert rest by its fountains. My companions had brought a few peaches along with them, which the Philanthropist bestowed upon the tired

and thirsty soldiers with a satisfaction which we all shared. I had with me a small flask of strong waters, to be used as a medicine in case of inward grief. From this, also, he dispensed relief, without hesitation, to a poor fellow who looked as if he needed it. I rather admired the simplicity with which he applied my limited means of solace to the first-comer who wanted it more than I; a genuine benevolent impulse does not stand on ceremony, and had I perished of colic for want of a stimulus that night, I should not have reproached my friend the Philanthropist, any more than I grudged my other ardent friend the two dollars and more which it cost me to send the charitable message he left in my hands.

It was a lovely country through which we were riding. The hillsides rolled away into the distance, slanting up fair and broad to the sun, as one sees them in the open parts of the Berkshire Valley, at Lanesborough, for instance, or in the many-hued mountain chalice at the bottom of which the Shaker houses of Lebanon have shaped themselves like a sediment of cubical crystals. The wheat was all garnered, and the land ploughed for a new crop. There was Indian corn standing, but I saw no pumpkins warming their yellow carapaces in the sunshine like so many turtles; only in a single instance did I notice some wretched little miniature specimens in form and hue not unlike those colossal oranges of our cornfields. The rail fences were somewhat disturbed, and the cinders of extinguished fires showed the use to which they had been applied. The houses along the road were not for the most part neatly kept; the garden fences were poorly built of laths or long slats, and very rarely of trim aspect. The men of this region seemed to ride in the saddle very generally, rather than drive. They looked sober and stern, less curious and lively than Yankees, and I fancied that a type of features familiar to us in the countenance of the late John Tyler, our accidental President, was frequently met with. The women were still more distinguishable from our New England pattern. Soft, sallow, succulent, delicately finished about the mouth and firmly shaped about the chin, dark-eyed, full-throated, they looked as if they had been grown in a land of olives. There was a little toss in their movement, full of muliebrity. I fancied there was something more of the duck and less of the chicken about them, as compared with the daughters of our leaner soil; but these are mere impressions caught from stray glances, and if there is any offence in them, my fair readers may consider them all retracted.

At intervals, a dead horse lay by the roadside, or in the fields, unburied, not grateful to gods or men. I saw no bird of prey, no ill-omened fowl, on my way to the carnival of death, or at the place where it had been held. The vulture of story, the crow of Talavera, the "two corbies" of the ghastly ballad, are all from Nature, doubtless; but no black wing was spread over these animal ruins, and no call to the banquet pierced through the heavy-laden and sickening air.

Full in the middle of the road, caring little for whom or what they met, came long strings of army wagons, returning empty from the front after supplies. James Grayden stated it as his conviction that they had a little rather run into a fellow than not. I liked the looks of these equipages and their drivers; they meant business. Drawn by mules mostly, six, I think, to a wagon, powdered well with dust, wagon, beast, and driver, they came jogging along the road, turning neither to right nor left,—some driven by bearded, solemn white men, some by careless, saucy-looking negroes, of a blackness like that of anthracite or obsidian. There seemed to be nothing about them, dead or alive, that was not serviceable. Sometimes a mule would give out on the road; then he was left where he lay, until by and by he would think better of it, and get up, when the first public wagon that came along would hitch him on, and restore him to the sphere of duty.

It was evening when we got to Middletown. The gentle lady who had graced our homely conveyance with her company here left us. She found her husband, the gallant Colonel, in very comfortable quarters, well cared for, very weak from the effects of the fearful operation he had been compelled to undergo, but showing calm courage to endure as he had shown manly energy to act. It was a meeting full of heroism and tenderness, of which I heard more than there is need to tell. Health to the brave soldier, and peace to the household over which so fair a spirit presides!

Dr. Thompson, the very active and intelligent surgical director of the hospitals of the place, took me in charge. He carried me to the house of a worthy and benevolent clergyman of the German Reformed Church, where I was to take tea and pass the night. What became of the Moravian chaplain I did not know; but my friend the Philanthropist had evidently made up his mind to adhere to my fortunes. He followed me, therefore, to the house of the "Dominie," as a newspaper correspondent calls my kind host, and partook of the fare there furnished me. He withdrew with me to the apartment assigned for my slumbers, and slept sweetly on the same pillow where I waked and tossed. Nay, I do affirm that he did, unconsciously, I believe, encroach on that moiety of the couch which I had flattered myself was to be my own through the watches of the night, and that I was in serious doubt at one time whether I should not be gradually, but irresistibly, expelled from the bed which I had supposed destined for my sole possession. As Ruth clave unto Naomi, so my friend the Philanthropist clave unto me. "Whither thou goest, I will go; and where thou lodgest, I will lodge." A really kind, good man, full of zeal, determined to help somebody, and absorbed in his one thought, he doubted nobody's willingness to serve him, going, as he was, on a purely benevolent errand. When he reads this, as I hope he will, let him be assured of my esteem and respect; and if he gained any accommodation from being in my company, let me tell him that I learned a lesson from his active benevolence. I could, however, have wished to hear him laugh once before we parted, perhaps forever. He did not, to the best of my recollection, even smile during the whole period that we were in company. I am afraid that a lightsome disposition and a relish for humor are not so common in those whose benevolence takes an active turn as in people of sentiment, who are always ready with their tears and abounding in passionate expressions of sympathy. Working philanthropy is a practical specialty, requiring not a mere impulse, but a talent, with its peculiar sagacity for finding its objects, a tact for selecting its agencies, an organizing and arranging faculty, a steady set of nerves, and a constitution such as Sallust describes in Catiline, patient of cold, of hunger, and of watching. Philanthropists are commonly grave, occasionally grim, and not very rarely morose. Their expansive social force is imprisoned as a working power, to show itself only through its legitimate pistons and cranks. The tighter the boiler, the less it whistles and sings at its work. When Dr. Waterhouse, in 1780, travelled with Howard, on his tour among the Dutch prisons and hospitals, he found his temper and manners very different from what would have been expected.

My benevolent companion having already made a preliminary exploration of the hospitals of the place,

before sharing my bed with him, as above mentioned I joined him in a second tour through them. The authorities of Middletown are evidently leagued with the surgeons of that place, for such a break-neck succession of pitfalls and chasms I have never seen in the streets of a civilized town. It was getting late in the evening when we began our rounds. The principal collections of the wounded were in the churches. Boards were laid over the tops of the pews, on these some straw was spread, and on this the wounded lay, with little or no covering other than such scanty clothes as they had on. There were wounds of all degrees of severity, but I heard no groans or murmurs. Most of the sufferers were hurt in the limbs, some had undergone amputation, and all had, I presume, received such attention as was required. Still, it was but a rough and dreary kind of comfort that the extemporized hospitals suggested. I could not help thinking the patients must be cold; but they were used to camp life, and did not complain. The men who watched were not of the soft-handed variety of the race. One of them was smoking his pipe as he went from bed to bed. I saw one poor fellow who had been shot through the breast; his breathing was labored, and he was tossing, anxious and restless. The men were debating about the opiate he was to take, and I was thankful that I happened there at the right moment to see that he was well narcotized for the night. Was it possible that my Captain could be lying on the straw in one of these places? Certainly possible, but not probable; but as the lantern was held over each bed, it was with a kind of thrill that I looked upon the features it illuminated. Many times as I went from hospital to hospital in my wanderings, I started as some faint resemblance,—the shade of a young man's hair, the outline of his half-turned face,—recalled the presence I was in search of. The face would turn towards me, and the momentary illusion would pass away, but still the fancy clung to me. There was no figure huddled up on its rude couch, none stretched at the roadside, none toiling languidly along the dusty pike, none passing in car or in ambulance, that I did not scrutinize, as if it might be that for which I was making my pilgrimage to the battlefield.

"There are two wounded Secesh," said my companion. I walked to the bedside of the first, who was an officer, a lieutenant, if I remember right, from North Carolina. He was of good family, son of a judge in one of the higher courts of his State, educated, pleasant, gentle, intelligent. One moment's intercourse with such an enemy, lying helpless and wounded among strangers, takes away all personal bitterness towards those with whom we or our children have been but a few hours before in deadly strife. The basest lie which the murderous contrivers of this Rebellion have told is that which tries to make out a difference of race in the men of the North and South. It would be worth a year of battles to abolish this delusion, though the great sponge of war that wiped it out were moistened with the best blood of the land. My Rebel was of slight, scholastic habit, and spoke as one accustomed to tread carefully among the parts of speech. It made my heart ache to see him, a man finished in the humanities and Christian culture, whom the sin of his forefathers and the crime of his rulers had set in barbarous conflict against others of like training with his own,—a man who, but for the curse which our generation is called on to expiate, would have taken his part in the beneficent task of shaping the intelligence and lifting the moral standard of a peaceful and united people.

On Sunday morning, the twenty-first, having engaged James Grayden and his team, I set out with the Chaplain and the Philanthropist for Keedysville. Our track lay through the South Mountain Gap, and led us first to the town of Boonsborough, where, it will be remembered, Colonel Dwight had been brought after the battle. We saw the positions occupied in the battle of South Mountain, and many traces of the conflict. In one situation a group of young trees was marked with shot, hardly one having escaped. As we walked by the side of the wagon, the Philanthropist left us for a while and climbed a hill, where, along the line of a fence, he found traces of the most desperate fighting. A ride of some three hours brought us to Boonsborough, where I roused the unfortunate army surgeon who had charge of the hospitals, and who was trying to get a little sleep after his fatigues and watchings. He bore this cross very creditably, and helped me to explore all places where my soldier might be lying among the crowds of wounded. After the useless search, I resumed my journey, fortified with a note of introduction to Dr. Letterman; also with a bale of oakum which I was to carry to that gentleman, this substance being employed as a substitute for lint. We were obliged also to procure a pass to Keedysville from the Provost Marshal of Boonsborough. As we came near the place, we learned that General McClellan's head quarters had been removed from this village some miles farther to the front.

On entering the small settlement of Keedysville, a familiar face and figure blocked the way, like one of Bunyan's giants. The tall form and benevolent countenance, set off by long, flowing hair, belonged to the excellent Mayor Frank B. Fay of Chelsea, who, like my Philanthropist, only still more promptly, had come to succor the wounded of the great battle. It was wonderful to see how his single personality pervaded this torpid little village; he seemed to be the centre of all its activities. All my questions he answered clearly and decisively, as one who knew everything that was going on in the place. But the one question I had come five hundred miles to ask,—Where is Captain H.?—he could not answer. There were some thousands of wounded in the place, he told me, scattered about everywhere. It would be a long job to hunt up my Captain; the only way would be to go to every house and ask for him. Just then a medical officer came up.

"Do you know anything of Captain H. of the Massachusetts Twentieth?"

"Oh yes; he is staying in that house. I saw him there, doing very well."

A chorus of hallelujahs arose in my soul, but I kept them to myself. Now, then, for our twice-wounded volunteer, our young centurion whose double-barred shoulder-straps we have never yet looked upon. Let us observe the proprieties, however; no swelling upward of the mother,—no hysteric passio, we do not like scenes. A calm salutation,—then swallow and hold hard. That is about the programme.

A cottage of squared logs, filled in with plaster, and whitewashed. A little yard before it, with a gate swinging. The door of the cottage ajar,—no one visible as yet. I push open the door and enter. An old woman, Margaret Kitzmuller her name proves to be, is the first person I see.

"Captain H. here?"

"Oh no, sir,—left yesterday morning for Hagerstown,—in a milk-cart."

The Kitzmuller is a beady-eyed, cheery-looking ancient woman, answers questions with a rising inflection, and gives a good account of the Captain, who got into the vehicle without assistance, and was in excellent spirits. Of course he had struck for Hagerstown as the terminus of the Cumberland Valley Railroad, and was

on his way to Philadelphia, via Chambersburg and Harrisburg, if he were not already in the hospitable home of Walnut Street, where his friends were expecting him.

I might follow on his track or return upon my own; the distance was the same to Philadelphia through Harrisburg as through Baltimore. But it was very difficult, Mr. Fay told me, to procure any kind of conveyance to Hagerstown; and, on the other hand, I had James Grayden and his wagon to carry me back to Frederick. It was not likely that I should overtake the object of my pursuit with nearly thirty-six hours start, even if I could procure a conveyance that day. In the mean time James was getting impatient to be on his return, according to the direction of his employers. So I decided to go back with him.

But there was the great battle-field only about three miles from Keedysville, and it was impossible to go without seeing that. James Grayden's directions were peremptory, but it was a case for the higher law. I must make a good offer for an extra couple of hours, such as would satisfy the owners of the wagon, and enforce it by a personal motive. I did this handsomely, and succeeded without difficulty. To add brilliancy to my enterprise, I invited the Chaplain and the Philanthropist to take a free passage with me.

We followed the road through the village for a space, then turned off to the right, and wandered somewhat vaguely, for want of precise directions, over the hills. Inquiring as we went, we forded a wide creek in which soldiers were washing their clothes, the name of which we did not then know, but which must have been the Antietam. At one point we met a party, women among them, bringing off various trophies they had picked up on the battlefield. Still wandering along, we were at last pointed to a hill in the distance, a part of the summit of which was covered with Indian corn. There, we were told, some of the fiercest fighting of the day had been done. The fences were taken down so as to make a passage across the fields, and the tracks worn within the last few days looked like old roads. We passed a fresh grave under a tree near the road. A board was nailed to the tree, bearing the name, as well as I could make it out, of Gardiner, of a New Hampshire regiment.

On coming near the brow of the hill, we met a party carrying picks and spades. "How many?" "Only one." The dead were nearly all buried, then, in this region of the field of strife. We stopped the wagon, and, getting out, began to look around us. Hard by was a large pile of muskets, scores, if not hundreds, which had been picked up, and were guarded for the Government. A long ridge of fresh gravel rose before us. A board stuck up in front of it bore this inscription, the first part of which was, I believe, not correct: "The Rebel General Anderson and 80 Rebels are buried in this hole." Other smaller ridges were marked with the number of dead lying under them. The whole ground was strewn with fragments of clothing, haversacks, canteens, cap-boxes, bullets, cartridge-boxes, cartridges, scraps of paper, portions of bread and meat. I saw two soldiers' caps that looked as though their owners had been shot through the head. In several places I noticed dark red patches where a pool of blood had curdled and caked, as some poor fellow poured his life out on the sod. I then wandered about in the cornfield. It surprised me to notice, that, though there was every mark of hard fighting having taken place here, the Indian corn was not generally trodden down. One of our cornfields is a kind of forest, and even when fighting, men avoid the tall stalks as if they were trees. At the edge of this cornfield lay a gray horse, said to have belonged to a Rebel colonel, who was killed near the same place. Not far off were two dead artillery horses in their harness. Another had been attended to by a burying-party, who had thrown some earth over him but his last bed-clothes were too short, and his legs stuck out stark and stiff from beneath the gravel coverlet. It was a great pity that we had no intelligent guide to explain to us the position of that portion of the two armies which fought over this ground. There was a shallow trench before we came to the cornfield, too narrow for a road, as I should think, too elevated for a water-course, and which seemed to have been used as a rifle-pit. At any rate, there had been hard fighting in and about it. This and the cornfield may serve to identify the part of the ground we visited, if any who fought there should ever look over this paper. The opposing tides of battle must have blended their waves at this point, for portions of gray uniform were mingled with the "garments rolled in blood" torn from our own dead and wounded soldiers. I picked up a Rebel canteen, and one of our own,—but there was something repulsive about the trodden and stained relics of the stale battle-field. It was like the table of some hideous orgy left uncleared, and one turned away disgusted from its broken fragments and muddy heeltaps. A bullet or two, a button, a brass plate from a soldier's belt, served well enough for mementos of my visit, with a letter which I picked up, directed to Richmond, Virginia, its seal unbroken. "N. C. Cleveland County. E. Wright to J. Wright." On the other side, "A few lines from W. L. Vaughn." who has just been writing for the wife to her husband, and continues on his own account. The postscript, "tell John that nancy's folks are all well and has a verry good Little Crop of corn a growing." I wonder, if, by one of those strange chances of which I have seen so many, this number or leaf of the "Atlantic" will not sooner or later find its way to Cleveland County, North Carolina, and E. Wright, widow of James Wright, and Nancy's folks, get from these sentences the last glimpse of husband and friend as he threw up his arms and fell in the bloody cornfield of Antietam? I will keep this stained letter for them until peace comes back, if it comes in my time, and my pleasant North Carolina Rebel of the Middletown Hospital will, perhaps look these poor people up, and tell them where to send for it.

On the battle-field I parted with my two companions, the Chaplain and the Philanthropist. They were going to the front, the one to find his regiment, the other to look for those who needed his assistance. We exchanged cards and farewells, I mounted the wagon, the horses' heads were turned homewards, my two companions went their way, and I saw them no more. On my way back, I fell into talk with James Grayden. Born in England, Lancashire; in this country since he was four years old. Had nothing to care for but an old mother; didn't know what he should do if he lost her. Though so long in this country, he had all the simplicity and childlike lightheartedness which belong to the Old World's people. He laughed at the smallest pleasantry, and showed his great white English teeth; he took a joke without retorting by an impertinence; he had a very limited curiosity about all that was going on; he had small store of information; he lived chiefly in his horses, it seemed to me. His quiet animal nature acted as a pleasing anodyne to my recurring fits of anxiety, and I liked his frequent "Deed I don't know, sir." better than I have sometimes relished the large discourse of professors and other very wise men.

I have not much to say of the road which we were travelling for the second time. Reaching Middletown, my first call was on the wounded Colonel and his lady. She gave me a most touching account of all the suffering he had gone through with his shattered limb before he succeeded in finding a shelter; showing the terrible

want of proper means of transportation of the wounded after the battle. It occurred to me, while at this house, that I was more or less famished, and for the first time in my life I begged for a meal, which the kind family with whom the Colonel was staying most graciously furnished me.

After tea, there came in a stout army surgeon, a Highlander by birth, educated in Edinburgh, with whom I had pleasant, not unstimulating talk. He had been brought very close to that immane and nefarious Burke-and-Hare business which made the blood of civilization run cold in the year 1828, and told me, in a very calm way, with an occasional pinch from the mull, to refresh his memory, some of the details of those frightful murders, never rivalled in horror until the wretch Dumollard, who kept a private cemetery for his victims, was dragged into the light of day. He had a good deal to say, too, about the Royal College of Surgeons in Edinburgh, and the famous preparations, mercurial and the rest, which I remember well having seen there,—the “*sudabit multum*,” and others,—also of our New York Professor Carnochan's handiwork, a specimen of which I once admired at the New York College. But the doctor was not in a happy frame of mind, and seemed willing to forget the present in the past: things went wrong, somehow, and the time was out of joint with him.

Dr. Thompson, kind, cheerful, companionable, offered me half his own wide bed, in the house of Dr. Baer, for my second night in Middletown. Here I lay awake again another night. Close to the house stood an ambulance in which was a wounded Rebel officer, attended by one of their own surgeons. He was calling out in a loud voice, all night long, as it seemed to me, “*Doctor! Doctor! Driver! Water!*” in loud, complaining tones, I have no doubt of real suffering, but in strange contrast with the silent patience which was the almost universal rule.

The courteous Dr. Thompson will let me tell here an odd coincidence, trivial, but having its interest as one of a series. The Doctor and myself lay in the bed, and a lieutenant, a friend of his, slept on the sofa. At night, I placed my match-box, a Scotch one, of the Macpherson-plaid pattern, which I bought years ago, on the bureau, just where I could put my hand upon it. I was the last of the three to rise in the morning, and on looking for my pretty match-box, I found it was gone. This was rather awkward,—not on account of the loss, but of the unavoidable fact that one of my fellow-lodgers must have taken it. I must try to find out what it meant.

“By the way, Doctor, have you seen anything of a little plaid-pattern match-box?”

The Doctor put his hand to his pocket, and, to his own huge surprise and my great gratification, pulled out two match-boxes exactly alike, both printed with the Macpherson plaid. One was his, the other mine, which he had seen lying round, and naturally took for his own, thrusting it into his pocket, where it found its twin-brother from the same workshop. In memory of which event, we exchanged boxes, like two Homeric heroes.

This curious coincidence illustrates well enough some supposed cases of plagiarism of which I will mention one where my name figured. When a little poem called “*The Two Streams*” was first printed, a writer in the New York “*Evening Post*” virtually accused the author of it of borrowing the thought from a baccalaureate sermon of President Hopkins of Williamstown, and printed a quotation from that discourse, which, as I thought, a thief or catch-poll might well consider as establishing a fair presumption that it was so borrowed. I was at the same time wholly unconscious of ever having met with the discourse or the sentence which the verses were most like, nor do I believe I ever had seen or heard either. Some time after this, happening to meet my eloquent cousin, Wendell Phillips, I mentioned the fact to him, and he told me that he had once used the special image said to be borrowed, in a discourse delivered at Williamstown. On relating this to my friend Mr. Buchanan Read, he informed me that he too, had used the image,—perhaps referring to his poem called “*The Twins*.” He thought Tennyson had used it also. The parting of the streams on the Alps is poetically elaborated in a passage attributed to “*M. Loisne*,” printed in the “*Boston Evening Transcript*” for October 23, 1859. Captain, afterwards Sir Francis Head, speaks of the showers parting on the Cordilleras, one portion going to the Atlantic, one to the Pacific. I found the image running loose in my mind, without a halter. It suggested itself as an illustration of the will, and I worked the poem out by the aid of Mitchell's School Atlas.—The spores of a great many ideas are floating about in the atmosphere. We no more know where all the growths of our mind came from, than where the lichens which eat the names off from the gravestones borrowed the germs that gave them birth. The two match-boxes were just alike, but neither was a plagiarism.

In the morning I took to the same wagon once more, but, instead of James Grayden, I was to have for my driver a young man who spelt his name “*Phillip Ottenheimer*” and whose features at once showed him to be an Israelite. I found him agreeable enough, and disposed to talk. So I asked him many questions about his religion, and got some answers that sound strangely in Christian ears. He was from Wittenberg, and had been educated in strict Jewish fashion. From his childhood he had read Hebrew, but was not much of a scholar otherwise. A young person of his race lost caste utterly by marrying a Christian. The Founder of our religion was considered by the Israelites to have been “*a right smart man and a great doctor*.” But the horror with which the reading of the New Testament by any young person of their faith would be regarded was as great, I judged by his language, as that of one of our straitest sectaries would be, if he found his son or daughter perusing the “*Age of Reason*.”

In approaching Frederick, the singular beauty of its clustered spires struck me very much, so that I was not surprised to find “*Fair-View*” laid down about this point on a railroad map. I wish some wandering photographer would take a picture of the place, a stereoscopic one, if possible, to show how gracefully, how charmingly, its group of steeples nestles among the Maryland hills. The town had a poetical look from a distance, as if seers and dreamers might dwell there. The first sign I read, on entering its long street, might perhaps be considered as confirming my remote impression. It bore these words: “*Miss Ogle, Past, Present, and Future*.” On arriving, I visited Lieutenant Abbott, and the attenuated unhappy gentleman, his neighbor, sharing between them as my parting gift what I had left of the balsam known to the Pharmacopoeia as *Spiritus Vini Gallici*. I took advantage of General Shriver's always open door to write a letter home, but had not time to partake of his offered hospitality. The railroad bridge over the Monocacy had been rebuilt since I passed through Frederick, and we trundled along over the track toward Baltimore.

It was a disappointment, on reaching the Eutaw House, where I had ordered all communications to be addressed, to find no telegraphic message from Philadelphia or Boston, stating that Captain H. had arrived at the former place, “*wound doing well in good spirits expects to leave soon for Boston*.” After all, it was no

great matter; the Captain was, no doubt, snugly lodged before this in the house called Beautiful, at — Walnut Street, where that “grave and beautiful damsel named Discretion” had already welcomed him, smiling, though “the water stood in her eyes,” and had “called out Prudence, Piety, and Charity, who, after a little more discourse with him, had him into the family.”

The friends I had met at the Eutaw House had all gone but one, the lady of an officer from Boston, who was most amiable and agreeable, and whose benevolence, as I afterwards learned, soon reached the invalids I had left suffering at Frederick. General Wool still walked the corridors, inexpressive, with Fort McHenry on his shoulders, and Baltimore in his breeches-pocket, and his courteous aid again pressed upon me his kind offices. About the doors of the hotel the news-boys cried the papers in plaintive, wailing tones, as different from the sharp accents of their Boston counterparts as a sigh from the southwest is from a northeastern breeze. To understand what they said was, of course, impossible to any but an educated ear, and if I made out “Starr” and “Clipp’rr,” it was because I knew beforehand what must be the burden of their advertising coranach.

I set out for Philadelphia on the morrow, Tuesday the twenty-third, there beyond question to meet my Captain, once more united to his brave wounded companions under that roof which covers a household of as noble hearts as ever throbbed with human sympathies. Back River, Bush River, Gunpowder Creek,—lives there the man with soul so dead that his memory has ceremonies to wrap up these senseless names in the same envelopes with their meaningless localities? But the Susquehanna,—the broad, the beautiful, the historical, the poetical Susquehanna,—the river of Wyoming and of Gertrude, dividing the shores where

*“Aye those sunny mountains half-way down
Would echo flageolet from some romantic town,”—*

did not my heart renew its allegiance to the poet who has made it lovely to the imagination as well as to the eye, and so identified his fame with the noble stream that it “rolls mingling with his fame forever?” The prosaic traveller perhaps remembers it better from the fact that a great sea-monster, in the shape of a steamboat, takes him, sitting in the car, on its back, and swims across with him like Arion's dolphin,—also that mercenary men on board offer him canvas-backs in the season, and ducks of lower degree at other periods.

At Philadelphia again at last! Drive fast, O colored man and brother, to the house called Beautiful, where my Captain lies sore wounded, waiting for the sound of the chariot wheels which bring to his bedside the face and the voice nearer than any save one to his heart in this his hour of pain and weakness! Up a long street with white shutters and white steps to all the houses. Off at right angles into another long street with white shutters and white steps to all the houses. Off again at another right angle into still another long street with white shutters and white steps to all the houses. The natives of this city pretend to know one street from another by some individual differences of aspect; but the best way for a stranger to distinguish the streets he has been in from others is to make a cross or other mark on the white shutters.

This corner-house is the one. Ring softly,—for the Lieutenant-Colonel lies there with a dreadfully wounded arm, and two sons of the family, one wounded like the Colonel, one fighting with death in the fog of a typhoid fever, will start with fresh pangs at the least sound you can make. I entered the house, but no cheerful smile met me. The sufferers were each of them thought to be in a critical condition. The fourth bed, waiting its tenant day after day, was still empty. Not a word from my Captain.

Then, foolish, fond body that I was, my heart sank within me. Had he been taken ill on the road, perhaps been attacked with those formidable symptoms which sometimes come on suddenly after wounds that seemed to be doing well enough, and was his life ebbing away in some lonely cottage, nay, in some cold barn or shed, or at the wayside, unknown, uncared for? Somewhere between Philadelphia and Hagerstown, if not at the latter town, he must be, at any rate. I must sweep the hundred and eighty miles between these places as one would sweep a chamber where a precious pearl had been dropped. I must have a companion in my search, partly to help me look about, and partly because I was getting nervous and felt lonely. Charley said he would go with me,—Charley, my Captain's beloved friend, gentle, but full of spirit and liveliness, cultivated, social, affectionate, a good talker, a most agreeable letter-writer, observing, with large relish of life, and keen sense of humor. He was not well enough to go, some of the timid ones said; but he answered by packing his carpet-bag, and in an hour or two we were on the Pennsylvania Central Railroad in full blast for Harrisburg.

I should have been a forlorn creature but for the presence of my companion. In his delightful company I half forgot my anxieties, which, exaggerated as they may seem now, were not unnatural after what I had seen of the confusion and distress that had followed the great battle, nay, which seem almost justified by the recent statement that “high officers” were buried after that battle whose names were never ascertained. I noticed little matters, as usual. The road was filled in between the rails with cracked stones, such as are used for macadamizing streets. They keep the dust down, I suppose, for I could not think of any other use for them. By and by the glorious valley which stretches along through Chester and Lancaster Counties opened upon us. Much as I had heard of the fertile regions of Pennsylvania, the vast scale and the uniform luxuriance of this region astonished me. The grazing pastures were so green, the fields were under such perfect culture, the cattle looked so sleek, the houses were so comfortable, the barns so ample, the fences so well kept, that I did not wonder, when I was told that this region was called the England of Pennsylvania. The people whom we saw were, like the cattle, well nourished; the young women looked round and wholesome.

“Grass makes girls.” I said to my companion, and left him to work out my Orphic saying, thinking to myself, that as guano makes grass, it was a legitimate conclusion that Ichaboe must be a nursery of female loveliness.

As the train stopped at the different stations, I inquired at each if they had any wounded officers. None as yet; the red rays of the battle-field had not streamed off so far as this. Evening found us in the cars; they lighted candles in spring-candle-sticks; odd enough I thought it in the land of oil-wells and unmeasured floods of kerosene. Some fellows turned up the back of a seat so as to make it horizontal, and began gambling, or pretending to gamble; it looked as if they were trying to pluck a young countryman; but appearances are deceptive, and no deeper stake than “drinks for the crowd” seemed at last to be involved. But remembering

that murder has tried of late years to establish itself as an institution in the cars, I was less tolerant of the doings of these "sportsmen" who tried to turn our public conveyance into a travelling Frascati. They acted as if they were used to it, and nobody seemed to pay much attention to their manoeuvres.

We arrived at Harrisburg in the course of the evening, and attempted to find our way to the Jones House, to which we had been commended. By some mistake, intentional on the part of somebody, as it may have been, or purely accidental, we went to the Herr House instead. I entered my name in the book, with that of my companion. A plain, middle-aged man stepped up, read it to himself in low tones, and coupled to it a literary title by which I have been sometimes known. He proved to be a graduate of Brown University, and had heard a certain Phi Beta Kappa poem delivered there a good many years ago. I remembered it, too; Professor Goddard, whose sudden and singular death left such lasting regret, was the Orator. I recollect that while I was speaking a drum went by the church, and how I was disgusted to see all the heads near the windows thrust out of them, as if the building were on fire. *Cedat armis toga*. The clerk in the office, a mild, pensive, unassuming young man, was very polite in his manners, and did all he could to make us comfortable. He was of a literary turn, and knew one of his guests in his character of author. At tea, a mild old gentleman, with white hair and beard, sat next us. He, too, had come hunting after his son, a lieutenant in a Pennsylvania regiment. Of these, father and son, more presently.

After tea we went to look up Dr. Wilson, chief medical officer of the hospitals in the place, who was staying at the Brady House. A magnificent old toddy-mixer, Bardolphian in hue, and stern of aspect, as all grog-dispensers must be, accustomed as they are to dive through the features of men to the bottom of their souls and pockets to see whether they are solvent to the amount of sixpence, answered my question by a wave of one hand, the other being engaged in carrying a dram to his lips. His superb indifference gratified my artistic feeling more than it wounded my personal sensibilities. Anything really superior in its line claims my homage, and this man was the ideal bartender, above all vulgar passions, untouched by commonplace sympathies, himself a lover of the liquid happiness he dispenses, and filled with a fine scorn of all those lesser felicities conferred by love or fame or wealth or any of the roundabout agencies for which his fiery elixir is the cheap, all-powerful substitute.

Dr. Wilson was in bed, though it was early in the evening, not having slept for I don't know how many nights.

"Take my card up to him, if you please."

"This way, sir."

A man who has not slept for a fortnight or so is not expected to be as affable, when attacked in his bed, as a French Princess of old time at her morning receptions. Dr. Wilson turned toward me, as I entered, without effusion, but without rudeness. His thick, dark moustache was chopped off square at the lower edge of the upper lip, which implied a decisive, if not a peremptory, style of character.

I am Dr. So-and-So of Hubtown, looking after my wounded son. (I gave my name and said Boston, of course, in reality.)

Dr. Wilson leaned on his elbow and looked up in my face, his features growing cordial. Then he put out his hand, and good-humoredly excused his reception of me. The day before, as he told me, he had dismissed from the service a medical man hailing from *****, Pennsylvania, bearing my last name, preceded by the same two initials; and he supposed, when my card came up, it was this individual who was disturbing his slumbers. The coincidence was so unlikely a priori, unless some forlorn parent without antecedents had named, a child after me, that I could not help cross-questioning the Doctor, who assured me deliberately that the fact was just as he had said, even to the somewhat unusual initials. Dr. Wilson very kindly furnished me all the information in his power, gave me directions for telegraphing to Chambersburg, and showed every disposition to serve me.

On returning to the Herr House, we found the mild, white-haired old gentleman in a very happy state. He had just discovered his son, in a comfortable condition, at the United States Hotel. He thought that he could probably give us some information which would prove interesting. To the United States Hotel we repaired, then, in company with our kind-hearted old friend, who evidently wanted to see me as happy as himself. He went up-stairs to his son's chamber, and presently came down to conduct us there.

Lieutenant P_____, of the Pennsylvania__th, was a very fresh, bright-looking young man, lying in bed from the effects of a recent injury received in action. A grape-shot, after passing through a post and a board, had struck him in the hip, bruising, but not penetrating or breaking. He had good news for me.

That very afternoon, a party of wounded officers had passed through Harrisburg, going East. He had conversed in the bar-room of this hotel with one of them, who was wounded about the shoulder (it might be the lower part of the neck), and had his arm in a sling. He belonged to the Twentieth Massachusetts; the Lieutenant saw that he was a Captain, by the two bars on his shoulder-strap. His name was my family-name; he was tall and youthful, like my Captain. At four o'clock he left in the train for Philadelphia. Closely questioned, the Lieutenant's evidence was as round, complete, and lucid as a Japanese sphere of rock-crystal.

TE DEUM LAUDAMUS! The Lord's name be praised! The dead pain in the semilunar ganglion (which I must remind my reader is a kind of stupid, unreasoning brain, beneath the pit of the stomach, common to man and beast, which aches in the supreme moments of life, as when the dam loses her young ones, or the wild horse is lassoed) stopped short. There was a feeling as if I had slipped off a tight boot, or cut a strangling garter,—only it was all over my system. What more could I ask to assure me of the Captain's safety? As soon as the telegraph office opens tomorrow morning we will send a message to our friends in Philadelphia, and get a reply, doubtless, which will settle the whole matter.

The hopeful morrow dawned at last, and the message was sent accordingly. In due time, the following reply was received: "Phil Sept 24 I think the report you have heard that W [the Captain] has gone East must be an error we have not seen or heard of him here M L H."

DE PROFUNDIS CLAMAVI! He could not have passed through Philadelphia without visiting the house called Beautiful, where he had been so tenderly cared for after his wound at Ball's Bluff, and where those whom he loved were lying in grave peril of life or limb. Yet he did pass through Harrisburg, going East, going to Philadelphia, on his way home. Ah, this is it! He must have taken the late night-train from Philadelphia for

New York, in his impatience to reach home. There is such a train, not down in the guide-book, but we were assured of the fact at the Harrisburg depot. By and by came the reply from Dr. Wilson's telegraphic message: nothing had been heard of the Captain at Chambersburg. Still later, another message came from our Philadelphia friend, saying that he was seen on Friday last at the house of Mrs. K_____, a well-known Union lady in Hagerstown. Now this could not be true, for he did not leave Keedysville until Saturday; but the name of the lady furnished a clew by which we could probably track him. A telegram was at once sent to Mrs. K_____, asking information. It was transmitted immediately, but when the answer would be received was uncertain, as the Government almost monopolized the line. I was, on the whole, so well satisfied that the Captain had gone East, that, unless something were heard to the contrary, I proposed following him in the late train leaving a little after midnight for Philadelphia.

This same morning we visited several of the temporary hospitals, churches and school-houses, where the wounded were lying. In one of these, after looking round as usual, I asked aloud, "Any Massachusetts men here?" Two bright faces lifted themselves from their pillows and welcomed me by name. The one nearest me was private John B. Noyes of Company B, Massachusetts Thirteenth, son of my old college class-tutor, now the reverend and learned Professor of Hebrew, etc., in Harvard University. His neighbor was Corporal Armstrong of the same Company. Both were slightly wounded, doing well. I learned then and since from Mr. Noyes that they and their comrades were completely overwhelmed by the attentions of the good people of Harrisburg,—that the ladies brought them fruits and flowers, and smiles, better than either,—and that the little boys of the place were almost fighting for the privilege of doing their errands. I am afraid there will be a good many hearts pierced in this war that will have no bulletmark to show.

There were some heavy hours to get rid of, and we thought a visit to Camp Curtin might lighten some of them. A rickety wagon carried us to the camp, in company with a young woman from Troy, who had a basket of good things with her for a sick brother. "Poor boy! he will be sure to die," she said. The rustic sentries uncrossed their muskets and let us in. The camp was on a fair plain, girdled with hills, spacious, well kept apparently, but did not present any peculiar attraction for us. The visit would have been a dull one, had we not happened to get sight of a singular-looking set of human beings in the distance. They were clad in stuff of different hues, gray and brown being the leading shades, but both subdued by a neutral tint, such as is wont to harmonize the variegated apparel of travel-stained vagabonds. They looked slouchy, listless, torpid,—an ill-conditioned crew, at first sight, made up of such fellows as an old woman would drive away from her hen-roost with a broomstick. Yet these were estrays from the fiery army which has given our generals so much trouble,—"Secesh prisoners," as a bystander told us. A talk with them might be profitable and entertaining. But they were tabooed to the common visitor, and it was necessary to get inside of the line which separated us from them.

A solid, square captain was standing near by, to whom we were referred. Look a man calmly through the very centre of his pupils and ask him for anything with a tone implying entire conviction that he will grant it, and he will very commonly consent to the thing asked, were it to commit hari-kari. The Captain acceded to my postulate, and accepted my friend as a corollary. As one string of my own ancestors was of Batavian origin, I may be permitted to say that my new friend was of the Dutch type, like the Amsterdam galiots, broad in the beam, capacious in the hold, and calculated to carry a heavy cargo rather than to make fast time. He must have been in politics at some time or other, for he made orations to all the "Secesh," in which he explained to them that the United States considered and treated them like children, and enforced upon them the ridiculous impossibility of the Rebels attempting to do anything against such a power as that of the National Government.

Much as his discourse edified them and enlightened me, it interfered somewhat with my little plans of entering into frank and friendly talk with some of these poor fellows, for whom I could not help feeling a kind of human sympathy, though I am as venomous a hater of the Rebellion as one is like to find under the stars and stripes. It is fair to take a man prisoner. It is fair to make speeches to a man. But to take a man prisoner and then make speeches to him while in durance is not fair.

I began a few pleasant conversations, which would have come to something but for the reason assigned.

One old fellow had a long beard, a drooping eyelid, and a black clay pipe in his mouth. He was a Scotchman from Ayr, dour enough, and little disposed to be communicative, though I tried him with the "Twa Briggs," and, like all Scotchmen, he was a reader of "Burrns." He professed to feel no interest in the cause for which he was fighting, and was in the army, I judged, only from compulsion. There was a wild-haired, unsoaped boy, with pretty, foolish features enough, who looked as if he might be about seventeen, as he said he was. I give my questions and his answers literally.

"What State do you come from?"

"Georgy."

"What part of Georgia?"

"Midway."

—[How odd that is! My father was settled for seven years as pastor over the church at Midway, Georgia, and this youth is very probably a grandson or great grandson of one of his parishioners.]

"Where did you go to church when you were at home?"

"Never went inside 'f a church b't once in m' life."

"What did you do before you became a soldier?"

"Nothin'."

"What do you mean to do when you get back?"

"Nothin'."

Who could have any other feeling than pity for this poor human weed, this dwarfed and etiolated soul, doomed by neglect to an existence but one degree above that of the idiot?

With the group was a lieutenant, buttoned close in his gray coat,—one button gone, perhaps to make a breastpin for some fair traitorous bosom. A short, stocky man, undistinguishable from one of the "subject

race" by any obvious meanderings of the *sangre azul* on his exposed surfaces. He did not say much, possibly because he was convinced by the statements and arguments of the Dutch captain. He had on strong, iron-heeled shoes, of English make, which he said cost him seventeen dollars in Richmond.

I put the question, in a quiet, friendly way, to several of the prisoners, what they were fighting for. One answered, "For our homes." Two or three others said they did not know, and manifested great indifference to the whole matter, at which another of their number, a sturdy fellow, took offence, and muttered opinions strongly derogatory to those who would not stand up for the cause they had been fighting for. A feeble; attenuated old man, who wore the Rebel uniform, if such it could be called, stood by without showing any sign of intelligence. It was cutting very close to the bone to carve such a shred of humanity from the body politic to make a soldier of.

We were just leaving, when a face attracted me, and I stopped the party. "That is the true Southern type," I said to my companion. A young fellow, a little over twenty, rather tall, slight, with a perfectly smooth, boyish cheek, delicate, somewhat high features, and a fine, almost feminine mouth, stood at the opening of his tent, and as we turned towards him fidgeted a little nervously with one hand at the loose canvas, while he seemed at the same time not unwilling to talk. He was from Mississippi, he said, had been at Georgetown College, and was so far imbued with letters that even the name of the literary humility before him was not new to his ears. Of course I found it easy to come into magnetic relation with him, and to ask him without incivility what he was fighting for. "Because I like the excitement of it," he answered. I know those fighters with women's mouths and boys' cheeks. One such from the circle of my own friends, sixteen years old, slipped away from his nursery, and dashed in under, an assumed name among the red-legged Zouaves, in whose company he got an ornamental bullet-mark in one of the earliest conflicts of the war.

"Did you ever see a genuine Yankee?" said my Philadelphia friend to the young Mississippian.

"I have shot at a good many of them," he replied, modestly, his woman's mouth stirring a little, with a pleasant, dangerous smile.

The Dutch captain here put his foot into the conversation, as his ancestors used to put theirs into the scale, when they were buying furs of the Indians by weight,—so much for the weight of a hand, so much for the weight of a foot. It deranged the balance of our intercourse; there was no use in throwing a fly where a paving-stone had just splashed into the water, and I nodded a good-by to the boy-fighter, thinking how much pleasanter it was for my friend the Captain to address him with unanswerable arguments and crushing statements in his own tent than it would be to meet him upon some remote picket station and offer his fair proportions to the quick eye of a youngster who would draw a bead on him before he had time to say *dunder* and *blixum*.

We drove back to the town. No message. After dinner still no message. Dr. Cuyler, Chief Army Hospital Inspector, is in town, they say. Let us hunt him up,—perhaps he can help us.

We found him at the Jones House. A gentleman of large proportions, but of lively temperament, his frame knit in the North, I think, but ripened in Georgia, incisive, prompt but good-humored, wearing his broad-brimmed, steeple-crowned felt hat with the least possible tilt on one side,—a sure sign of exuberant vitality in a mature and dignified person like him, business-like in his ways, and not to be interrupted while occupied with another, but giving himself up heartily to the claimant who held him for the time. He was so genial, so cordial, so encouraging, that it seemed as if the clouds, which had been thick all the morning, broke away as we came into his presence, and the sunshine of his large nature filled the air all around us. He took the matter in hand at once, as if it were his own private affair. In ten minutes he had a second telegraphic message on its way to Mrs. K at Hagerstown, sent through the Government channel from the State Capitol,—one so direct and urgent that I should be sure of an answer to it, whatever became of the one I had sent in the morning.

While this was going on, we hired a dilapidated barouche, driven by an odd young native, neither boy nor man, "as a codling when 't is almost an apple," who said wery for very, simple and sincere, who smiled faintly at our pleasantries, always with a certain reserve of suspicion, and a gleam of the shrewdness that all men get who live in the atmosphere of horses. He drove us round by the Capitol grounds, white with tents, which were disgraced in my eyes by unsoldierly scrawls in huge letters, thus: THE SEVEN BLOOMSBURY BROTHERS, DEVIL'S HOLE, and similar inscriptions. Then to the Beacon Street of Harrisburg, which looks upon the Susquehanna instead of the Common, and shows a long front of handsome houses with fair gardens. The river is pretty nearly a mile across here, but very shallow now. The codling told us that a Rebel spy had been caught trying its fords a little while ago, and was now at Camp Curtin with a heavy ball chained to his leg,—a popular story, but a lie, Dr. Wilson said. A little farther along we came to the barkless stump of the tree to which Mr. Harris, the Cecrops of the city named after him, was tied by the Indians for some unpleasant operation of scalping or roasting, when he was rescued by friendly savages, who paddled across the stream to save him. Our youngling pointed out a very respectable-looking stone house as having been "built by the Indians" about those times. Guides have queer notions occasionally.

I was at Niagara just when Dr. Rae arrived there with his companions and dogs and things from his Arctic search after the lost navigator.

"Who are those?" I said to my conductor.

"Them?" he answered. "Them's the men that's been out West, out to Michig'n, aft' Sir Ben Franklin."

Of the other sights of Harrisburg the Brant House or Hotel, or whatever it is called, seems most worth notice. Its facade is imposing, with a row of stately columns, high above which a broad sign impends, like a crag over the brow of a lofty precipice. The lower floor only appeared to be open to the public. Its tessellated pavement and ample courts suggested the idea of a temple where great multitudes might kneel uncrowded at their devotions; but from appearances about the place where the altar should be, I judged, that, if one asked the officiating priest for the cup which cheers and likewise inebriates, his prayer would not be unanswered. The edifice recalled to me a similar phenomenon I had once looked upon,—the famous *Caffe Pedrocchi* at Padua. It was the same thing in Italy and America: a rich man builds himself a mausoleum, and calls it a place of entertainment. The fragrance of innumerable libations and the smoke of incense-breathing cigars and

pipes shall ascend day and night through the arches of his funereal monument. What are the poor dips which flare and flicker on the crowns of spikes that stand at the corners of St. Genevieve's filigree-cased sarcophagus to this perpetual offering of sacrifice?

Ten o'clock in the evening was approaching. The telegraph office would presently close, and as yet there were no tidings from Hagerstown. Let us step over and see for ourselves. A message! A message!

"Captain H. still here leaves seven to-morrow for Harrisburg Penna Is doing well Mrs HK—."

A note from Dr. Cuyler to the same effect came soon afterwards to the hotel.

We shall sleep well to-night; but let us sit awhile with nubiferous, or, if we may coin a word, nepheligenous accompaniment, such as shall gently narcotize the over-wearied brain and fold its convolutions for slumber like the leaves of a lily at nightfall. For now the over-tense nerves are all unstraining themselves, and a buzz, like that which comes over one who stops after being long jolted upon an uneasy pavement, makes the whole frame alive with a luxurious languid sense of all its inmost fibres. Our cheerfulness ran over, and the mild, pensive clerk was so magnetized by it that he came and sat down with us. He presently confided to me, with infinite naivete and ingenuousness, that, judging from my personal appearance, he should not have thought me the writer that he in his generosity reckoned me to be. His conception, so far as I could reach it, involved a huge, uplifted forehead, embossed with protuberant organs of the intellectual faculties, such as all writers are supposed to possess in abounding measure. While I fell short of his ideal in this respect, he was pleased to say that he found me by no means the remote and inaccessible personage he had imagined, and that I had nothing of the dandy about me, which last compliment I had a modest consciousness of most abundantly deserving.

Sweet slumbers brought us to the morning of Thursday. The train from Hagerstown was due at 11.15 A. M.: We took another ride behind the codling, who showed us the sights of yesterday over again. Being in a gracious mood of mind, I enlarged on the varying aspects of the town-pumps and other striking objects which we had once inspected, as seen by the different lights of evening and morning. After this, we visited the school-house hospital. A fine young fellow, whose arm had been shattered, was just falling into the spasms of lock-jaw. The beads of sweat stood large and round on his flushed and contracted features. He was under the effect of opiates,—why not (if his case was desperate, as it seemed to be considered) stop his sufferings with chloroform? It was suggested that it might shorten life. "What then?" I said. "Are a dozen additional spasms worth living for?"

The time approached for the train to arrive from Hagerstown, and we went to the station. I was struck, while waiting there, with what seemed to me a great want of care for the safety of the people standing round. Just after my companion and myself had stepped off the track, I noticed a car coming quietly along at a walk, as one may say, without engine, without visible conductor, without any person heralding its approach, so silently, so insidiously, that I could not help thinking how very near it came to flattening out me and my match-box worse than the Ravel pantomimist and his snuff-box were flattened out in the play. The train was late,—fifteen minutes, half an hour late, and I began to get nervous, lest something had happened. While I was looking for it, out started a freight-train, as if on purpose to meet the cars I was expecting, for a grand smash-up. I shivered at the thought, and asked an employee of the road, with whom I had formed an acquaintance a few minutes old, why there should not be a collision of the expected train with this which was just going out. He smiled an official smile, and answered that they arranged to prevent that, or words to that effect.

Twenty-four hours had not passed from that moment when a collision did occur, just out of the city, where I feared it, by which at least eleven persons were killed, and from forty to sixty more were maimed and crippled!

To-day there was the delay spoken of, but nothing worse. The expected train came in so quietly that I was almost startled to see it on the track. Let us walk calmly through the cars, and look around us.

In the first car, on the fourth seat to the right, I saw my Captain; there saw I him, even my first-born, whom I had sought through many cities.

"How are you, Boy?"

"How are you, Dad?"

Such are the proprieties of life, as they are observed among us Anglo-Saxons of the nineteenth century, decently disguising those natural impulses that made Joseph, the Prime Minister of Egypt, weep aloud so that the Egyptians and the house of Pharaoh heard, nay, which had once overcome his shaggy old uncle Esau so entirely that he fell on his brother's neck and cried like a baby in the presence of all the women. But the hidden cisterns of the soul may be filling fast with sweet tears, while the windows through which it looks are undimmed by a drop or a film of moisture.

These are times in which we cannot live solely for selfish joys or griefs. I had not let fall the hand I held, when a sad, calm voice addressed me by name. I fear that at the moment I was too much absorbed in my own feelings; for certainly at any other time. I should have yielded myself without stint to the sympathy which this meeting might well call forth.

"You remember my son, Cortland Saunders, whom I brought to see you once in Boston?"

"I do remember him well."

"He was killed on Monday, at Shepherdstown. I am carrying his body back with me on this train. He was my only child. If you could come to my house,—I can hardly call it my home now,—it would be a pleasure to me."

This young man, belonging in Philadelphia, was the author of a "New System of Latin Paradigms," a work showing extraordinary scholarship and capacity. It was this book which first made me acquainted with him, and I kept him in my memory, for there was genius in the youth. Some time afterwards he came to me with a modest request to be introduced to President Felton, and one or two others, who would aid him in a course of independent study he was proposing to himself. I was most happy to smooth the way for him, and he came repeatedly after this to see me and express his satisfaction in the opportunities for study he enjoyed at Cambridge. He was a dark, still, slender person, always with a trance-like remoteness, a mystic dreaminess of

manner, such as I never saw in any other youth. Whether he heard with difficulty, or whether his mind reacted slowly on an alien thought, I could not say; but his answer would often be behind time, and then a vague, sweet smile, or a few words spoken under his breath, as if he had been trained in sick men's chambers. For such a young man, seemingly destined for the inner life of contemplation, to be a soldier seemed almost unnatural. Yet he spoke to me of his intention to offer himself to his country, and his blood must now be reckoned among the precious sacrifices which will make her soil sacred forever. Had he lived, I doubt not that he would have redeemed the rare promise of his earlier years. He has done better, for he has died that unborn generations may attain the hopes held out to our nation and to mankind.

So, then, I had been within ten miles of the place where my wounded soldier was lying, and then calmly turned my back upon him to come once more round by a journey of three or four hundred miles to the same region I had left! No mysterious attraction warned me that the heart warm with the same blood as mine was throbbing so near my own. I thought of that lovely, tender passage where Gabriel glides unconsciously by Evangeline upon the great river. Ah, me! if that railroad crash had been a few hours earlier, we two should never have met again, after coming so close to each other!

The source of my repeated disappointments was soon made clear enough. The Captain had gone to Hagerstown, intending to take the cars at once for Philadelphia, as his three friends actually did, and as I took it for granted he certainly would. But as he walked languidly along, some ladies saw him across the street, and seeing, were moved with pity, and pitying, spoke such soft words that he was tempted to accept their invitation and rest awhile beneath their hospitable roof. The mansion was old, as the dwellings of gentlefolks should be; the ladies were some of them young, and all were full of kindness; there were gentle cares, and unasked luxuries, and pleasant talk, and music-sprinklings from the piano, with a sweet voice to keep them company,—and all this after the swamps of the Chickahominy, the mud and flies of Harrison's Landing, the dragging marches, the desperate battles, the fretting wound, the jolting ambulance, the log-house, and the rickety milk—cart! Thanks, uncounted thanks to the angelic ladies whose charming attentions detained him from Saturday to Thursday, to his great advantage and my infinite bewilderment! As for his wound, how could it do otherwise than well under such hands? The bullet had gone smoothly through, dodging everything but a few nervous branches, which would come right in time and leave him as well as ever.

At ten that evening we were in Philadelphia, the Captain at the house of the friends so often referred to, and I the guest of Charley, my kind companion. The Quaker element gives an irresistible attraction to these benignant Philadelphia households. Many things reminded me that I was no longer in the land of the Pilgrims. On the table were Kool Slaa and Schmeer Kase, but the good grandmother who dispensed with such quiet, simple grace these and more familiar delicacies was literally ignorant of Baked Beans, and asked if it was the Lima bean which was employed in that marvellous dish of animalized leguminous farina!

Charley was pleased with my comparing the face of the small Ethiop known to his household as "Tines" to a huckleberry with features. He also approved my parallel between a certain German blonde young maiden whom we passed in the street and the "Morris White" peach. But he was so good-humored at times, that, if one scratched a lucifer, he accepted it as an illumination.

A day in Philadelphia left a very agreeable impression of the outside of that great city, which has endeared itself so much of late to all the country by its most noble and generous care of our soldiers. Measured by its sovereign hotel, the Continental, it would stand at the head of our economic civilization. It provides for the comforts and conveniences, and many of the elegances of life, more satisfactorily than any American city, perhaps than any other city anywhere. Many of its characteristics are accounted for to some extent by its geographical position. It is the great neutral centre of the Continent, where the fiery enthusiasms of the South and the keen fanaticisms of the North meet at their outer limits, and result in a compound which neither turns litmus red nor turmeric brown. It lives largely on its traditions, of which, leaving out Franklin and Independence Hall, the most imposing must be considered its famous water-works. In my younger days I visited Fairmount, and it was with a pious reverence that I renewed my pilgrimage to that perennial fountain. Its watery ventricles were throbbing with the same systole and diastole as when, the blood of twenty years bounding in my own heart, I looked upon their giant mechanism. But in the place of "Pratt's Garden" was an open park, and the old house where Robert Morris held his court in a former generation was changing to a public restaurant. A suspension bridge cobwebbed itself across the Schuylkill where that audacious arch used to leap the river at a single bound,—an arch of greater span, as they loved to tell us, than was ever before constructed. The Upper Ferry Bridge was to the Schuylkill what the Colossus was to the harbor of Rhodes. It had an air of dash about it which went far towards redeeming the dead level of respectable average which flattens the physiognomy of the rectangular city. Philadelphia will never be herself again until another Robert Mills and another Lewis Wernwag have shaped her a new palladium. She must leap the Schuylkill again, or old men will sadly shake their heads, like the Jews at the sight of the second temple, remembering the glories of that which it replaced.

There are times when Ethiopian minstrelsy can amuse, if it does not charm, a weary soul, and such a vacant hour there was on this same Friday evening. The "opera-house" was spacious and admirably ventilated. As I was listening to the merriment of the sooty buffoons, I happened to cast my eyes up to the ceiling, and through an open semicircular window a bright solitary star looked me calmly in the eyes. It was a strange intrusion of the vast eternities beckoning from the infinite spaces. I called the attention of one of my neighbors to it, but "Bones" was irresistibly droll, and Arcturus, or Aldebaran, or whatever the blazing luminary may have been, with all his revolving worlds, sailed uncared-for down the firmament.

On Saturday morning we took up our line of march for New York. Mr. Felton, President of the Philadelphia, Wilmington and Baltimore Railroad, had already called upon me, with a benevolent and sagacious look on his face which implied that he knew how to do me a service and meant to do it. Sure enough, when we got to the depot, we found a couch spread for the Captain, and both of us were passed on to New York with no visits, but those of civility, from the conductor. The best thing I saw on the route was a rustic fence, near Elizabethtown, I think, but I am not quite sure. There was more genius in it than in any structure of the kind I have ever seen,—each length being of a special pattern, ramified, reticulated, contorted, as the limbs of the

trees had grown. I trust some friend will photograph or stereograph this fence for me, to go with the view of the spires of Frederick, already referred to, as mementos of my journey.

I had come to feeling that I knew most of the respectably dressed people whom I met in the cars, and had been in contact with them at some time or other. Three or four ladies and gentlemen were near us, forming a group by themselves. Presently one addressed me by name, and, on inquiry, I found him to be the gentleman who was with me in the pulpit as Orator on the occasion of another Phi Beta Kappa poem, one delivered at New Haven. The party were very courteous and friendly, and contributed in various ways to our comfort.

It sometimes seems to me as if there were only about a thousand people in the world, who keep going round and round behind the scenes and then before them, like the "army" in a beggarly stage-show. Suppose that I should really wish; some time or other, to get away from this everlasting circle of revolving supernumeraries, where should I buy a ticket the like of which was not in some of their pockets, or find a seat to which some one of them was not a neighbor.

A little less than a year before, after the Ball's Bluff accident, the Captain, then the Lieutenant, and myself had reposed for a night on our homeward journey at the Fifth Avenue Hotel, where we were lodged on the ground-floor, and fared sumptuously. We were not so peculiarly fortunate this time, the house being really very full. Farther from the flowers and nearer to the stars,—to reach the neighborhood of which last the per ardua of three or four flights of stairs was formidable for any mortal, wounded or well.

The "vertical railway" settled that for us, however. It is a giant corkscrew forever pulling a mammoth cork, which, by some divine judgment, is no sooner drawn than it is replaced in its position. This ascending and descending stopper is hollow, carpeted, with cushioned seats, and is watched over by two condemned souls, called conductors, one of whom is said to be named Igion, and the other Sisyphus.

I love New York, because, as in Paris, everybody that lives in it feels that it is his property,—at least, as much as it is anybody's. My Broadway, in particular, I love almost as I used to love my Boulevards. I went, therefore, with peculiar interest, on the day that we rested at our grand hotel, to visit some new pleasure-grounds the citizens had been arranging for us, and which I had not yet seen. The Central Park is an expanse of wild country, well crumpled so as to form ridges which will give views and hollows that will hold water. The hips and elbows and other bones of Nature stick out here and there in the shape of rocks which give character to the scenery, and an unchangeable, unpurchasable look to a landscape that without them would have been in danger of being fattened by art and money out of all its native features. The roads were fine, the sheets of water beautiful, the bridges handsome, the swans elegant in their deportment, the grass green and as short as a fast horse's winter coat. I could not learn whether it was kept so by clipping or singeing. I was delighted with my new property,—but it cost me four dollars to get there, so far was it beyond the Pillars of Hercules of the fashionable quarter. What it will be by and by depends on circumstances; but at present it is as much central to New York as Brookline is central to Boston.

The question is not between Mr. Olmsted's admirably arranged, but remote pleasure-ground and our Common, with its batrachian pool, but between his Excentric Park and our finest suburban scenery, between its artificial reservoirs and the broad natural sheet of Jamaica Pond. I say this not invidiously, but in justice to the beauties which surround our own metropolis. To compare the situations of any dwellings in either of the great cities with those which look upon the Common, the Public Garden, the waters of the Back Bay, would be to take an unfair advantage of Fifth Avenue and Walnut Street. St. Botolph's daughter dresses in plainer clothes than her more stately sisters, but she wears an emerald on her right hand and a diamond on her left that Cybele herself need not be ashamed of.

On Monday morning, the twenty-ninth of September, we took the cars for home. Vacant lots, with Irish and pigs; vegetable-gardens; straggling houses; the high bridge; villages, not enchanting; then Stamford: then NORWALK. Here, on the sixth of May, 1853, I passed close on the heels of the great disaster. But that my lids were heavy on that morning, my readers would probably have had no further trouble with me. Two of my friends saw the car in which they rode break in the middle and leave them hanging over the abyss. From Norwalk to Boston, that day's journey of two hundred miles was a long funeral procession.

Bridgeport, waiting for Iranistan to rise from its ashes with all its phoenix-egg domes,—bubbles of wealth that broke, ready to be blown again; iridescent as ever, which is pleasant, for the world likes cheerful Mr. Barnum's success; New Haven, girt with flat marshes that look like monstrous billiard-tables, with hay-cocks lying about for balls,—romantic with West Rock and its legends,—cursed with a detestable depot, whose niggardly arrangements crowd the track so murderously close to the wall that the peine forte et dure must be the frequent penalty of an innocent walk on its platform,—with its neat carriages, metropolitan hotels, precious old college-dormitories, its vistas of elms and its dishevelled weeping-willows; Hartford, substantial, well-bridged, many—steeped city,—every conical spire an extinguisher of some nineteenth-century heresy; so onward, by and across the broad, shallow Connecticut,—dull red road and dark river woven in like warp and woof by the shuttle of the darting engine; then Springfield, the wide-meadowed, well-feeding, horse-loving, hot-summered, giant-treed town,—city among villages, village among cities; Worcester, with its Daedalian labyrinth of crossing railroad-bars, where the snorting Minotaurs, breathing fire and smoke and hot vapors, are stabled in their dens; Framingham, fair cup-bearer, leaf-cinctured Hebe of the deep-bosomed Queen sitting by the seaside on the throne of the Six Nations. And now I begin to know the road, not by towns, but by single dwellings; not by miles, but by rods. The poles of the great magnet that draws in all the iron tracks through the grooves of all the mountains must be near at hand, for here are crossings, and sudden stops, and screams of alarmed engines heard all around. The tall granite obelisk comes into view far away on the left, its bevelled cap-stone sharp against the sky; the lofty chimneys of Charlestown and East Cambridge flaunt their smoky banners up in the thin air; and now one fair bosom of the three-pilled city, with its dome-crowned summit, reveals itself, as when many-breasted Ephesian Artemis appeared with half-open chlamys before her worshippers.

Fling open the window-blinds of the chamber that looks out on the waters and towards the western sun! Let the joyous light shine in upon the pictures that hang upon its walls and the shelves thick-set with the names of poets and philosophers and sacred teachers, in whose pages our boys learn that life is noble only when it is held cheap by the side of honor and of duty. Lay him in his own bed, and let him sleep off his aches and

weariness. So comes down another night over this household, unbroken by any messenger of evil tidings,—a night of peaceful rest and grateful thoughts; for this our son and brother was dead and is alive again, and was lost and is found.

THE INEVITABLE TRIAL

[An Oration delivered before the City Authorities of Boston, on the 4th of July, 1863.]

It is our first impulse, upon this returning day of our nation's birth, to recall whatever is happiest and noblest in our past history, and to join our voices in celebrating the statesmen and the heroes, the men of thought and the men of action, to whom that history owes its existence. In other years this pleasing office may have been all that was required of the holiday speaker. But to-day, when the very life of the nation is threatened, when clouds are thick about us, and men's hearts are throbbing with passion, or failing with fear, it is the living question of the hour, and not the dead story of the past, which forces itself into all minds, and will find unrebuked debate in all assemblies.

In periods of disturbance like the present, many persons who sincerely love their country and mean to do their duty to her disappoint the hopes and expectations of those who are actively working in her cause. They seem to have lost whatever moral force they may have once possessed, and to go drifting about from one profitless discontent to another, at a time when every citizen is called upon for cheerful, ready service. It is because their minds are bewildered, and they are no longer truly themselves. Show them the path of duty, inspire them with hope for the future, lead them upwards from the turbid stream of events to the bright, translucent springs of eternal principles, strengthen their trust in humanity and their faith in God, and you may yet restore them to their manhood and their country.

At all times, and especially on this anniversary of glorious recollections and kindly enthusiasms, we should try to judge the weak and wavering souls of our brothers fairly and generously. The conditions in which our vast community of peace-loving citizens find themselves are new and unprovided for. Our quiet burghers and farmers are in the position of river-boats blown from their moorings out upon a vast ocean, where such a typhoon is raging as no mariner who sails its waters ever before looked upon. If their beliefs change with the veering of the blast, if their trust in their fellow-men, and in the course of Divine Providence, seems well-nigh shipwrecked, we must remember that they were taken unawares, and without the preparation which could fit them to struggle with these tempestuous elements. In times like these the faith is the man; and they to whom it is given in larger measure owe a special duty to those who for want of it are faint at heart, uncertain in speech, feeble in effort, and purposeless in aim.

Assuming without argument a few simple propositions,—that self-government is the natural condition of an adult society, as distinguished from the immature state, in which the temporary arrangements of monarchy and oligarchy are tolerated as conveniences; that the end of all social compacts is, or ought to be, to give every child born into the world the fairest chance to make the most and the best of itself that laws can give it; that Liberty, the one of the two claimants who swears that her babe shall not be split in halves and divided between them, is the true mother of this blessed Union; that the contest in which we are engaged is one of principles overlaid by circumstances; that the longer we fight, and the more we study the movements of events and ideas, the more clearly we find the moral nature of the cause at issue emerging in the field and in the study; that all honest persons with average natural sensibility, with respectable understanding, educated in the school of northern teaching, will have eventually to range themselves in the armed or unarmed host which fights or pleads for freedom, as against every form of tyranny; if not in the front rank now, then in the rear rank by and by;—assuming these propositions, as many, perhaps most of us, are ready to do, and believing that the more they are debated before the public the more they will gain converts, we owe it to the timid and the doubting to keep the great questions of the time in unceasing and untiring agitation. They must be discussed, in all ways consistent with the public welfare, by different classes of thinkers; by priests and laymen; by statesmen and simple voters; by moralists and lawyers; by men of science and uneducated hand-laborers; by men of facts and figures, and by men of theories and aspirations; in the abstract and in the concrete; discussed and rediscussed every month, every week, every day, and almost every hour, as the telegraph tells us of some new upheaval or subsidence of the rocky base of our political order.

Such discussions may not be necessary to strengthen the convictions of the great body of loyal citizens. They may do nothing toward changing the views of those, if such there be, as some profess to believe, who follow politics as a trade. They may have no hold upon that class of persons who are defective in moral sensibility, just as other persons are wanting in an ear for music. But for the honest, vacillating minds, the tender consciences supported by the tremulous knees of an infirm intelligence, the timid compromisers who are always trying to curve the straight lines and round the sharp angles of eternal law, the continual debate of these living questions is the one offered means of grace and hope of earthly redemption. And thus a true, unhesitating patriot may be willing to listen with patience to arguments which he does not need, to appeals which have no special significance for him, in the hope that some less clear in mind or less courageous in temper may profit by them.

As we look at the condition in which we find ourselves on this fourth day of July, 1863, at the beginning of the Eighty-eighth Year of American Independence, we may well ask ourselves what right we have to indulge in public rejoicings. If the war in which we are engaged is an accidental one, which might have been avoided but for our fault; if it is for any ambitious or unworthy purpose on our part; if it is hopeless, and we are madly persisting in it; if it is our duty and in our power to make a safe and honorable peace, and we refuse to do it; if our free institutions are in danger of becoming subverted, and giving place to an irresponsible tyranny; if we are moving in the narrow circles which are to engulf us in national ruin,—then we had better sing a dirge, and leave this idle assemblage, and hush the noisy cannon which are reverberating through the air, and tear

down the scaffolds which are soon to blaze with fiery symbols; for it is mourning and not joy that should cover the land; there should be silence, and not the echo of noisy gladness, in our streets; and the emblems with which we tell our nation's story and prefigure its future should be traced, not in fire, but in ashes.

If, on the other hand, this war is no accident, but an inevitable result of long incubating causes; inevitable as the cataclysms that swept away the monstrous births of primeval nature; if it is for no mean, unworthy end, but for national life, for liberty everywhere, for humanity, for the kingdom of God on earth; if it is not hopeless, but only growing to such dimensions that the world shall remember the final triumph of right throughout all time; if there is no safe and honorable peace for us but a peace proclaimed from the capital of every revolted province in the name of the sacred, inviolable Union; if the fear of tyranny is a phantasm, conjured up by the imagination of the weak, acted on by the craft of the cunning; if so far from circling inward to the gulf of our perdition, the movement of past years is reversed, and every revolution carries us farther and farther from the centre of the vortex, until, by God's blessing, we shall soon find ourselves freed from the outermost coil of the accursed spiral; if all these things are true; if we may hope to make them seem true, or even probable, to the doubting soul, in an hour's discourse, then we may join without madness in the day's exultant festivities; the bells may ring, the cannon may roar, the incense of our harmless saltpetre fill the air, and the children who are to inherit the fruit of these toiling, agonizing years, go about unblamed, making day and night vocal with their jubilant patriotism.

The struggle in which we are engaged was inevitable; it might have come a little sooner, or a little later, but it must have come. The disease of the nation was organic, and not functional, and the rough chirurgery of war was its only remedy.

In opposition to this view, there are many languid thinkers who lapse into a forlorn belief that if this or that man had never lived, or if this or that other man had not ceased to live, the country might have gone on in peace and prosperity, until its felicity merged in the glories of the millennium. If Mr. Calhoun had never proclaimed his heresies; if Mr. Garrison had never published his paper; if Mr. Phillips, the Cassandra in masculine shape of our long prosperous Ilium, had never uttered his melodious prophecies; if the silver tones of Mr. Clay had still sounded in the senate-chamber to smooth the billows of contention; if the Olympian brow of Daniel Webster had been lifted from the dust to fix its awful frown on the darkening scowl of rebellion,—we might have been spared this dread season of convulsion. All this is but simple Martha's faith, without the reason she could have given: "If Thou hadst been here, my brother had not died."

They little know the tidal movements of national thought and feeling, who believe that they depend for existence on a few swimmers who ride their waves. It is not Leviathan that leads the ocean from continent to continent, but the ocean which bears his mighty bulk as it wafts its own bubbles. If this is true of all the narrower manifestations of human progress, how much more must it be true of those broad movements in the intellectual and spiritual domain which interest all mankind? But in the more limited ranges referred to, no fact is more familiar than that there is a simultaneous impulse acting on many individual minds at once, so that genius comes in clusters, and shines rarely as a single star. You may trace a common motive and force in the pyramid-builders of the earliest recorded antiquity, in the evolution of Greek architecture, and in the sudden springing up of those wondrous cathedrals of the twelfth and following centuries, growing out of the soil with stem and bud and blossom, like flowers of stone whose seeds might well have been the flaming aerolites cast over the battlements of heaven. You may see the same law showing itself in the brief periods of glory which make the names of Pericles and Augustus illustrious with reflected splendors; in the painters, the sculptors, the scholars of "Leo's golden days"; in the authors of the Elizabethan time; in the poets of the first part of this century following that dreary period, suffering alike from the silence of Cowper and the song of Hayley. You may accept the fact as natural, that Zwingli and Luther, without knowing each other, preached the same reformed gospel; that Newton, and Hooke, and Halley, and Wren arrived independently of each other at the great law of the diminution of gravity with the square of the distance; that Leverrier and Adams felt their hands meeting, as it were, as they stretched them into the outer darkness beyond the orbit of Uranus, in search of the dim, unseen Planet; that Fulton and Bell, that Wheatstone and Morse, that Daguerre and Niepce, were moving almost simultaneously in parallel paths to the same end. You see why Patrick Henry, in Richmond, and Samuel Adams, in Boston, were startling the crown officials with the same accents of liberty, and why the Mecklenburg Resolutions had the very ring of the Protest of the Province of Massachusetts. This law of simultaneous intellectual movement, recognized by all thinkers, expatiated upon by Lord Macaulay and by Mr. Herbert Spencer among recent writers, is eminently applicable to that change of thought and feeling which necessarily led to the present conflict.

The antagonism of the two sections of the Union was not the work of this or that enthusiast or fanatic. It was the consequence of a movement in mass of two different forms of civilization in different directions, and the men to whom it was attributed were only those who represented it most completely, or who talked longest and loudest about it. Long before the accents of those famous statesmen referred to ever resounded in the halls of the Capitol, long before the "Liberator" opened its batteries, the controversy now working itself out by trial of battle was foreseen and predicted. Washington warned his countrymen of the danger of sectional divisions, well knowing the line of cleavage that ran through the seemingly solid fabric. Jefferson foreshadowed the judgment to fall upon the land for its sins against a just God. Andrew Jackson announced a quarter of a century beforehand that the next pretext of revolution would be slavery. De Tocqueville recognized with that penetrating insight which analyzed our institutions and conditions so keenly, that the Union was to be endangered by slavery, not through its interests, but through the change of character it was bringing about in the people of the two sections, the same fatal change which George Mason, more than half a century before, had declared to be the most pernicious effect of the system, adding the solemn warning, now fearfully justifying itself in the sight of his descendants, that "by an inevitable chain of causes and effects, Providence punishes national sins by national calamities." The Virginian romancer pictured the far-off scenes of the conflict which he saw approaching as the prophets of Israel painted the coming woes of Jerusalem, and the strong iconoclast of Boston announced the very year when the curtain should rise on the yet unopened drama.

The wise men of the past, and the shrewd men of our own time, who warned us of the calamities in store for

our nation, never doubted what was the cause which was to produce first alienation and finally rupture. The descendants of the men "daily exercised in tyranny," the "petty tyrants" as their own leading statesmen called them long ago, came at length to love the institution which their fathers had condemned while they tolerated. It is the fearful realization of that vision of the poet where the lost angels snuff up with eager nostrils the sulphurous emanations of the bottomless abyss,—so have their natures become changed by long breathing the atmosphere of the realm of darkness.

At last, in the fulness of time, the fruits of sin ripened in a sudden harvest of crime. Violence stalked into the senate-chamber, theft and perjury wound their way into the cabinet, and, finally, openly organized conspiracy, with force and arms, made burglarious entrance into a chief stronghold of the Union. That the principle which underlay these acts of fraud and violence should be irrevocably recorded with every needed sanction, it pleased God to select a chief ruler of the false government to be its Messiah to the listening world. As with Pharaoh, the Lord hardened his heart, while he opened his mouth, as of old he opened that of the unwise animal ridden by cursing Balaam. Then spake Mr. "Vice-President" Stephens those memorable words which fixed forever the theory of the new social order. He first lifted a degraded barbarism to the dignity of a philosophic system. He first proclaimed the gospel of eternal tyranny as the new revelation which Providence had reserved for the western Palestine. Hear, O heavens! and give ear, O earth! The corner-stone of the new-born dispensation is the recognized inequality of races; not that the strong may protect the weak, as men protect women and children, but that the strong may claim the authority of Nature and of God to buy, to sell, to scourge, to hunt, to cheat out of the reward of his labor, to keep in perpetual ignorance, to blast with hereditary curses throughout all time, the bronzed founding of the New World, upon whose darkness has dawned the star of the occidental Bethlehem!

After two years of war have consolidated the opinion of the Slave States, we read in the "Richmond Examiner": "The establishment of the Confederacy is verily a distinct reaction against the whole course of the mistaken civilization of the age. For 'Liberty, Equality, Fraternity,' we have deliberately substituted Slavery, Subordination, and Government."

A simple diagram, within the reach of all, shows how idle it is to look for any other cause than slavery as having any material agency in dividing the country. Match the two broken pieces of the Union, and you will find the fissure that separates them zigzagging itself half across the continent like an isothermal line, shooting its splintery projections, and opening its reentering angles, not merely according to the limitations of particular States, but as a county or other limited section of ground belongs to freedom or to slavery. Add to this the official statement made in 1862, that "there is not one regiment or battalion, or even company of men, which was organized in or derived from the Free States or Territories, anywhere, against the Union"; throw in gratuitously Mr. Stephens's explicit declaration in the speech referred to, and we will consider the evidence closed for the present on this count of the indictment.

In the face of these predictions, these declarations, this line of fracture, this precise statement, testimony from so many sources, extending through several generations, as to the necessary effect of slavery, a priori, and its actual influence as shown by the facts, few will suppose that anything we could have done would have stayed its course or prevented it from working out its legitimate effects on the white subjects of its corrupting dominion. Northern acquiescence or even sympathy may have sometimes helped to make it sit more easily on the consciences of its supporters. Many profess to think that Northern fanaticism, as they call it, acted like a mordant in fixing the black dye of slavery in regions which would but for that have washed themselves free of its stain in tears of penitence. It is a delusion and a snare to trust in any such false and flimsy reasons where there is enough and more than enough in the institution itself to account for its growth. Slavery gratifies at once the love of power, the love of money, and the love of ease; it finds a victim for anger who cannot smite back his oppressor; and it offers to all, without measure, the seductive privileges which the Mormon gospel reserves for the true believers on earth, and the Bible of Mahomet only dares promise to the saints in heaven.

Still it is common, common even to vulgarity, to hear the remark that the same gallows-tree ought to bear as its fruit the arch-traitor and the leading champion of aggressive liberty. The mob of Jerusalem was not satisfied with its two crucified thieves; it must have a cross also for the reforming Galilean, who interfered so rudely with its conservative traditions! It is asserted that the fault was quite as much on our side as on the other; that our agitators and abolishers kindled the flame for which the combustibles were all ready on the other side of the border. If these men could have been silenced, our brothers had not died.

Who are the persons that use this argument? They are the very ones who are at the present moment most zealous in maintaining the right of free discussion. At a time when every power the nation can summon is needed to ward off the blows aimed at its life, and turn their force upon its foes,—when a false traitor at home may lose us a battle by a word, and a lying newspaper may demoralize an army by its daily or weekly stillicidium of poison, they insist with loud acclaim upon the liberty of speech and of the press; liberty, nay license, to deal with government, with leaders, with every measure, however urgent, in any terms they choose, to traduce the officer before his own soldiers, and assail the only men who have any claim at all to rule over the country, as the very ones who are least worthy to be obeyed. If these opposition members of society are to have their way now, they cannot find fault with those persons who spoke their minds freely in the past on that great question which, as we have agreed, underlies all our present dissensions.

It is easy to understand the bitterness which is often shown towards reformers. They are never general favorites. They are apt to interfere with vested rights and time-hallowed interests. They often wear an unlovely, forbidding aspect. Their office corresponds to that of Nature's sanitary commission for the removal of material nuisances. It is not the butterfly, but the beetle, which she employs for this duty. It is not the bird of paradise and the nightingale, but the fowl of dark plumage and unmelodious voice, to which is entrusted the sacred duty of eliminating the substances that infect the air. And the force of obvious analogy teaches us not to expect all the qualities which please the general taste in those whose instincts lead them to attack the moral nuisances which poison the atmosphere of society. But whether they please us in all their aspects or not, is not the question. Like them or not, they must and will perform their office, and we cannot stop them. They may be unwise, violent, abusive, extravagant, impracticable, but they are alive, at any rate, and it is their business to remove abuses as soon as they are dead, and often to help them to die. To quarrel with them

because they are beetles, and not butterflies, is natural, but far from profitable. They grow none the less vigorously for being trodden upon, like those tough weeds that love to nestle between the stones of courtyard pavements. If you strike at one of their heads with the bludgeon of the law, or of violence, it flies open like the seedcapsule of a snap-weed, and fills the whole region with seminal thoughts which will spring up in a crop just like the original martyr. They chased one of these enthusiasts, who attacked slavery, from St. Louis, and shot him at Alton in 1837; and on the 23d of June just passed, the Governor of Missouri, chairman of the Committee on Emancipation, introduced to the Convention an Ordinance for the final extinction of Slavery! They hunted another through the streets of a great Northern city in 1835; and within a few weeks a regiment of colored soldiers, many of them bearing the marks of the slave-driver's whip on their backs, marched out before a vast multitude tremulous with newly-stirred sympathies, through the streets of the same city, to fight our battles in the name of God and Liberty!

The same persons who abuse the reformers, and lay all our troubles at their door, are apt to be severe also on what they contemptuously emphasize as "sentiments" considered as motives of action. It is charitable to believe that they do not seriously contemplate or truly understand the meaning of the words they use, but rather play with them, as certain so-called "learned" quadrupeds play with the printed characters set before them. In all questions involving duty, we act from sentiments. Religion springs from them, the family order rests upon them, and in every community each act involving a relation between any two of its members implies the recognition or the denial of a sentiment. It is true that men often forget them or act against their bidding in the keen competition of business and politics. But God has not left the hard intellect of man to work out its devices without the constant presence of beings with gentler and purer instincts. The breast of woman is the ever-rocking cradle of the pure and holy sentiments which will sooner or later steal their way into the mind of her sterner companion; which will by and by emerge in the thoughts of the world's teachers, and at last thunder forth in the edicts of its law-givers and masters. Woman herself borrows half her tenderness from the sweet influences of maternity; and childhood, that weeps at the story of suffering, that shudders at the picture of wrong, brings down its inspiration "from God, who is our home." To quarrel, then, with the class of minds that instinctively attack abuses, is not only profitless but senseless; to sneer at the sentiments which are the springs of all just and virtuous actions, is merely a display of unthinking levity, or of want of the natural sensibilities.

With the hereditary character of the Southern people moving in one direction, and the awakened conscience of the North stirring in the other, the open conflict of opinion was inevitable, and equally inevitable its appearance in the field of national politics. For what is meant by self-government is, that a man shall make his convictions of what is right and expedient regulate the community so far as his fractional share of the government extends. If one has come to the conclusion, be it right or wrong, that any particular institution or statute is a violation of the sovereign law of God, it is to be expected that he will choose to be represented by those who share his belief, and who will in their wider sphere do all they legitimately can to get rid of the wrong in which they find themselves and their constituents involved. To prevent opinion from organizing itself under political forms may be very desirable, but it is not according to the theory or practice of self-government. And if at last organized opinions become arrayed in hostile shape against each other, we shall find that a just war is only the last inevitable link in a chain of closely connected impulses of which the original source is in Him who gave to tender and humble and uncorrupted souls the sense of right and wrong, which, after passing through various forms, has found its final expression in the use of material force. Behind the bayonet is the law-giver's statute, behind the statute the thinker's argument, behind the argument is the tender conscientiousness of woman, woman, the wife, the mother,—who looks upon the face of God himself reflected in the unsullied soul of infancy. "Out of the mouths of babes and sucklings hast thou ordained strength, because of thine enemies."

The simplest course for the malcontent is to find fault with the order of Nature and the Being who established it. Unless the law of moral progress were changed, or the Governor of the Universe were dethroned, it would be impossible to prevent a great uprising of the human conscience against a system, the legislation relating to which, in the words of so calm an observer as De Tocqueville, the Montesquieu of our laws, presents "such unparalleled atrocities as to show that the laws of humanity have been totally perverted." Until the infinite selfishness of the powers that hate and fear the principles of free government swallowed up their convenient virtues, that system was hissed at by all the old-world civilization. While in one section of our land the attempt has been going on to lift it out of the category of tolerated wrongs into the sphere of the world's beneficent agencies, it was to be expected that the protest of Northern manhood and womanhood would grow louder and stronger until the conflict of principles led to the conflict of forces. The moral uprising of the North came with the logical precision of destiny; the rage of the "petty tyrants" was inevitable; the plot to erect a slave empire followed with fated certainty; and the only question left for us of the North was, whether we should suffer the cause of the Nation to go by default, or maintain its existence by the argument of cannon and musket, of bayonet and sabre.

The war in which we are engaged is for no meanly ambitious or unworthy purpose. It was primarily, and is to this moment, for the preservation of our national existence. The first direct movement towards it was a civil request on the part of certain Southern persons, that the Nation would commit suicide, without making any unnecessary trouble about it. It was answered, with sentiments of the highest consideration, that there were constitutional and other objections to the Nation's laying violent hands upon itself. It was then requested, in a somewhat peremptory tone, that the Nation would be so obliging as to abstain from food until the natural consequences of that proceeding should manifest themselves. All this was done as between a single State and an isolated fortress; but it was not South Carolina and Fort Sumter that were talking; it was a vast conspiracy uttering its menace to a mighty nation; the whole menagerie of treason was pacing its cages, ready to spring as soon as the doors were opened; and all that the tigers of rebellion wanted to kindle their wild natures to frenzy, was the sight of flowing blood.

As if to show how coldly and calmly all this had been calculated beforehand by the conspirators, to make sure that no absence of malice aforesaid should degrade the grand malignity of settled purpose into the trivial effervescence of transient passion, the torch which was literally to launch the first missile, figuratively, to "fire the southern heart" and light the flame of civil war, was given into the trembling hand of an old white-

headed man, the wretched incendiary whom history will handcuff in eternal infamy with the temple-burner of ancient Ephesus. The first gun that spat its iron insult at Fort Sumter, smote every loyal American full in the face. As when the foul witch used to torture her miniature image, the person it represented suffered all that she inflicted on his waxen counterpart, so every buffet that fell on the smoking fortress was felt by the sovereign nation of which that was the representative. Robbery could go no farther, for every loyal man of the North was despoiled in that single act as much as if a footpad had laid hands upon him to take from him his father's staff and his mother's Bible. Insult could go no farther, for over those battered walls waved the precious symbol of all we most value in the past and most hope for in the future,—the banner under which we became a nation, and which, next to the cross of the Redeemer, is the dearest object of love and honor to all who toil or march or sail beneath its waving folds of glory.

Let us pause for a moment to consider what might have been the course of events if under the influence of fear, or of what some would name humanity, or of conscientious scruples to enter upon what a few please themselves and their rebel friends by calling a "wicked war"; if under any or all these influences we had taken the insult and the violence of South Carolina without accepting it as the first blow of a mortal combat, in which we must either die or give the last and finishing stroke.

By the same title which South Carolina asserted to Fort Sumter, Florida would have challenged as her own the Gibraltar of the Gulf, and Virginia the Ehrenbreitstein of the Chesapeake. Half our navy would have anchored under the guns of these suddenly alienated fortresses, with the flag of the rebellion flying at their peaks. "Old Ironsides" herself would have perhaps sailed out of Annapolis harbor to have a wooden Jefferson Davis shaped for her figure-head at Norfolk,—for Andrew Jackson was a hater of secession, and his was no fitting effigy for the battle-ship of the red-handed conspiracy. With all the great fortresses, with half the ships and warlike material, in addition to all that was already stolen, in the traitors' hands, what chance would the loyal men in the Border States have stood against the rush of the desperate fanatics of the now triumphant faction? Where would Maryland, Kentucky, Missouri, Tennessee,—saved, or looking to be saved, even as it is, as by fire,—have been in the day of trial? Into whose hands would the Capital, the archives, the glory, the name, the very life of the nation as a nation, have fallen, endangered as all of them were, in spite of the volcanic outburst of the startled North which answered the roar of the first gun at Sumter? Worse than all, are we permitted to doubt that in the very bosom of the North itself there was a serpent, coiled but not sleeping, which only listened for the first word that made it safe to strike, to bury its fangs in the heart of Freedom, and blend its golden scales in close embrace with the deadly reptile of the cotton-fields. Who would not wish that he were wrong in such a suspicion? yet who can forget the mysterious warnings that the allies of the rebels were to be found far north of the fatal boundary line; and that it was in their own streets, against their own brothers, that the champions of liberty were to defend her sacred heritage?

Not to have fought, then, after the supreme indignity and outrage we had suffered, would have been to provoke every further wrong, and to furnish the means for its commission. It would have been to placard ourselves on the walls of the shattered fort, as the spiritless race the proud labor-thieves called us. It would have been to die as a nation of freemen, and to have given all we had left of our rights into the hands of alien tyrants in league with home-bred traitors.

Not to have fought would have been to be false to liberty everywhere, and to humanity. You have only to see who are our friends and who are our enemies in this struggle, to decide for what principles we are combating. We know too well that the British aristocracy is not with us. We know what the West End of London wishes may be result of this controversy. The two halves of this Union are the two blades of the shears, threatening as those of Atropos herself, which will sooner or later cut into shreds the old charters of tyranny. How they would exult if they could but break the rivet that makes of the two blades one resistless weapon! The man who of all living Americans had the best opportunity of knowing how the fact stood, wrote these words in March, 1862: "That Great Britain did, in the most terrible moment of our domestic trial in struggling with a monstrous social evil she had earnestly professed to abhor, coldly and at once assume our inability to master it, and then become the only foreign nation steadily contributing in every indirect way possible to verify its pre-judgment, will probably be the verdict made up against her by posterity, on a calm comparison of the evidence."

So speaks the wise, tranquil statesman who represents the nation at the Court of St. James, in the midst of embarrassments perhaps not less than those which vexed his illustrious grandfather, when he occupied the same position as the Envoy of the hated, newborn Republic.

"It cannot be denied,"—says another observer, placed on one of our national watch-towers in a foreign capital,—"it cannot be denied that the tendency of European public opinion, as delivered from high places, is more and more unfriendly to our cause"; "but the people," he adds, "everywhere sympathize with us, for they know that our cause is that of free institutions,—that our struggle is that of the people against an oligarchy." These are the words of the Minister to Austria, whose generous sympathies with popular liberty no homage paid to his genius by the class whose admiring welcome is most seductive to scholars has ever spoiled; our fellow-citizen, the historian of a great Republic which infused a portion of its life into our own,—John Lothrop Motley.

It is a bitter commentary on the effects of European, and especially of British institutions, that such men should have to speak in such terms of the manner in which our struggle has been regarded. We had, no doubt, very generally reckoned on the sympathy of England, at least, in a strife which, whatever pretexts were alleged as its cause, arrayed upon one side the supporters of an institution she was supposed to hate in earnest, and on the other its assailants. We had forgotten what her own poet, one of the truest and purest of her children, had said of his countrymen, in words which might well have been spoken by the British Premier to the American Ambassador asking for some evidence of kind feeling on the part of his government:

*"Alas I expect it not. We found no bait
To tempt us in thy country. Doing good,
Disinterested good, is not our trade."*

We know full well by this time what truth there is in these honest lines. We have found out, too, who our

European enemies are, and why they are our enemies. Three bending statues bear up that gilded seat, which, in spite of the time-hallowed usurpations and consecrated wrongs so long associated with its history, is still venerated as the throne. One of these supports is the pensioned church; the second is the purchased army; the third is the long-suffering people. Whenever the third caryatid comes to life and walks from beneath its burden, the capitals of Europe will be filled with the broken furniture of palaces. No wonder that our ministers find the privileged orders willing to see the ominous republic split into two antagonistic forces, each paralyzing the other, and standing in their mighty impotence a spectacle to courts and kings; to be pointed at as helots who drank themselves blind and giddy out of that broken chalice which held the poisonous draught of liberty!

We know our enemies, and they are the enemies of popular rights. We know our friends, and they are the foremost champions of political and social progress. The eloquent voice and the busy pen of John Bright have both been ours, heartily, nobly, from the first; the man of the people has been true to the cause of the people. That deep and generous thinker, who, more than any of her philosophical writers, represents the higher thought of England, John Stuart Mill, has spoken for us in tones to which none but her sordid hucksters and her selfish land-graspers can refuse to listen. Count Gasparin and Laboulaye have sent us back the echo from liberal France; France, the country of ideas, whose earlier inspirations embodied themselves for us in the person of the youthful Lafayette. Italy,—would you know on which side the rights of the people and the hopes of the future are to be found in this momentous conflict, what surer test, what ampler demonstration can you ask—than the eager sympathy of the Italian patriot whose name is the hope of the toiling many, and the dread of their oppressors, wherever it is spoken, the heroic Garibaldi?

But even when it is granted that the war was inevitable; when it is granted that it is for no base end, but first for the life of the nation, and more and more, as the quarrel deepens, for the welfare of mankind, for knowledge as against enforced ignorance, for justice as against oppression, for that kingdom of God on earth which neither the unrighteous man nor the extortioner can hope to inherit, it may still be that the strife is hopeless, and must therefore be abandoned. Is it too much to say that whether the war is hopeless or not for the North depends chiefly on the answer to the question, whether the North has virtue and manhood enough to persevere in the contest so long as its resources hold out? But how much virtue and manhood it has can never be told until they are tried, and those who are first to doubt the prevailing existence of these qualities are not commonly themselves patterns of either. We have a right to trust that this people is virtuous and brave enough not to give up a just and necessary contest before its end is attained, or shown to be unattainable for want of material agencies. What was the end to be attained by accepting the gage of battle? It was to get the better of our assailants, and, having done so, to take exactly those steps which we should then consider necessary to our present and future safety. The more obstinate the resistance, the more completely must it be subdued. It may not even have been desirable, as Mr. Mill suggested long since, that the victory over the rebellion should have been easily and speedily won, and so have failed to develop the true meaning of the conflict, to bring out the full strength of the revolted section, and to exhaust the means which would have served it for a still more desperate future effort. We cannot complain that our task has proved too easy. We give our Southern army,—for we must remember that it is our army, after all, only in a state of mutiny,—we give our Southern army credit for excellent spirit and perseverance in the face of many disadvantages. But we have a few plain facts which show the probable course of events; the gradual but sure operation of the blockade; the steady pushing back of the boundary of rebellion, in spite of resistance at many points, or even of such aggressive inroads as that which our armies are now meeting with their long lines of bayonets,—may God grant them victory!—the progress of our arms down the Mississippi; the relative value of gold and currency at Richmond and Washington. If the index-hands of force and credit continue to move in the ratio of the past two years, where will the Confederacy be in twice or thrice that time?

Either all our statements of the relative numbers, power, and wealth of the two sections of the country signify nothing, or the resources of our opponents in men and means must be much nearer exhaustion than our own. The running sand of the hour-glass gives no warning, but runs as freely as ever when its last grains are about to fall. The merchant wears as bold a face the day before he is proclaimed a bankrupt, as he wore at the height of his fortunes. If Colonel Grierson found the Confederacy "a mere shell," so far as his equestrian excursion carried him, how can we say how soon the shell will collapse? It seems impossible that our own dissensions can produce anything more than local disturbances, like the Morristown revolt, which Washington put down at once by the aid of his faithful Massachusetts soldiers. But in a rebellious state dissension is ruin, and the violence of an explosion in a strict ratio to the pressure on every inch of the containing surface. Now we know the tremendous force which has compelled the "unanimity" of the Southern people. There are men in the ranks of the Southern army, if we can trust the evidence which reaches us, who have been recruited with packs of blood-hounds, and drilled, as it were, with halters around their necks. We know what is the bitterness of those who have escaped this bloody harvest of the remorseless conspirators; and from that we can judge of the elements of destruction incorporated with many of the seemingly solid portions of the fabric of the rebellion. The facts are necessarily few, but we can reason from the laws of human nature as to what must be the feelings of the people of the South to their Northern neighbors. It is impossible that the love of the life which they have had in common, their glorious recollections, their blended histories, their sympathies as Americans, their mingled blood, their birthright as born under the same flag and protected by it the world over, their worship of the same God, under the same outward form, at least, and in the folds of the same ecclesiastical organizations, should all be forgotten, and leave nothing but hatred and eternal alienation. Men do not change in this way, and we may be quite sure that the pretended unanimity of the South will some day or other prove to have been a part of the machinery of deception which the plotters have managed with such consummate skill. It is hardly to be doubted that in every part of the South, as in New Orleans, in Charleston, in Richmond, there are multitudes who wait for the day of deliverance, and for whom the coming of "our good friends, the enemies," as Beranger has it, will be like the advent of the angels to the prison-cells of Paul and Silas. But there is no need of depending on the aid of our white Southern friends, be they many or be they few; there is material power enough in the North, if there be the will to use it, to overrun and by degrees to recolonize the South, and it is far from impossible that some such process may be a part of the mechanism of its new birth, spreading from various centres of organization, on the plan

which Nature follows when she would fill a half-finished tissue with blood-vessels or change a temporary cartilage into bone.

Suppose, however, that the prospects of the war were, we need not say absolutely hopeless,—because that is the unfounded hypothesis of those whose wish is father to their thought,—but full of discouragement. Can we make a safe and honorable peace as the quarrel now stands? As honor comes before safety, let us look at that first. We have undertaken to resent a supreme insult, and have had to bear new insults and aggressions, even to the direct menace of our national capital. The blood which our best and bravest have shed will never sink into the ground until our wrongs are righted, or the power to right them is shown to be insufficient. If we stop now, all the loss of life has been butchery; if we carry out the intention with which we first resented the outrage, the earth drinks up the blood of our martyrs, and the rose of honor blooms forever where it was shed. To accept less than indemnity for the past, so far as the wretched kingdom of the conspirators can afford it, and security for the future, would discredit us in our own eyes and in the eyes of those who hate and long to be able to despise us. But to reward the insults and the robberies we have suffered, by the surrender of our fortresses along the coast, in the national gulf, and on the banks of the national river,—and this and much more would surely be demanded of us,—would place the United Fraction of America on a level with the Peruvian guano-islands, whose ignoble but coveted soil is open to be plundered by all comers!

If we could make a peace without dishonor, could we make one that would be safe and lasting? We could have an armistice, no doubt, long enough for the flesh of our wounded men to heal and their broken bones to knit together. But could we expect a solid, substantial, enduring peace, in which the grass would have time to grow in the war-paths, and the bruised arms to rust, as the old G. R. cannon rusted in our State arsenal, sleeping with their tompions in their mouths, like so many sucking lambs? It is not the question whether the same set of soldiers would be again summoned to the field. Let us take it for granted that we have seen enough of the miseries of warfare to last us for a while, and keep us contented with militia musters and sham-fights. The question is whether we could leave our children and our children's children with any secure trust that they would not have to go through the very trials we are enduring, probably on a more extended scale and in a more aggravated form.

It may be well to look at the prospects before us, if a peace is established on the basis of Southern independence, the only peace possible, unless we choose to add ourselves to the four millions who already call the Southern whites their masters. We know what the prevailing—we do not mean universal—spirit and temper of those people have been for generations, and what they are like to be after a long and bitter warfare. We know what their tone is to the people of the North; if we do not, De Bow and Governor Hammond are schoolmasters who will teach us to our heart's content. We see how easily their social organization adapts itself to a state of warfare. They breed a superior order of men for leaders, an ignorant commonalty ready to follow them as the vassals of feudal times followed their lords; and a race of bondsmen, who, unless this war changes them from chattels to human beings, will continue to add vastly to their military strength in raising their food, in building their fortifications, in all the mechanical work of war, in fact, except, it may be, the handling of weapons. The institution proclaimed as the corner-stone of their government does violence not merely to the precepts of religion, but to many of the best human instincts, yet their fanaticism for it is as sincere as any tribe of the desert ever manifested for the faith of the Prophet of Allah. They call themselves by the same name as the Christians of the North, yet there is as much difference between their Christianity and that of Wesley or of Channing, as between creeds that in past times have vowed mutual extermination. Still we must not call them barbarians because they cherish an institution hostile to civilization. Their highest culture stands out all the more brilliantly from the dark background of ignorance against which it is seen; but it would be injustice to deny that they have always shone in political science, or that their military capacity makes them most formidable antagonists, and that, however inferior they may be to their Northern fellow-countrymen in most branches of literature and science, the social elegances and personal graces lend their outward show to the best circles among their dominant class.

Whom have we then for our neighbors, in case of separation,—our neighbors along a splintered line of fracture extending for thousands of miles,—but the Saracens of the Nineteenth Century; a fierce, intolerant, fanatical people, the males of which will be a perpetual standing army; hating us worse than the Southern Hamilcar taught his swarthy boy to hate the Romans; a people whose existence as a hostile nation on our frontier is incompatible with our peaceful development? Their wealth, the proceeds of enforced labor, multiplied by the breaking up of new cottonfields, and in due time by the reopening of the slave-trade, will go to purchase arms, to construct fortresses, to fit out navies. The old Saracens, fanatics for a religion which professed to grow by conquest, were a nation of predatory and migrating warriors. The Southern people, fanatics for a system essentially aggressive, conquering, wasting, which cannot remain stationary, but must grow by alternate appropriations of labor and of land, will come to resemble their earlier prototypes. Already, even, the insolence of their language to the people of the North is a close imitation of the style which those proud and arrogant Asiatics affected toward all the nations of Europe. What the “Christian dogs” were to the followers of Mahomet, the “accursed Yankees,” the “Northern mud-sills” are to the followers of the Southern Moloch. The accomplishments which we find in their choicer circles were prefigured in the court of the chivalric Saladin, and the long train of Painim knights who rode forth to conquest under the Crescent. In all branches of culture, their heathen predecessors went far beyond them. The schools of mediaeval learning were filled with Arabian teachers. The heavens declare the glory of the Oriental astronomers, as Algorab and Aldebaran repeat their Arabic names to the students of the starry firmament. The sumptuous edifice erected by the Art of the nineteenth century, to hold the treasures of its Industry, could show nothing fairer than the court which copies the Moorish palace that crowns the summit of Granada. Yet this was the power which Charles the Hammer, striking for Christianity and civilization, had to break like a potter's vessel; these were the people whom Spain had to utterly extirpate from the land where they had ruled for centuries.

Prepare, then, if you unseal the vase which holds this dangerous Afrit of Southern nationality, for a power on your borders that will be to you what the Saracens were to Europe before the son of Pepin shattered their armies, and flung the shards and shivers of their broken strength upon the refuse heap of extinguished barbarisms. Prepare for the possible fate of Christian Spain; for a slave-market in Philadelphia; for the Alhambra of a Southern caliph on the grounds consecrated by the domestic virtues of a long line of

Presidents and their exemplary families. Remember the ages of border warfare between England and Scotland, closed at last by the union of the two kingdoms. Recollect the hunting of the deer on the Cheviot hills, and all that it led to; then think of the game which the dogs will follow open-mouthed across our Southern border, and all that is like to follow which the child may rue that is unborn; think of these possibilities, or probabilities, if you will, and say whether you are ready to make a peace which will give you such a neighbor; which may betray your civilization as that of half the Peninsula was given up to the Moors; which may leave your fair border provinces to be crushed under the heel of a tyrant, as Holland was left to be trodden down by the Duke of Alva!

No! no! fellow-citizens! We must fight in this quarrel until one side or the other is exhausted. Rather than suffer all that we have poured out of our blood, all that we have lavished of our substance, to have been expended in vain, and to bequeath an unsettled question, an unfinished conflict, an unavenged insult, an unrighted wrong, a stained escutcheon, a tarnished shield, a dishonored flag, an unheroic memory to the descendants of those who have always claimed that their fathers were heroes; rather than do all this, it were hardly an American exaggeration to say, better that the last man and the last dollar should be followed by the last woman and the last dime, the last child and the last copper!

There are those who profess to fear that our government is becoming a mere irresponsible tyranny. If there are any who really believe that our present Chief Magistrate means to found a dynasty for himself and family, that a coup d'etat is in preparation by which he is to become ABRAHAM, DEI GRATIA REX,—they cannot have duly pondered his letter of June 12th, in which he unbosoms himself with the simplicity of a rustic lover called upon by an anxious parent to explain his intentions. The force of his argument is not at all injured by the homeliness of his illustrations. The American people are not much afraid that their liberties will be usurped. An army of legislators is not very likely to throw away its political privileges, and the idea of a despotism resting on an open ballot-box, is like that of Bunker Hill Monument built on the waves of Boston Harbor. We know pretty well how much of sincerity there is in the fears so clamorously expressed, and how far they are found in company with uncompromising hostility to the armed enemies of the nation. We have learned to put a true value on the services of the watch-dog who bays the moon, but does not bite the thief!

The men who are so busy holy-stoning the quarterdeck, while all hands are wanted to keep the ship afloat, can no doubt show spots upon it that would be very unsightly in fair weather. No thoroughly loyal man, however, need suffer from any arbitrary exercise of power, such as emergencies always give rise to. If any half-loyal man forgets his code of half-decencies and half-duties so far as to become obnoxious to the peremptory justice which takes the place of slower forms in all centres of conflagration, there is no sympathy for him among the soldiers who are risking their lives for us; perhaps there is even more satisfaction than when an avowed traitor is caught and punished. For of all men who are loathed by generous natures, such as fill the ranks of the armies of the Union, none are so thoroughly loathed as the men who contrive to keep just within the limits of the law, while their whole conduct provokes others to break it; whose patriotism consists in stopping an inch short of treason, and whose political morality has for its safeguard a just respect for the jailer and the hangman! The simple preventive against all possible injustice a citizen is like to suffer at the hands of a government which in its need and haste must of course commit many errors, is to take care to do nothing that will directly or indirectly help the enemy, or hinder the government in carrying on the war. When the clamor against usurpation and tyranny comes from citizens who can claim this negative merit, it may be listened to. When it comes from those who have done what they could to serve their country, it will receive the attention it deserves. Doubtless there may prove to be wrongs which demand righting, but the pretence of any plan for changing the essential principle of our self-governing system is a figment which its contrivers laugh over among themselves. Do the citizens of Harrisburg or of Philadelphia quarrel to-day about the strict legality of an executive act meant in good faith for their protection against the invader? We are all citizens of Harrisburg, all citizens of Philadelphia, in this hour of their peril, and with the enemy at work in our own harbors, we begin to understand the difference between a good and bad citizen; the man that helps and the man that hinders; the man who, while the pirate is in sight, complains that our anchor is dragging in his mud, and the man who violates the proprieties, like our brave Portland brothers, when they jumped on board the first steamer they could reach, cut her cable, and bore down on the corsair, with a habeas corpus act that lodged twenty buccaneers in Fort Preble before sunset!

We cannot, then, we cannot be circling inward to be swallowed up in the whirlpool of national destruction. If our borders are invaded, it is only as the spur that is driven into the courser's flank to rouse his slumbering mettle. If our property is taxed, it is only to teach us that liberty is worth paying for as well as fighting for. We are pouring out the most generous blood of our youth and manhood; alas! this is always the price that must be paid for the redemption of a people. What have we to complain of, whose granaries are choking with plenty, whose streets are gay with shining robes and glittering equipages, whose industry is abundant enough to reap all its overflowing harvest, yet sure of employment and of its just reward, the soil of whose mighty valleys is an inexhaustible mine of fertility, whose mountains cover up such stores of heat and power, imprisoned in their coal measures, as would warm all the inhabitants and work all the machinery of our planet for unnumbered ages, whose rocks pour out rivers of oil, whose streams run yellow over beds of golden sand,—what have we to complain of?

Have we degenerated from our English fathers, so that we cannot do and bear for our national salvation what they have done and borne over and over again for their form of government? Could England, in her wars with Napoleon, bear an income-tax of ten per cent., and must we faint under the burden of an income-tax of three per cent.? Was she content to negotiate a loan at fifty-three for the hundred, and that paid in depreciated paper, and can we talk about financial ruin with our national stocks ranging from one to eight or nine above par, and the "five-twenty" war loan eagerly taken by our own people to the amount of nearly two hundred millions, without any check to the flow of the current pressing inwards against the doors of the Treasury? Except in those portions of the country which are the immediate seat of war, or liable to be made so, and which, having the greatest interest not to become the border states of hostile nations, can best afford to suffer now, the state of prosperity and comfort is such as to astonish those who visit us from other countries. What are war taxes to a nation which, as we are assured on good authority, has more men worth a million now than it had worth ten thousand dollars at the close of the Revolution,—whose whole property is a

hundred times, and whose commerce, inland and foreign, is five hundred times, what it was then? But we need not study Mr. Still's pamphlet and "Thompson's Bank-Note Reporter" to show us what we know well enough, that, so far from having occasion to tremble in fear of our impending ruin, we must rather blush for our material prosperity. For the multitudes who are unfortunate enough to be taxed for a million or more, of course we must feel deeply, at the same time suggesting that the more largely they report their incomes to the tax-gatherer, the more consolation they will find in the feeling that they have served their country. But,—let us say it plainly,—it will not hurt our people to be taught that there are other things to be cared for besides money-making and money-spending; that the time has come when manhood must assert itself by brave deeds and noble thoughts; when womanhood must assume its most sacred office, "to warn, to comfort," and, if need be, "to command," those whose services their country calls for. This Northern section of the land has become a great variety shop, of which the Atlantic cities are the long-extended counter. We have grown rich for what? To put gilt bands on coachmen's hats? To sweep the foul sidewalks with the heaviest silks which the toiling artisans of France can send us? To look through plate-glass windows, and pity the brown soldiers,—or sneer at the black ones? to reduce the speed of trotting horses a second or two below its old minimum? to color meerschaums? to flaunt in laces, and sparkle in diamonds? to dredge our maidens' hair with gold-dust? to float through life, the passive shuttlecocks of fashion, from the avenues to the beaches, and back again from the beaches to the avenues? Was it for this that the broad domain of the Western hemisphere was kept so long unvisited by civilization?—for this, that Time, the father of empires, unbound the virgin zone of this youngest of his daughters, and gave her, beautiful in the long veil of her forests, to the rude embrace of the adventurous Colonist? All this is what we see around us, now, now while we are actually fighting this great battle, and supporting this great load of indebtedness. Wait till the diamonds go back to the Jews of Amsterdam; till the plate-glass window bears the fatal announcement, For Sale or to Let; till the voice of our Miriam is obeyed, as she sings,

"Weave no more silks, ye Lyons looms!"

till the gold-dust is combed from the golden locks, and hoarded to buy bread; till the fast-driving youth smokes his clay-pipe on the platform of the horse-cars; till the music-grinders cease because none will pay them; till there are no peaches in the windows at twenty-four dollars a dozen, and no heaps of bananas and pine-apples selling at the street-corners; till the ten-flounced dress has but three flounces, and it is felony to drink champagne; wait till these changes show themselves, the signs of deeper wants, the preludes of exhaustion and bankruptcy; then let us talk of the Maelstrom;—but till then, let us not be cowards with our purses, while brave men are emptying their hearts upon the earth for us; let us not whine over our imaginary ruin, while the reversed current of circling events is carrying us farther and farther, every hour, out of the influence of the great failing which was born of our wealth, and of the deadly sin which was our fatal inheritance!

Let us take a brief general glance at the wide field of discussion we are just leaving.

On Friday, the twelfth day of the month of April, in the year of our Lord eighteen hundred and sixty-one, at half-past four of the clock in the morning, a cannon was aimed and fired by the authority of South Carolina at the wall of a fortress belonging to the United States. Its ball carried with it the hatreds, the rages of thirty years, shaped and cooled in the mould of malignant deliberation. Its wad was our national charter of our national existence. Its muzzle was pointed at the stone which bore the symbol of our national sovereignty. As the echoes of its thunder died away, the telegraph clicked one word through every office of the land. That word was WAR!

War is a child that devours its nurses one after another, until it is claimed by its true parents. This war has eaten its way backward through all the technicalities of lawyers learned in the infinitesimals of ordinances and statutes; through all the casuistries of divines, experts in the differential calculus of conscience and duty; until it stands revealed to all men as the natural and inevitable conflict of two incompatible forms of civilization, one or the other of which must dominate the central zone of the continent, and eventually claim the hemisphere for its development.

We have reached the region of those broad principles and large axioms which the wise Romans, the world's lawgivers, always recognized as above all special enactments. We have come to that solid substratum acknowledged by Grotius in his great Treatise: "Necessity itself which reduces things to the mere right of Nature." The old rules which were enough for our guidance in quiet times, have become as meaningless "as moonlight on the dial of the day." We have followed precedents as long as they could guide us; now we must make precedents for the ages which are to succeed us.

If we are frightened from our object by the money we have spent, the current prices of United States stocks show that we value our nationality at only a small fraction of our wealth. If we feel that we are paying too dearly for it in the blood of our people, let us recall those grand words of Samuel Adams:

"I should advise persisting in our struggle for liberty, though it were revealed from heaven that nine hundred and ninety-nine were to perish, and only one of a thousand were to survive and retain his liberty!"

What we want now is a strong purpose; the purpose of Luther, when he said, in repeating his Pater Noster, fiat voluntas MEA,—let my will be done; though he considerably added, quia Tua,—because my will is Thine. We want the virile energy of determination which made the oath of Andrew Jackson sound so like the devotion of an ardent saint that the recording angel might have entered it unquestioned among the prayers of the faithful.

War is a grim business. Two years ago our women's fingers were busy making "Havelocks." It seemed to us then as if the Havelock made half the soldier; and now we smile to think of those days of inexperience and illusion. We know now what War means, and we cannot look its dull, dead ghastliness in the face unless we feel that there is some great and noble principle behind it. It makes little difference what we thought we were fighting for at first; we know what we are fighting for now, and what we are fighting against.

We are fighting for our existence. We say to those who would take back their several contributions to that undivided unity which we call the Nation; the bronze is cast; the statue is on its pedestal; you cannot reclaim

the brass you flung into the crucible! There are rights, possessions, privileges, policies, relations, duties, acquired, retained, called into existence in virtue of the principle of absolute solidarity,—belonging to the United States as an organic whole, which cannot be divided, which none of its constituent parties can claim as its own, which perish out of its living frame when the wild forces of rebellion tear it limb from limb, and which it must defend, or confess self-government itself a failure.

We are fighting for that Constitution upon which our national existence reposes, now subjected by those who fired the scroll on which it was written from the cannon at Fort Sumter, to all those chances which the necessities of war entail upon every human arrangement, but still the venerable charter of our wide Republic.

We cannot fight for these objects without attacking the one mother cause of all the progeny of lesser antagonisms. Whether we know it or not, whether we mean it or not, we cannot help fighting against the system that has proved the source of all those miseries which the author of the Declaration of Independence trembled to anticipate. And this ought to make us willing to do and to suffer cheerfully. There were Holy Wars of old, in which it was glory enough to die, wars in which the one aim was to rescue the sepulchre of Christ from the hands of infidels. The sepulchre of Christ is not in Palestine! He rose from that burial-place more than eighteen hundred years ago. He is crucified wherever his brothers are slain without cause; he lies buried wherever man, made in his Maker's image, is entombed in ignorance lest he should learn the rights which his Divine Master gave him! This is our Holy War, and we must fight it against that great General who will bring to it all the powers with which he fought against the Almighty before he was cast down from heaven. He has retained many a cunning advocate to recruit for him; he has bribed many a smooth-tongued preacher to be his chaplain; he has engaged the sordid by their avarice, the timid by their fears, the profligate by their love of adventure, and thousands of nobler natures by motives which we can all understand; whose delusion we pity as we ought always to pity the error of those who know not what they do. Against him or for him we are all called upon to declare ourselves. There is no neutrality for any single true-born American. If any seek such a position, the stony finger of Dante's awful muse points them to their place in the antechamber of the Halls of Despair,—

*"—With that ill band
Of angels mixed, who nor rebellious proved,
Nor yet were true to God, but for themselves
Were only."*

*"—Fame of them the world hath none
Nor suffers; mercy and justice scorn them both.
Speak not of them, but look, and pass them by."*

We must use all the means which God has put into our hands to serve him against the enemies of civilization. We must make and keep the great river free, whatever it costs us; it is strapping up the forefoot of the wild, untamable rebellion. We must not be too nice in the choice of our agents. *Non eget Mauri jaculis*,—no African bayonets wanted,—was well enough while we did not yet know the might of that desperate giant we had to deal with; but *Tros, Tyriusve*,—white or black,—is the safer motto now; for a good soldier, like a good horse, cannot be of a bad color. The iron-skins, as well as the iron-clads, have already done us noble service, and many a mother will clasp the returning boy, many a wife will welcome back the war-worn husband, whose smile would never again have gladdened his home, but that, cold in the shallow trench of the battle-field, lies the half-buried form of the unchained bondsman whose dusky bosom sheathes the bullet which would else have claimed that darling as his country's sacrifice.

We shall have success if we truly will success, not otherwise. It may be long in coming,—Heaven only knows through what trials and humblings we may have to pass before the full strength of the nation is duly arrayed and led to victory. We must be patient, as our fathers were patient; even in our worst calamities, we must remember that defeat itself may be a gain where it costs our enemy more in relation to his strength than it costs ourselves. But if, in the inscrutable providence of the Almighty, this generation is disappointed in its lofty aspirations for the race, if we have not virtue enough to ennoble our whole people, and make it a nation of sovereigns, we shall at least hold in undying honor those who vindicated the insulted majesty of the Republic, and struck at her assailants so long as a drum-beat summoned them to the field of duty.

Citizens of Boston, sons and daughters of New England, men and women of the North, brothers and sisters in the bond of the American Union, you have among you the scarred and wasted soldiers who have shed their blood for your temporal salvation. They bore your nation's emblems bravely through the fire and smoke of the battle-field; nay, their own bodies are starred with bullet-wounds and striped with sabre-cuts, as if to mark them as belonging to their country until their dust becomes a portion of the soil which they defended. In every Northern graveyard slumber the victims of this destroying struggle. Many whom you remember playing as children amidst the clover-blossoms of our Northern fields, sleep under nameless mounds with strange Southern wild-flowers blooming over them. By those wounds of living heroes, by those graves of fallen martyrs, by the hopes of your children, and the claims of your children's children yet unborn, in the name of outraged honor, in the interest of violated sovereignty, for the life of an imperilled nation, for the sake of men everywhere and of our common humanity, for the glory of God and the advancement of his kingdom on earth, your country calls upon you to stand by her through good report and through evil report, in triumph and in defeat, until she emerges from the great war of Western civilization, Queen of the broad continent, Arbitress in the councils of earth's emancipated peoples; until the flag that fell from the wall of Fort Sumter floats again inviolate, supreme, over all her ancient inheritance, every fortress, every capital, every ship, and this warring land is once more a United Nation!

CINDERS FROM THE ASHES.

The personal revelations contained in my report of certain breakfast-table conversations were so charitably listened to and so good-naturedly interpreted, that I may be in danger of becoming over-communicative. Still, I should never have ventured to tell the trivial experiences here thrown together, were it not that my brief story is illuminated here and there by a glimpse of some shining figure that trod the same path with me for a time, or crossed it, leaving a momentary or lasting brightness in its track. I remember that, in furnishing a chamber some years ago, I was struck with its dull aspect as I looked round on the black-walnut chairs and bedstead and bureau. "Make me a large and handsomely wrought gilded handle to the key of that dark chest of drawers," I said to the furnisher. It was done, and that one luminous point redeemed the sombre apartment as the evening star glorifies the dusky firmament. So, my loving reader,—and to none other can such table-talk as this be addressed,—I hope there will be lustre enough in one or other of the names with which I shall gild my page to redeem the dulness of all that is merely personal in my recollections.

After leaving the school of Dame Prentiss, best remembered by infantine loves, those pretty preludes of more serious passions; by the great forfeit-basket, filled with its miscellaneous waifs and deodands, and by the long willow stick by the aid of which the good old body, now stricken in years and unwieldy in person could stimulate the sluggish faculties or check the mischievous sallies of the child most distant from his ample chair,—a school where I think my most noted schoolmate was the present Bishop of Delaware, became the pupil of Master William Biglow. This generation is not familiar with his title to renown, although he fills three columns and a half in Mr. Duyckinck's "Cyclopaedia of American Literature." He was a humorist hardly robust enough for more than a brief local immortality. I am afraid we were an undistinguished set, for I do not remember anybody near a bishop in dignity graduating from our benches.

At about ten years of age I began going to what we always called the "Port School," because it was kept at Cambridgeport, a mile from the College. This suburb was at that time thinly inhabited, and, being much of it marshy and imperfectly reclaimed, had a dreary look as compared with the thriving College settlement. The tenants of the many beautiful mansions that have sprung up along Main Street, Harvard Street, and Broadway can hardly recall the time when, except the "Dana House" and the "Opposition House" and the "Clark House," these roads were almost all the way bordered by pastures until we reached the "stores" of Main Street, or were abreast of that forlorn "First Row" of Harvard Street. We called the boys of that locality "Port-chucks." They called us "Cambridge-chucks," but we got along very well together in the main.

Among my schoolmates at the Port School was a young girl of singular loveliness. I once before referred to her as "the golden blonde," but did not trust myself to describe her charms. The day of her appearance in the school was almost as much a revelation to us boys as the appearance of Miranda was to Caliban. Her abounding natural curls were so full of sunshine, her skin was so delicately white, her smile and her voice were so all-subduing, that half our heads were turned. Her fascinations were everywhere confessed a few years afterwards; and when I last met her, though she said she was a grandmother, I questioned her statement, for her winning looks and ways would still have made her admired in any company.

Not far from the golden blonde were two small boys, one of them very small, perhaps the youngest boy in school, both ruddy, sturdy, quiet, reserved, sticking loyally by each other, the oldest, however, beginning to enter into social relations with us of somewhat maturer years. One of these two boys was destined to be widely known, first in literature, as author of one of the most popular books of its time and which is freighted for a long voyage; then as an eminent lawyer; a man who, if his countrymen are wise, will yet be prominent in the national councils. Richard Henry Dana, Junior, is the name he bore and bears; he found it famous, and will bequeath it a fresh renown.

Sitting on the girls' benches, conspicuous among the school-girls of unlettered origin by that look which rarely fails to betray hereditary and congenital culture, was a young person very nearly of my own age. She came with the reputation of being "smart," as we should have called it, clever as we say nowadays. This was Margaret Fuller, the only one among us who, like "Jean Paul," like "The Duke," like "Bettina," has slipped the cable of the more distinctive name to which she was anchored, and floats on the waves of speech as "Margaret." Her air to her schoolmates was marked by a certain stateliness and distance, as if she had other thoughts than theirs and was not of them. She was a great student and a great reader of what she used to call "naw-vels." I remember her so well as she appeared at school and later, that I regret that she had not been faithfully given to canvas or marble in the day of her best looks. None know her aspect who have not seen her living. Margaret, as I remember her at school and afterwards, was tall, fair complexioned, with a watery, aqua-marine lustre in her light eyes, which she used to make small, as one does who looks at the sunshine. A remarkable point about her was that long, flexile neck, arching and undulating in strange sinuous movements, which one who loved her would compare to those of a swan, and one who loved her not to those of the ophidian who tempted our common mother. Her talk was affluent, magisterial, *de haut en bas*, some would say euphuistic, but surpassing the talk of women in breadth and audacity. Her face kindled and reddened and dilated in every feature as she spoke, and, as I once saw her in a fine storm of indignation at the supposed ill-treatment of a relative, showed itself capable of something resembling what Milton calls the viraginic aspect.

Little incidents bear telling when they recall anything of such a celebrity as Margaret. I remember being greatly awed once, in our school-days, with the maturity of one of her expressions. Some themes were brought home from the school for examination by my father, among them one of hers. I took it up with a certain emulous interest (for I fancied at that day that I too had drawn a prize, say a five-dollar one, at least, in the great intellectual life-lottery) and read the first words.

"It is a trite remark," she began.

I stopped. Alas! I did not know what trite meant. How could I ever judge Margaret fairly after such a crushing discovery of her superiority? I doubt if I ever did; yet oh, how pleasant it would have been, at about the age, say, of threescore and ten, to rake over these ashes for cinders with her,—she in a snowy cap, and I in a decent peruke!

After being five years at the Port School, the time drew near when I was to enter college. It seemed advisable to give me a year of higher training, and for that end some public school was thought to offer advantages. Phillips Academy at Andover was well known to us. We had been up there, my father and myself,

at anniversaries. Some Boston boys of well-known and distinguished parentage had been scholars there very lately, Master Edmund Quincy, Master Samuel Hurd Walley, Master Nathaniel Parker Willis,—all promising youth, who fulfilled their promise.

I do not believe there was any thought of getting a little respite of quiet by my temporary absence, but I have wondered that there was not. Exceptional boys of fourteen or fifteen make home a heaven, it is true; but I have suspected, late in life, that I was not one of the exceptional kind. I had tendencies in the direction of flageolets and octave flutes. I had a pistol and a gun, and popped at everything that stirred, pretty nearly, except the house-cat. Worse than this, I would buy a cigar and smoke it by instalments, putting it meantime in the barrel of my pistol, by a stroke of ingenuity which it gives me a grim pleasure to recall; for no maternal or other female eyes would explore the cavity of that dread implement in search of contraband commodities.

It was settled, then, that I should go to Phillips Academy, and preparations were made that I might join the school at the beginning of the autumn.

In due time I took my departure in the old carriage, a little modernized from the pattern of my Lady Bountiful's, and we jogged soberly along,—kind parents and slightly nostalgic boy,—towards the seat of learning, some twenty miles away. Up the old West Cambridge road, now North Avenue; past Davenport's tavern, with its sheltering tree and swinging sign; past the old powder-house, looking like a colossal conical ball set on end; past the old Tidd House, one of the finest of the ante-Revolutionary mansions; past Miss Swan's great square boarding-school, where the music of girlish laughter was ringing through the windy corridors; so on to Stoneham, town of the bright lake, then darkened with the recent memory of the barbarous murder done by its lonely shore; through pleasant Reading, with its oddly named village centres, "Trapelo," "Read'nwoodeend," as rustic speech had it, and the rest; through Wilmington, then renowned for its hops; so at last into the hallowed borders of the academic town.

It was a shallow, two-story white house before which we stopped, just at the entrance of the central village, the residence of a very worthy professor in the theological seminary,—learned, amiable, exemplary, but thought by certain experts to be a little questionable in the matter of homoousianism, or some such doctrine. There was a great rock that showed its round back in the narrow front yard. It looked cold and hard; but it hinted firmness and indifference to the sentiments fast struggling to get uppermost in my youthful bosom; for I was not too old for home-sickness,—who is: The carriage and my fond companions had to leave me at last. I saw it go down the declivity that sloped southward, then climb the next ascent, then sink gradually until the window in the back of it disappeared like an eye that shuts, and leaves the world dark to some widowed heart.

Sea-sickness and home-sickness are hard to deal with by any remedy but time. Mine was not a bad case, but it excited sympathy. There was an ancient, faded old lady in the house, very kindly, but very deaf, rustling about in dark autumnal foliage of silk or other murmurous fabric, somewhat given to snuff, but a very worthy gentlewoman of the poor-relation variety. She comforted me, I well remember, but not with apples, and stayed me, but not with flagons. She went in her benevolence, and, taking a blue and white soda-powder, mingled the same in water, and encouraged me to drink the result. It might be a specific for seasickness, but it was not for home-sickness. The fiz was a mockery, and the saline refrigerant struck a colder chill to my despondent heart. I did not disgrace myself, however, and a few days cured me, as a week on the water often cures seasickness.

There was a sober-faced boy of minute dimensions in the house, who began to make some advances to me, and who, in spite of all the conditions surrounding him, turned out, on better acquaintance, to be one of the most amusing, free-spoken, mocking little imps I ever met in my life. My room-mate came later. He was the son of a clergyman in a neighboring town,—in fact I may remark that I knew a good many clergymen's sons at Andover. He and I went in harness together as well as most boys do, I suspect; and I have no grudge against him, except that once, when I was slightly indisposed, he administered to me,—with the best intentions, no doubt,—a dose of Indian pills, which effectually knocked me out of time, as Mr. Morrissey would say,—not quite into eternity, but so near it that I perfectly remember one of the good ladies told me (after I had come to my senses a little, and was just ready for a sip of cordial and a word of encouragement), with that delightful plainness of speech which so brings realities home to the imagination, that "I never should look any whiter when I was laid out as a corpse." After my room-mate and I had been separated twenty-five years, fate made us fellow-townsmen and acquaintances once more in Berkshire, and now again we are close literary neighbors; for I have just read a very pleasant article, signed by him, in the last number of the "Galaxy." Does it not sometimes seem as if we were all marching round and round in a circle, like the supernumeraries who constitute the "army" of a theatre, and that each of us meets and is met by the same and only the same people, or their doubles, twice, thrice, or a little oftener, before the curtain drops and the "army" puts off its borrowed clothes?

The old Academy building had a dreary look, with its flat face, bare and uninteresting as our own "University Building" at Cambridge, since the piazza which relieved its monotony was taken away, and, to balance the ugliness thus produced, the hideous projection was added to "Harvard Hall." Two masters sat at the end of the great room,—the principal and his assistant. Two others presided in separate rooms, one of them the late Rev. Samuel Horatio Stearns, an excellent and lovable man, who looked kindly on me, and for whom I always cherished a sincere regard, a clergyman's son, too, which privilege I did not always find the warrant of signal virtues; but no matter about that here, and I have promised myself to be amiable.

On the side of the long room was a large clock-dial, bearing these words:

YOUTH IS THE SEED-TIME OF LIFE.

I had indulged in a prejudice, up to that hour, that youth was the budding time of life, and this clock-dial, perpetually twitting me with its seedy moral, always had a forbidding look to my vernal apprehension.

I was put into a seat with an older and much bigger boy, or youth, with a fuliginous complexion, a dilating and whitening nostril, and a singularly malignant scowl. Many years afterwards he committed an act of murderous violence, and ended by going to finish his days in a madhouse. His delight was to kick my shins with all his might, under the desk, not at all as an act of hostility, but as a gratifying and harmless pastime.

Finding this, so far as I was concerned, equally devoid of pleasure and profit, I managed to get a seat by another boy, the son of a very distinguished divine. He was bright enough, and more select in his choice of recreations, at least during school hours, than my late homicidal neighbor. But the principal called me up presently, and cautioned me against him as a dangerous companion. Could it be so? If the son of that boy's father could not be trusted, what boy in Christendom could? It seemed like the story of the youth doomed to be slain by a lion before reaching a certain age, and whose fate found him out in the heart of the tower where his father had shut him up for safety. Here was I, in the very dove's nest of Puritan faith, and out of one of its eggs a serpent had been hatched and was trying to nestle in my bosom! I parted from him, however, none the worse for his companionship so far as I can remember.

Of the boys who were at school with me at Andover one has acquired great distinction among the scholars of the land. One day I observed a new boy in a seat not very far from my own. He was a little fellow, as I recollect him, with black hair and very bright black eyes, when at length I got a chance to look at them. Of all the new-comers during my whole year he was the only one whom the first glance fixed in my memory, but there he is now, at this moment, just as he caught my eye on the morning of his entrance. His head was between his hands (I wonder if he does not sometimes study in that same posture nowadays!) and his eyes were fastened to his book as if he had been reading a will that made him heir to a million. I feel sure that Professor Horatio Balch Hackett will not find fault with me for writing his name under this inoffensive portrait. Thousands of faces and forms that I have known more or less familiarly have faded from my remembrance, but this presentment of the youthful student, sitting there entranced over the page of his textbook,—the child-father of the distinguished scholar that was to be,—is not a picture framed and hung up in my mind's gallery, but a fresco on its walls, there to remain so long as they hold together.

My especial intimate was a fine, rosy-faced boy, not quite so free of speech as myself, perhaps, but with qualities that promised a noble manhood, and ripened into it in due season. His name was Phineas Barnes, and, if he is inquired after in Portland or anywhere in the State of Maine, something will be heard to his advantage from any honest and intelligent citizen of that Commonwealth who answers the question. This was one of two or three friendships that lasted. There were other friends and classmates, one of them a natural humorist of the liveliest sort, who would have been quarantined in any Puritan port, his laugh was so potently contagious.

Of the noted men of Andover the one whom I remember best was Professor Moses Stuart. His house was nearly opposite the one in which I resided and I often met him and listened to him in the chapel of the Seminary. I have seen few more striking figures in my life than his, as I remember it. Tall, lean, with strong, bold features, a keen, scholarly, accipitrine nose, thin, expressive lips, great solemnity and impressiveness of voice and manner, he was my early model of a classic orator. His air was Roman, his neck long and bare like Cicero's, and his toga,—that is his broadcloth cloak,—was carried on his arm, whatever might have been the weather, with such a statue-like rigid grace that he might have been turned into marble as he stood, and looked noble by the side of the antiques of the Vatican.

Dr. Porter was an invalid, with the prophetic handkerchief bundling his throat, and his face "festooned"—as I heard Hillard say once, speaking of one of our College professors—in folds and wrinkles. Ill health gives a certain common character to all faces, as Nature has a fixed course which she follows in dismantling a human countenance: the noblest and the fairest is but a death's-head decently covered over for the transient ceremony of life, and the drapery often falls half off before the procession has passed.

Dr. Woods looked his creed more decidedly, perhaps, than any of the Professors. He had the firm fibre of a theological athlete, and lived to be old without ever mellowing, I think, into a kind of half-heterodoxy, as old ministers of stern creed are said to do now and then,—just as old doctors grow to be sparing of the more exasperating drugs in their later days. He had manipulated the mysteries of the Infinite so long and so exhaustively, that he would have seemed more at home among the mediaeval schoolmen than amidst the working clergy of our own time.

All schools have their great men, for whose advent into life the world is waiting in dumb expectancy. In due time the world seizes upon these wondrous youth, opens the shell of their possibilities like the valves of an oyster, swallows them at a gulp, and they are for the most part heard of no more. We had two great men, grown up both of them. Which was the more awful intellectual power to be launched upon society, we debated. Time cut the knot in his rude fashion by taking one away early, and padding the other with prosperity so that his course was comparatively noiseless and ineffective. We had our societies, too; one in particular, "The Social Fraternity," the dread secrets of which I am under a lifelong obligation never to reveal. The fate of William Morgan, which the community learned not long after this time, reminds me of the danger of the ground upon which I am treading.

There were various distractions to make the time not passed in study a season of relief. One good lady, I was told, was in the habit of asking students to her house on Saturday afternoons and praying with and for them. Bodily exercise was not, however, entirely superseded by spiritual exercises, and a rudimentary form of base-ball and the heroic sport of football were followed with some spirit.

A slight immature boy finds his materials of thought and enjoyment in very shallow and simple sources. Yet a kind of romance gilds for me the sober tableland of that cold New England hill where I came in contact with a world so strange to me, and destined to leave such mingled and lasting impressions. I looked across the valley to the hillside where Methuen hung suspended, and dreamed of its wooded seclusion as a village paradise. I tripped lightly down the long northern slope with *facilis descensus* on my lips, and toiled up again, repeating *sed revocare gradum*. I wandered in the autumnal woods that crown the "Indian Ridge," much wondering at that vast embankment, which we young philosophers believed with the vulgar to be of aboriginal workmanship, not less curious, perhaps, since we call it an *escarpment*, and refer it to alluvial agencies. The little Shawshine was our swimming-school, and the great Merrimack, the right arm of four toiling cities, was within reach of a morning stroll. At home we had the small imp to make us laugh at his enormities, for he spared nothing in his talk, and was the drollest little living protest against the prevailing solemnities of the locality. It did not take much to please us, I suspect, and it is a blessing that this is apt to be so with young people. What else could have made us think it great sport to leave our warm beds in the middle of winter and

"camp out,"—on the floor of our room,—with blankets disposed tent-wise, except the fact that to a boy a new discomfort in place of an old comfort is often a luxury.

More exciting occupation than any of these was to watch one of the preceptors to see if he would not drop dead while he was praying. He had a dream one night that he should, and looked upon it as a warning, and told it round very seriously, and asked the boys to come and visit him in turn, as one whom they were soon to lose. More than one boy kept his eye on him during his public devotions, possessed by the same feeling the man had who followed Van Amburgh about with the expectation, let us not say the hope, of seeing the lion bite his head off sooner or later.

Let me not forget to recall the interesting visit to Haverhill with my room-mate, and how he led me to the mighty bridge over the Merrimack which defied the ice-rafts of the river; and to the old meetinghouse, where, in its porch, I saw the door of the ancient parsonage, with the bullet-hole in it through which Benjamin Rolfe, the minister, was shot by the Indians on the 29th of August, 1708. What a vision it was when I awoke in the morning to see the fog on the river seeming as if it wrapped the towers and spires of a great city!—for such was my fancy, and whether it was a mirage of youth or a fantastic natural effect I hate to inquire too nicely.

My literary performances at Andover, if any reader who may have survived so far cares to know, included a translation from Virgil, out of which I remember this couplet, which had the inevitable cockney rhyme of beginners:

*"Thus by the power of Jove's imperial arm
The boiling ocean trembled into calm."*

Also a discussion with Master Phinehas Barnes on the case of Mary, Queen of Scots, which he treated argumentatively and I rhetorically and sentimentally. My sentences were praised and his conclusions adopted. Also an Essay, spoken at the great final exhibition, held in the large hall up-stairs, which hangs oddly enough from the roof, suspended by iron rods. Subject, Fancy. Treatment, brief but comprehensive, illustrating the magic power of that brilliant faculty in charming life into forgetfulness of all the ills that flesh is heir to,—the gift of Heaven to every condition and every clime, from the captive in his dungeon to the monarch on his throne; from the burning sands of the desert to the frozen icebergs of the poles, from—but I forget myself.

This was the last of my coruscations at Andover. I went from the Academy to Harvard College, and did not visit the sacred hill again for a long time.

On the last day of August, 1867, not having been at Andover, for many years, I took the cars at noon, and in an hour or a little more found myself at the station,—just at the foot of the hill. My first pilgrimage was to the old elm, which I remembered so well as standing by the tavern, and of which they used to tell the story that it held, buried in it by growth, the iron rings put round it in the old time to keep the Indians from chopping it with their tomahawks. I then began the once familiar toil of ascending the long declivity. Academic villages seem to change very slowly. Once in a hundred years the library burns down with all its books. A new edifice or two may be put up, and a new library begun in the course of the same century; but these places are poor, for the most part, and cannot afford to pull down their old barracks.

These sentimental journeys to old haunts must be made alone. The story of them must be told succinctly. It is like the opium-smoker's showing you the pipe from which he has just inhaled elysian bliss, empty of the precious extract which has given him his dream.

I did not care much for the new Academy building on my right, nor for the new library building on my left. But for these it was surprising to see how little the scene I remembered in my boyhood had changed. The Professors' houses looked just as they used to, and the stage-coach landed its passengers at the Mansion House as of old. The pale brick seminary buildings were behind me on the left, looking as if "Hollis" and "Stoughton" had been transplanted from Cambridge,—carried there in the night by orthodox angels, perhaps, like the Santa Casa. Away to my left again, but abreast of me, was the bleak, bare old Academy building; and in front of me stood unchanged the shallow oblong white house where I lived a year in the days of James Monroe and of John Quincy Adams.

The ghost of a boy was at my side as I wandered among the places he knew so well. I went to the front of the house. There was the great rock showing its broad back in the front yard. I used to crack nuts on that, whispered the small ghost. I looked in at the upper window in the farther part of the house. I looked out of that on four long changing seasons, said the ghost. I should have liked to explore farther, but, while I was looking, one came into the small garden, or what used to be the garden, in front of the house, and I desisted from my investigation and went on my way. The apparition that put me and my little ghost to flight had a dressing-gown on its person and a gun in its hand. I think it was the dressing-gown, and not the gun, which drove me off.

And now here is the shop, or store, that used to be Shipman's, after passing what I think used to be Jonathan Leavitt's bookbindery, and here is the back road that will lead me round by the old Academy building.

Could I believe my senses when I found that it was turned into a gymnasium, and heard the low thunder of ninepin balls, and the crash of tumbling pins from those precincts? The little ghost said, Never! It cannot be. But it was. "Have they a billiard-room in the upper story?" I asked myself. "Do the theological professors take a hand at all-fours or poker on weekdays, now and then, and read the secular columns of the 'Boston Recorder' on Sundays?" I was demoralized for the moment, it is plain; but now that I have recovered from the shock, I must say that the fact mentioned seems to show a great advance in common sense from the notions prevailing in my time.

I sauntered,—we, rather, my ghost and I,—until we came to a broken field where there was quarrying and digging going on,—our old base-ball ground, hard by the burial-place. There I paused; and if any thoughtful boy who loves to tread in the footsteps that another has sown with memories of the time when he was young shall follow my footsteps, I need not ask him to rest here awhile, for he will be enchained by the noble view before him. Far to the north and west the mountains of New Hampshire lifted their summits in along

encircling ridge of pale blue waves. The day was clear, and every mound and peak traced its outline with perfect definition against the sky. This was a sight which had more virtue and refreshment in it than any aspect of nature that I had looked upon, I am afraid I must say for years. I have been by the seaside now and then, but the sea is constantly busy with its own affairs, running here and there, listening to what the winds have to say and getting angry with them, always indifferent, often insolent, and ready to do a mischief to those who seek its companionship. But these still, serene, unchanging mountains,—Monadnock, Kearsarge,—what memories that name recalls!—and the others, the dateless Pyramids of New England, the eternal monuments of her ancient race, around which cluster the homes of so many of her bravest and hardest children,—I can never look at them without feeling that, vast and remote and awful as they are, there is a kind of inward heat and muffled throb in their stony cores, that brings them into a vague sort of sympathy with human hearts. It is more than a year since I have looked on those blue mountains, and they “are to me as a feeling” now, and have been ever since.

I had only to pass a wall and I was in the burial-ground. It was thinly tenanted as I remember it, but now populous with the silent immigrants of more than a whole generation. There lay the dead I had left, the two or three students of the Seminary; the son of the worthy pair in whose house I lived, for whom in those days hearts were still aching, and by whose memory the house still seemed haunted. A few upright stones were all that I recollect. But now, around them were the monuments of many of the dead whom I remembered as living. I doubt if there has been a more faithful reader of these graven stones than myself for many a long day. I listened to more than one brief sermon from preachers whom I had often heard as they thundered their doctrines down upon me from the throne-like desk. Now they spoke humbly out of the dust, from a narrower pulpit, from an older text than any they ever found in Cruden's Concordance, but there was an eloquence in their voices the listening chapel had never known. There were stately monuments and studied inscriptions, but none so beautiful, none so touching, as that which hallows the resting-place of one of the children of the very learned Professor Robinson: “Is it well with the child? And she answered, It is well.”

While I was musing amidst these scenes in the mood of Hamlet, two old men, as my little ghost called them, appeared on the scene to answer to the gravedigger and his companion. They christened a mountain or two for me, “Kearsarge” among the rest, and revived some old recollections, of which the most curious was “Basil's Cave.” The story was recent, when I was there, of one Basil, or Bezill, or Buzzell, or whatever his name might have been, a member of the Academy, fabulously rich, Orientally extravagant, and of more or less lawless habits. He had commanded a cave to be secretly dug, and furnished it sumptuously, and there with his companions indulged in revelries such as the daylight of that consecrated locality had never looked upon. How much truth there was in it all I will not pretend to say, but I seem to remember stamping over every rock that sounded hollow, to question if it were not the roof of what was once Basil's Cave.

The sun was getting far past the meridian, and I sought a shelter under which to partake of the hermit fare I had brought with me. Following the slope of the hill northward behind the cemetery, I found a pleasant clump of trees grouped about some rocks, disposed so as to give a seat, a table, and a shade. I left my benediction on this pretty little natural caravansera, and a brief record on one of its white birches, hoping to visit it again on some sweet summer or autumn day.

Two scenes remained to look upon,—the Shawshine River and the Indian Ridge. The streamlet proved to have about the width with which it flowed through my memory. The young men and the boys were bathing in its shallow current, or dressing and undressing upon its banks as in the days of old; the same river, only the water changed; “The same boys, only the names and the accidents of local memory different,” I whispered to my little ghost.

The Indian Ridge more than equalled what I expected of it. It is well worth a long ride to visit. The lofty wooded bank is a mile and a half in extent, with other ridges in its neighborhood, in general running nearly parallel with it, one of them still longer. These singular formations are supposed to have been built up by the eddies of conflicting currents scattering sand and gravel and stones as they swept over the continent. But I think they pleased me better when I was taught that the Indians built them; and while I thank Professor Hitchcock, I sometimes feel as if I should like to found a chair to teach the ignorance of what people do not want to know.

“Two tickets to Boston.” I said to the man at the station.

But the little ghost whispered, “When you leave this place you leave me behind you.”

“One ticket to Boston, if you please. Good by, little ghost.”

I believe the boy-shadow still lingers around the well-remembered scenes I traversed on that day, and that, whenever I revisit them, I shall find him again as my companion.

THE PULPIT AND THE PEW.

The priest is dead for the Protestant world. Luther's inkstand did not kill the devil, but it killed the priest, at least for us: He is a loss in many respects to be regretted. He kept alive the spirit of reverence. He was looked up to as possessing qualities superhuman in their nature, and so was competent to be the stay of the weak and their defence against the strong. If one end of religion is to make men happier in this world as well as in the next, mankind lost a great source of happiness when the priest was reduced to the common level of humanity, and became only a minister. Priest, which was presbyter, corresponded to senator, and was a title of respect and honor. Minister is but the diminutive of magister, and implies an obligation to render service.

It was promised to the first preachers that in proof of their divine mission they should have the power of casting out devils and talking in strange tongues; that they should handle serpents and drink poisons with impunity; that they should lay hands on the sick and they should recover. The Roman Church claims some of

these powers for its clergy and its sacred objects to this day. Miracles, it is professed, are wrought by them, or through them, as in the days of the apostles. Protestantism proclaims that the age of such occurrences as the apostles witnessed is past. What does it know about miracles? It knows a great many records of miracles, but this is a different kind of knowledge.

The minister may be revered for his character, followed for his eloquence, admired for his learning, loved for his amiable qualities, but he can never be what the priest was in past ages, and is still, in the Roman Church. Dr. Arnold's definition may be found fault with, but it has a very real meaning. "The essential point in the notion of a priest is this: that he is a person made necessary to our intercourse with God, without being necessary or beneficial to us morally,—an unreasonable, immoral, spiritual necessity." He did not mean, of course, that the priest might not have all the qualities which would recommend him as a teacher or as a man, but that he had a special power, quite independent of his personal character, which could act, as it were, mechanically; that out of him went a virtue, as from the hem of his Master's raiment, to those with whom his sacred office brought him in contact.

It was a great comfort to poor helpless human beings to have a tangible personality of like nature with themselves as a mediator between them and the heavenly powers. Sympathy can do much for the sorrowing, the suffering, the dying, but to hear God himself speaking directly through human lips, to feel the touch of a hand which is the channel of communication with the unseen Omnipotent, this was and is the privilege of those who looked and those who still look up to a priesthood. It has been said, and many who have walked the hospitals or served in the dispensaries can bear witness to the truth of the assertion, that the Roman Catholics know how to die. The same thing is less confidently to be said of Protestants. How frequently is the story told of the most exemplary Protestant Christians, nay, how common is it to read in the lives of the most exemplary Protestant ministers, that they were beset with doubts and terrors in their last days! The blessing of the viaticum is unknown to them. Man is essentially an idolater,—that is, in bondage to his imagination,—for there is no more harm in the Greek word *eidolon* than in the Latin word *imago*. He wants a visible image to fix his thought, a scarabee or a *crux ansata*, or the modern symbols which are to our own time what these were to the ancient Egyptians. He wants a vicegerent of the Almighty to take his dying hand and bid him *godspeed* on his last journey. Who but such an immediate representative of the Divinity would have dared to say to the monarch just laying his head on the block, "*Fils de Saint Louis, monte au ciel*"?

It has been a long and gradual process to thoroughly republicanize the American Protestant descendant of the ancient priesthood. The history of the Congregationalists in New England would show us how this change has gone on, until we have seen the church become a hall open to all sorts of purposes, the pulpit come down to the level of the rostrum, and the clergyman take on the character of a popular lecturer who deals with every kind of subject, including religion.

Whatever fault we may find with many of their beliefs, we have a right to be proud of our Pilgrim and Puritan fathers among the clergy. They were ready to do and to suffer anything for their faith, and a faith which breeds heroes is better than an unbelief which leaves nothing worth being a hero for. Only let us be fair, and not defend the creed of Mohammed because it nurtured brave men and enlightened scholars, or refrain from condemning polygamy in our admiration of the indomitable spirit and perseverance of the Pilgrim Fathers of Mormonism, or justify an inhuman belief, or a cruel or foolish superstition, because it was once held or acquiesced in by men whose nobility of character we heartily recognize. The New England clergy can look back to a noble record, but the pulpit has sometimes required a homily from the pew, and may sometimes find it worth its while to listen to one even in our own days.

From the settlement of the country to the present time, the ministers have furnished the highest type of character to the people among whom they have lived. They have lost to a considerable extent the position of leaders, but if they are in our times rather to be looked upon as representatives of their congregations, they represent what is best among those of whom they are the speaking organs. We have a right to expect them to be models as well as teachers of all that makes the best citizens for this world and the next, and they have not been, and are not in these later days unworthy of their high calling. They have worked hard for small earthly compensation. They have been the most learned men the country had to show, when learning was a scarce commodity. Called by their consciences to self-denying labors, living simply, often half-supported by the toil of their own hands, they have let the light, such light as shone for them, into the minds of our communities as the settler's axe let the sunshine into their log-huts and farm-houses.

Their work has not been confined to their professional duties, as a few instances will illustrate. Often, as was just said, they toiled like day-laborers, teasing lean harvests out of their small inclosures of land, for the New England soil is not one that "laughs when tickled with a hoe," but rather one that sulks when appealed to with that persuasive implement. The father of the eminent Boston physician whose recent loss is so deeply regretted, the Reverend Pitt Clarke, forty-two years pastor of the small fold in the town of Norton, Massachusetts, was a typical example of this union of the two callings, and it would be hard to find a story of a more wholesome and useful life, within a limited and isolated circle, than that which the pious care of one of his children commemorated. Sometimes the New England minister, like worthy Mr. Ward of Stratford-on-Avon, in old England, joined the practice of medicine to the offices of his holy profession. Michael Wigglesworth, the poet of "The Day of Doom," and Charles Chauncy, the second president of Harvard College, were instances of this twofold service. In politics their influence has always been felt, and in many cases their drums ecclesiastic have beaten the reveille as vigorously, and to as good purpose, as it ever sounded in the slumbering camp. Samuel Cooper sat in council with the leaders of the Revolution in Boston. The three Northampton-born brothers Allen, Thomas, Moses, and Solomon, lifted their voices, and, when needed, their armed hands, in the cause of liberty. In later days, Elijah Parish and David Osgood carried politics into their pulpits as boldly as their antislavery successors have done in times still more recent.

The learning, the personal character, the sacredness of their office, tended, to give the New England clergy of past generations a kind of aristocratic dignity, a personal grandeur, much more felt in the days when class distinctions were recognized less unwillingly than at present. Their costume added to the effect of their bodily presence, as the old portraits illustrate for us, as those of us who remember the last of the "fair, white, curly" wigs, as it graced the imposing figure of the Reverend Dr. Marsh of Wethersfield, Connecticut, can

testify. They were not only learned in the history of the past, but they were the interpreters of the prophecy, and announced coming events with a confidence equal to that with which the weather-bureau warns us of a coming storm. The numbers of the book of Daniel and the visions of the Revelation were not too hard for them. In the commonplace book of the Reverend Joel Benedict is to be found the following record, made, as it appears, about the year 1773: "Conversing with Dr. Bellamy upon the downfall of Antichrist, after many things had been said upon the subject, the Doctor began to warm, and uttered himself after this manner: 'Tell your children to tell their children that in the year 1866 something notable will happen in the church; tell them the old man says so.'"

The "old man" came pretty near hitting the mark, as we shall see if we consider what took place in the decade from 1860 to 1870. In 1864 the Pope issued the "Syllabus of Errors," which "must be considered by Romanists—as an infallible official document, and which arrays the papacy in open war against modern civilization and civil and religious freedom." The Vatican Council in 1870 declared the Pope to be the bishop of bishops, and immediately after this began the decisive movement of the party known as the "Old Catholics." In the exact year looked forward to by the New England prophet, 1866, the evacuation of Rome by the French and the publication of "Ecce Homo" appear to be the most remarkable events having special relation to the religious world. Perhaps the National Council of the Congregationalists, held at Boston in 1865, may be reckoned as one of the occurrences which the oracle just missed.

The confidence, if not the spirit of prophecy, lasted down to a later period. "In half a century," said the venerable Dr. Porter of Conway, New Hampshire, in 1822, "there will be no Pagans, Jews, Mohammedans, Unitarians, or Methodists." The half-century has more than elapsed, and the prediction seems to stand in need of an extension, like many other prophetic utterances.

The story is told of David Osgood, the shaggy-browed old minister of Medford, that he had expressed his belief that not more than one soul in two thousand would be saved. Seeing a knot of his parishioners in debate, he asked them what they were discussing, and was told that they were questioning which of the Medford people was the elected one, the population being just two thousand, and that opinion was divided whether it would be the minister or one of his deacons. The story may or may not be literally true, but it illustrates the popular belief of those days, that the clergyman saw a good deal farther into the councils of the Almighty than his successors could claim the power of doing.

The objects about me, as I am writing, call to mind the varied accomplishments of some of the New England clergy. The face of the Revolutionary preacher, Samuel Cooper, as Copley painted it, looks upon me with the pleasantest of smiles and a liveliness of expression which makes him seem a contemporary after a hundred years' experience of eternity. The Plato on this lower shelf bears the inscription: "Ezroe Stiles, 1766. Olim e libris Rev. Jaredis Eliot de Killingworth." Both were noted scholars and philosophers. The hand-lens before me was imported, with other philosophical instruments, by the Reverend John Prince of Salem, an earlier student of science in the town since distinguished by the labors of the Essex Institute. Jeremy Belknap holds an honored place in that unpretending row of local historians. And in the pages of his "History of New Hampshire" may be found a chapter contributed in part by the most remarkable man, in many respects, among all the older clergymen preacher, lawyer, physician, astronomer, botanist, entomologist, explorer, colonist, legislator in state and national governments, and only not seated on the bench of the Supreme Court of a Territory because he declined the office when Washington offered it to him. This manifold individual was the minister of Hamilton, a pleasant little town in Essex County, Massachusetts,—the Reverend Manasseh Cutler. These reminiscences from surrounding objects came up unexpectedly, of themselves: and have a right here, as showing how wide is the range of intelligence in the clerical body thus accidentally represented in a single library making no special pretensions.

It is not so exalted a claim to make for them, but it may be added that they were often the wits and humorists of their localities. Mather Byles's facetie are among the colonial classic reminiscences. But these were, for the most part, verbal quips and quibbles. True humor is an outgrowth of character. It is never found in greater perfection than in old clergymen and old college professors. Dr. Sprague's "Annals of the American Pulpit" tells many stories of our old ministers as good as Dean Ramsay's "Scottish Reminiscences." He has not recorded the following, which is to be found in Miss Larned's excellent and most interesting History of Windham County, Connecticut. The Reverend Josiah Dwight was the minister of Woodstock, Connecticut, about the year 1700. He was not old, it is true, but he must have caught the ways of the old ministers. The "sensational" pulpit of our own time could hardly surpass him in the drollery of its expressions. A specimen or two may dispose the reader to turn over the pages which follow in a good-natured frame of mind. "If unconverted men ever got to heaven," he said, "they would feel as uneasy as a shad up the crotch of a white-oak." Some of his ministerial associates took offence at his eccentricities, and called on a visit of admonition to the offending clergyman. "Mr. Dwight received their reproofs with great meekness, frankly acknowledged his faults, and promised amendment, but, in prayer at parting, after returning thanks for the brotherly visit and admonition, 'hoped that they might so hitch their horses on earth that they should never kick in the stables of everlasting salvation.'"

It is a good thing to have some of the blood of one of these old ministers in one's veins. An English bishop proclaimed the fact before an assembly of physicians the other day that he was not ashamed to say that he had a son who was a doctor. Very kind that was in the bishop, and very proud his medical audience must have felt. Perhaps he was not ashamed of the Gospel of Luke, "the beloved physician," or even of the teachings which came from the lips of one who was a carpenter, and the son of a carpenter. So a New-Englander, even if he were a bishop, need not be ashamed to say that he consented to have an ancestor who was a minister. On the contrary, he has a right to be grateful for a probable inheritance of good instincts, a good name, and a bringing up in a library where he bumped about among books from the time when he was hardly taller than one of his father's or grandfather's folios. What are the names of ministers' sons which most readily occur to our memory as illustrating these advantages? Edward Everett, Joseph Stevens Buckminster, Ralph Waldo Emerson, George Bancroft, Richard Hildreth, James Russell Lowell, Francis Parkman, Charles Eliot Norton, were all ministers' boys. John Lothrop Motley was the grandson of the clergyman after whom he was named. George Ticknor was next door to such a descent, for his father was a deacon. This is a group which it did not

take a long or a wide search to bring together.

Men such as the ministers who have been described could not fail to exercise a good deal of authority in the communities to which they belonged. The effect of the Revolution must have been to create a tendency to rebel against spiritual dictation. Republicanism levels in religion as in everything. It might have been expected, therefore, that soon after civil liberty had been established there would be conflicts between the traditional, authority of the minister and the claims of the now free and independent congregation. So it was, in fact, as for instance in the case which follows, for which the reader is indebted to Miss Lamed's book, before cited.

The ministerial veto allowed by the Saybrook Platform gave rise, in the year 1792, to a fierce conflict in the town of Pomfret, Connecticut. Zephaniah Swift, a lawyer of Windham, came out in the Windham "Herald," in all the vehemence of partisan phraseology, with all the emphasis of italics and small capitals. Was it not time, he said, for people to look about them and see whether "such despotism was founded in Scripture, in reason, in policy, or on the rights of man! A minister, by his vote, by his single voice, may negative the unanimous vote of the church! Are ministers composed of finer clay than the rest of mankind, that entitles them to this preeminence? Does a license to preach transform a man into a higher order of beings and endow him with a natural quality to govern? Are the laity an inferior order of beings, fit only to be slaves and to be governed? Is it good policy for mankind to subject themselves to such degrading vassalage and abject submission? Reason, common sense, and the Bible, with united voice, proclaim to all mankind that they are all born free and equal; that every member of a church or Christian congregation must be on the same footing in respect of church government, and that the CONSTITUTION, which delegates to one the power to negative the vote of all the rest, is SUBVERSIVE OF THE NATURAL RIGHT OF MANKIND AND REPUGNANT TO THE WORD OF GOD."

The Reverend Mr. Welch replied to the lawyer's attack, pronouncing him to be "destitute of delicacy, decency, good manners, sound judgment, honesty, manhood, and humanity; a poltroon, a cat's-paw, the infamous tool of a party, a partisan, a political weathercock, and a ragamuffin."

No Fourth-of-July orator would in our day rant like the lawyer, and no clergyman would use such language as that of the Reverend Moses Welch. The clergy have been pretty well republicanized within that last two or three generations, and are not likely to provoke quarrels by assertion of their special dignities or privileges. The public is better bred than to carry on an ecclesiastical controversy in terms which political brawlers would hardly think admissible. The minister of religion is generally treated with something more than respect; he is allowed to say undisputed what would be sharply controverted in anybody else. Bishop Gilbert Haven, of happy memory, had been discussing a religious subject with a friend who was not convinced by his arguments. "Wait till you hear me from the pulpit," he said; "there you cannot answer me." The preacher—if I may use an image which would hardly have suggested itself to him—has his hearer's head in chancery, and can administer punishment ad libitum. False facts, false reasoning, bad rhetoric, bad grammar, stale images, borrowed passages, if not borrowed sermons, are listened to without a word of comment or a look of disapprobation.

One of the ablest and most conscientiously laborious of our clergymen has lately ventured to question whether all his professional brethren invariably give utterance to their sincerest beliefs, and has been sharply criticised for so doing. The layman, who sits silent in his pew, has his rights when out of it, and among them is the right of questioning that which has been addressed to him from the privileged eminence of the pulpit, or in any way sanctioned by his religious teacher. It is nearly two hundred years since a Boston layman wrote these words: "I am not ignorant that the pious frauds of the ancient, and the inbred fire (I do not call it pride) of many of our modern divines, have precipitated them to propagate and maintain truth as well as falsehoods, in such an unfair manner as has given advantage to the enemy to suspect the whole doctrine these men have professed to be nothing but a mere trick."

So wrote Robert Calef, the Boston merchant, whose book the Reverend Increase Mather, president of Harvard College, burned publicly in the college yard. But the pity of it is that the layman had not cried out earlier and louder, and saved the community from the horror of those judicial murders for witchcraft, the blame of which was so largely attributable to the clergy.

Perhaps no, laymen have given the clergy more trouble than the doctors. The old reproach against physicians, that where there were three of them together there were two atheists, had a real significance, but not that which was intended by the sharp-tongued ecclesiastic who first uttered it. Undoubtedly there is a strong tendency in the pursuits of the medical profession to produce disbelief in that figment of tradition and diseased human imagination which has been installed in the seat of divinity by the priesthood of cruel and ignorant ages. It is impossible, or at least very difficult, for a physician who has seen the perpetual efforts of Nature—whose diary is the book he reads oftenest—to heal wounds, to expel poisons, to do the best that can be done under the given conditions,—it is very difficult for him to believe in a world where wounds cannot heal, where opiates cannot give a respite from pain, where sleep never comes with its sweet oblivion of suffering, where the art of torture is the only science cultivated, and the capacity for being tormented is the only faculty which remains to the children of that same Father who cares for the falling sparrow. The Deity has often been pictured as Moloch, and the physician has, no doubt, frequently repudiated him as a monstrosity.

On the other hand, the physician has often been renowned for piety as well as for his peculiarly professional virtue of charity,—led upward by what he sees to the source of all the daily marvels wrought before his own eyes. So it was that Galen gave utterance to that psalm of praise which the sweet singer of Israel need not have been ashamed of; and if this "heathen" could be lifted into such a strain of devotion, we need not be surprised to find so many devout Christian worshippers among the crowd of medical "atheists."

No two professions should come into such intimate and cordial relations as those to which belong the healers of the body and the headers of the mind. There can be no more fatal mistake than that which brings them into hostile attitudes with reference to each other, both having in view the welfare of their fellow-creatures. But there is a territory always liable to be differed about between them. There are patients who never tell their physician the grief which lies at the bottom of their ailments. He goes through his accustomed routine with them, and thinks he has all the elements needed for his diagnosis. But he has seen no deeper

into the breast than the tongue, and got no nearer the heart than the wrist. A wise and experienced clergyman, coming to the patient's bedside,—not with the professional look on his face which suggests the undertaker and the sexton, but with a serene countenance and a sympathetic voice, with tact, with patience, waiting for the right moment,—will surprise the shy spirit into a confession of the doubt, the sorrow, the shame, the remorse, the terror which underlies all the bodily symptoms, and the unburdening of which into a loving and pitying soul is a more potent anodyne than all the drowsy sirups of the world. And, on the other hand, there are many nervous and over-sensitive natures which have been wrought up by self-torturing spiritual exercises until their best confessor would be a sagacious and wholesome-minded physician.

Suppose a person to have become so excited by religious stimulants that he is subject to what are known to the records of insanity as hallucinations: that he hears voices whispering blasphemy in his ears, and sees devils coming to meet him, and thinks he is going to be torn in pieces, or trodden into the mire. Suppose that his mental conflicts, after plunging him into the depths of despondency, at last reduce him to a state of despair, so that he now contemplates taking his own life, and debates with himself whether it shall be by knife, halter, or poison, and after much questioning is apparently making up his mind to commit suicide. Is not this a manifest case of insanity, in the form known as melancholia? Would not any prudent physician keep such a person under the eye of constant watchers, as in a dangerous state of, at least, partial mental alienation? Yet this is an exact transcript of the mental condition of Christian in "Pilgrim's Progress," and its counterpart has been found in thousands of wretched lives terminated by the act of self-destruction, which came so near taking place in the hero of the allegory. Now the wonderful book from which this example is taken is, next to the Bible and the Treatise of "De Imitatione Christi," the best-known religious work of Christendom. If Bunyan and his contemporary, Sydenham, had met in consultation over the case of Christian at the time when he was meditating self-murder, it is very possible that there might have been a difference of judgment. The physician would have one advantage in such a consultation. He would pretty certainly have received a Christian education, while the clergyman would probably know next to nothing of the laws or manifestations of mental or bodily disease. It does not seem as if any theological student was really prepared for his practical duties until he had learned something of the effects of bodily derangements, and, above all, had become familiar with the gamut of mental discord in the wards of an insane asylum.

It is a very thoughtless thing to say that the physician stands to the divine in the same light as the divine stands to the physician, so far as each may attempt to handle subjects belonging especially to the other's profession. Many physicians know a great deal more about religious matters than they do about medicine. They have read the Bible ten times as much as they ever read any medical author. They have heard scores of sermons for one medical lecture to which they have listened. They often hear much better preaching than the average minister, for he hears himself chiefly, and they hear abler men and a variety of them. They have now and then been distinguished in theology as well as in their own profession. The name of Servetus might call up unpleasant recollections, but that of another medical practitioner may be safely mentioned. "It was not till the middle of the last century that the question as to the authorship of the Pentateuch was handled with anything like a discerning criticism. The first attempt was made by a layman, whose studies we might have supposed would scarcely have led him to such an investigation." This layman was "Astruc, doctor and professor of medicine in the Royal College at Paris, and court physician to Louis XIV." The quotation is from the article "Pentateuch" in Smith's "Dictionary of the Bible," which, of course, lies on the table of the least instructed clergyman. The sacred profession has, it is true, returned the favor by giving the practitioner of medicine Bishop Berkeley's "Treatise on Tar-water," and the invaluable prescription of that "aged clergyman whose sands of life"—but let us be fair, if not generous, and remember that Cotton Mather shares with Zabdiel Boylston the credit of introducing the practice of inoculation into America. The professions should be cordial allies, but the church-going, Bible-reading physician ought to know a great deal more of the subjects included under the general name of theology than the clergyman can be expected to know of medicine. To say, as has been said not long since, that a young divinity student is as competent to deal with the latter as an old physician is to meddle with the former, suggests the idea that wisdom is not an heirloom in the family of the one who says it. What a set of idiots our clerical teachers must have been and be, if, after a quarter or half a century of their instruction, a person of fair intelligence is utterly incompetent to form any opinion about the subjects which they have been teaching, or trying to teach him, so long!

A minister must find it very hard work to preach to hearers who do not believe, or only half believe, what he preaches. But pews without heads in them are a still more depressing spectacle. He may convince the doubter and reform the profligate. But he cannot produce any change on pine and mahogany by his discourses, and the more wood he sees as he looks along his floor and galleries, the less his chance of being useful. It is natural that in times like the present changes of faith and of place of worship should be far from infrequent. It is not less natural that there should be regrets on one side and gratification on the other, when such changes occur. It even happens occasionally that the regrets become aggravated into reproaches, rarely from the side which receives the new accessions, less rarely from the one which is left. It is quite conceivable that the Roman Church, which considers itself the only true one, should look on those who leave its communion as guilty of a great offence. It is equally natural that a church which considers Pope and Pagan a pair of murderous giants, sitting at the mouths of their caves, alike in their hatred to true Christians, should regard any of its members who go over to Romanism as lost in fatal error. But within the Protestant fold there are many compartments, and it would seem that it is not a deadly defection to pass from one to another.

So far from such exchanges between sects being wrong, they ought to happen a great deal oftener than they do. All the larger bodies of Christians should be constantly exchanging members. All men are born with conservative or aggressive tendencies: they belong naturally with the idol-worshippers or the idol-breakers. Some wear their fathers' old clothes, and some will have a new suit. One class of men must have their faith hammered in like a nail, by authority; another class must have it worked in like a screw, by argument. Members of one of these classes often find themselves fixed by circumstances in the other. The late Orestes A. Brownson used to preach at one time to a little handful of persons, in a small upper room, where some of them got from him their first lesson about the substitution of reverence for idolatry, in dealing with the books they hold sacred. But after a time Mr. Brownson found he had mistaken his church, and went over to the Roman Catholic establishment, of which he became and remained to his dying day one of the most stalwart

champions. Nature is prolific and ambidextrous. While this strong convert was trying to carry us back to the ancient faith, another of her sturdy children, Theodore Parker, was trying just as hard to provide a new church for the future. One was driving the sheep into the ancient fold, while the other was taking down the bars that kept them out of the new pasture. Neither of these powerful men could do the other's work, and each had to find the task for which he was destined.

The "old gospel ship," as the Methodist song calls it, carries many who would steer by the wake of their vessel. But there are many others who do not trouble themselves to look over the stern, having their eyes fixed on the light-house in the distance before them. In less figurative language, there are multitudes of persons who are perfectly contented with the old formulae of the church with which they and their fathers before them have been and are connected, for the simple reason that they fit, like old shoes, because they have been worn so long, and mingled with these, in the most conservative religious body, are here and there those who are restless in the fetters of a confession of faith to which they have pledged themselves without believing in it. This has been true of the Athanasian creed, in the Anglican Church, for two centuries more or less, unless the Archbishop of Canterbury, Tillotson, stood alone in wishing the church were well rid of it. In fact, it has happened to the present writer to hear the Thirty-nine Articles summarily disposed of by one of the most zealous members of the American branch of that communion, in a verb of one syllable, more familiar to the ears of the fore-castle than to those of the vestry.

But on the other hand, it is far from uncommon to meet with persons among the so-called "liberal" denominations who are uneasy for want of a more definite ritual and a more formal organization than they find in their own body. Now, the rector or the minister must be well aware that there are such cases, and each of them must be aware that there are individuals under his guidance whom he cannot satisfy by argument, and who really belong by all their instincts to another communion. It seems as if a thoroughly honest, straight-collared clergyman would say frankly to his restless parishioner: "You do not believe the central doctrines of the church which you are in the habit of attending. You belong properly to Brother A.'s or Brother B.'s fold, and it will be more manly and probably more profitable for you to go there than to stay with us." And, again, the rolling-collared clergyman might be expected to say to this or that uneasy listener: "You are longing for a church which will settle your beliefs for you, and relieve you to a great extent from the task, to which you seem to be unequal, of working out your own salvation with fear and trembling. Go over the way to Brother C.'s or Brother D.'s; your spine is weak, and they will furnish you a back-board which will keep you straight and make you comfortable." Patients are not the property of their physicians, nor parishioners of their ministers.

As for the children of clergymen, the presumption is that they will adhere to the general belief professed by their fathers. But they do not lose their birthright or their individuality, and have the world all before them to choose their creed from, like other persons. They are sometimes called to account for attacking the dogmas they are supposed to have heard preached from their childhood. They cannot defend themselves, for various good reasons. If they did, one would have to say he got more preaching than was good for him, and came at last to feel about sermons and their doctrines as confectioners' children do about candy. Another would have to own that he got his religious belief, not from his father, but from his mother. That would account for a great deal, for the milk in a woman's veins sweetens, or at least, dilutes an acrid doctrine, as the blood of the motherly cow softens the virulence of small-pox, so that its mark survives only as the seal of immunity. Another would plead atavism, and say he got his religious instincts from his great-grandfather, as some do their complexion or their temper. Others would be compelled to confess that the belief of a wife or a sister had displaced that which they naturally inherited. No man can be expected to go thus into the details of his family history, and, therefore, it is an ill-bred and indecent thing to fling a man's father's creed in his face, as if he had broken the fifth commandment in thinking for himself in the light of a new generation. Common delicacy would prevent him from saying that he did not get his faith from his father, but from somebody else, perhaps from his grandmother Lois and his mother Eunice, like the young man whom the Apostle cautioned against total abstinence.

It is always the right, and may sometimes be the duty, of the layman to call the attention of the clergy to the short-comings and errors, not only of their own time, but also of the preceding generations, of which they are the intellectual and moral product. This is especially true when the authority of great names is fallen back upon as a defence of opinions not in themselves deserving to be upheld. It may be very important to show that the champions of this or that set of dogmas, some of which are extinct or obsolete as beliefs, while others retain their vitality, held certain general notions which vitiated their conclusions. And in proportion to the eminence of such champions, and the frequency with which their names are appealed to as a bulwark of any particular creed or set of doctrines, is it urgent to show into what obliquities or extravagances or contradictions of thought they have been betrayed.

In summing up the religious history of New England, it would be just and proper to show the agency of the Mathers, father and son, in the witchcraft delusion. It would be quite fair to plead in their behalf the common beliefs of their time. It would be an extenuation of their acts that, not many years before, the great and good magistrate, Sir Matthew Hale, had sanctioned the conviction of prisoners accused of witchcraft. To fall back on the errors of the time is very proper when we are trying our predecessors in foro conscientiae: The houses they dwelt in may have had some weak or decayed beams and rafters, but they served for their shelter, at any rate. It is quite another matter when those rotten timbers are used in holding up the roofs over our own heads. Still more, if one of our ancestors built on an unsafe or an unwholesome foundation, the best thing we can do is to leave it and persuade others to leave it if we can. And if we refer to him as a precedent, it must be as a warning and not as a guide.

Such was the reason of the present writer's taking up the writings of Jonathan Edwards for examination in a recent essay. The "Edwardsian" theology is still recognized as a power in and beyond the denomination to which he belonged. One or more churches bear his name, and it is thrown into the scale of theological belief as if it added great strength to the party which claims him. That he was a man of extraordinary endowments and deep spiritual nature was not questioned, nor that he was a most acute reasoner, who could unfold a proposition into its consequences as patiently, as convincingly, as a palaeontologist extorts its confession

from a fossil fragment. But it was maintained that so many dehumanizing ideas were mixed up with his conceptions of man, and so many diabolizing attributes embodied in his imagination of the Deity, that his system of beliefs was tainted throughout by them, and that the fact of his being so remarkable a logician recoiled on the premises which pointed his inexorable syllogisms to such revolting conclusions. When he presents us a God, in whose sight children, with certain not too frequent exceptions, "are young vipers, and are infinitely more hateful than vipers;" when he gives the most frightful detailed description of infinite and endless tortures which it drives men and women mad to think of prepared for "the bulk of mankind;" when he cruelly pictures a future in which parents are to sing hallelujahs of praise as they see their children driven into the furnace, where they are to lie "roasting" forever,—we have a right to say that the man who held such beliefs and indulged in such imaginations and expressions is a burden and not a support in reference to the creed with which his name is associated. What heathenism has ever approached the horrors of this conception of human destiny? It is not an abuse of language to apply to such a system of beliefs the name of Christian pessimism.

If these and similar doctrines are so generally discredited as some appear to think, we might expect to see the change showing itself in catechisms and confessions of faith, to hear the joyful news of relief from its horrors in all our churches, and no longer to read in the newspapers of ministers rejected or put on trial for heresy because they could not accept the most dreadful of these doctrines. Whether this be so or not, it must be owned that the name of Jonathan Edwards does at this day carry a certain authority with it for many persons, so that anything he believed gains for them some degree of probability from that circumstance. It would, therefore, be of much interest to know whether he was trustworthy in his theological speculations, and whether he ever changed his belief with reference to any of the great questions above alluded to.

Some of our readers may remember a story which got abroad many years ago that a certain M. Babinet, a scientific Frenchman of note, had predicted a serious accident soon to occur to the planet on which we live by the collision with it of a great comet then approaching us, or some such occurrence. There is no doubt that this prediction produced anxiety and alarm in many timid persons. It became a very interesting question with them who this M. Babinet might be. Was he a sound observer, who had made other observations and predictions which had proved accurate? Or was he one of those men who are always making blunders for other people to correct? Is he known to have changed his opinion as to the approaching disastrous event?

So long as there were any persons made anxious by this prediction, so long as there was even one who believed that he, and his family, and his nation, and his race, and the home of mankind, with all its monuments, were very soon to be smitten in mid-heaven and instantly shivered into fragments, it was very desirable to find any evidence that this prophet of evil was a man who held many extravagant and even monstrous opinions. Still more satisfactory would it be if it could be shown that he had reconsidered his predictions, and declared that he could not abide by his former alarming conclusions. And we should think very ill of any astronomer who would not rejoice for the sake of his fellow-creatures, if not for his own, to find the threatening presage invalidated in either or both of the ways just mentioned, even though he had committed himself to M. Babinet's dire belief.

But what is the trivial, temporal accident of the wiping out of a planet and its inhabitants to the infinite catastrophe which shall establish a mighty world of eternal despair? And which is it most desirable for mankind to have disproved or weakened, the grounds of the threat of M. Babinet, or those of the other infinitely more terrible comminations, so far as they rest on the authority of Jonathan Edwards?

The writer of this paper had been long engaged in the study of the writings of Edwards, with reference to the essay he had in contemplation, when, on speaking of the subject to a very distinguished orthodox divine, this gentleman mentioned the existence of a manuscript of Edwards which had been held back from the public on account of some opinions or tendencies it contained, or was suspected of containing "High Arianism" was the exact expression he used with reference to it. On relating this fact to an illustrious man of science, whose name is best known to botanists, but is justly held in great honor by the orthodox body to which he belongs, it appeared that he, too, had heard of such a manuscript, and the questionable doctrine associated with it in his memory was Sabellianism. It was of course proper in the writer of an essay on Jonathan Edwards to mention the alleged existence of such a manuscript, with reference to which the same caution seemed to have been exercised as that which led, the editor of his collected works to suppress the language Edwards had used about children.

This mention led to a friendly correspondence between the writer and one of the professors in the theological school at Andover, and finally to the publication of a brief essay, which, for some reason, had been withheld from publication for more than a century. Its title is "Observations concerning the Scripture OEconomy of the Trinity and Covenant of Redemption. By Jonathan Edwards." It contains thirty-six pages and a half, each small page having about two hundred words. The pages before the reader will be found to average about three hundred and twenty-five words. An introduction and an appendix by the editor, Professor Egbert C. Smyth, swell the contents to nearly a hundred pages, but these additions, and the circumstance that it is bound in boards, must not lead us to overlook the fact that the little volume is nothing more than a pamphlet in book's clothing.

A most extraordinary performance it certainly is, dealing with the arrangements entered into by the three persons of the Trinity, in as bald and matter-of-fact language and as commercial a spirit as if the author had been handling the adjustment of a limited partnership between three retail tradesmen. But, lest a layman's judgment might be considered insufficient, the treatise was submitted by the writer to one of the most learned of our theological experts,—the same who once informed a church dignitary, who had been attempting to define his theological position, that he was a Eutychian,—a fact which he seems to have been no more aware of than M. Jourdain was conscious that he had been speaking prose all his life. The treatise appeared to this professor anti-trinitarian, not in the direction of Unitarianism, however, but of Tritheism. Its anthropomorphism affected him like blasphemy, and the paper produced in him the sense of "great disgust," which its whole character might well excite in the unlearned reader.

All this is, however, of little importance, for this is not the work of Edwards referred to by the present writer in his previous essay. The tract recently printed as a volume may be the one referred to by Dr.

Bushnell, in 1851, but of this reference by him the writer never heard until after his own essay was already printed. The manuscript of the "Observations" was received by Professor Smyth, as he tells us in his introduction, about fifteen years ago, from the late Reverend William T. Dwight, D. D., to whom it was bequeathed by his brother, the Reverend Dr. Sereno E. Dwight.

But the reference of the present writer was to another production of the great logician, thus spoken of in a quotation from "the accomplished editor of the Hartford 'Courant,'" to be found in Professor Smyth's introduction:

"It has long been a matter of private information that Professor Edwards A. Park, of Andover, had in his possession an unpublished manuscript of Edwards of considerable extent, perhaps two thirds as long as his treatise on the will. As few have ever seen the manuscript, its contents are only known by vague reports.... It is said that it contains a departure from his published views on the Trinity and a modification of the view of original sin. One account of it says that the manuscript leans toward Sabellianism, and that it even approaches Pelagianism."

It was to this "suppressed" manuscript the present writer referred, and not to the slender brochure recently given to the public. He is bound, therefore, to say plainly that to satisfy inquirers who may be still in doubt with reference to Edwards's theological views, it would be necessary to submit this manuscript, and all manuscripts of his which have been kept private, to their inspection, in print, if possible, so that all could form their own opinion about it or them.

The whole matter may be briefly stated thus: Edwards believed in an eternity of unimaginable horrors for "the bulk of mankind." His authority counts with many in favor of that belief, which affects great numbers as the idea of ghosts affected Madame de Stall: "Je n'y crois pas, mais je les crains." This belief is one which it is infinitely desirable to the human race should be shown to be possibly, probably, or certainly erroneous. It is, therefore, desirable in the interest of humanity that any force the argument in its favor may derive from Edwards's authority should be weakened by showing that he was capable of writing most unwisely, and if it should be proved that he changed his opinions, or ran into any "heretical" vagaries, by using these facts against the validity of his judgment. That he was capable of writing most unwisely has been sufficiently shown by the recent publication of his "Observations." Whether he, anywhere contradicted what were generally accepted as his theological opinions, or how far he may have lapsed into heresies, the public will never rest satisfied until it sees and interprets for itself everything that is open to question which may be contained in his yet unpublished manuscripts. All this is not in the least a personal affair with the writer, who, in the course of his studies of Edwards's works, accidentally heard, from the unimpeachable sources sufficiently indicated, the reports, which it seems must have been familiar to many, that there was unpublished matter bearing on the opinions of the author through whose voluminous works he had been toiling. And if he rejoiced even to hope that so wise a man as Edwards has been considered, so good a man as he is recognized to have been, had, possibly in his changes of opinion, ceased to think of children as vipers, and of parents as shouting hallelujahs while their lost darlings were being driven into the flames, where is the theologian who would not rejoice to hope so with him or who would be willing to tell his wife or his daughter that he did not?

The real, vital division of the religious part of our Protestant communities is into Christian optimists and Christian pessimists. The Christian optimist in his fullest development is characterized by a cheerful countenance, a voice in the major key, an undisguised enjoyment of earthly comforts, and a short confession of faith. His theory of the universe is progress; his idea of God is that he is a Father with all the true paternal attributes, of man that he is destined to come into harmony with the key-note of divine order, of this earth that it is a training school for a better sphere of existence. The Christian pessimist in his most typical manifestation is apt to wear a solemn aspect, to speak, especially from the pulpit, in the minor key, to undervalue the lesser enjoyments of life, to insist on a more extended list of articles of belief. His theory of the universe recognizes this corner of it as a moral ruin; his idea of the Creator is that of a ruler whose pardoning power is subject to the veto of what is called "justice;" his notion of man is that he is born a natural hater of God and goodness, and that his natural destiny is eternal misery. The line dividing these two great classes zigzags its way through the religious community, sometimes following denominational layers and cleavages, sometimes going, like a geological fracture, through many different strata. The natural antagonists of the religious pessimists are the men of science, especially the evolutionists, and the poets. It was but a conditioned prophecy, yet we cannot doubt what was in Milton's mind when he sang, in one of the divinest of his strains, that

*"Hell itself will pass away,
And leave her dolorous mansions to the peering day."*

And Nature, always fair if we will allow her time enough, after giving mankind the inspired tinker who painted the Christian's life as that of a hunted animal, "never long at ease," desponding, despairing, on the verge of self-murder,—painted it with an originality, a vividness, a power and a sweetness, too, that rank him with the great authors of all time,—kind Nature, after this gift, sent as his counterpoise the inspired ploughman, whose songs have done more to humanize the hard theology of Scotland than all the rationalistic sermons that were ever preached. Our own Whittier has done and is doing the same thing, in a far holier spirit than Burns, for the inherited beliefs of New England and the country to which New England belongs. Let me sweeten these closing paragraphs of an essay not meaning to hold a word of bitterness with a passage or two from the lay-preacher who is listened to by a larger congregation than any man who speaks from the pulpit. Who will not hear his words with comfort and rejoicing when he speaks of "that larger hope which, secretly cherished from the times of Origen and Duns Scotus to those of Foster and Maurice, has found its fitting utterance in the noblest poem of the age?"

It is Tennyson's "In Memoriam" to which he refers, and from which he quotes four verses, of which this is the last:

"Behold! we know not anything

*I can but trust that good shall fall
At last,—far off,—at last, to all,
And every winter change to spring."*

If some are disposed to think that the progress of civilization and the rapidly growing change of opinion renders unnecessary any further effort to humanize "the Gospel of dread tidings;" if any believe the doctrines of the Longer and Shorter Catechism of the Westminster divines are so far obsolete as to require no further handling; if there are any who think these subjects have lost their interest for living souls ever since they themselves have learned to stay at home on Sundays, with their cakes and ale instead of going to meeting,—not such is Mr. Whittier's opinion, as we may infer from his recent beautiful poem, "The Minister's Daughter." It is not science alone that the old Christian pessimism has got to struggle with, but the instincts of childhood, the affections of maternity, the intuitions of poets, the contagious humanity of the philanthropist,—in short, human nature and the advance of civilization. The pulpit has long helped the world, and is still one of the chief defences against the dangers that threaten society, and it is worthy now, as it always has been in its best representation, of all love and honor. But many of its professed creeds imperatively demand revision, and the pews which call for it must be listened to, or the preacher will by and by find himself speaking to a congregation of bodiless echoes by and by find himself speaking to a congregation of bodiless echoes.

MEDICAL ESSAYS

PREFACE.

The character of the opposition which some of these papers have met with suggests the inference that they contain really important, but unwelcome truths. Negatives multiplied into each other change their sign and become positives. Hostile criticisms meeting together are often equivalent to praise, and the square of fault-finding turns out to be the same thing as eulogy.

But a writer has rarely so many enemies as it pleases him to believe. Self-love leads us to overrate the numbers of our negative constituency. The larger portion of my limited circle of readers must be quite indifferent to, if not ignorant of, the adverse opinions which have been expressed or recorded concerning any of these Addresses or Essays now submitted to their own judgment. It is proper, however, to inform them, that some of the positions maintained in these pages have been unsparingly attacked, with various degrees of ability, scholarship, and good-breeding. The tone of criticism naturally changes with local conditions in different parts of a country extended like our own, so that it is one of the most convenient gauges of the partial movements in the direction of civilization. It is satisfactory to add, that the views assailed have also been unflinchingly defended by unsought champions, among the ablest of whom it is pleasant to mention, at this moment of political alienation, the Editor of the Charleston Medical Journal.

"Currents and Counter-Currents" was written and delivered as an Oration, a florid rhetorical composition, expressly intended to secure the attention of an audience not easy to hold as listeners. It succeeded in doing this, and also in being as curiously misunderstood and misrepresented as if it had been a political harangue. This gave it more local notoriety than it might otherwise have attained, so that, as I learn, one ingenious person made use of its title as an advertisement to a production of his own.

The commonest mode of misrepresentation was this: qualified propositions, the whole meaning of which depended on the qualifications, were stripped of these and taken as absolute. Thus, the attempt to establish a presumption against giving poisons to sick persons was considered as equivalent to condemning the use of these substances. The only important inference the writer has been able to draw from the greater number of the refutations of his opinions which have been kindly sent him, is that the preliminary education of the Medical Profession is not always what it ought to be.

One concession he is willing to make, whatever sacrifice of pride it may involve. The story of Massasoit, which has furnished a coral, as it were, for some teething critics, when subjected to a powerful logical analysis, though correct in its essentials, proves to have been told with exceptionable breadth of statement, and therefore (to resume the metaphor) has been slightly rounded off at its edges, so as to be smoother for any who may wish to bite upon it hereafter. In other respects the Discourse has hardly been touched. It is only an individual's expression, in his own way, of opinions entertained by hundreds of the Medical Profession in every civilized country, and has nothing in it which on revision the writer sees cause to retract or modify. The superstitions it attacks lie at the very foundation of Homoeopathy, and of almost every form of medical charlatanism. Still the mere routinists and unthinking artisans in most callings dislike whatever shakes the dust out of their traditions, and it may be unreasonable to expect that Medicine will always prove an exception to the rule. One half the opposition which the numerical system of Louis has met with, as applied to the results of treatment, has been owing to the fact that it showed the movements of disease to be far more independent of the kind of practice pursued than was agreeable to the pride of those whose self-confidence it abated.

The statement, that medicines are more sparingly used in physicians' families than in most others, admits of a very natural explanation, without putting a harsh construction upon it, which it was not intended to admit. Outside pressure is less felt in the physician's own household; that is all. If this does not sometimes influence him to give medicine, or what seems to be medicine, when among those who have more confidence in drugging than his own family commonly has, the learned Professor Dungalson is hereby requested to apologize for his definition of the word Placebo, or to expunge it from his Medical Dictionary.

One thing is certain. A loud outcry on a slight touch reveals the weak spot in a profession, as well as in a patient. It is a doubtful policy to oppose the freest speech in those of our own number who are trying to show us where they honestly believe our weakness lies. Vast as are the advances of our Science and Art, may it not possibly prove on examination that we retain other old barbarisms beside the use of the astrological sign of Jupiter, with which we endeavor to insure good luck to our prescriptions? Is it the act of a friend or a foe to try to point them out to our brethren when asked to address them, and is the speaker to subdue the constitutional habit of his style to a given standard, under penalty of giving offence to a grave assembly?

"Homoeopathy and its Kindred Delusions" was published nearly twenty years ago, and has been long out of print, so that the author tried in vain to procure a copy until the kindness of a friend supplied him with the only one he has had for years. A foolish story reached his ears that he was attempting to buy up stray copies for the sake of suppressing it. This edition was in the press at that very time.

Many of the arguments contained in the Lectures have lost whatever novelty they may have possessed. All its predictions have been submitted to the formidable test of time. They appear to have stood it, so far, about as well as most uninspired prophecies; indeed, some of them require much less accommodation than certain grave commentators employ in their readings of the ancient Prophets.

If some statistics recently published are correct, Homoeopathy has made very slow progress in Europe.

In all England, as it appears, there are hardly a fifth more Homoeopathic practitioners than there are students attending Lectures at the Massachusetts Medical College at the present time. In America it has undoubtedly proved more popular and lucrative, yet how loose a hold it has on the public confidence is shown by the fact that, when a specially valued life, which has been played with by one of its agents, is seriously threatened, the first thing we expect to hear is that a regular practitioner is by the patient's bed, and the Homoeopathic counsellor overruled or discarded. Again, how many of the ardent and capricious persons who embraced Homoeopathy have run the whole round of pretentious novelties;—have been boarded at water-cure establishments, closeted with uterine and other specialists, and finally wandered over seas to put themselves in charge of foreign celebrities, who dosed them as lustily as they were ever dosed before they

took to globules! It will surprise many to learn to what a shadow of a shade Homoeopathy has dwindled in the hands of many of its noted practitioners. The itch-doctrine is treated with contempt. Infinitesimal doses are replaced by full ones whenever the fancy-practitioner chooses. Good Homoeopathic reasons can be found for employing anything that anybody wants to employ. Homoeopathy is now merely a name, an unproved theory, and a box of pellets pretending to be specifics, which, as all of us know, fail ignominiously in those cases where we would thankfully sacrifice all our prejudices and give the world to have them true to their promises.

Homoeopathy has not died out so rapidly as Tractoration. Perhaps it was well that it should not, for it has taught us a lesson of the healing faculty of Nature which was needed, and for which many of us have made proper acknowledgments. But it probably does more harm than good to medical science at the present time, by keeping up the delusion of treating everything by specifics,—the old barbarous notion that sick people should feed on poisons [Lachesis, arrow-poison, obtained from a serpent (Pulte). *Crotalus horridus*, rattlesnake's venom (Neidhard). The less dangerous *Pediculus capitis* is the favorite remedy of Dr. Mure, the English "Apostle of Homoeopathy." These are examples of the retrograde current setting towards barbarism] against which a part of the Discourse at the beginning of this volume is directed.

The infinitesimal globules have not become a curiosity as yet, like Perkins's Tractors. But time is a very elastic element in Geology and Prophecy. If Daniel's seventy weeks mean four hundred and ninety years, as the learned Prideaux and others have settled it that they do, the "not many years" of my prediction may be stretched out a generation or two beyond our time, if necessary, when the prophecy will no doubt prove true.

It might be fitting to add a few words with regard to the Essay on the Contagiousness of Puerperal Fever. But the whole question I consider to be now transferred from the domain of medical inquiry to the consideration of Life Insurance agencies and Grand Juries. For the justification of this somewhat sharply accented language I must refer the reader to the paper itself for details which I regret to have been forced to place on permanent record.

BOSTON, January, 1861.

A SECOND PREFACE.

These Lectures and Essays are arranged in the order corresponding to the date of their delivery or publication. They must, of course, be read with a constant reference to these dates, by such as care to read them. I have not attempted to modernize their aspect or character in presenting them, in this somewhat altered connection, to the public. Several of them were contained in a former volume which received its name from the Address called "Currents and Counter-Currents." Some of those contained in the former volume have been replaced by others. The Essay called "Mechanism of Vital Actions" has been transferred to a distinct collection of Miscellaneous essays, forming a separate volume.

I had some intention of including with these papers an Essay on Intermittent Fever in New England, which received one of the Boylston prizes in 1837, and was published in the following year. But as this was upon a subject of local interest, chiefly, and would have taken up a good deal of room, I thought it best to leave it out, trusting that the stray copies to be met with in musty book-shops would sufficiently supply the not very extensive or urgent demand for a paper almost half a century old.

Some of these papers created a little stir when they first fell from the press into the pool of public consciousness. They will slide in very quietly now in this new edition, and find out for themselves whether the waters are those of Lethe, or whether they are to live for a time as not wholly unvalued reminiscences.

March 21, 1883.

PREFACE TO THE NEW EDITION.

These Essays are old enough now to go alone without staff or crutch in the shape of Prefaces. A very few words may be a convenience to the reader who takes up the book and wishes to know what he is likely to find in it.

HOMOEOPATHY AND ITS KINDRED DELUSIONS.

Homoeopathy has proved lucrative, and so long as it continues to be so will surely exist,—as surely as astrology, palmistry, and other methods of getting a living out of the weakness and credulity of mankind and womankind. Though it has no pretensions to be considered as belonging among the sciences, it may be looked upon by a scientific man as a curious object of study among the vagaries of the human mind. Its influence for good or the contrary may be made a matter of calm investigation. I have studied it in the Essay before the reader, under the aspect of an extravagant and purely imaginative creation of its founder. Since that first essay was written, nearly half a century ago, we have all had a chance to witness its practical working. Two opposite inferences may be drawn from its doctrines and practice. The first is that which is accepted by its disciples. This is that all diseases are "cured" by drugs. The opposite conclusion is drawn by a much larger number of persons. As they see that patients are very commonly getting well under treatment by infinitesimal drugging, which they consider equivalent to no medication at all, they come to disbelieve in every form of drugging and put their whole trust in "nature." Thus experience,

"From seeming evil still educing good,"

has shown that the dealers in this preposterous system of pseudo-therapeutics have cooperated with the wiser class of practitioners in breaking up the system of over-dosing and over-drugging which has been one of the standing reproaches of medical practice. While keeping up the miserable delusion that diseases were all to be "cured" by drugging, Homoeopathy has been unintentionally showing that they would very generally get well without any drugging at all. In the mean time the newer doctrines of the "mind cure," the "faith cure," and the rest are encroaching on the territory so long monopolized by that most ingenious of the pseudo-sciences. It would not be surprising if its whole ground should be taken possession of by these new claimants with their flattering appeals to the imaginative class of persons open to such attacks. Similia similibus may prove fatally true for once, if Homoeopathy is killed out by its new-born rivals.

It takes a very moderate amount of erudition to unearth a charlatan like the supposed father of the infinitesimal dosing system. The real inventor of that specious trickery was an Irishman by the name of Butler. The whole story is to be found in the "Ortus Medicinæ" of Van Helmont. I have given some account of his chapter "Butler" in different articles, but I would refer the students of our Homoeopathic educational institutions to the original, which they will find very interesting and curious.

CURRENTS AND COUNTER-CURRENTS

My attack on over-drugging brought out some hostile comments and treatment. Thirty years ago I expressed myself with more vivacity than I should show if I were writing on the same subjects today. Some of my more lively remarks called out very sharp animadversion. Thus my illustration of prevention as often better than treatment in the mother's words to her child which had got a poisonous berry in its mouth,—“Spit it out!” gave mortal offence to a well-known New York practitioner and writer, who advised the Massachusetts Medical Society to spit out the offending speaker. Worse than this was my statement of my belief that if a ship-load of miscellaneous drugs, with certain very important exceptions,—drugs, many of which were then often given needlessly and in excess, as then used “could be sunk to the bottom of the sea, it would be all the better for mankind and all the worse for the fishes.” This was too bad. The sentence was misquoted, quoted without its qualifying conditions, and frightened some of my worthy professional brethren as much as if I had told them to throw all physic to the dogs. But for the epigrammatic sting the sentiment would have been unnoticed as a harmless overstatement at the very worst.

Since this lecture was delivered a great and, as I think, beneficial change has taken place in the practice of medicine. The habit of the English “general practitioner” of making his profit out of the pills and potions he administered was ruinous to professional advancement and the dignity of the physician. When a half-starving medical man felt that he must give his patient draught and boluses for which he could charge him, he was in a pitiable position and too likely to persuade himself that his drugs were useful to his patient because they were profitable to him. This practice has prevailed a good deal in America, and was doubtless the source in some measure of the errors I combated.

THE CONTAGIOUSNESS OF PUERPERAL FEVER.

This Essay was read before a small Association called “The Society for Medical Improvement,” and published in a Medical Journal which lasted but a single year. It naturally attracted less attention than it would have done if published in such a periodical as the “American Journal of Medical Sciences.” Still it had its effect, as I have every reason to believe. I cannot doubt that it has saved the lives of many young mothers by calling attention to the existence and propagation of “Puerperal Fever as a Private Pestilence,” and laying down rules for taking the necessary precautions against it. The case has long been decided in favor of the views I advocated, but, at the time when I wrote two of the most celebrated professors of Obstetrics in this country opposed my conclusions with all the weight of their experience and position.

This paper was written in a great heat and with passionate indignation. If I touched it at all I might trim its rhetorical exuberance, but I prefer to leave it all its original strength of expression. I could not, if I had tried, have disguised the feelings with which I regarded the attempt to put out of sight the frightful facts which I brought forward and the necessary conclusions to which they led. Of course the whole matter has been looked at in a new point of view since the microbe as a vehicle of contagion has been brought into light, and explained the mechanism of that which was plain enough as a fact to all who were not blind or who did not shut their eyes.

O. W. H.

BEVERLY Farms, Mass., August 3, 1891

HOMOEOPATHY AND ITS KINDRED DELUSIONS

[Two lectures delivered before the Boston Society for the Diffusion of Useful Knowledge. 1842.]

[When a physician attempts to convince a person, who has fallen into the Homoeopathic delusion, of the emptiness of its pretensions, he is often answered by a statement of cases in which its practitioners are thought to have effected wonderful cures. The main object of the first of these Lectures is to show, by abundant facts, that such statements, made by persons unacquainted with the fluctuations of disease and the fallacies of observation, are to be considered in general as of little or no value in establishing the truth of a medical doctrine or the utility of a method of practice.

Those kind friends who suggest to a person suffering from a tedious complaint, that he “Had better try Homoeopathy,” are apt to enforce their suggestion by adding, that “at any rate it can do no harm.” This may

or may not be true as regards the individual. But it always does very great harm to the community to encourage ignorance, error, or deception in a profession which deals with the life and health of our fellow-creatures. Whether or not those who countenance Homoeopathy are guilty of this injustice towards others, the second of these Lectures may afford them some means of determining.

To deny that good effects may happen from the observance of diet and regimen when prescribed by Homoeopaths as well as by others, would be very unfair to them. But to suppose that men with minds so constituted as to accept such statements and embrace such doctrines as make up the so-called science of Homoeopathy are more competent than others to regulate the circumstances which influence the human body in health and disease, would be judging very harshly the average capacity of ordinary practitioners.

To deny that some patients may have been actually benefited through the influence exerted upon their imaginations, would be to refuse to Homoeopathy what all are willing to concede to every one of those numerous modes of practice known to all intelligent persons by an opprobrious title.

So long as the body is affected through the mind, no audacious device, even of the most manifestly dishonest character, can fail of producing occasional good to those who yield it an implicit or even a partial faith. The argument founded on this occasional good would be as applicable in justifying the counterfeiter and giving circulation to his base coin, on the ground that a spurious dollar had often relieved a poor man's necessities.

Homoeopathy has come before our public at a period when the growing spirit of eclecticism has prepared many ingenious and honest minds to listen to all new doctrines with a candor liable to degenerate into weakness. It is not impossible that the pretended evolution of great and mysterious virtues from infinitely attenuated atoms may have enticed a few over-refining philosophers, who have slid into a vague belief that matter subdivided grows less material, and approaches nearer to a spiritual nature as it requires a more powerful microscope for its detection.

However this may be, some persons seem disposed to take the ground of Menzel that the Laity must pass formal judgment between the Physician and the Homoeopathist, as it once did between Luther and the Romanists. The practitioner and the scholar must not, therefore, smile at the amount of time and labor expended in these Lectures upon this shadowy system; which, in the calm and serious judgment of many of the wisest members of the medical profession, is not entitled by anything it has ever said or done to the notoriety of a public rebuke, still less to the honors of critical martyrdom.]

I.

I have selected four topics for this lecture, the first three of which I shall touch but slightly, the last more fully. They are

1. The Royal cure of the King's Evil, or Scrofula.
2. The Weapon Ointment, and its twin absurdity, the Sympathetic Powder.
3. The Tar-water mania of Bishop Berkeley.
4. The History of the Metallic Tractors, or Perkinism.

The first two illustrate the ease with which numerous facts are accumulated to prove the most fanciful and senseless extravagances.

The third exhibits the entire insufficiency of exalted wisdom, immaculate honesty, and vast general acquirements to make a good physician of a great bishop.

The fourth shows us the intimate machinery of an extinct delusion, which flourished only forty years ago; drawn in all its details, as being a rich and comparatively recent illustration of the pretensions, the arguments, the patronage, by means of which windy errors have long been, and will long continue to be, swollen into transient consequence. All display in superfluous abundance the boundless credulity and excitability of mankind upon subjects connected with medicine.

"From the time of Edward the Confessor to Queen Anne, the monarchs of England were in the habit of touching those who were brought to them suffering with the scrofula, for the cure of that distemper. William the Third had good sense enough to discontinue the practice, but Anne resumed it, and, among her other patients, performed the royal operation upon a child, who, in spite of his, disease, grew up at last into Samuel Johnson. After laying his hand upon the sufferers, it was customary for the monarch to hang a gold piece around the neck of each patient. Very strict precautions were adopted to prevent those who thought more of the golden angel hung round the neck by a white ribbon, than of relief of their bodily infirmities, from making too many calls, as they sometimes attempted to do. According to the statement of the advocates and contemporaries of this remedy, none ever failed of receiving benefit unless their little faith and credulity starved their merits. Some are said to have been cured immediately on the very touch, others did not so easily get rid of their swellings, until they were touched a second time. Several cases are related, of persons who had been blind for several weeks, and months, and obliged even to be led to Whitehall, yet recovered their sight immediately upon being touched, so as to walk away without any guide." So widely, at one period, was the belief diffused, that, in the course of twelve years, nearly a hundred thousand persons were touched by Charles the Second. Catholic divines; in disputes upon the orthodoxy of their church, did not deny that the power had descended to protestant princes;—Dr. Harpsfield, in his "Ecclesiastical History of England," admitted it, and in Wiseman's words, "when Bishop Tooker would make use of this Argument to prove the Truth of our Church, Smitheus doth not thereupon go about to deny the Matter of fact; nay, both he and Cope acknowledge it." "I myself," says Wiseman, the best English surgical writer of his day, [Edinburgh Medical and Surgical Journal, vol. iii. p. 103.]—"I myself have been a frequent Eye-witness of many hundred of Cures performed by his Majesties Touch alone, without any assistance of Chirurgery; and those, many of them such as had tired out the endeavours of able Chirurgeons before they came hither. It were endless to recite what I myself have seen, and what I have received acknowledgments of by Letter, not only from the severall parts of this Nation, but also from Ireland, Scotland, Jersey, Garnsey. It is needless also to remember what Miracles of this nature were performed by the very Bloud of his late Majesty of Blessed memory, after whose decollation by the inhuman Barbarity of the Regicides, the reliques of that were gathered on Chips and in Handkerchieffs

by the pious Devotes, who could not but think so great a suffering in so honourable and pious a Cause, would be attended by an extraordinary assistance of God, and some more than ordinary a miracle: nor did their Faith deceive them in this there point, being so many hundred that found the benefit of it." [Severall Chirurgicall Treatises. London.1676. p. 246.]

Obstinate and incredulous men, as he tells us, accounted for these cures in three ways: by the journey and change of air the patients obtained in coming to London; by the influence of imagination; and the wearing of gold.

To these objections he answers, 1st. That many of those cured were inhabitants of the city. 2d. That the subjects of treatment were frequently infants. 3d. That sometimes silver was given, and sometimes nothing, yet the patients were cured.

A superstition resembling this probably exists at the present time in some ignorant districts of England and this country. A writer in a Medical Journal in the year 1807, speaks of a farmer in Devonshire, who, being a ninth son of a ninth son, is thought endowed with healing powers like those of ancient royalty, and who is accustomed one day in every week to strike for the evil.

I remember that one of my schoolmates told me, when a boy, of a seventh son of a seventh son, somewhere in Essex County, who touched for the scrofula, and who used to hang a silver fourpence halfpenny about the neck of those who came to him, which fourpence halfpenny it was solemnly affirmed became of a remarkably black color after having been some time worn, and that his own brother had been subjected to this extraordinary treatment; but I must add that my schoolmate drew a bow of remarkable length, strength, and toughness for his tender years.

One of the most curious examples of the fallacy of popular belief and the uncertainty of asserted facts in medical experience is to be found in the history of the UNGUENTUM ARMARIUM, or WEAPON OINTMENT.

Fabricius Hildanus, whose name is familiar to every surgical scholar, and Lord Bacon, who frequently dipped a little into medicine, are my principal authorities for the few circumstances I shall mention regarding it. The Weapon Ointment was a preparation used for the healing of wounds, but instead of its being applied to them, the injured part was washed and bandaged, and the weapon with which the wound was inflicted was carefully anointed with the unguent. Empirics, ignorant barbers, and men of that sort, are said to have especially employed it. Still there were not wanting some among the more respectable members of the medical profession who supported its claims. The composition of this ointment was complicated, in the different formulæ given by different authorities; but some substances addressed to the imagination, rather than the wound or weapon, entered into all. Such were portions of mummy, of human blood, and of moss from the skull of a thief hung in chains.

Hildanus was a wise and learned man, one of the best surgeons of his time. He was fully aware that a part of the real secret of the Unguentum Armarium consisted in the washing and bandaging the wound and then letting it alone. But he could not resist the solemn assertions respecting its efficacy; he gave way before the outcry of facts, and therefore, instead of denying all their pretensions, he admitted and tried to account for them upon supernatural grounds. As the virtue of those applications, he says, which are made to the weapon cannot reach the wound, and as they can produce no effect without contact, it follows, of necessity, that the Devil must have a hand in the business; and as he is by far the most long headed and experienced of practitioners, he cannot find this a matter of any great difficulty. Hildanus himself reports, in detail, the case of a lady who had received a moderate wound, for which the Unguentum Armarium was employed without the slightest use. Yet instead of receiving this flat case of failure as any evidence against the remedy, he accounts for its not succeeding by the devout character of the lady, and her freedom from that superstitious and over-imaginative tendency which the Devil requires in those who are to be benefited by his devices.

Lord Bacon speaks of the Weapon Ointment, in his Natural History, as having in its favor the testimony of men of credit, though, in his own language, he himself "as yet is not fully inclined to believe it." His remarks upon the asserted facts respecting it show a mixture of wise suspicion and partial belief. He does not like the precise directions given as to the circumstances under which the animals from which some of the materials were obtained were to be killed; for he thought it looked like a provision for an excuse in case of failure, by laying the fault to the omission of some of these circumstances. But he likes well that "they do not observe the confecting of the Ointment under any certain constellation; which is commonly the excuse of magical medicines, when they fail, that they were not made under a fit figure of heaven." [This was a mistake, however, since the two recipes given by Hildanus are both very explicit as to the aspect of the heavens required for different stages of the process.] "It was pretended that if the offending weapon could not be had, it would serve the purpose to anoint a wooden one made like it." "This," says Bacon, "I should doubt to be a device to keep this strange form of cure in request and use; because many times you cannot come by the weapon itself." And in closing his remarks on the statements of the advocates of the ointment, he says, "Lastly, it will cure a beast as well as a man, which I like best of all the rest, because it subjecteth the matter to an easy trial." It is worth remembering, that more than two hundred years ago, when an absurd and fantastic remedy was asserted to possess wonderful power, and when sensible persons ascribed its pretended influence to imagination, it was boldly answered that the cure took place when the wounded party did not know of the application made to the weapon, and even when a brute animal was the subject of the experiment, and that this assertion, as we all know it was, came in such a shape as to shake the incredulity of the keenest thinker of his time. The very same assertion has been since repeated in favor of Perkinism, and, since that, of Homoeopathy.

The same essential idea as that of the Weapon Ointment reproduced itself in the still more famous SYMPATHETIC POWDER. This Powder was said to have the faculty, if applied to the blood-stained garments of a wounded person, to cure his injuries, even though he were at a great distance at the time. A friar, returning from the East, brought the recipe to Europe somewhat before the middle of the seventeenth century. The Grand Duke of Florence, in which city the friar was residing, heard of his cures, and tried, but without success, to obtain his secret. Sir Kenehn Digby, an Englishman well known to fame, was fortunate enough to do him a favor, which wrought upon his feelings and induced him to impart to his benefactor the composition of his extraordinary Powder. This English knight was at different periods of his life an admiral, a

theologian, a critic, a metaphysician, a politician, and a disciple of Alchemy. As is not unfrequent with versatile and inflammable people, he caught fire at the first spark of a new medical discovery, and no sooner got home to England than he began to spread the conflagration.

An opportunity soon offered itself to try the powers of the famous powder. Mr. J. Howell, having been wounded in endeavoring to part two of his friends who were fighting a duel, submitted himself to a trial of the Sympathetic Powder. Four days after he received his wounds, Sir Kenehn dipped one of Mr. Howell's gaiters in a solution of the Powder, and immediately, it is said, the wounds, which were very painful, grew easy, although the patient, who was conversing in a corner of the chamber, had not, the least idea of what was doing with his garter. He then returned home, leaving his garter in the hands of Sir Kenelm, who had hung it up to dry, when Mr. Howell sent his servant in a great hurry to tell him that his wounds were paining him horribly; the garter was therefore replaced in the solution of the Powder, "and the patient got well after five or six days of its continued immersion."

King James First, his son Charles the First, the Duke of Buckingham, then prime minister, and all the principal personages of the time, were cognizant of this fact; and James himself, being curious to know the secret of this remedy, asked it of Sir Kenelm, who revealed it to him, and his Majesty had the opportunity of making several trials of its efficacy, "which all succeeded in a surprising manner." [Dict. des Sciences Medieales.]

The king's physician, Dr. Mayerne, was made master of the secret, which he carried to France and communicated to the Duke of Mayenne, who performed many cures by means of it, and taught it to his surgeon, who, after the Duke's death, sold it to many distinguished persons, by whose agency it soon ceased to be a secret. What was this wonderful substance which so astonished kings, princes, dukes, knights, and doctors? Nothing but powdered blue vitriol. But it was made to undergo several processes that conferred on it extraordinary virtues. Twice or thrice it was to be dissolved, filtered, and crystallized. The crystals were to be laid in the sun during the months of June, July, and August, taking care to turn them carefully that all should be exposed. Then they were to be powdered, triturated, and again exposed to the sun, again reduced to a very fine powder, and secured in a vessel, while hot, from the sunshine. If there seem anything remarkable in the fact of such astonishing properties being developed by this process, it must be from our short-sightedness, for common salt and charcoal develop powers quite as marvellous after a certain number of thumps, stirs, and shakes, from the hands of modern workers of miracles. In fact the Unguentum Armarium and Sympathetic Powder resemble some more recent prescriptions; the latter consisting in an infinite dilution of the common dose in which remedies are given, and the two former in an infinite dilution of the common distance at which they are applied.

Whether philosophers, and more especially metaphysicians, have any peculiar tendency to dabble in drugs and dose themselves with physic, is a question which might suggest itself to the reader of their biographies.

When Bishop Berkeley visited the illustrious Malebranche at Paris, he found him in his cell, cooking in a small pipkin a medicine for an inflammation of the lungs, from which he was suffering; and the disease, being unfortunately aggravated by the vehemence of their discussion, or the contents of the pipkin, carried him off in the course of a few days. Berkeley himself afforded a remarkable illustration of a truth which has long been known to the members of one of the learned professions, namely, that no amount of talent, or of acquirements in other departments, can rescue from lamentable folly those who, without something of the requisite preparation, undertake to experiment with nostrums upon themselves and their neighbors. The exalted character of Berkeley is thus drawn by Sir James Mackintosh: Ancient learning, exact science, polished society, modern literature, and the fine arts, contributed to adorn and enrich the mind of this accomplished man. All his contemporaries agreed with the satirist in ascribing

"'To Berkeley every virtue under heaven.'

"Even the discerning, fastidious, and turbulent Atterbury said, after an interview with him, 'So much understanding, so much knowledge, so much innocence, and such humility, I did not think had been the portion of any but angels, till I saw this gentleman.'"

But among the writings of this great and good man is an Essay of the most curious character, illustrating his weakness upon the point in question, and entitled, "Siris, a Chain of Philosophical Reflections and Inquiries concerning the Virtues of TAR WATER, and divers other Subjects,"—an essay which begins with a recipe for his favorite fluid, and slides by gentle gradations into an examination of the sublimest doctrines of Plato. To show how far a man of honesty and benevolence, and with a mind of singular acuteness and depth, may be run away with by a favorite notion on a subject which his habits and education do not fit him to investigate, I shall give a short account of this Essay, merely stating that as all the supposed virtues of Tar Water, made public in successive editions of his treatise by so illustrious an author, have not saved it from neglect and disgrace, it may be fairly assumed that they were mainly imaginary.

The bishop, as is usual in such cases, speaks of himself as indispensably obliged, by the duty he owes to mankind, to make his experience public. Now this was by no means evident, nor does it follow in general, that because a man has formed a favorable opinion of a person or a thing he has not the proper means of thoroughly understanding, he shall be bound to print it, and thus give currency to his impressions, which may be erroneous, and therefore injurious. He would have done much better to have laid his impressions before some experienced physicians and surgeons, such as Dr. Mead and Mr. Cheselden, to have asked them to try his experiment over again, and have been guided by their answers. But the good bishop got excited; he pleased himself with the thought that he had discovered a great panacea; and having once tasted the bewitching cup of self-quackery, like many before and since his time, he was so infatuated with the draught that he would insist on pouring it down the throats of his neighbors and all mankind.

The precious fluid was made by stirring a gallon of water with a quart of tar, leaving it forty-eight hours, and pouring off the clear water. Such was the specific which the great metaphysician recommended for averting and curing all manner of diseases. It was, if he might be believed, a preventive of the small-pox, and of great use in the course of the disease. It was a cure for impurities of the blood, coughs, pleurisy, peripneumony, erysipelas, asthma, indigestion, carchexia, hysterics, dropsy, mortification, scurvy, and

hypochondria. It was of great use in gout and fevers, and was an excellent preservative of the teeth and gums; answered all the purpose of Elixir Proprietatis, Stoughton's drops, diet drinks, and mineral waters; was particularly to be recommended to sea-faring persons, ladies, and men of studious and sedentary lives; could never be taken too long, but, on the contrary, produced advantages which sometimes did not begin to show themselves for two or three months.

"From my representing Tar Water as good for so many things," says Berkeley, "some perhaps may conclude it is good for nothing. But charity obligeth me to say what I know, and what I think, however it may be taken. Men may censure and object as they please, but I appeal to time and experiment. Effects misimputed, cases wrong told, circumstances overlooked, perhaps, too, prejudices and partialities against truth, may for a time prevail and keep her at the bottom of her well, from whence nevertheless she emergeth sooner or later, and strikes the eyes of all who do not keep them shut." I cannot resist the temptation of illustrating the bishop's belief in the wonderful powers of his remedy, by a few sentences from different parts of his essay. "The hardness of stubbed vulgar constitutions renders them insensible of a thousand things that fret and gall those delicate people, who, as if their skin was peeled off, feel to the quick everything that touches them. The tender nerves and low spirits of such poor creatures would be much relieved by the use of Tar Water, which might prolong and cheer their lives." "It [the Tar Water] may be made stronger for brute beasts, as horses, in whose disorders I have found it very useful." "This same water will also give charitable relief to the ladies, who often want it more than the parish poor; being many of them never able to make a good meal, and sitting pale, puny, and forbidden, like ghosts, at their own table, victims of vapors and indigestion." It does not appear among the virtues of Tar Water that "children cried for it," as for some of our modern remedies, but the bishop says, "I have known children take it for above six months together with great benefit, and without any inconvenience; and after long and repeated experience I do esteem it a most excellent diet drink, fitted to all seasons and ages." After mentioning its usefulness in febrile complaints, he says: "I have had all this confirmed by my own experience in the late sickly season of the year one thousand seven hundred and forty-one, having had twenty-five fevers in my own family cured by this medicinal water, drunk copiously." And to finish these extracts with a most important suggestion for the improvement of the British nation: "It is much to be lamented that our Insulars who act and think so much for themselves, should yet, from grossness of air and diet, grow stupid or doat sooner than other people, who, by virtue of elastic air, water-drinking, and light food, preserve their faculties to extreme old age; an advantage which may perhaps be approached, if not equaled, even in these regions, by Tar Water, temperance, and early hours."

Berkeley died at the age of about seventy; he might have lived longer, but his fatal illness was so sudden that there was not time enough to stir up a quart of the panacea. He was an illustrious man, but he held two very odd opinions; that tar water was everything, and that the whole material universe was nothing.

Most of those present have at some time in their lives heard mention made of the METALLIC TRACTORS, invented by one Dr. Perkins, an American, and formerly enjoying great repute for the cure of various diseases. Many have seen or heard of a satirical poem, written by one of our own countrymen also, about forty years since, and called "Terrible Tractoration." The Metallic Tractors are now so utterly abandoned that I have only by good fortune fallen upon a single one of a pair, to show for the sake of illustration. For more than thirty years this great discovery, which was to banish at least half the evils which afflict humanity, has been sleeping undisturbed in the grave of oblivion. Not a voice has, for this long period, been raised in its favor; its noble and learned patrons, its public institutions, its eloquent advocates, its brilliant promises are all covered with the dust of silent neglect; and of the generation which has sprung up since the period when it flourished, very few know anything of its history, and hardly even the title which in its palmy days it bore of PERKINISM. Taking it as settled, then, as no one appears to answer for it, that Perkinism is entirely dead and gone, that both in public and private, officially and individually, its former adherents even allow it to be absolutely defunct, I select it for anatomical examination. If this pretended discovery was made public; if it was long kept before the public; if it was addressed to the people of different countries; if it was formally investigated by scientific men, and systematically adopted by benevolent persons, who did everything in their power to diffuse the knowledge and practice of it; if various collateral motives, such as interest and vanity, were embarked in its cause; if, notwithstanding all these things, it gradually sickened and died, then the conclusion seems a fair one, that it did not deserve to live. Contrasting its failure with its high pretensions, it is fair to call it an imposition; whether an expressly fraudulent contrivance or not, some might be ready to question. Everything historically shown to have happened concerning the mode of promulgation, the wide diffusion, the apparent success of this delusion, the respectability and enthusiasm of its advocates, is of great interest in showing to what extent and by what means a considerable part of the community may be led into the belief of that which is to be eventually considered as an idle folly. If there is any existing folly, fraudulent or innocent in its origin, which appeals to certain arguments for its support; provided that the very same arguments can be shown to have been used for Perkinism with as good reason, they will at once fall to the ground. Still more, if it shall appear that the general course of any existing delusion bears a strong resemblance to that of Perkinism, that the former is most frequently advocated by the same class of persons who were conspicuous in behalf of the latter, and treated with contempt or opposed by the same kind of persons who thus treated Perkinism; if the facts in favor of both have a similar aspect; if the motives of their originators and propagators may be presumed to have been similar; then there is every reason to suppose that the existing folly will follow in the footsteps of the past, and after displaying a given amount of cunning and credulity in those deceiving and deceived, will drop from the public view like a fruit which has ripened into spontaneous rottenness, and be succeeded by the fresh bloom of some other delusion required by the same excitable portion of the community.

Dr. Elisha Perkins was born at Norwich, Connecticut, in the year 1740. He had practised his profession with a good local reputation for many years, when he fell upon a course of experiments, as it is related, which led to his great discovery. He conceived the idea that metallic substances might have the effect of removing diseases, if applied in a certain manner; a notion probably suggested by the then recent experiments of Galvani, in which muscular contractions were found to be produced by the contact of two metals with the

living fibre. It was in 1796 that his discovery was promulgated in the shape of the Metallic Tractors, two pieces of metal, one apparently iron and the other brass, about three inches long, blunt at one end and pointed at the other. These instruments were applied for the cure of different complaints, such as rheumatism, local pains, inflammations, and even tumors, by drawing them over the affected part very lightly for about twenty minutes. Dr. Perkins took out a patent for his discovery, and travelled about the country to diffuse the new practice. He soon found numerous advocates of his discovery, many of them of high standing and influence. In the year 1798 the tractors had crossed the Atlantic, and were publicly employed in the Royal Hospital at Copenhagen. About the same time the son of the inventor, Mr. Benjamin Douglass Perkins, carried them to London, where they soon attracted attention. The Danish physicians published an account of their cases, containing numerous instances of alleged success, in a respectable octavo volume. In the year 1804 an establishment, honored with the name of the Perkinian Institution, was founded in London. The transactions of this institution were published in pamphlets, the Perkinian Society had public dinners at the Crown and Anchor, and a poet celebrated their medical triumph in strains like these:

*"See, pointed metals, blest with power t' appease
The ruthless rage of merciless disease,
O'er the frail part a subtle fluid pour,
Drenched with invisible Galvanic shower,
Till the arthritic staff and crutch forego,
And leap exulting like the bounding roe!"*

While all these things were going on, Mr. Benjamin Douglass Perkins was calmly pocketing money, so that after some half a dozen years he left the country with more than ten thousand pounds, which had been paid him by the believers in Great Britain. But in spite of all this success, and the number of those interested and committed in its behalf, Perkinism soon began to decline, and in 1811 the Tractors are spoken of by an intelligent writer as being almost forgotten. Such was the origin and duration of this doctrine and practice, into the history of which we will now look a little more narrowly.

Let us see, then, by whose agency this delusion was established and kept up; whether it was principally by those who were accustomed to medical pursuits, or those whose habits and modes of reasoning were different; whether it was with the approbation of those learned bodies usually supposed to take an interest in scientific discoveries, or only of individuals whose claims to distinction were founded upon their position in society, or political station, or literary eminence; whether the judicious or excitable classes entered most deeply into it; whether, in short, the scientific men of that time were deceived, or only intruded upon, and shouted down for the moment by persons who had no particular call to invade their precincts.

Not much, perhaps, was to be expected of the Medical Profession in the way of encouragement. One Dr. Fuller, who wrote in England, himself a Perkinist, thus expressed his opinion: "It must be an extraordinary exertion of virtue and humanity for a medical man, whose livelihood depends either on the sale of drugs, or on receiving a guinea for writing a prescription, which must relate to those drugs, to say to his patient, 'You had better purchase a set of Tractors to keep in your family; they will cure you without the expense of my attendance, or the danger of the common medical practice.' For very obvious reasons medical men must never be expected to recommend the use of Perkinism. The Tractors must trust for their patronage to the enlightened and philanthropic out of the profession, or to medical men retired from practice, and who know of no other interest than the luxury of relieving the distressed. And I do not despair of seeing the day when but very few of this description as well as private families will be without them."

Whether the motives assigned by this medical man to his professional brethren existed or not, it is true that Dr. Perkins did not gain a great deal at their hands. The Connecticut Medical Society expelled him in 1797 for violating their law against the use of nostrums, or secret remedies. The leading English physicians appear to have looked on with singular apathy or contempt at the miracles which it was pretended were enacting in the hands of the apostles of the new practice. In looking over the reviews of the time, I have found little beyond brief occasional notices of their pretensions; the columns of these journals being occupied with subjects of more permanent interest. The state of things in London is best learned, however, from the satirical poem to which I have already alluded as having been written at the period referred to. This was entitled, "Terrible Tractoration!! A Poetical Petition against Galvanizing Trumpery and the Perkinistic Institution. Most respectfully addressed to the Royal College of Physicians, by Christopher Caustic, M. D., LL. D., A. S. S., Fellow of the Royal College of Physicians, Aberdeen, and Honorary Member of no less than nineteen very learned Societies." Two editions of this work were published in London in the years 1803 and 1804, and one or two have been published in this country.

"Terrible Tractoration" is supposed, by those who never read it, to be a satire upon the follies of Perkins and his followers. It is, on the contrary, a most zealous defence of Perkinism, and a fierce attack upon its opponents, most especially upon such of the medical profession as treated the subject with neglect or ridicule. The Royal College of Physicians was the more peculiar object of the attack, but with this body, the editors of some of the leading periodicals, and several physicians distinguished at that time, and even now remembered for their services to science and humanity, were involved in unsparing denunciations. The work is by no means of the simply humorous character it might be supposed, but is overloaded with notes of the most seriously polemical nature. Much of the history of the subject, indeed, is to be looked for in this volume.

It appears from this work that the principal members of the medical profession, so far from hailing Mr. Benjamin Douglass Perkins as another Harvey or Jenner, looked very coldly upon him and his Tractors; and it is now evident that, though they were much abused for so doing, they knew very well what they had to deal with, and were altogether in the right. The delusion at last attracted such an amount of attention as to induce Dr. Haygarth and some others of respectable standing to institute some experiments which I shall mention in their proper place, the result of which might have seemed sufficient to show the emptiness of the whole contrivance.

The Royal Society, that learned body which for ages has constituted the best tribunal to which Britain can appeal in questions of science, accepted Mr. Perkins's Tractors and the book written about them, passed the customary vote of thanks, and never thought of troubling itself further in the investigation of pretensions of

such an aspect. It is not to be denied that a considerable number of physicians did avow themselves advocates of the new practice; but out of the whole catalogue of those who were publicly proclaimed as such, no one has ever been known, so far as I am aware, to the scientific world, except in connection with the short-lived notoriety of Perkinism. Who were the people, then, to whose activity, influence, or standing with the community was owing all the temporary excitement produced by the Metallic Tractors?

First, those persons who had been induced to purchase a pair of Tractors. These little bits of brass and iron, the intrinsic value of which might, perhaps, amount to ninepence, were sold at five guineas a pair! A man who has paid twenty-five dollars for his whistle is apt to blow it louder and longer than other people. So it appeared that when the "Perkinean Society" applied to the possessors of Tractors in the metropolis to concur in the establishment of a public institution for the use of these instruments upon the poor, "it was found that only five out of above a hundred objected to subscribe, on account of their want of confidence in the efficacy of the practice; and these," the committee observes, "there is reason to believe, never gave them a fair trial, probably never used them in more than one case, and that perhaps a case in which the Tractors had never been recommended as serviceable." "Purchasers of the Tractors," said one of their ardent advocates, "would be among the last to approve of them if they had reason to suppose themselves defrauded of five guineas." He forgot poor Moses, with his "gross of green spectacles, with silver rims and shagreen cases." "Dear mother," cried the boy, "why won't you listen to reason? I had them a dead bargain, or I should not have bought them. The silver rims alone will sell for double the money."

But it is an undeniable fact, that many persons of considerable standing, and in some instances holding the most elevated positions in society, openly patronized the new practice. In a translation of a work entitled "Experiments with the Metallic Tractors," originally published in Danish, thence rendered successively into German and English, Mr. Benjamin Perkins, who edited the English edition, has given a copious enumeration of the distinguished individuals, both in America and Europe, whose patronage he enjoyed. He goes so far as to signify that ROYALTY itself was to be included among the number. When the Perkinean Institution was founded, no less a person than Lord Rivers was elected President, and eleven other individuals of distinction, among them Governor Franklin, son of Dr. Franklin, figured as Vice-Presidents. Lord Henniker, a member of the Royal Society, who is spoken of as a man of judgment and talents, condescended to patronize the astonishing discovery, and at different times bought three pairs of Tractors. When the Tractors were introduced into Europe, a large number of testimonials accompanied them from various distinguished characters in America, the list of whom is given in the translation of the Danish work referred to as follows:

"Those who have individually stated cases, or who have presented their names to the public as men who approved of this remedy, and acknowledged themselves instrumental in circulating the Tractors, are fifty-six in number; thirty-four of whom are physicians and surgeons, and many of them of the first eminence, thirteen clergymen, most of whom are doctors of divinity, and connected with the literary institutions of America; among the remainder are two members of Congress, one professor of natural philosophy in a college, etc., etc." It seemed to be taken rather hardly by Mr. Perkins that the translators of the work which he edited, in citing the names of the advocates of the Metallic Practice, frequently omitted the honorary titles which should have been annexed. The testimonials were obtained by the Danish writer, from a pamphlet published in America, in which these titles were given in full. Thus one of these testimonials is from "John Tyler, Esq., a magistrate in the county of New London, and late Brigadier-General of the militia in that State." The "omission of the General's title" is the subject of complaint, as if this title were sufficient evidence of the commanding powers of one of the patrons of tractoration. A similar complaint is made when "Calvin Goddard, Esq., of Plainfield, Attorney at Law, and a member of the Legislature of the State of Connecticut," is mentioned without his titular honors, and even on account of the omission of the proper official titles belonging to "Nathan Pierce, Esq., Governor and Manager of the Almshouse of Newburyport." These instances show the great importance to be attached to civil and military dignities, in qualifying their holders to judge of scientific subjects, a truth which has not been overlooked by the legitimate successors of the Perkinists. In Great Britain, the Tractors were not less honored than in America, by the learned and the illustrious. The "Perkinistic Committee" made this statement in their report: "Mr. Perkins has annually laid before the public a large collection of new cases communicated to him for that purpose by disinterested and intelligent characters, from almost every quarter of Great Britain. In regard to the competency of these vouchers, it will be sufficient simply to state that, amongst others whose names have been attached to their communications, are eight professors, in four different universities, twenty-one regular Physicians, nineteen Surgeons, thirty Clergymen, twelve of whom are Doctors of Divinity, and numerous other characters of equal respectability."

It cannot but excite our notice and surprise that the number of clergymen both in America and Great Britain who thrust forward their evidence on this medical topic was singularly large in proportion to that of the members of the medical profession. Whole pages are contributed by such worthies as the Rev. Dr. Trotter of Hans Place, the Rear. Waring Willett, Chaplain to the Earl of Dunmore, the Rev. Dr. Clarke, Chaplain to the Prince of Wales. The style of these theologicico-medical communications may be seen in the following from a divine who was also professor in one of the colleges of New England. "I have used the Tractors with success in several other cases in my own family, and although, like Naaman the Syrian, I cannot tell why the waters of Jordan should be better than Abana and Pharpar, rivers of Damascus; yet since experience has proved them so, no reasoning can change the opinion. Indeed, the causes of all common facts are, we think, perfectly well known to us; and it is very probable, fifty or a hundred years hence, we shall as well know why the Metallic Tractors should in a few minutes remove violent pains, as we now know why cantharides and opium will produce opposite effects, namely, we shall know very little about either excepting facts." Fifty or a hundred years hence! if he could have looked forward forty years, he would have seen the descendants of the "Perkinistic" philosophers swallowing infinitesimal globules, and knowing and caring as much about the Tractors as the people at Saratoga Springs do about the waters of Abana and Pharpar.

I trust it will not be thought in any degree disrespectful to a profession which we all honor, that I have mentioned the great zeal of many clergymen in the cause of Perkinism. I hope, too, that I may without offence suggest the causes which have often led them out of their own province into one to which their education has no special reference. The members of that profession ought to be, and commonly are, persons of benevolent

character. Their duties carry them into the midst of families, and particularly at times when the members of them are suffering from bodily illness. It is natural enough that a strong desire should be excited to alleviate sufferings which may have defied the efforts of professional skill; as natural that any remedy which recommends itself to the belief or the fancy of the spiritual physician should be applied with the hope of benefit; and perfectly certain that the weakness of human nature, from which no profession is exempt, will lead him to take the most flattering view of its effects upon the patient; his own sagacity and judgment being staked upon the success of the trial. The inventor of the Tractors was aware of these truths. He therefore sent the Tractors gratuitously to many clergymen, accompanied with a formal certificate that the holder had become entitled to their possession by the payment of five guineas. This was practised in our own neighborhood, and I remember finding one of these certificates, so presented, which proved that amongst the risks of infancy I had to encounter Perkins's Tractors. Two clergymen of Boston and the vicinity, both well known to local fame, gave in their testimony to the value of the instruments thus presented to them; an unusually moderate proportion, when it is remembered that to the common motives of which I have spoken was added the seduction of a gift for which the profane public was expected to pay so largely.

It was remarkable, also, that Perkinism, which had so little success with the medical and scientific part of the community, found great favor in the eyes of its more lovely and less obstinate portion. "The lady of Major Oxholin,"—I quote from Mr. Perkins's volume,—*"having been lately in America, had seen and heard much of the great effects of Perkinism. Influenced by a most benevolent disposition, she brought these Tractors and the pamphlet with her to Europe, with a laudable desire of extending their utility to her suffering countrymen."* Such was the channel by which the Tractors were conveyed to Denmark, where they soon became the ruling passion. The workmen, says a French writer, could not manufacture them fast enough. Women carried them about their persons, and delighted in bringing them into general use. To what extent the Tractors were favored with the patronage of English and American ladies, it is of course not easy to say, except on general principles, as their names were not brought before the public. But one of Dr. Haygarth's stories may lead us to conjecture that there was a class of female practitioners who went about doing good with the Tractors in England as well as in Denmark. A certain lady had the misfortune to have a spot as big as a silver penny at the corner of her eye, caused by a bruise, or some such injury. Another lady, who was a friend of hers, and a strong believer in Perkinism, was very anxious to try the effects of tractoration upon this unfortunate blemish. The patient consented; the lady *"produced the instruments, and, after drawing them four or five times over the spot, declared that it changed to a paler color, and on repeating the use of them a few minutes longer, that it had almost vanished, and was scarcely visible, and departed in high triumph at her success."* The lady who underwent the operation assured the narrator *"that she looked in the glass immediately after, and that not the least visible alteration had taken place."*

It would be a very interesting question, what was the intellectual character of those persons most conspicuous in behalf of the Perkinistic delusion? Such an inquiry might bring to light some principles which we could hereafter apply to the study of other popular errors. But the obscurity into which nearly all these enthusiasts have subsided renders the question easier to ask than to answer. I believe it would have been found that most of these persons were of ardent temperament and of considerable imagination, and that their history would show that Perkinism was not the first nor the last hobby-horse they rode furiously. Many of them may very probably have been persons of more than common talent, of active and ingenious minds, of versatile powers and various acquirements. Such, for instance, was the estimable man to whom I have repeatedly referred as a warm defender of tractoration, and a bitter assailant of its enemies. The story tells itself in the biographical preface to his poem. He went to London with the view of introducing a hydraulic machine, which he and his Vermont friends regarded as a very important invention. He found, however, that the machine was already in common use in that metropolis. A brother Yankee, then in London, had started the project of a mill, which was to be carried by the water of the Thames. He was sanguine enough to purchase one fifth of this concern, which also proved a failure. At about the same period he wrote the work which proved the great excitement of his mind upon the subject of the transient folly then before the public. Originally a lawyer, he was in succession a mechanic, a poet, and an editor, meeting with far less success in each of these departments than usually attends men of less varied gifts, but of more tranquil and phlegmatic composition. But who is ignorant that there is a class of minds characterized by qualities like those I have mentioned; minds with many bright and even beautiful traits; but aimless and fickle as the butterfly; that settle upon every gayly-colored illusion as it opens into flower, and flutter away to another when the first has dropped its leaves, and stands naked in the icy air of truth!

Let us now look at the general tenor of the arguments addressed by believers to sceptics and opponents. Foremost of all, emblazoned at the head of every column, loudest shouted by every triumphant disputant, held up as paramount to all other considerations, stretched like an impenetrable shield to protect the weakest advocate of the great cause against the weapons of the adversary, was that omnipotent monosyllable which has been the patrimony of cheats and the currency of dupes from time immemorial,—*Facts! Facts! Facts!* First came the published cases of the American clergymen, brigadier-generals, almshouse governors, representatives, attorneys, and esquires. Then came the published cases of the surgeons of Copenhagen. Then followed reports of about one hundred and fifty cases published in England, *"demonstrating the efficacy of the metallic practice in a variety of complaints both upon the human body and on horses, etc."* But the progress of facts in Great Britain did not stop here. Let those who rely upon the numbers of their testimonials, as being alone sufficient to prove the soundness and stability of a medical novelty, digest the following from the report of the Perkinistic Committee. *"The cases published [in Great Britain] amounted, in March last, the date of Mr. Perkins's last publication, to about five thousand. Supposing that not more than one cure in three hundred which the Tractors have performed has been published, and the proportion is probably much greater, it will be seen that the number, to March last, will have exceeded one million five hundred thousand!"*

Next in order after the appeal to what were called facts, came a series of arguments, which have been so long bruised and battered round in the cause of every doctrine or pretension, new, monstrous, or deliriously impossible, that each of them is as odiously familiar to the scientific scholar as the faces of so many old acquaintances, among the less reputable classes, to the officers of police.

No doubt many of my hearers will recognize, in the following passages, arguments they may have heard brought forward with triumphant confidence in behalf of some doctrine not yet extinct. No doubt some may have honestly thought they proved something; may have used them with the purpose of convincing their friends, or of silencing the opponents of their favorite doctrine, whatever that might be. But any train of arguments which was contrived for Perkinism, which was just as applicable to it as to any other new doctrine in the same branch of science, and which was fully employed against its adversaries forty years since, might, in common charity, be suffered to slumber in the grave of Perkinism. Whether or not the following sentences, taken literally from the work of Mr. Perkins, were the originals of some of the idle propositions we hear bandied about from time to time, let those who listen judge.

The following is the test assumed for the new practice: "If diseases are really removed, as those persons who have practised extensively with the Tractors declare, it should seem there would be but little doubt of their being generally adopted; but if the numerous reports of their efficacy which have been published are forgeries, or are unfounded, the practice ought to be crushed." To this I merely add, it has been crushed.

The following sentence applies to that a priori judging and uncandid class of individuals who buy their dinners without tasting all the food there is in the market. "On all discoveries there are persons who, without descending to any inquiry into the truth, pretend to know, as it were by intuition, that newly asserted facts are founded in the grossest errors. These were those who knew that Harvey's report of the circulation of the blood was a preposterous and ridiculous suggestion, and in latter later days there were others who knew that Franklin deserved reproach for declaring that points were preferable to balls for protecting buildings from lightning."

Again: "This unwarrantable mode of offering assertion for proof, so unauthorized and even unprecedented except in the condemnation of a Galileo, the persecution of a Copernicus, and a few other acts of inquisitorial authority, in the times of ignorance and superstition, affords but a lamentable instance of one of his remarks, that this is far from being the Age of Reason."

"The most valuable medicines in the Materia Medica act on principles of which we are totally ignorant. None have ever yet been able to explain how opium produces sleep, or how bark cures intermittent fevers; and yet few, it is hoped, will be so absurd as to desist from the use of these important articles because they know nothing of the principle of their operations." Or if the argument is preferred, in the eloquent language of the Perkinistic poet:

*"What though the CAUSES may not be explained,
Since these EFFECTS are duly ascertained,
Let not self-interest, prejudice, or pride,
Induce mankind to set the means aside;
Means which, though simple, are by
Heaven designed to alleviate the woes of human kind."*

This course of argument is so often employed, that it deserves to be expanded a little, so that its length and breadth may be fairly seen. A series of what are called facts is brought forward to prove some very improbable doctrine. It is objected by judicious people, or such as have devoted themselves to analogous subjects, that these assumed facts are in direct opposition to all that is known of the course of nature, that the universal experience of the past affords a powerful presumption against their truth, and that in proportion to the gravity of these objections, should be the number and competence of the witnesses. The answer is a ready one. What do we know of the mysteries of Nature? Do we understand the intricate machinery of the Universe? When to this is added the never-failing quotation,

*"There are more things in heaven and earth, Horatio,
Than are dreamt of in your philosophy,"—*

the question is thought to be finally disposed of.

Take the case of astrology as an example. It is in itself strange and incredible that the relations of the heavenly bodies to each other at a given moment of time, perhaps half a century ago, should have anything to do with my success or misfortune in any undertaking of to-day. But what right have I to say it cannot be so? Can I bind the sweet influences of Pleiades, or loose the bands of Orion? I do not know by what mighty magic the planets roll in their fluid paths, confined to circles as unchanging as if they were rings of steel, nor why the great wave of ocean follows in a sleepless round upon the skirts of moonlight; nor can I say from any certain knowledge that the phases of the heavenly bodies, or even the falling of the leaves of the forest, or the manner in which the sands lie upon the sea-shore, may not be knit up by invisible threads with the web of human destiny. There is a class of minds much more ready to believe that which is at first sight incredible, and because it is incredible, than what is generally thought reasonable. *Credo quia impossibile est*,—"I believe, because it is impossible,"—is an old paradoxical expression which might be literally applied to this tribe of persons. And they always succeed in finding something marvellous, to call out the exercise of their robust faith. The old Cabalistic teachers maintained that there was not a verse, line, word, or even letter in the Bible which had not a special efficacy either to defend the person who rightly employed it, or to injure his enemies; always provided the original Hebrew was made use of. In the hands of modern Cabalists every substance, no matter how inert, acquires wonderful medicinal virtues, provided it be used in a proper state of purity and subdivision.

I have already mentioned the motives attributed by the Perkinists to the Medical Profession, as preventing its members from receiving the new but unwelcome truths. This accusation is repeated in different forms and places, as, for instance, in the following passage: "Will the medical man who has spent much money and labor in the pursuit of the arcana of Physic, and on the exercise of which depends his support in life, proclaim the inefficacy of his art, and recommend a remedy to his patient which the most unlettered in society can employ as advantageously as himself? and a remedy, too, which, unlike the drops, the pills, the powders, etc., of the Materia Medica, is inconsumable, and ever in readiness to be employed in successive diseases?"

As usual with these people, much indignation was expressed at any parallel between their particular doctrine and practice and those of their exploded predecessors. "The motives," says the disinterested Mr.

Perkins, "which must have impelled to this attempt at classing the METALLIC PRACTICE with the most paltry of empirical projects, are but too thinly veiled to escape detection."

To all these arguments was added, as a matter of course, an appeal to the feelings of the benevolent in behalf of suffering humanity, in the shape of a notice that the poor would be treated gratis. It is pretty well understood that this gratuitous treatment of the poor does not necessarily imply an excess of benevolence, any more than the gratuitous distribution of a trader's shop-bills is an evidence of remarkable generosity; in short, that it is one of those things which honest men often do from the best motives, but which rogues and impostors never fail to announce as one of their special recommendations. It is astonishing to see how these things brighten up at the touch of Mr. Perkins's poet:

*"Ye worthy, honored, philanthropic few,
The muse shall weave her brightest wreaths for you,
Who in Humanity's bland cause unite,
Nor heed the shaft by interest aimed or spite;
Like the great Pattern of Benevolence,
Hygeia's blessings to the poor dispense;
And though opposed by folly's servile brood,
ENJOY THE LUXURY OF DOING GOOD."*

Having thus sketched the history of Perkinism in its days of prosperity; having seen how it sprung into being, and by what means it maintained its influence, it only remains to tell the brief story of its discomfiture and final downfall. The vast majority of the sensible part of the medical profession were contented, so far as we can judge, to let it die out of itself. It was in vain that the advocates of this invaluable discovery exclaimed over their perverse and interested obstinacy,—in vain that they called up the injured ghosts of Harvey, Galileo, and Copernicus to shame that unbelieving generation; the Baillies and the Heberdens,—men whose names have come down to us as synonymous with honor and wisdom,—bore their reproaches in meek silence, and left them unanswered to their fate. There were some others, however, who, believing the public to labor under a delusion, thought it worth while to see whether the charm would be broken by an open trial of its virtue, as compared with that of some less hallowed formula. It must be remembered that a peculiar value was attached to the Metallic Tractors, as made and patented by Mr. Perkins. Dr. Haygarth, of Bath, performed various experiments upon patients afflicted with different complaints,—the patients supposing that the real five-guinea Tractors were employed. Strange to relate, he obtained equally wonderful effects with Tractors of lead and of wood; with nails, pieces of bone, slate pencil, and tobacco-pipe. Dr. Alderson employed sham Tractors made of wood, and produced such effects upon five patients that they returned solemn thanks in church for their cures. A single specimen of these cases may stand for all of them. Ann Hill had suffered for some months from pain in the right arm and shoulder. The Tractors (wooden ones) were applied, and in the space of five minutes she expressed herself relieved in the following apostrophe: "Bless me! why, who could have thought it, that them little things could pull the pain from one. Well, to be sure, the longer one lives, the more one sees; ah, dear!"

These experiments did not result in the immediate extinction of Perkinism. Doubtless they were a great comfort to many obstinate unbelievers, and helped to settle some sceptical minds; but for the real Perkinistic enthusiasts, it may be questioned whether they would at that time have changed their opinion though one had risen from the dead to assure them that it was an error. It perished without violence, by an easy and natural process. Like the famous toy of Mongolfier, it rose by means of heated air,—the fevered breath of enthusiastic ignorance,—and when this grew cool, as it always does in a little while, it collapsed and fell.

And now, on reviewing the whole subject, how shall we account for the extraordinary prevalence of the belief in Perkinism among a portion of what is supposed to be the thinking part of the community?

Could the cures have been real ones, produced by the principle of ANIMAL MAGNETISM? To this it may be answered that the Perkinists ridiculed the idea of approximating Mesmer and the founder of their own doctrine, that nothing like the somnambulant condition seems to have followed the use of the Tractors, and that neither the exertion of the will nor the powers of the individual who operated seem to have been considered of any consequence. Besides, the absolute neglect into which the Tractors soon declined is good evidence that they were incapable of affording any considerable and permanent relief in the complaints for the cure of which they were applied.

Of course a large number of apparent cures were due solely to nature; which is true under every form of treatment, orthodox or empirical. Of course many persons experienced at least temporary relief from the strong impression made upon their minds by this novel and marvellous method of treatment.

Many, again, influenced by the sanguine hopes of those about them, like dying people, who often say sincerely, from day to day, that they are getting better, cheated themselves into a false and short-lived belief that they were cured; and as happens in such cases, the public never knew more than the first half of the story.

When it was said to the Perkinists, that whatever effects they produced were merely through the imagination, they declared (like the advocates of the ROYAL TOUCH and the UNGUENTUM ARMARIUM) that this explanation was sufficiently disproved by the fact of numerous and successful cures which had been witnessed in infants and brute animals. Dr. Haygarth replied to this, that "in these cases it is not the Patient, but the Observer, who is deceived by his own imagination," and that such may be the fact, we have seen in the case of the good lady who thought she had conjured away the spot from her friend's countenance, when it remained just as before.

As to the motives of the inventor and vender of the Tractors, the facts must be allowed to speak for themselves. But when two little bits of brass and iron are patented, as an invention, as the result of numerous experiments, when people are led, or even allowed, to infer that they are a peculiar compound, when they are artfully associated with a new and brilliant discovery (which then happened to be Galvanism), when they are sold at many hundred times their value, and the seller prints his opinion that a Hospital will suffer inconvenience, "unless it possesses many sets of the Tractors, and these placed in the hands of the patients to practise on each other," one cannot but suspect that they were contrived in the neighborhood of a wooden

nutmeg factory; that legs of ham in that region are not made of the best mahogany; and that such as buy their cucumber seed in that vicinity have to wait for the fruit as long as the Indians for their crop of gunpowder.

The succeeding lecture will be devoted to an examination of the doctrines of Samuel Hahnemann and his disciples; doctrines which some consider new and others old; the common title of which is variously known as Ho-moeopathy, Homoe-op-athy, Homoeo-paith-y, or Hom'pathy, and the claims of which are considered by some as infinitely important, and by many as immeasurably ridiculous.

I wish to state, for the sake of any who may be interested in the subject, that I shall treat it, not by ridicule, but by argument; perhaps with great freedom, but with good temper and in peaceable language; with very little hope of reclaiming converts, with no desire of making enemies, but with a firm belief that its pretensions and assertions cannot stand before a single hour of calm investigation.

II.

It may be thought that a direct attack upon the pretensions of HOMOEOPATHY is an uncalled-for aggression upon an unoffending doctrine and its peaceful advocates.

But a little inquiry will show that it has long assumed so hostile a position with respect to the Medical Profession, that any trouble I, or any other member of that profession, may choose to bestow upon it may be considered merely as a matter of self-defence. It began with an attempt to show the insignificance of all existing medical knowledge. It not only laid claim to wonderful powers of its own, but it declared the common practice to be attended with the most positively injurious effects, that by it acute diseases are aggravated, and chronic diseases rendered incurable. It has at various times brought forward collections of figures having the air of statistical documents, pretending to show a great proportional mortality among the patients of the Medical Profession, as compared with those treated according to its own rules. Not contented with choosing a name of classical origin for itself, it invented one for the whole community of innocent physicians, assuring them, to their great surprise, that they were all ALLOPATHISTS, whether they knew it or not, and including all the illustrious masters of the past, from Hippocrates down to Hunter, under the same gratuitous title. The line, then, has been drawn by the champions of the new doctrine; they have lifted the lance, they have sounded the charge, and are responsible for any little skirmishing which may happen.

But, independently of any such grounds of active resistance, the subject involves interests so disproportioned to its intrinsic claims, that it is no more than an act of humanity to give it a public examination. If the new doctrine is not truth, it is a dangerous, a deadly error. If it is a mere illusion, and acquires the same degree of influence that we have often seen obtained by other illusions, there is not one of my audience who may not have occasion to deplore the fatal credulity which listened to its promises.

I shall therefore undertake a sober examination of its principles, its facts, and some points of its history. The limited time at my disposal requires me to condense as much as possible what I have to say, but I shall endeavor to be plain and direct in expressing it. Not one statement shall be made which cannot be supported by unimpeachable reference: not one word shall be uttered which I am not as willing to print as to speak. I have no quibbles to utter, and I shall stoop to answer none; but, with full faith in the sufficiency of a plain statement of facts and reasons, I submit the subject to the discernment of my audience.

The question may be asked in the outset,—Have you submitted the doctrines you are professing to examine to the test of long-repeated and careful experiment; have you tried to see whether they were true or not? To this I answer, that it is abundantly evident, from what has often happened, that it would be of no manner of use for me to allege the results of any experiments I might have instituted. Again and again have the most explicit statements been made by the most competent persons of the utter failure of all their trials, and there were the same abundant explanations offered as used to be for the Unguentum Armarium and the Metallic Tractors. I could by no possibility perform any experiments the result of which could not be easily explained away so as to be of no conclusive significance. Besides, as arguments in favor of Homoeopathy are constantly addressed to the public in journals, pamphlets, and even lectures, by inexperienced dilettanti, the same channel must be open to all its opponents.

It is necessary, for the sake of those to whom the whole subject may be new, to give in the smallest possible compass the substance of the Homoeopathic Doctrine. Samuel Hahnemann, its founder, is a German physician, now living in Paris, [Hahnemann died in 1843 at the age of eighty-seven years. In 1796 he published the first paper containing his peculiar notions; in 1805 his first work on the subject; in 1810 his somewhat famous "Organon of the Healing Art;" the next year what he called the "Pure Materia Medica;" and in 1828 his last work, the "Treatise on Chronic Diseases." He has therefore been writing at intervals on his favorite subject for nearly half a century.

The one great doctrine which constitutes the basis of Homoeopathy as a system is expressed by the Latin aphorism, "SIMILIA SIBILIBUS CURANTUR,"

or like cures like, that is, diseases are cured by agents capable of producing symptoms resembling those found in the disease under treatment. A disease for Hahnemann consists essentially in a group of symptoms. The proper medicine for any disease is the one which is capable of producing a similar group of symptoms when given to a healthy person.

It is of course necessary to know what are the trains of symptoms excited by different substances, when administered to persons in health, if any such can be shown to exist. Hahnemann and his disciples give catalogues of the symptoms which they affirm were produced upon themselves or others by a large number of drugs which they submitted to experiment.

The second great fact which Hahnemann professes to have established is the efficacy of medicinal substances reduced to a wonderful degree of minuteness or dilution. The following account of his mode of preparing his medicines is from his work on Chronic Diseases, which has not, I believe, yet been translated into English. A grain of the substance, if it is solid, a drop if it is liquid, is to be added to about a third part of one hundred grains of sugar of milk in an unglazed porcelain capsule which has had the polish removed from the lower part of its cavity by rubbing it with wet sand; they are to be mingled for an instant with a bone or

horn spatula, and then rubbed together for six minutes; then the mass is to be scraped together from the mortar and pestle, which is to take four minutes; then to be again rubbed for six minutes. Four minutes are then to be devoted to scraping the powder into a heap, and the second third of the hundred grains of sugar of milk to be added. Then they are to be stirred an instant and rubbed six minutes,—again to be scraped together four minutes and forcibly rubbed six; once more scraped together for four minutes, when the last third of the hundred grains of sugar of milk is to be added and mingled by stirring with the spatula; six minutes of forcible rubbing, four of scraping together, and six more (positively the last six) of rubbing, finish this part of the process.

Every grain of this powder contains the hundredth of a grain of the medicinal substance mingled with the sugar of milk. If, therefore, a grain of the powder just prepared is mingled with another hundred grains of sugar of milk, and the process just described repeated, we shall have a powder of which every grain contains the hundredth of the hundredth, or the ten thousandth part of a grain of the medicinal substance. Repeat the same process with the same quantity of fresh sugar of milk, and every grain of your powder will contain the millionth of a grain of the medicinal substance. When the powder is of this strength, it is ready to employ in the further solutions and dilutions to be made use of in practice.

A grain of the powder is to be taken, a hundred drops of alcohol are to be poured on it, the vial is to be slowly turned for a few minutes, until the powder is dissolved, and two shakes are to be given to it. On this point I will quote Hahnemann's own words. "A long experience and multiplied observations upon the sick lead me within the last few years to prefer giving only two shakes to medicinal liquids, whereas I formerly used to give ten." The process of dilution is carried on in the same way as the attenuation of the powder was done; each successive dilution with alcohol reducing the medicine to a hundredth part of the quantity of that which preceded it. In this way the dilution of the original millionth of a grain of medicine contained in the grain of powder operated on is carried successively to the billionth, trillionth, quadrillionth, quintillionth, and very often much higher fractional divisions. A dose of any of these medicines is a minute fraction of a drop, obtained by moistening with them one or more little globules of sugar, of which Hahnemann says it takes about two hundred to weigh a grain.

As an instance of the strength of the medicines prescribed by Hahnemann, I will mention carbonate of lime. He does not employ common chalk, but prefers a little portion of the friable part of an oystershell. Of this substance, carried to the sextillionth degree, so much as one or two globules of the size mentioned can convey is a common dose. But for persons of very delicate nerves it is proper that the dilution should be carried to the decillionth degree. That is, an important medicinal effect is to be expected from the two hundredth or hundredth part of the millionth of the millionth of the millionth of the millionth of the millionth of the millionth of the millionth of the millionth of the millionth of a grain of oyster-shell. This is only the tenth degree of potency, but some of his disciples profess to have obtained palpable effects from "much higher dilutions."

The third great doctrine of Hahnemann is the following. Seven eighths at least of all chronic diseases are produced by the existence in the system of that infectious disorder known in the language of science by the appellation of PSORA, but to the less refined portion of the community by the name of ITCH. In the words of Hahnemann's "Organon," "This Psora is the sole true and fundamental cause that produces all the other countless forms of disease, which, under the names of nervous debility, hysteria, hypochondriasis, insanity, melancholy, idiocy, madness, epilepsy, and spasms of all kinds, softening of the bones, or rickets, scoliosis and cyphosis, caries, cancer, fungua haematodes, gout,—yellow jaundice and cyanosis, dropsy,—"

["The degrees of DILUTION must not be confounded with those of POTENCY. Their relations may be seen by this table:

- 1st dilution,—One hundredth of a drop or grain.
- 2d " One ten thousandth.
- 3d " One millionth, marked I.
- 4th " One hundred millionth.
- 5th " One ten thousand millionth.
- 6th " One million millionth, or one billionth, marked II.
- 7th " One hundred billionth.
- 8th " One ten thousand billionth.
- 9th " One million billionth, or one trillionth, marked III.
- 10th " One hundred trillionth.
- 11th " One ten thousand trillionth.

12th " One million trillionth, or one quadrillionth, marked IV.,—and so on indefinitely.

The large figures denote the degrees of POTENCY.]

"gastralgia, epistaxis, haemoptysis,—asthma and suppuration of the lungs,—megrin, deafness, cataract and amaurosis,—paralysis, loss of sense, pains of every kind, etc., appear in our pathology as so many peculiar, distinct, and independent diseases."

For the last three centuries, if the same authority may be trusted, under the influence of the more refined personal habits which have prevailed, and the application of various external remedies which repel the affection from the skin; Psora has revealed itself in these numerous forms of internal disease, instead of appearing, as in former periods, under the aspect of an external malady.

These are the three cardinal doctrines of Hahnemann, as laid down in those standard works of Homoeopathy, the "Organon" and the "Treatise on Chronic Diseases."

Several other principles may be added, upon all of which he insists with great force, and which are very generally received by his disciples.

1. Very little power is allowed to the curative efforts of nature. Hahnemann goes so far as to say that no one has ever seen the simple efforts of nature effect the durable recovery of a patient from a chronic disease. In general, the Homoeopathist calls every recovery which happens under his treatment a cure.

2. Every medicinal substance must be administered in a state of the most perfect purity, and uncombined with any other. The union of several remedies in a single prescription destroys its utility, and, according to the "Organon," frequently adds a new disease.

3. A large number of substances commonly thought to be inert develop great medicinal powers when prepared in the manner already described; and a great proportion of them are ascertained to have specific antidotes in case their excessive effects require to be neutralized.

4. Diseases should be recognized, as far as possible, not by any of the common names imposed upon them, as fever or epilepsy, but as individual collections of symptoms, each of which differs from every other collection.

5. The symptoms of any complaint must be described with the most minute exactness, and so far as possible in the patient's own words. To illustrate the kind of circumstances the patient is expected to record, I will mention one or two from the 313th page of the "Treatise on Chronic Diseases,"—being the first one at which I opened accidentally.

"After dinner, disposition to sleep; the patient winks."

"After dinner, prostration and feeling of weakness (nine days after taking the remedy)."

This remedy was that same oyster-shell which is to be prescribed "fractions of the sextillionth or decillionth degree." According to Hahnemann, the action of a single dose of the size mentioned does not fully display itself in some cases until twenty-four or even thirty days after it is taken, and in such instances has not exhausted its good effects until towards the fortieth or fiftieth day,—before which time it would be absurd and injurious to administer a new remedy.

So much for the doctrines of Hahnemann, which have been stated without comment, or exaggeration of any of their features, very much as any adherent of his opinions might have stated them, if obliged to compress them into so narrow a space.

Does Hahnemann himself represent Homoeopathy as it now exists? He certainly ought to be its best representative, after having created it, and devoted his life to it for half a century. He is spoken of as the great physician of the time, in most, if not all Homoeopathic works. If he is not authority on the subject of his own doctrines, who is? So far as I am aware, not one tangible discovery in the so-called science has ever been ascribed to any other observer; at least, no general principle or law, of consequence enough to claim any prominence in Homoeopathic works, has ever been pretended to have originated with any of his illustrious disciples. He is one of the only two Homoeopathic writers with whom, as I shall mention, the Paris publisher will have anything to do upon his own account. The other is Jahr, whose Manual is little more than a catalogue of symptoms and remedies. If any persons choose to reject Hahnemann as not in the main representing Homoeopathy, if they strike at his authority, if they wink out of sight his deliberate and formally announced results, it is an act of suicidal rashness; for upon his sagacity and powers of observation, and experience, as embodied in his works, and especially in his *Materia Medica*, repose the foundations of Homoeopathy as a practical system.

So far as I can learn from the conflicting statements made upon the subject, the following is the present condition of belief.

1. All of any note agree that the law *Similia similibus* is the only fundamental principle in medicine. Of course if any man does not agree to this the name Homoeopathist can no longer be applied to him with propriety.

2. The belief in and employment of the infinitesimal doses is general, and in some places universal, among the advocates of Homoeopathy; but a distinct movement has been made in Germany to get rid of any restriction to the use of these doses, and to employ medicines with the same license as other practitioners.

3. The doctrine of the origin of most chronic diseases in *Psora*, notwithstanding Hahnemann says it cost him twelve years of study and research to establish the fact and its practical consequences, has met with great neglect and even opposition from very many of his own disciples.

It is true, notwithstanding, that, throughout most of their writings which I have seen, there runs a prevailing tone of great deference to Hahnemann's opinions, a constant reference to his authority, a general agreement with the minor points of his belief, and a pretence of harmonious union in a common faith. [Those who will take the trouble to look over Hull's Translation of Jahr's Manual may observe how little comparative space is given to remedies resting upon any other authority than that of Hahnemann.]

Many persons, and most physicians and scientific men, would be satisfied with the statement of these doctrines, and examine them no further. They would consider it vastly more probable that any observer in so fallacious and difficult a field of inquiry as medicine had been led into error, or walked into it of his own accord, than that such numerous and extraordinary facts had really just come to light. They would feel a right to exercise the same obduracy towards them as the French Institute is in the habit of displaying when memoirs or models are offered to it relating to the squaring of the circle or perpetual motion; which it is the rule to pass over without notice. They would feel as astronomers and natural philosophers must have felt when, some half a dozen years ago, an unknown man came forward, and asked for an opportunity to demonstrate to Arago and his colleagues that the moon and planets were at a distance of a little more than a hundred miles from the earth. And so they would not even look into Homoeopathy, though all its advocates should exclaim in the words of Mr. Benjamin Douglass Perkins, vender of the Metallic Tractors, that "On all discoveries there are persons who, without descending to any inquiry into the truth, pretend to know, as it were by intuition, that newly asserted facts are founded in the grossest errors." And they would lay their heads upon their pillows with a perfectly clear conscience, although they were assured that they were behaving in the same way that people of old did towards Harvey, Galileo, and Copernicus, the identical great names which were invoked by Mr. Benjamin Douglass Perkins.

But experience has shown that the character of these assertions is not sufficient to deter many, from examining their claims to belief. I therefore lean but very slightly on the extravagance and extreme apparent singularity of their pretensions. I might have omitted them, but on the whole it seemed more just to the claims of my argument to suggest the vast complication of improbabilities involved in the statements enumerated. Every one must of course judge for himself as to the weight of these objections, which are by no means brought forward as a proof of the extravagance of Homoeopathy, but simply as entitled to a brief consideration before the facts of the case are submitted to our scrutiny.

The three great asserted discoveries of Hahnemann are entirely unconnected with and independent of each other. Were there any natural relation between them it would seem probable enough that the discovery of the first would have led to that of the others. But assuming it to be a fact that diseases are cured by remedies capable of producing symptoms like their own, no manifest relation exists between this fact and the next assertion, namely, the power of the infinitesimal doses. And allowing both these to be true, neither has the remotest affinity to the third new doctrine, that which declares seven eighths of all chronic diseases to be owing to Psora.

This want of any obvious relation between Hahnemann's three cardinal doctrines appears to be self-evident upon inspection. But if, as is often true with his disciples, they prefer the authority of one of their own number, I will refer them to Dr. Trinks's paper on the present state of Homoeopathy in Europe, with which, of course, they are familiar, as his name is mentioned as one of the most prominent champions of their faith, in their American official organ. It would be a fact without a parallel in the history, not merely of medicine, but of science, that three such unconnected and astonishing discoveries, each of them a complete revolution of all that ages of the most varied experience had been taught to believe, should spring full formed from the brain of a single individual.

Let us look a moment at the first of his doctrines. Improbable though it may seem to some, there is no essential absurdity involved in the proposition that diseases yield to remedies capable of producing like symptoms. There are, on the other hand, some analogies which lend a degree of plausibility to the statement. There are well-ascertained facts, known from the earliest periods of medicine, showing that, under certain circumstances, the very medicine which, from its known effects, one would expect to aggravate the disease, may contribute to its relief. I may be permitted to allude, in the most general way, to the case in which the spontaneous efforts of an overtasked stomach are quieted by the agency of a drug which that organ refuses to entertain upon any terms. But that every cure ever performed by medicine should have been founded upon this principle, although without the knowledge of a physician; that the Homoeopathic axiom is, as Hahnemann asserts, "the sole law of nature in therapeutics," a law of which nothing more than a transient glimpse ever presented itself to the innumerable host of medical observers, is a dogma of such sweeping extent, and pregnant novelty, that it demands a corresponding breadth and depth of unquestionable facts to cover its vast pretensions.

So much ridicule has been thrown upon the pretended powers of the minute doses that I shall only touch upon this point for the purpose of conveying, by illustrations, some shadow of ideas far transcending the powers of the imagination to realize. It must be remembered that these comparisons are not matters susceptible of dispute, being founded on simple arithmetical computations, level to the capacity of any intelligent schoolboy. A person who once wrote a very small pamphlet made some show of objecting to calculations of thus kind, on the ground that the highest dilutions could easily be made with a few ounces of alcohol. But he should have remembered that at every successive dilution he lays aside or throws away ninety-nine hundredths of the fluid on which he is operating, and that, although he begins with a drop, he only prepares a millionth, billionth, trillionth, and similar fractions of it, all of which, added together, would constitute but a vastly minute portion of the drop with which he began. But now let us suppose we take one single drop of the Tincture of Camomile, and that the whole of this were to be carried through the common series of dilutions.

A calculation nearly like the following was made by Dr. Panvini, and may be readily followed in its essential particulars by any one who chooses.

For the first dilution it would take 100 drops of alcohol.

For the second dilution it would take 10,000 drops, or about a pint.

For the third dilution it would take 100 pints.

For the fourth dilution it would take 10,000 pints, or more than 1,000 gallons, and so on to the ninth dilution, which would take ten billion gallons, which he computed would fill the basin of Lake Agnano, a body of water two miles in circumference. The twelfth dilution would of course fill a million such lakes. By the time the seventeenth degree of dilution should be reached, the alcohol required would equal in quantity the waters of ten thousand Adriatic seas. Trifling errors must be expected, but they are as likely to be on one side as the other, and any little matter like Lake Superior or the Caspian would be but a drop in the bucket.

Swallowers of globules, one of your little pellets, moistened in the mingled waves of one million lakes of alcohol, each two miles in circumference, with which had been blended that one drop of Tincture of Camomile, would be of precisely the strength recommended for that medicine in your favorite Jahr's Manual, "against the most sudden, frightful, and fatal diseases!" [In the French edition of 1834, the proper doses of the medicines are mentioned, and Camomile is marked IV. Why are the doses omitted in Hull's Translation, except in three instances out of the whole two hundred remedies, notwithstanding the promise in the preface that "some remarks upon the doses used may be found at the head of each medicine"? Possibly because it makes no difference whether they are employed in one Homoeopathic dose or another; but then it is very singular that such precise directions were formerly given in the same work, and that Hahnemann's "experience" should have led him to draw the nice distinctions we have seen in a former part of this Lecture (p. 44).]

And proceeding on the common data, I have just made a calculation which shows that this single drop of Tincture of Camomile, given in the quantity ordered by Jahr's Manual, would have supplied every individual of the whole human family, past and present, with more than five billion doses each, the action of each dose

lasting about four days.

Yet this is given only at the quadrillionth, or fourth degree of potency, and various substances are frequently administered at the decillionth or tenth degree, and occasionally at still higher attenuations with professed medicinal results. Is there not in this as great an exception to all the hitherto received laws of nature as in the miracle of the loaves and fishes? Ask this question of a Homoeopathist, and he will answer by referring to the effects produced by a very minute portion of vaccine matter, or the extraordinary diffusion of odors. But the vaccine matter is one of those substances called morbid poisons, of which it is a peculiar character to multiply themselves, when introduced into the system, as a seed does in the soil. Therefore the hundredth part of a grain of the vaccine matter, if no more than this is employed, soon increases in quantity, until, in the course of about a week, it is a grain or more, and can be removed in considerable drops. And what is a very curious illustration of Homoeopathy, it does not produce its most characteristic effects until it is already in sufficient quantity not merely to be visible, but to be collected for further use. The thoughtlessness which can allow an inference to be extended from a product of disease possessing this susceptibility of multiplication when conveyed into the living body, to substances of inorganic origin, such as silex or sulphur, would be capable of arguing that a pebble may produce a mountain, because an acorn can become a forest.

As to the analogy to be found between the alleged action of the infinitely attenuated doses, and the effects of some odorous substances which possess the extraordinary power of diffusing their imponderable emanations through a very wide space, however it may be abused in argument, and rapidly as it evaporates on examination, it is not like that just mentioned, wholly without meaning. The fact of the vast diffusion of some odors, as that of musk or the rose, for instance, has long been cited as the most remarkable illustration of the divisibility of matter, and the nicety of the senses. And if this were compared with the effects of a very minute dose of morphia on the whole system, or the sudden and fatal impression of a single drop of prussic acid, or, with what comes still nearer, the poisonous influence of an atmosphere impregnated with invisible malaria, we should find in each of these examples an evidence of the degree to which nature, in some few instances, concentrates powerful qualities in minute or subtle forms of matter. But if a man comes to me with a pestle and mortar in his hand, and tells me that he will take a little speck of some substance which nobody ever thought to have any smell at all, as, for instance, a grain of chalk or of charcoal, and that he will, after an hour or two of rubbing and scraping, develop in a portion of it an odor which, if the whole grain were used, would be capable of pervading an apartment, a house, a village, a province, an empire, nay, the entire atmosphere of this broad planet upon which we tread; and that from each of fifty or sixty substances he can in this way develop a distinct and hitherto unknown odor: and if he tries to show that all this is rendered quite reasonable by the analogy of musk and roses, I shall certainly be justified in considering him incapable of reasoning, and beyond the reach of my argument. What if, instead of this, he professes to develop new and wonderful medicinal powers from the same speck of chalk or charcoal, in such proportions as would impregnate every pond, lake, river, sea, and ocean of our globe, and appeals to the same analogy in favor of the probability of his assertion.

All this may be true, notwithstanding these considerations. But so extraordinary would be the fact, that a single atom of substances which a child might swallow without harm by the teaspoonful could, by an easy mechanical process, be made to develop such inconceivable powers, that nothing but the strictest agreement of the most cautious experimenters, secured by every guaranty that they were honest and faithful, appealing to repeated experiments in public, with every precaution to guard against error, and with the most plain and peremptory results, should induce us to lend any credence to such pretensions.

The third doctrine, that Psora, the other name of which you remember, is the cause of the great majority of chronic diseases, is a startling one, to say the least. That an affection always recognized as a very unpleasant personal companion, but generally regarded as a mere temporary incommmodity, readily yielding to treatment in those unfortunate enough to suffer from it, and hardly known among the better classes of society, should be all at once found out by a German physician to be the great scourge of mankind, the cause of their severest bodily and mental calamities, cancer and consumption, idiocy and madness, must excite our unqualified surprise. And when the originator of this singular truth ascribes, as in the page now open before me, the declining health of a disgraced courtier, the chronic malady of a bereaved mother, even the melancholy of the love-sick and slighted maiden, to nothing more nor less than the insignificant, unseemly, and almost unmentionable ITCH, does it not seem as if the very soil upon which we stand were dissolving into chaos, over the earthquake-heaving of discovery?

And when one man claims to have established these three independent truths, which are about as remote from each other as the discovery of the law of gravitation, the invention of printing, and that of the mariner's compass, unless the facts in their favor are overwhelming and unanimous, the question naturally arises, Is not this man deceiving himself, or trying to deceive others?

I proceed to examine the proofs of the leading ideas of Hahnemann and his school.

In order to show the axiom, *similia similibus curantur* (or like is cured by like), to be the basis of the healing art,—“the sole law of nature in therapeutics,”—it is necessary,

1. That the symptoms produced by drugs in healthy persons should be faithfully studied and recorded.
2. That drugs should be shown to be always capable of curing those diseases most like their own symptoms.
3. That remedies should be shown not to cure diseases when they do not produce symptoms resembling those presented in these diseases.

1. The effects of drugs upon healthy persons have been studied by Hahnemann and his associates. Their results were made known in his *Materia Medica*, a work in three large volumes in the French translation, published about eight years ago. The mode of experimentation appears to have been, to take the substance on trial, either in common or minute doses, and then to set down every little sensation, every little movement of mind or body, which occurred within many succeeding hours or days, as being produced solely by the substance employed. When I have enumerated some of the symptoms attributed to the power of the drugs taken, you will be able to judge how much value is to be ascribed to the assertions of such observers.

The following list was taken literally from the *Materia Medica* of Hahnemann, by my friend M. Vernois, for whose accuracy I am willing to be responsible. He has given seven pages of these symptoms, not selected, but taken at hazard from the French translation of the work. I shall be very brief in my citations.

"After stooping some time, sense of painful weight about the head upon resuming the erect posture."

"An itching, tickling sensation at the outer edge of the palm of the left hand, which obliges the person to scratch." The medicine was acetate of lime, and as the action of the globule taken is said to last twenty-eight days, you may judge how many such symptoms as the last might be supposed to happen.

Among the symptoms attributed to muriatic acid are these: a catarrh, sighing, pimples; "after having written a long time with the back a little bent over, violent pain in the back and shoulder-blades, as if from a strain,"—"dreams which are not remembered,—disposition to mental dejection,—wakefulness before and after midnight."

I might extend this catalogue almost indefinitely. I have not cited these specimens with any view to exciting a sense of the ridiculous, which many others of those mentioned would not fail to do, but to show that the common accidents of sensation, the little bodily inconveniences to which all of us are subject, are seriously and systematically ascribed to whatever medicine may have been exhibited, even in the minute doses I have mentioned, whole days or weeks previously.

To these are added all the symptoms ever said by anybody, whether deserving confidence or not, as I shall hereafter illustrate, to be produced by the substance in question.

The effects of sixty-four medicinal substances, ascertained by one or both of these methods, are enumerated in the *Materia Medica* of Hahnemann, which may be considered as the basis of practical Homoeopathy. In the *Manual of Jahr*, which is the common guide, so far as I know, of those who practise Homoeopathy in these regions, two hundred remedies are enumerated, many of which, however, have never been employed in practice. In at least one edition there were no means of distinguishing those which had been tried upon the sick from the others. It is true that marks have been added in the edition employed here, which serve to distinguish them; but what are we to think of a standard practical author on *Materia Medica*, who at one time omits to designate the proper doses of his remedies, and at another to let us have any means of knowing whether a remedy has ever been tried or not, while he is recommending its employment in the most critical and threatening diseases?

I think that, from what I have shown of the character of Hahnemann's experiments, it would be a satisfaction to any candid inquirer to know whether other persons, to whose assertions he could look with confidence, confirm these pretended facts. Now there are many individuals, long and well known to the scientific world, who have tried these experiments upon healthy subjects, and utterly deny that their effects have at all corresponded to Hahnemann's assertions.

I will take, for instance, the statements of Andral (and I am not referring to his well-known public experiments in his hospital) as to the result of his own trials. This distinguished physician is Professor of Medicine in the School of Paris, and one of the most widely known and valued authors upon practical and theoretical subjects the profession can claim in any country. He is a man of great kindness of character, a most liberal eclectic by nature and habit, of unquestioned integrity, and is called, in the leading article of the first number of the "*Homoeopathic Examiner*," "an eminent and very enlightened allopathist." Assisted by a number of other persons in good health, he experimented on the effects of cinchona, aconite, sulphur, arnica, and the other most highly extolled remedies. His experiments lasted a year, and he stated publicly to the Academy of Medicine that they never produced the slightest appearance of the symptoms attributed to them. The results of a man like this, so extensively known as one of the most philosophical and candid, as well as brilliant of instructors, and whose admirable abilities and signal liberality are generally conceded, ought to be of great weight in deciding the question.

M. Double, a well-known medical writer and a physician of high standing in Paris, had occasion so long ago as 1801, before he had heard of Homoeopathy, to make experiments upon Cinchona, or Peruvian bark. He and several others took the drug in every kind of dose for four months, and the fever it is pretended by Hahnemann to excite never was produced.

M. Bonnet, President of the Royal Society of Medicine of Bordeaux, had occasion to observe many soldiers during the Peninsular War, who made use of Cinchona as a preservative against different diseases, but he never found it to produce the pretended paroxysms.

If any objection were made to evidence of this kind, I would refer to the express experiments on many of the Homoeopathic substances, which were given to healthy persons with every precaution as to diet and regimen, by M. Louis Fleury, without being followed by the slightest of the pretended consequences. And let me mention as a curious fact, that the same quantity of arsenic given to one animal in the common form of the unprepared powder, and to another after having been rubbed up into six hundred globules, offered no particular difference of activity in the two cases.

This is a strange contradiction to the doctrine of the development of what they call dynamic power, by means of friction and subdivision.

In 1835 a public challenge was offered to the best known Homoeopathic physician in Paris to select any ten substances asserted to produce the most striking effects; to prepare them himself; to choose one by lot without knowing which of them he had taken, and try it upon himself or any intelligent and devoted Homoeopathist, and, waiting his own time, to come forward and tell what substance had been employed. The challenge was at first accepted, but the acceptance retracted before the time of trial arrived.

From all this I think it fair to conclude that the catalogues of symptoms attributed in Homoeopathic works to the influence of various drugs upon healthy persons are not entitled to any confidence.

2. It is necessary to show, in the next place, that medicinal substances are always capable of curing diseases most like their own symptoms. For facts relating to this question we must look to two sources; the recorded experience of the medical profession in general, and the results of trials made according to Homoeopathic principles, and capable of testing the truth of the doctrine.

No person, that I am aware of, has ever denied that in some cases there exists a resemblance between the effects of a remedy and the symptoms of diseases in which it is beneficial. This has been recognized, as Hahnemann himself has shown, from the time of Hippocrates. But according to the records of the medical profession, as they have been hitherto interpreted, this is true of only a very small proportion of useful remedies. Nor has it ever been considered as an established truth that the efficacy of even these few remedies was in any definite ratio to their power of producing symptoms more or less like those they cured.

Such was the state of opinion when Hahnemann came forward with the proposition that all the cases of successful treatment found in the works of all preceding medical writers were to be ascribed solely to the operation of the Homoeopathic principle, which had effected the cure, although without the physician's knowledge that this was the real secret. And strange as it may seem, he was enabled to give such a degree of plausibility to this assertion, that any person not acquainted somewhat with medical literature, not quite familiar, I should rather say, with the relative value of medical evidence, according to the sources whence it is derived, would be almost frightened into the belief, at seeing the pages upon pages of Latin names he has summoned as his witnesses.

It has hitherto been customary, when examining the writings of authors of preceding ages, upon subjects as to which they were less enlightened than ourselves, and which they were very liable to misrepresent, to exercise some little discretion; to discriminate, in some measure, between writers deserving confidence and those not entitled to it. But there is not the least appearance of any such delicacy on the part of Hahnemann. A large majority of the names of old authors he cites are wholly unknown to science. With some of them I have been long acquainted, and I know that their accounts of diseases are no more to be trusted than their contemporary Ambroise Pare's stories of mermen, and similar absurdities. But if my judgment is rejected, as being a prejudiced one, I can refer to Cullen, who mentioned three of Hahnemann's authors in one sentence, as being "not necessarily bad authorities; but certainly such when they delivered very improbable events;" and as this was said more than half a century ago, it could not have had any reference to Hahnemann. But although not the slightest sign of discrimination is visible in his quotations,—although for him a handful of chaff from Schenck is all the same thing as a measure of wheat from Morgagni,—there is a formidable display of authorities, and an abundant proof of ingenious researches to be found in each of the great works of Hahnemann with which I am familiar. [Some painful surmises might arise as to the erudition of Hahnemann's English Translator, who makes two individuals of "Zacutus, Lucitanus," as well as respecting that of the conductors of an American Homoeopathic periodical, who suffer the name of the world-renowned Cardanus to be spelt Cardamus in at least three places, were not this gross ignorance of course attributable only to the printer.]

It is stated by Dr. Leo-Wolf, that Professor Joerg, of Leipsic, has proved many of Hahnemann's quotations from old authors to be adulterate and false. What particular instances he has pointed out I have no means of learning. And it is probably wholly impossible on this side of the Atlantic, and even in most of the public libraries of Europe, to find anything more than a small fraction of the innumerable obscure publications which the neglect of grocers and trunkmakers has spared to be ransacked by the all-devouring genius of Homoeopathy. I have endeavored to verify such passages as my own library afforded me the means of doing. For some I have looked in vain, for want, as I am willing to believe, of more exact references. But this I am able to affirm, that, out of the very small number which I have been able, to trace back to their original authors, I have found two to be wrongly quoted, one of them being a gross misrepresentation.

The first is from the ancient Roman author, Caelius Aurelianus; the second from the venerable folio of Forestus. Hahnemann uses the following expressions,—if he is not misrepresented in the English Translation of the 'Organon': "Asclepiades on one occasion cured an inflammation of the brain by administering a small quantity of wine." After correcting the erroneous reference of the Translator, I can find no such case alluded to in the chapter. But Caelius Aurelianus mentions two modes of treatment employed by Asclepiades, into both of which the use of wine entered, as being "in the highest degree irrational and dangerous." [Caelius Aurel. De Morb. Acut. et Chron. lib. I. cap. xv. not xvi. Amsterdam. Wetstein, 1755.]

In speaking of the oil of anise-seed, Hahnemann says that Forestus observed violent colic caused by its administration. But, as the author tells the story, a young man took, by the counsel of a surgeon, an acrid and virulent medicine, the name of which is not given, which brought on a most cruel fit of the gripes and colic. After this another surgeon was called, who gave him oil of anise-seed and wine, "which increased his suffering." [Observ. et Curat. Med. lib. XXI obs. xiii. Frankfort, 1614.] Now if this was the Homoeopathic remedy, as Hahnemann pretends, it might be a fair question why the young man was not cured by it. But it is a much graver question why a man who has shrewdness and learning enough to go so far after his facts, should think it right to treat them with such astonishing negligence or such artful unfairness.

Even if every word he had pretended to take from his old authorities were to be found in them, even if the authority of every one of these authors were beyond question, the looseness with which they are used to prove whatever Hahnemann chooses is beyond the bounds of credibility. Let me give one instance to illustrate the character of this man's mind. Hahnemann asserts, in a note annexed to the 110th paragraph of the "Organon," that the smell of the rose will cause certain persons to faint. And he says in the text that substances which produce peculiar effects of this nature on particular constitutions cure the same symptoms in people in general. Then in another note to the same paragraph he quotes the following fact from one of the last sources one would have looked to for medical information, the Byzantine Historians.

"It was by these means (i.e. Homoeopathically) that the Princess Eudisia with rose-water restored a person who had fainted!"

Is it possible that a man who is guilty of such pedantic folly as this,—a man who can see a confirmation of his doctrine in such a recovery as this,—a recovery which is happening every day, from a breath of air, a drop or two of water, untying a bonnet-string, loosening a stay-lace, and which can hardly help happening, whatever is done,—is it possible that a man, of whose pages, not here and there one, but hundreds upon hundreds are loaded with such trivialities, is the Newton, the Columbus, the Harvey of the nineteenth century!

The whole process of demonstration he employs is this. An experiment is instituted with some drug upon

one or more healthy persons. Everything that happens for a number of days or weeks is, as we have seen, set down as an effect of the medicine. Old volumes are then ransacked promiscuously, and every morbid sensation or change that anybody ever said was produced by the drug in question is added to the list of symptoms. By one or both of these methods, each of the sixty-four substances enumerated by Hahnemann is shown to produce a very large number of symptoms, the lowest in his scale being ninety-seven, and the highest fourteen hundred and ninety-one. And having made out this list respecting any drug, a catalogue which, as you may observe in any Homoeopathic manual, contains various symptoms belonging to every organ of the body, what can be easier than to find alleged cures in every medical author which can at once be attributed to the Homoeopathic principle; still more if the grave of extinguished credulity is called upon to give up its dead bones as living witnesses; and worst of all, if the monuments of the past are to be mutilated in favor of "the sole law of Nature in therapeutics"?

There are a few familiar facts of which great use has been made as an entering wedge for the Homoeopathic doctrine. They have been suffered to pass current so long that it is time they should be nailed to the counter, a little operation which I undertake, with perfect cheerfulness, to perform for them.

The first is a supposed illustration of the Homoeopathic law found in the precept given for the treatment of parts which have been frozen, by friction with snow or similar means. But we deceive ourselves by names, if we suppose the frozen part to be treated by cold, and not by heat. The snow may even be actually warmer than the part to which it is applied. But even if it were at the same temperature when applied, it never did and never could do the least good to a frozen part, except as a mode of regulating the application of what? of heat. But the heat must be applied gradually, just as food must be given a little at a time to those perishing with hunger. If the patient were brought into a warm room, heat would be applied very rapidly, were not something interposed to prevent this, and allow its gradual admission. Snow or iced water is exactly what is wanted; it is not cold to the part; it is very possibly warm, on the contrary, for these terms are relative, and if it does not melt and let the heat in, or is not taken away, the part will remain frozen up until doomsday. Now the treatment of a frozen limb by heat, in large or small quantities, is not Homoeopathy.

The next supposed illustration of the Homoeopathic law is the alleged successful management of burns, by holding them to the fire. This is a popular mode of treating those burns which are of too little consequence to require any more efficacious remedy, and would inevitably get well of themselves, without any trouble being bestowed upon them. It produces a most acute pain in the part, which is followed by some loss of sensibility, as happens with the eye after exposure to strong light, and the ear after being subjected to very intense sounds. This is all it is capable of doing, and all further notions of its efficacy must be attributed merely to the vulgar love of paradox. If this example affords any comfort to the Homoeopathist, it seems as cruel to deprive him of it as it would be to convince the mistress of the smoke-jack or the flatiron that the fire does not literally "draw the fire out," which is her hypothesis.

But if it were true that frost-bites were cured by cold and burns by heat, it would be subversive, so far as it went, of the great principle of Homoeopathy.

For you will remember that this principle is that Like cures Like, and not that Same cures Same; that there is resemblance and not identity between the symptoms of the disease and those produced by the drug which cures it, and none have been readier to insist upon this distinction than the Homoeopathists themselves. For if Same cures Same, then every poison must be its own antidote,—which is neither a part of their theory nor their so-called experience. They have been asked often enough, why it was that arsenic could not cure the mischief which arsenic had caused, and why the infectious cause of small-pox did not remedy the disease it had produced, and then they were ready enough to see the distinction I have pointed out. O no! it was not the hair of the same dog, but only of one very much like him!

A third instance in proof of the Homoeopathic law is sought for in the acknowledged efficacy of vaccination. And how does the law apply to this? It is granted by the advocates of Homoeopathy that there is a resemblance between the effects of the vaccine virus on a person in health and the symptoms of small-pox. Therefore, according to the rule, the vaccine virus will cure the small-pox, which, as everybody knows, is entirely untrue. But it prevents small-pox, say the Homoeopathists. Yes, and so does small-pox prevent itself from ever happening again, and we know just as much of the principle involved in the one case as in the other. For this is only one of a series of facts which we are wholly unable to explain. Small-pox, measles, scarlet-fever, hooping-cough, protect those who have them once from future attacks; but nettle-rash and catarrh and lung fever, each of which is just as Homoeopathic to itself as any one of the others, have no such preservative power. We are obliged to accept the fact, unexplained, and we can do no more for vaccination than for the rest.

I come now to the most directly practical point connected with the subject, namely,—

What is the state of the evidence as to the efficacy of the proper Homoeopathic treatment in the cure of diseases.

As the treatment adopted by the Homoeopathists has been almost universally by means of the infinitesimal doses, the question of their efficacy is thrown open, in common with that of the truth of their fundamental axiom, as both are tested in practice.

We must look for facts as to the actual working of Homoeopathy to three sources.

1. The statements of the unprofessional public.
2. The assertions of Homoeopathic practitioners.
3. The results of trials by competent and honest physicians, not pledged to the system.

I think, after what we have seen of medical facts, as they are represented by incompetent persons, we are disposed to attribute little value to all statements of wonderful cures, coming from those who have never been accustomed to watch the caprices of disease, and have not cooled down their young enthusiasm by the habit of tranquil observation. Those who know nothing of the natural progress of a malady, of its ordinary duration, of its various modes of terminating, of its liability to accidental complications, of the signs which mark its insignificance or severity, of what is to be expected of it when left to itself, of how much or how little is to be anticipated from remedies, those who know nothing or next to nothing of all these things, and who

are in a great state of excitement from benevolence, sympathy, or zeal for a new medical discovery, can hardly be expected to be sound judges of facts which have misled so many sagacious men, who have spent their lives in the daily study and observation of them. I believe that, after having drawn the portrait of defunct Perkinism, with its five thousand printed cures, and its million and a half computed ones, its miracles blazoned about through America, Denmark, and England; after relating that forty years ago women carried the Tractors about in their pockets, and workmen could not make them fast enough for the public demand; and then showing you, as a curiosity, a single one of these instruments, an odd one of a pair, which I obtained only by a lucky accident, so utterly lost is the memory of all their wonderful achievements; I believe, after all this, I need not waste time in showing that medical accuracy is not to be looked for in the florid reports of benevolent associations, the assertions of illustrious patrons, the lax effusions of daily journals, or the effervescent gossip of the tea-table.

Dr. Hering, whose name is somewhat familiar to the champions of Homoeopathy, has said that "the new healing art is not to be judged by its success in isolated cases only, but according to its success in general, its innate truth, and the incontrovertible nature of its innate principles."

We have seen something of "the incontrovertible nature of its innate principles," and it seems probable, on the whole, that its success in general must be made up of its success in isolated cases. Some attempts have been made, however, to finish the whole matter by sweeping statistical documents, which are intended to prove its triumphant success over the common practice.

It is well known to those who have had the good fortune to see the "Homoeopathic Examiner," that this journal led off, in its first number, with a grand display of everything the newly imported doctrine had to show for itself. It is well remarked, on the twenty-third page of this article, that "the comparison of bills of mortality among an equal number of sick, treated by divers methods, is a most poor and lame way to get at conclusions touching principles of the healing art." In confirmation of which, the author proceeds upon the twenty-fifth page to prove the superiority of the Homoeopathic treatment of cholera, by precisely these very bills of mortality. Now, every intelligent physician is aware that the poison of cholera differed so much in its activity at different times and, places, that it was next to impossible to form any opinion as to the results of treatment, unless every precaution was taken to secure the most perfectly corresponding conditions in the patients treated, and hardly even then. Of course, then, a Russian Admiral, by the name of Mordvinov, backed by a number of so-called physicians practising in Russian villages, is singularly competent to the task of settling the whole question of the utility of this or that kind of treatment; to prove that, if not more than eight and a half per cent. of those attacked with the disease perished, the rest owed their immunity to Hahnemann. I can remember when more than a hundred patients in a public institution were attacked with what, I doubt not, many Homoeopathic physicians (to say nothing of Homoeopathic admirals) would have called cholera, and not one of them died, though treated in the common way, and it is my firm belief that, if such a result had followed the administration of the omnipotent globules, it would have been in the mouth of every adept in Europe, from Quin of London to Spohr of Gandersheim. No longer ago than yesterday, in one of the most widely circulated papers of this city, there was published an assertion that the mortality in several Homoeopathic Hospitals was not quite five in a hundred, whereas, in what are called by the writer Allopathic Hospitals, it is said to be eleven in a hundred. An honest man should be ashamed of such an argumentum ad ignorantiam. The mortality of a hospital depends not merely on the treatment of the patients, but on the class of diseases it is in the habit of receiving, on the place where it is, on the season, and many other circumstances. For instance, there are many hospitals in the great cities of Europe that receive few diseases of a nature to endanger life, and, on the other hand, there are others where dangerous diseases are accumulated out of the common proportion. Thus, in the wards of Louis, at the Hospital of La Pitie, a vast number of patients in the last stages of consumption were constantly entering, to swell the mortality of that hospital. It was because he was known to pay particular attention to the diseases of the chest that patients laboring under those fatal affections to an incurable extent were so constantly coming in upon him. It is always a miserable appeal to the thoughtlessness of the vulgar, to allege the naked fact of the less comparative mortality in the practice of one hospital or of one physician than another, as an evidence of the superiority of their treatment. Other things being equal, it must always be expected that those institutions and individuals enjoying to the highest degree the confidence of the community will lose the largest proportion of their patients; for the simple reason that they will naturally be looked to by those suffering from the gravest class of diseases; that many, who know that they are affected with mortal disease, will choose to die under their care or shelter, while the subjects of trifling maladies, and merely troublesome symptoms, amuse themselves to any extent among the fancy practitioners. When, therefore, Dr. Mublenbein, as stated in the "Homoeopathic Examiner," and quoted in yesterday's "Daily Advertiser," asserts that the mortality among his patients is only one per cent. since he has practised Homoeopathy, whereas it was six per cent. when he employed the common mode of practice, I am convinced by this, his own statement, that the citizens of Brunswick, whenever they are seriously sick, take good care not to send for Dr. Muhlenbein!

It is evidently impossible that I should attempt, within the compass of a single lecture, any detailed examination of the very numerous cases reported in the Homoeopathic Treatises and Journals. Having been in the habit of receiving the French "Archives of Homoeopathic Medicine" until the premature decease of that Journal, I have had the opportunity of becoming acquainted somewhat with the style of these documents, and experiencing whatever degree of conviction they were calculated to produce. Although of course I do not wish any value to be assumed for my opinion, such as it is, I consider that you are entitled to hear it. So far, then, as I am acquainted with the general character of the cases reported by the Homoeopathic physicians, they would for the most part be considered as wholly undeserving a place in any English, French, or American periodical of high standing, if, instead of favoring the doctrine they were intended to support, they were brought forward to prove the efficacy of any common remedy administered by any common practitioner. There are occasional exceptions to this remark; but the general truth of it is rendered probable by the fact that these cases are always, or almost always, written with the single object of showing the efficacy of the medicine used, or the skill of the practitioner, and it is recognized as a general rule that such cases deserve very little confidence. Yet they may sound well enough, one at a time, to those who are not fully aware of the fallacies of medical evidence. Let me state a case in illustration. Nobody doubts that some patients recover

under every form of practice. Probably all are willing to allow that a large majority, for instance, ninety in a hundred, of such cases as a physician is called to in daily practice, would recover, sooner or later, with more or less difficulty, provided nothing were done to interfere seriously with the efforts of nature.

Suppose, then, a physician who has a hundred patients prescribes to each of them pills made of some entirely inert substance, as starch, for instance. Ninety of them get well, or if he chooses to use such language, he cures ninety of them. It is evident, according to the doctrine of chances, that there must be a considerable number of coincidences between the relief of the patient and the administration of the remedy. It is altogether probable that there will happen two or three very striking coincidences out of the whole ninety cases, in which it would seem evident that the medicine produced the relief, though it had, as we assumed, nothing to do with it. Now suppose that the physician publishes these cases, will they not have a plausible appearance of proving that which, as we granted at the outset, was entirely false? Suppose that instead of pills of starch he employs microscopic sugarplums, with the five' million billion trillionth part of a suspicion of aconite or pulsatilla, and then publishes his successful cases, through the leaden lips of the press, or the living ones of his female acquaintances,—does that make the impression a less erroneous one? But so it is that in Homoeopathic works and journals and gossip one can never, or next to never, find anything but successful cases, which might do very well as a proof of superior skill, did it not prove as much for the swindling advertisers whose certificates disgrace so many of our newspapers. How long will it take mankind to learn that while they listen to “the speaking hundreds and units,” who make the world ring with the pretended triumphs they have witnessed, the “dumb millions” of deluded and injured victims are paying the daily forfeit of their misplaced confidence!

I am sorry to see, also, that a degree of ignorance as to the natural course of diseases is often shown in these published cases, which, although it may not be detected by the unprofessional reader, conveys an unpleasant impression to those who are acquainted with the subject. Thus a young woman affected with jaundice is mentioned in the German “Annals of Clinical Homoeopathy” as having been cured in twenty-nine days by pulsatilla and nux vomica. Rummel, a well-known writer of the same school, speaks of curing a case of jaundice in thirty-four days by Homoeopathic doses of pulsatilla, aconite, and cinchona. I happened to have a case in my own household, a few weeks since, which lasted about ten days, and this was longer than I have repeatedly seen it in hospital practice, so that it was nothing to boast of.

Dr. Munneche of Lichtenburg in Saxony is called to a patient with sprained ankle who had been a fortnight under the common treatment. The patient gets well by the use of arnica in a little more than a month longer, and this extraordinary fact is published in the French “Archives of Homoeopathic Medicine.”

In the same Journal is recorded the case of a patient who with nothing more, so far as any proof goes, than influenza, gets down to her shop upon the sixth day.

And again, the cool way in which everything favorable in a case is set down by these people entirely to their treatment, may be seen in a case of croup reported in the “Homoeopathic Gazette” of Leipsic, in which leeches, blistering, inhalation of hot vapor, and powerful internal medicine had been employed, and yet the merit was all attributed to one drop of some Homoeopathic fluid.

I need not multiply these quotations, which illustrate the grounds of an opinion which the time does not allow me to justify more at length; other such cases are lying open before me; there is no end to them if more were wanted; for nothing is necessary but to look into any of the numerous broken-down Journals of Homoeopathy, the volumes of which may be found on the shelves of those curious in such matters.

A number of public trials of Homoeopathy have been made in different parts of the world. Six of these are mentioned in the Manifesto of the “Homoeopathic Examiner.” Now to suppose that any trial can absolutely silence people, would be to forget the whole experience of the past. Dr. Haygarth and Dr. Alderson could not stop the sale of the five-guinea Tractors, although they proved that they could work the same miracles with pieces of wood and tobacco-pipe. It takes time for truth to operate as well as Homoeopathic globules. Many persons thought the results of these trials were decisive enough of the nullity of the treatment; those who wish to see the kind of special pleading and evasion by which it is attempted to cover results which, stated by the “Homoeopathic Examiner” itself, look exceedingly like a miserable failure, may consult the opening flourish of that Journal. I had not the intention to speak of these public trials at all, having abundant other evidence on the point. But I think it best, on the whole, to mention two of them in a few words,—that instituted at Naples and that of Andral.

There have been few names in the medical profession, for the last half century, so widely known throughout the world of science as that of M. Esquirol, whose life was devoted to the treatment of insanity, and who was without a rival in that department of practical medicine. It is from an analysis communicated by him to the “Gazette Medicale de Paris” that I derive my acquaintance with the account of the trial at Naples by Dr. Panvini, physician to the Hospital della Pace. This account seems to be entirely deserving of credit. Ten patients were set apart, and not allowed to take any medicine at all,—much against the wish of the Homoeopathic physician. All of them got well, and of course all of them would have been claimed as triumphs if they had been submitted to the treatment. Six other slight cases (each of which is specified) got well under the Homoeopathic treatment, none of its asserted specific effects being manifested.

All the rest were cases of grave disease; and so far as the trial, which was interrupted about the fortieth day, extended, the patients grew worse, or received no benefit. A case is reported on the page before me of a soldier affected with acute inflammation in the chest, who took successively aconite, bryonia, nux vomica, and pulsatilla, and after thirty-eight days of treatment remained without any important change in his disease. The Homoeopathic physician who treated these patients was M. de Horatiis, who had the previous year been announcing his wonderful cures. And M. Esquirol asserted to the Academy of Medicine in 1835, that this M. de Horatiis, who is one of the prominent personages in the “Examiner's” Manifesto published in 1840, had subsequently renounced Homoeopathy. I may remark, by the way, that this same periodical, which is so very easy in explaining away the results of these trials, makes a mistake of only six years or a little more as to the time when this at Naples was instituted.

M. Andral, the “eminent and very enlightened allopathist” of the “Homoeopathic Examiner,” made the

following statement in March, 1835, to the Academy of Medicine: "I have submitted this doctrine to experiment; I can reckon at this time from one hundred and thirty to one hundred and forty cases, recorded with perfect fairness, in a great hospital, under the eye of numerous witnesses; to avoid every objection—I obtained my remedies of M. Guibourt, who keeps a Homoeopathic pharmacy, and whose strict exactness is well known; the regimen has been scrupulously observed, and I obtained from the sisters attached to the hospital a special regimen, such as Hahnemann orders. I was told, however, some months since, that I had not been faithful to all the rules of the doctrine. I therefore took the trouble to begin again; I have studied the practice of the Parisian Homoeopathists, as I had studied their books, and I became convinced that they treated their patients as I had treated mine, and I affirm that I have been as rigorously exact in the treatment as any other person."

And he expressly asserts the entire nullity of the influence of all the Homoeopathic remedies tried by him in modifying, so far as he could observe, the progress or termination of diseases. It deserves notice that he experimented with the most boasted substances,—cinchona, aconite, mercury, bryonia, belladonna. Aconite, for instance, he says he administered in more than forty cases of that collection of feverish symptoms in which it exerts so much power, according to Hahnemann, and in not one of them did it have the slightest influence, the pulse and heat remaining as before.

These statements look pretty honest, and would seem hard to be explained away, but it is calmly said that he "did not know enough of the method to select the remedies with any tolerable precision." ["Homoeopathic Examiner, vol. i. p. 22.]

"Nothing is left to the caprice of the physician." (In a word, instead of being dependent upon blind chance, that there is an infallible law, guided by which; the physician MUST select the proper remedies.) ['Ibid.,' in a notice of Menzel's paper.] Who are they that practice Homoeopathy, and say this of a man with the *Materia Medica* of Hahnemann lying before him? Who are they that send these same globules, on which he experimented, accompanied by a little book, into families, whose members are thought competent to employ them, when they deny any such capacity to a man whose life has been passed at the bedside of patients, the most prominent teacher in the first Medical Faculty in the world, the consulting physician of the King of France, and one of the most renowned practical writers, not merely of his nation, but of his age? I leave the quibbles by which such persons would try to creep out from under the crushing weight of these conclusions to the unfortunates who suppose that a reply is equivalent to an answer.

Dr. Baillie, one of the physicians in the great Hotel Dieu of Paris, invited two Homoeopathic practitioners to experiment in his wards. One of these was Curie, now of London, whose works are on the counters of some of our bookstores, and probably in the hands of some of my audience. This gentleman, whom Dr. Baillie declares to be an enlightened man, and perfectly sincere in his convictions, brought his own medicines from the pharmacy which furnished Hahnemann himself, and employed them for four or five months upon patients in his ward, and with results equally unsatisfactory, as appears from Dr. Baillie's statement at a meeting of the Academy of Medicine. And a similar experiment was permitted by the Clinical Professor of the Hotel Dieu of Lyons, with the same complete failure.

But these are old and prejudiced practitioners. Very well, then take the statement of Dr. Fleury, a most intelligent young physician, who treated homoeopathically more than fifty patients, suffering from diseases which it was not dangerous to treat in this way, taking every kind of precaution as to regimen, removal of disturbing influences, and the state of the atmosphere, insisted upon by the most vigorous partisans of the doctrine, and found not the slightest effect produced by the medicines. And more than this, read nine of these cases, which he has published, as I have just done, and observe the absolute nullity of aconite, belladonna, and bryonia, against the symptoms over which they are pretended to exert such palpable, such obvious, such astonishing influences. In the view of these statements, it is impossible not to realize the entire futility of attempting to silence this asserted science by the flattest and most peremptory results of experiment. Were all the hospital physicians of Europe and America to devote themselves, for the requisite period, to this sole pursuit, and were their results to be unanimous as to the total worthlessness of the whole system in practice, this slippery delusion would slide through their fingers without the slightest discomposure, when, as they supposed, they had crushed every joint in its tortuous and trailing body.

3. I have said, that to show the truth of the Homoeopathic doctrine, as announced by Hahnemann, it would be necessary to show, in the third place, that remedies never cure diseases when they are not capable of producing similar symptoms! The burden of this somewhat comprehensive demonstration lying entirely upon the advocates of this doctrine, it may be left to their mature reflections.

It entered into my original plan to treat of the doctrine relating to Psora, or itch,—an almost insane conception, which I am glad to get rid of, for this is a subject one does not care to handle without gloves. I am saved this trouble, however, by finding that many of the disciples of Hahnemann, those disciples the very gospel of whose faith stands upon his word, make very light of his authority on this point, although he himself says, "It has cost me twelve years of study and research to trace out the source of this incredible number of chronic affections, to discover this great truth, which remained concealed from all my predecessors and contemporaries, to establish the basis of its demonstration, and find out, at the same time, the curative medicines that were fit to combat this hydra in all its different forms."

But, in the face of all this, the following remarks are made by Wolff, of Dresden, whose essays, according to the editor of the "Homoeopathic Examiner," "represent the opinions of a large majority of Homoeopathists in Europe."

"It cannot be unknown to any one at all familiar with Homoeopathic literature, that Hahnemann's idea of tracing the large majority of chronic diseases to actual itch has met with the greatest opposition from Homoeopathic physicians themselves." And again, "If the Psoric theory has led to no proper schism, the reason is to be found in the fact that it is almost without any influence in practice."

We are told by Jahr, that Dr. Griesselich, "Surgeon to the Grand Duke of Baden," and a "distinguished" Homoeopathist, actually asked Hahnemann for the proof that chronic diseases, such as dropsy, for instance, never arise from any other cause than itch; and that, according to common report, the venerable sage was

highly incensed (fort courrouce) with Dr. Hartmann, of Leipsic, another "distinguished" Homoeopathist, for maintaining that they certainly did arise from other causes.

And Dr. Fielitz, in the "Homoeopathic Gazette" of Leipsic, after saying, in a good-natured way, that Psora is the Devil in medicine, and that physicians are divided on this point into diabolists and exorcists, declares that, according to a remark of Hahnemann, the whole civilized world is affected with Psora. I must therefore disappoint any advocate of Hahnemann who may honor me with his presence, by not attacking a doctrine on which some of the disciples of his creed would be very happy to have its adversaries waste their time and strength. I will not meddle with this excrescence, which, though often used in time of peace, would be dropped, like the limb of a shell-fish, the moment it was assailed; time is too precious, and the harvest of living extravagances nods too heavily to my sickle, that I should blunt it upon straw and stubble.

I will close the subject with a brief examination of some of the statements made in Homoeopathic works, and more particularly in the brilliant Manifesto of the "Examiner," before referred to. And first, it is there stated under the head of "Homoeopathic Literature," that "SEVEN HUNDRED volumes have been issued from the press developing the peculiarities of the system, and many of them possessed of a scientific character that savans know well how to respect." If my assertion were proper evidence in the case, I should declare, that, having seen a good many of these publications, from the year 1834, when I bought the work of the Rev. Thomas Everest, [Dr. Curie speaks of this silly pamphlet as having been published in 1835.] to within a few weeks, when I received my last importation of Homoeopathic literature, I have found that all, with a very few exceptions, were stitched pamphlets varying from twenty or thirty pages to somewhat less than a hundred, and generally resembling each other as much as so many spelling-books.

But not being evidence in the case, I will give you the testimony of Dr. Trinks, of Dresden, who flourishes on the fifteenth page of the same Manifesto as one of the most distinguished among the Homoeopathists of Europe. I translate the sentence literally from the "Archives de la Medecine Homoeopathique."

"The literature of Homoeopathy, if that honorable name must be applied to all kinds of book-making, has been degraded to the condition of the humblest servitude. Productions without talent, without spirit, without discrimination, flat and pitiful eulogies, exaggerations surpassing the limits of the most robust faith, invectives against such as dared to doubt the dogmas which had been proclaimed, or catalogues of remedies; of such materials is it composed! From distance to distance only, have appeared some memoirs useful to science or practice, which appear as so many green oases in the midst of this literary desert."

It is a very natural as well as a curious question to ask, What has been the success of Homoeopathy in the different countries of Europe, and what is its present condition?

The greatest reliance of the advocates of Homoeopathy is of course on Germany. We know very little of its medical schools, its medical doctrines, or its medical men, compared with those of England and France. And, therefore, when an intelligent traveller gives a direct account from personal inspection of the miserable condition of the Homoeopathic hospital at Leipsic, the first established in Europe, and the first on the list of the ever-memorable Manifesto, it is easy enough answer or elude the fact by citing various hard names of "distinguished" practitioners, which sound just as well to the uninformed public as if they were Meckel, or Tiedemann, or Langenbeck. Dr. Leo-Wolf, who, to be sure, is opposed to Homoeopathy, but who is a scholar, and ought to know something of his own countrymen, assures us that "Dr. Kopp is the only German Homoeopathist, if we can call him so, who has been distinguished as an author and practitioner before he examined this method." And Dr. Lee, the same gentleman in whose travels the paragraph relating to the Leipsic Hospital is to be found, says the same thing. And I will cheerfully expose myself to any impertinent remark which it might suggest, to assure my audience that I never heard or saw one authentic Homoeopathic name of any country in Europe, which I had ever heard mentioned before as connected with medical science by a single word or deed sufficient to make it in any degree familiar to my ears, unless Arnold of Heidelberg is the anatomist who discovered a little nervous centre, called the otic ganglion. But you need ask no better proof of who and what the German adherents of this doctrine must be, than the testimony of a German Homoeopathist as to the wretched character of the works they manufacture to enforce its claims.

As for the act of this or that government tolerating or encouraging Homoeopathy, every person of common intelligence knows that it is a mere form granted or denied according to the general principles of policy adopted in different states, or the degree of influence which some few persons who have adopted it may happen to have at court. What may be the value of certain pompous titles with which many of the advocates of Homoeopathy are honored, it might be disrespectful to question. But in the mean time the judicious inquirer may ponder over an extract which I translate from a paper relating to a personage well known to the community as Williams the Oculist, with whom I had the honor of crossing the Atlantic some years since, and who himself handed me two copies of the paper in question.

"To say that he was oculist of Louis XVIII. and of Charles X., and that he now enjoys the same title with respect to His Majesty, Louis Philippe, and the King of the Belgians, is unquestionably to say a great deal; and yet it is one of the least of his titles to public confidence. His reputation rests upon a basis more substantial even than the numerous diplomas with which he is provided, than the membership of the different medical societies which have chosen him as their associate," etc., etc.

And as to one more point, it is time that the public should fully understand that the common method of supporting barefaced imposture at the present day, both in Europe and in this country, consists in trumping up "Dispensaries," "Colleges of Health," and other advertising charitable clap-traps, which use the poor as decoy-ducks for the rich, and the proprietors of which have a strong predilection for the title of "Professor." These names, therefore, have come to be of little or no value as evidence of the good character, still less of the high pretensions of those who invoke their authority. Nor does it follow, even when a chair is founded in connection with a well-known institution, that it has either a salary or an occupant; so that it may be, and probably is, a mere harmless piece of toleration on the part of the government if a Professorship of Homoeopathy is really in existence at Jena or Heidelberg. And finally, in order to correct the error of any who might suppose that the whole Medical Profession of Germany has long since fallen into the delusions of Hahnemann, I will quote two lines which a celebrated anatomist and surgeon (whose name will occur again in this lecture in connection with a very pleasing letter) addressed to the French Academy of Medicine in 1835.

"I happened to be in Germany some months since, at a meeting of nearly six hundred physicians; one of them wished to bring up the question of Homoeopathy; they would not even listen to him." This may have been very impolite and bigoted, but that is not precisely the point in reference to which I mention the circumstance.

But if we cannot easily get at Germany, we can very easily obtain exact information from France and England. I took the trouble to write some months ago to two friends in Paris, in whom I could place confidence, for information upon the subject. One of them answered briefly to the effect that nothing was said about it. When the late Curator of the Lowell Institute, at his request, asked about the works upon the subject, he was told that they had remained a long time on the shelves quite unsalable, and never spoken of.

The other gentleman, [Dr. Henry T. Bigelow, now Professor of Surgery in Harvard University] whose name is well known to my audience, and who needs no commendation of mine, had the kindness to procure for me many publications upon the subject, and some information which sets the whole matter at rest, so far as Paris is concerned. He went directly to the Baillieres, the principal and almost the only publishers of all the Homoeopathic books and journals in that city. The following facts were taken by him from the account-books of this publishing firm. Four Homoeopathic Journals have been published in Paris; three of them by the Baillieres.

The reception they met with may be judged of by showing the number of subscribers to each on the books of the publishing firm.

A Review published by some other house, which lasted one year, and had about fifty subscribers, appeared in 1834, 1835.

There were only four Journals of Homoeopathy ever published in Paris. The Baillieres informed my correspondent that the sale of Homoeopathic books was much less than formerly, and that consequently they should undertake to publish no new books upon the subject, except those of Jahr or Hahnemann. "This man," says my correspondent,—referring to one of the brothers,—"the publisher and headquarters of Homoeopathy in Paris, informs me that it is going down in England and Germany as well as in Paris." For all the facts he had stated he pledged himself as responsible.

Homoeopathy was in its prime in Paris, he said, in 1836 and 1837, and since then has been going down.

Louis told my correspondent that no person of distinction in Paris had embraced Homoeopathy, and that it was declining. If you ask who Louis is, I refer you to the well-known Homoeopathist, Peschier of Geneva, who says, addressing him, "I respect no one more than yourself; the feeling which guides your researches, your labors, and your pen, is so honorable and rare, that I could not but bow down before it; and I own, if there were any allopathist who inspired me with higher veneration, it would be him and not yourself whom I should address."

Among the names of "Distinguished Homoeopathists," however, displayed in imposing columns, in the index of the "Homoeopathic Examiner," are those of MARJOLIN, AMUSSAT, and BRESCHET, names well known to the world of science, and the last of them identified with some of the most valuable contributions which anatomical knowledge has received since the commencement of the present century. One Dr. Chrysaora, who stands sponsor for many facts in that Journal, makes the following statement among the rest: "Professors, who are esteemed among the most distinguished of the Faculty (Faculty de Medicine), both as to knowledge and reputation, have openly confessed the power of Homoeopathia in forms of disease where the ordinary method of practice proved totally insufficient. It affords me the highest pleasure to select from among these gentlemen, Marjolin, Amussat, and Breschet."

Here is a literal translation of an original letter, now in my possession, from one of these Homoeopathists to my correspondent:—

"DEAR SIR, AND RESPECTED PROFESSIONAL BROTHER:

"You have had the kindness to inform me in your letter that a new American Journal, the 'New World,' has made use of my name in support of the pretended Homoeopathic doctrines, and that I am represented as one of the warmest partisans of Homoeopathy in France.

"I am vastly surprised at the reputation manufactured for me upon the new continent; but I am obliged, in deference to truth, to reject it with my whole energy. I spurn far from me everything which relates to that charlatanism called Homoeopathy, for these pretended doctrines cannot endure the scrutiny of wise and enlightened persons, who are guided by honorable sentiments in the practice of the noblest of arts.

"PARIS, 3d November, 1841

"I am, etc., etc.,

"G. BRESCHET,

"Professor in the Faculty of Medicine, Member of the Institute, Surgeon of Hotel Dieu, and Consulting Surgeon to the King, etc." [I first saw M. Breschet's name mentioned in that Journal]

Concerning Amussat, my correspondent writes, that he was informed by Madame Hahnemann, who converses in French more readily than her husband, and therefore often speaks for him, that "he was not a physician, neither Homoeopathist nor Allopathist, but that he was the surgeon of their own establishment; that is, performed as a surgeon all the operations they had occasion for in their practice."

I regret not having made any inquiries as to Marjolin, who, I doubt not, would strike his ponderous snuff-box until it resounded like the Grecian horse, at hearing such a doctrine associated with his respectable name. I was not aware, when writing to Paris, that this worthy Professor, whose lectures I long attended, was included in these audacious claims; but after the specimens I have given of the accuracy of the foreign correspondence of the "Homoeopathic Examiner," any further information I might obtain would seem so superfluous as hardly to be worth the postage.

Homoeopathy may be said, then, to be in a sufficiently miserable condition in Paris. Yet there lives, and there has lived for years, the illustrious Samuel Hahnemann, who himself assured my correspondent that no place offered the advantages of Paris in its investigation, by reason of the attention there paid to it.

In England, it appears by the statement of Dr. Curie in October, 1839, about eight years after its introduction into the country, that there were eighteen Homoeopathic physicians in the United Kingdom, of whom only three were to be found out of London, and that many of these practised Homoeopathy in secret.

It will be seen, therefore, that, according to the recent statement of one of its leading English advocates, Homoeopathy had obtained not quite half as many practical disciples in England as Perkinism could show for itself in a somewhat less period from the time of its first promulgation in that country.

Dr. Curie's letter, dated London, October 30, 1839, says there is "one in Dublin, Dr. Luther; at Glasgow, Dr. Scott." The "distinguished" Chrysaora writes from Paris, dating October 20, 1839, "On the other hand, Homoeopathy is commencing to make an inroad into England by the way of Ireland. At Dublin, distinguished physicians have already embraced the new system, and a great part of the nobility and gentry of that city have emancipated themselves from the English fashion and professional authority."

But the Marquis of Anglesea and Sir Edward Lytton Bulwer patronize Homoeopathy; the Queen Dowager Adelaide has been treated by a Homoeopathic physician. "Jarley is the delight of the nobility and gentry." "The Royal Family are the patrons of Jarley."

Let me ask if a Marquis and a Knight are better than two Lords, and if the Dowager of Royalty is better than Royalty itself, all of which illustrious dignities were claimed in behalf of Benjamin Douglass Perkins?

But if the balance is thought too evenly suspended in this case, another instance can be given in which the evidence of British noblemen and their ladies is shown to be as valuable in establishing the character of a medical man or doctrine, as would be the testimony of the Marquis of Waterford concerning the present condition and prospects of missionary enterprise. I have before me an octavo volume of more than four hundred pages, in which, among much similar matter, I find highly commendatory letters from the Marchioness of Ormond, Lady Harriet Kavanagh, the Countess of Buckinghamshire, the Right Hon. Viscount Ingestre, M. P., and the Most Noble, the Marquis of Sligo,—all addressed to "John St. John Long, Esq.," a wretched charlatan, twice tried for, and once convicted of, manslaughter at the Old Bailey.

This poor creature, too, like all of his tribe, speaks of the medical profession as a great confederation of bigoted monopolists. He, too, says that "If an innovator should appear, holding out hope to those in despair, and curing disorders which the faculty have recorded as irremediable, he is at once, and without inquiry, denounced as an empiric and an impostor." He, too, cites the inevitable names of Galileo and Harvey, and refers to the feelings excited by the great discovery of Jenner. From the treatment of the great astronomer who was visited with the punishment of other heretics by the ecclesiastical authorities of a Catholic country some centuries since, there is no very direct inference to be drawn to the medical profession of the present time. His name should be babbled no longer, after having been placarded for the hundredth time in the pages of St. John Long. But if we are doomed to see constant reference to the names of Harvey and Jenner in every worthless pamphlet containing the prospectus of some new trick upon the public, let us, once for all, stare the facts in the face, and see how the discoveries of these great men were actually received by the medical profession.

In 1628, Harvey published his first work upon the circulation. His doctrines were a complete revolution of the prevailing opinions of all antiquity. They immediately found both champions and opponents; of which last, one only, Riolanus, seemed to Harvey worthy of an answer, on account of his "rank, fame, and learning." Controversy in science, as in religion, was not, in those days, carried on with all the courtesy which our present habits demand, and it is possible that some hard words may have been applied to Harvey, as it is very certain that he used the most contemptuous expressions towards others.

Harvey declares in his second letter to Riolanus, "Since the first discovery of the circulation, hardly a day, or a moment, has passed without my hearing it both well and ill spoken of; some attack it with great hostility, others defend it with high encomiums; one party believe that I have abundantly proved the truth of the doctrine against all the weight of opposing arguments, by experiments, observations, and dissections; others think it not yet sufficiently cleared up, and free from objections." Two really eminent Professors, Plempius of Louvain, and Walaeus of Leyden, were among its early advocates.

The opinions sanctioned by the authority of long ages, and the names of Hippocrates and Galen, dissolved away, gradually, but certainly, before the demonstrations of Harvey. Twenty-four years after the publication of his first work, and six years before his death, his bust in marble was placed in the Hall of the College of Physicians, with a suitable inscription recording his discoveries.

Two years after this he was unanimously invited to accept the Presidency of that body; and he lived to see his doctrine established, and all reputable opposition withdrawn.

There were many circumstances connected with the discovery of Dr. Jenner which were of a nature to excite repugnance and opposition. The practice of inoculation for the small-pox had already disarmed that disease of many of its terrors. The introduction of a contagious disease from a brute creature into the human system naturally struck the public mind with a sensation of disgust and apprehension, and a part of the medical public may have shared these feelings. I find that Jenner's discovery of vaccination was made public in June, 1798. In July of the same year the celebrated surgeon, Mr. Cline, vaccinated a child with virus received from Dr. Jenner, and in communicating the success of this experiment, he mentions that Dr. Lister, formerly of the Small-Pox Hospital, and himself, are convinced of the efficacy of the cow-pox. In November of the same year, Dr. Pearson published his "Inquiry," containing the testimony of numerous practitioners in different parts of the kingdom, to the efficacy of the practice. Dr. HAYGARTH, who was so conspicuous in exposing the follies of Perkinism, was among the very earliest to express his opinion in favor of vaccination. In 1801, Dr. Lettsom mentions the circumstance "as being to the honor of the medical professors, that they have very generally encouraged this salutary practice, although it is certainly calculated to lessen their pecuniary advantages by its tendency to extirpate a fertile source of professional practice."

In the same year the Medical Committee of Paris spoke of vaccination in a public letter, as "the most brilliant and most important discovery of the eighteenth century." The Directors of a Society for the Extermination of the Small-Pox, in a Report dated October 1st, 1807, "congratulate the public on the very favorable opinion which the Royal College of Physicians of London, after a most minute and laborious

investigation made by the command of his Majesty, have a second time expressed on the subject of vaccination, in their Report laid before the House of Commons, in the last session of Parliament; in consequence of which the sum of twenty thousand pounds was voted to Dr. Jenner, as a remuneration for his discovery, in addition to ten thousand pounds before granted." (In June, 1802.)

These and similar accusations, so often brought up against the Medical Profession, are only one mode in which is manifested a spirit of opposition not merely to medical science, but to all science, and to all sound knowledge. It is a spirit which neither understands itself nor the object at which it is aiming. It gropes among the loose records of the past, and the floating fables of the moment, to glean a few truths or falsehoods tending to prove, if they prove anything, that the persons who have passed their lives in the study of a branch of knowledge the very essence of which must always consist in long and accurate observation, are less competent to judge of new doctrines in their own department than the rest of the community. It belongs to the clown in society, the destructive in politics, and the rogue in practice.

The name of Harvey, whose great discovery was the legitimate result of his severe training and patient study, should be mentioned only to check the pretensions of presumptuous ignorance. The example of Jenner, who gave his inestimable secret, the result of twenty-two years of experiment and researches, unpurchased, to the public,—when, as was said in Parliament, he might have made a hundred thousand pounds by it as well as any smaller sum,—should be referred to only to rebuke the selfish venders of secret remedies, among whom his early history obliges us reluctantly to record Samuel Hahnemann. Those who speak of the great body of physicians as if they were united in a league to support the superannuated notions of the past against the progress of improvement, have read the history of medicine to little purpose. The prevalent failing of this profession has been, on the contrary, to lend a too credulous ear to ambitious and plausible innovators. If at the present time ten years of public notoriety have passed over any doctrine professing to be of importance in medical science, and if it has not succeeded in raising up a powerful body of able, learned, and ingenious advocates for its claims, the fault must be in the doctrine and not in the medical profession.

Homoeopathy has had a still more extended period of trial than this, and we have seen with what results. It only remains to throw out a few conjectures as to the particular manner in which it is to break up and disappear.

1. The confidence of the few believers in this delusion will never survive the loss of friends who may die of any acute disease, under a treatment such as that prescribed by Homoeopathy. It is doubtful how far cases of this kind will be trusted to its tender mercies, but wherever it acquires any considerable foothold, such cases must come, and with them the ruin of those who practise it, should any highly valued life be thus sacrificed.

2. After its novelty has worn out, the ardent and capricious individuals who constitute the most prominent class of its patrons will return to visible doses, were it only for the sake of a change.

3. The Semi-Homoeopathic practitioner will gradually withdraw from the rotten half of his business and try to make the public forget his connection with it.

4. The ultra Homoeopathist will either recant and try to rejoin the medical profession; or he will embrace some newer and if possible equally extravagant doctrine; or he will stick to his colors and go down with his sinking doctrine. Very few will pursue the course last mentioned.

A single fact may serve to point out in what direction there will probably be a movement of the dissolving atoms of Homoeopathy. On the 13th page of the too frequently cited Manifesto of the "Examiner" I read the following stately paragraph:

"Bigelius, M. D., physician to the Emperor of Russia, whose elevated reputation is well known in Europe, has been an acknowledged advocate of Hahnemann's doctrines for several years. He abandoned Allopathia for Homoeopathia." The date of this statement is January, 1840. I find on looking at the booksellers' catalogues that one Bigel, or Bigelius, to speak more classically, has been at various times publishing Homoeopathic books for some years.

Again, on looking into the "Encyclographie des Sciences Medicales" for April, 1840, I find a work entitled "Manual of HYDROSUDOPATHY, or the Treatment of Diseases by Cold Water, etc., etc., by Dr. Bigel, Physician of the School of Strasburg, Member of the Medico-Chirurgical Institute of Naples, of the Academy of St. Petersburg,—Assessor of the College of the Empire of Russia, Physician of his late Imperial Highness the Grand Duke Constantine, Chevalier of the Legion of Honor, etc." Hydrosudopathy or Hydropathy, as it is sometimes called, is a new medical doctrine or practice which has sprung up in Germany since Homoeopathy, which it bids fair to drive out of the market, if, as Dr. Bigel says, fourteen physicians afflicted with diseases which defied themselves and their colleagues came to Graefenberg, in the year 1836 alone, and were cured. Now Dr. Bigel, "whose elevated reputation is well known in Europe," writes as follows: "The reader will not fail to see in this defence of the curative method of Graefenberg a profession of medical faith, and he will be correct in so doing." And his work closes with the following sentence, worthy of so distinguished an individual: "We believe, with religion, that the water of baptism purifies the soul from its original sin; let us believe also, with experience, that it is for our corporeal sins the redeemer of the human body." If Bigel, Physician to the late Grand Duke Constantine, is identical with Bigel whom the "Examiner" calls Physician to the Emperor of Russia, it appears that he is now actively engaged in throwing cold water at once upon his patients and the future prospects of Homoeopathy.

If, as must be admitted, no one of Hahnemann's doctrines is received with tolerable unanimity among his disciples, except the central axiom, *Similia similibus curantur*; if this axiom itself relies mainly for its support upon the folly and trickery of Hahnemann, what can we think of those who announce themselves ready to relinquish all the accumulated treasures of our art, to trifle with life upon the strength of these fantastic theories? What shall we think of professed practitioners of medicine, if, in the words of Jahr, "from ignorance, for their personal convenience, or through charlatanism, they treat their patients one day Homoeopathically and the next Allopathically;" if they parade their pretended new science before the unguarded portion of the community; if they suffer their names to be coupled with it wherever it may gain a credulous patient; and deny all responsibility for its character, refuse all argument for its doctrines, allege no palliation for the ignorance and deception interwoven with every thread of its flimsy tissue, when they are questioned by those

competent to judge and entitled to an answer?

Such is the pretended science of Homoeopathy, to which you are asked to trust your lives and the lives of those dearest to you. A mingled mass of perverse ingenuity, of tinsel erudition, of imbecile credulity, and of artful misrepresentation, too often mingled in practice, if we may trust the authority of its founder, with heartless and shameless imposition. Because it is suffered so often to appeal unanswered to the public, because it has its journals, its patrons, its apostles, some are weak enough to suppose it can escape the inevitable doom of utter disgrace and oblivion. Not many years can pass away before the same curiosity excited by one of Perkins's Tractors will be awakened at the sight of one of the Infinitesimal Globules. If it should claim a longer existence, it can only be by falling into the hands of the sordid wretches who wring their bread from the cold grasp of disease and death in the hovels of ignorant poverty.

As one humble member of a profession which for more than two thousand years has devoted itself to the pursuit of the best earthly interests of mankind, always assailed and insulted from without by such as are ignorant of its infinite perplexities and labors, always striving in unequal contest with the hundred-armed giant who walks in the noonday, and sleeps not in the midnight, yet still toiling, not merely for itself and the present moment, but for the race and the future, I have lifted my voice against this lifeless delusion, rolling its shapeless bulk into the path of a noble science it is too weak to strike, or to injure.

THE CONTAGIOUSNESS OF PUERPERAL FEVER

Printed in 1843; reprinted with additions, 1855.

THE POINT AT ISSUE. THE AFFIRMATIVE.

"The disease known as Puerperal Fever is so far contagious as to be frequently carried from patient to patient by physicians and nurses." O. W. Holmes, 1843.

THE NEGATIVE.

"The result of the whole discussion will, I trust, serve, not only to exalt your views of the value and dignity of our profession, but to divest your minds of the overpowering dread that you can ever become, especially to woman, under the extremely interesting circumstances of gestation and parturition, the minister of evil; that you can ever convey, in any possible manner, a horrible virus, so destructive in its effects, and so mysterious in its operations as that attributed to puerperal fever."—Professor Hodge, 1852.

"I prefer to attribute them to accident, or Providence, of which I can form a conception, rather than to a contagion of which I cannot form any clear idea, at least as to this particular malady."—Professor Meigs, 1852.

"... in the propagation of which they have no more to do, than with the propagation of cholera from Jessore to San Francisco, and from Mauritius to St. Petersburg."—Professor Meigs, 1854.

"I arrived at that certainty in the matter, that I could venture to foretell what women would be affected with the disease, upon hearing by what midwife they were to be delivered, or by what nurse they were to be attended, during their lying-in; and, almost in every instance, my prediction was verified."—Gordon, 1795.

"A certain number of deaths is caused every year by the contagion of puerperal fever, communicated by the nurses and medical attendants." Farr, in Fifth Annual Report of Registrar-General of England, 1843.

"... boards of health, if such exist, or, without them, the medical institutions of a country, should have the power of coercing, or of inflicting some kind of punishment on those who recklessly go from cases of puerperal fevers to parturient or puerperal females, without using due precaution; and who, having been shown the risk, criminally encounter it, and convey pestilence and death to the persons they are employed to aid in the most interesting and suffering period of female existence." —Copland's Medical Dictionary, Art. Puerperal States and Diseases, 1852.

"We conceive it unnecessary to go into detail to prove the contagious nature of this disease, as there are few, if any, American practitioners who do not believe in this doctrine."—Dr. Lee, in Additions to Article last cited.

[INTRODUCTORY NOTE.] It happened, some years ago, that a discussion arose in a Medical Society of which I was a member, involving the subject of a certain supposed cause of disease, about which something was known, a good deal suspected, and not a little feared. The discussion was suggested by a case, reported at the preceding meeting, of a physician who made an examination of the body of a patient who had died with puerperal fever, and who himself died in less than a week, apparently in consequence of a wound received at the examination, having attended several women in confinement in the mean time, all of whom, as it was alleged, were attacked with puerperal fever.

Whatever apprehensions and beliefs were entertained, it was plain that a fuller knowledge of the facts relating to the subject would be acceptable to all present. I therefore felt that it would be doing a good service to look into the best records I could find, and inquire of the most trustworthy practitioners I knew, to learn what experience had to teach in the matter, and arrived at the results contained in the following pages.

The Essay was read before the Boston Society for Medical Improvement, and, at the request of the Society, printed in the "New England Quarterly Journal of Medicine and Surgery" for April, 1843. As this Journal

never obtained a large circulation, and ceased to be published after a year's existence, and as the few copies I had struck off separately were soon lost sight of among the friends to whom they were sent, the Essay can hardly be said to have been fully brought before the Profession.

The subject of this Paper has the same profound interest for me at the present moment as it had when I was first collecting the terrible evidence out of which, as it seems to me, the commonest exercise of reason could not help shaping the truth it involved. It is not merely on account of the bearing of the question,—if there is a question,—on all that is most sacred in human life and happiness, that the subject cannot lose its interest. It is because it seems evident that a fair statement of the facts must produce its proper influence on a very large proportion of well-constituted and unprejudiced minds. Individuals may, here and there, resist the practical bearing of the evidence on their own feelings or interests; some may fail to see its meaning, as some persons may be found who cannot tell red from green; but I cannot doubt that most readers will be satisfied and convinced, to loathing, long before they have finished the dark obituary calendar laid before them.

I do not know that I shall ever again have so good an opportunity of being useful as was granted me by the raising of the question which produced this Essay. For I have abundant evidence that it has made many practitioners more cautious in their relations with puerperal females, and I have no doubt it will do so still, if it has a chance of being read, though it should call out a hundred counterblasts, proving to the satisfaction of their authors that it proved nothing. And for my part, I had rather rescue one mother from being poisoned by her attendant, than claim to have saved forty out of fifty patients to whom I had carried the disease. Thus, I am willing to avail myself of any hint coming from without to offer this paper once more to the press. The occasion has presented itself, as will be seen, in a convenient if not in a flattering form.

I send this Essay again to the MEDICAL PROFESSION, without the change of a word or syllable. I find, on reviewing it, that it anticipates and eliminates those secondary questions which cannot be entertained for a moment until the one great point of fact is peremptorily settled. In its very statement of the doctrine maintained it avoids all discussion of the nature of the disease "known as puerperal fever," and all the somewhat stale philology of the word contagion. It mentions, fairly enough, the names of sceptics, or unbelievers as to the reality of personal transmission; of Dewees, of Tonnelle, of Duges, of Baudelocque, and others; of course, not including those whose works were then unwritten or unpublished; nor enumerating all the Continental writers who, in ignorance of the great mass of evidence accumulated by British practitioners, could hardly be called well informed on this subject. It meets all the array of negative cases,—those in which disease did not follow exposure,—by the striking example of small-pox, which, although one of the most contagious of diseases, is subject to the most remarkable irregularities and seeming caprices in its transmission. It makes full allowance for other causes besides personal transmission, especially for epidemic influences. It allows for the possibility of different modes of conveyance of the destructive principle. It recognizes and supports the belief that a series of cases may originate from a single primitive source which affects each new patient in turn; and especially from cases of Erysipelas. It does not undertake to discuss the theoretical aspect of the subject; that is a secondary matter of consideration. Where facts are numerous, and unquestionable, and unequivocal in their significance, theory must follow them as it best may, keeping time with their step, and not go before them, marching to the sound of its own drum and trumpet. Having thus narrowed its area to a limited practical platform of discussion, a matter of life and death, and not of phrases or theories, it covers every inch of it with a mass of evidence which I conceive a Committee of Husbands, who can count coincidences and draw conclusions as well as a Synod of Accoucheurs, would justly consider as affording ample reasons for an unceremonious dismissal of a practitioner (if it is conceivable that such a step could be waited for), after five or six funerals had marked the path of his daily visits, while other practitioners were not thus escorted. To the Profession, therefore, I submit the paper in its original form, and leave it to take care of itself.

To the MEDICAL STUDENTS, into whose hands this Essay may fall, some words of introduction may be appropriate, and perhaps, to a small number of them, necessary. There are some among them who, from youth, or want of training, are easily bewildered and confused in any conflict of opinions into which their studies lead them. They are liable to lose sight of the main question in collateral issues, and to be run away with by suggestive speculations. They confound belief with evidence, often trusting the first because it is expressed with energy, and slighting the latter because it is calm and unimpassioned. They are not satisfied with proof; they cannot believe a point is settled so long as everybody is not silenced. They have not learned that error is got out of the minds that cherish it, as the taenia is removed from the body, one joint, or a few joints at a time, for the most part, rarely the whole evil at once. They naturally have faith in their instructors, turning to them for truth, and taking what they may choose to give them; babes in knowledge, not yet able to tell the breast from the bottle, pumping away for the milk of truth at all that offers, were it nothing better than a Professor's shrivelled forefinger.

In the earliest and embryonic stage of professional development, any violent impression on the instructor's mind is apt to be followed by some lasting effect on that of the pupil. No mother's mark is more permanent than the mental naevi and moles, and excrescences, and mutilations, that students carry with them out of the lecture-room, if once the teeming intellect which nourishes theirs has been scared from its propriety by any misshapen fantasy. Even an impatient or petulant expression, which to a philosopher would be a mere index of the low state of amiability of the speaker at the moment of its utterance, may pass into the young mind as an element of its future constitution, to injure its temper or corrupt its judgment. It is a duty, therefore, which we owe to this younger class of students, to clear any important truth which may have been rendered questionable in their minds by such language, or any truth-teller against whom they may have been prejudiced by hasty epithets, from the impressions such words have left. Until this is done, they are not ready for the question, where there is a question, for them to decide. Even if we ourselves are the subjects of the prejudice, there seems to be no impropriety in showing that this prejudice is local or personal, and not an acknowledged conviction with the public at large. It may be necessary to break through our usual habits of reserve to do this, but this is the fault of the position in which others have placed us.

Two widely-known and highly-esteemed practitioners, Professors in two of the largest Medical Schools of the Union, teaching the branch of art which includes the Diseases of Women, and therefore speaking with

authority; addressing in their lectures and printed publications large numbers of young men, many of them in the tenderest immaturity of knowledge, have recently taken ground in a formal way against the doctrine maintained in this paper:

On the Non-Contagious Character of Puerperal Fever: An Introductory Lecture. By Hugh L. Hodge, M. D., Professor of Obstetrics in the University of Pennsylvania. Delivered Monday, October 11, 1852. Philadelphia, 1852.

On the Nature, Signs, and Treatment of Childbed Fevers: in a Series of Letters addressed to the Students of his Class. By Charles D. Meigs, M. D., Professor of Midwifery and the Diseases of Women and Children in Jefferson Medical College, Philadelphia, etc., etc. Philadelphia, 1854. Letter VI.

The first of the two publications, Dr. Hodge's Lecture, while its theoretical considerations and negative experiences do not seem to me to require any further notice than such as lay ready for them in my Essay written long before, is, I am pleased to say, unobjectionable in tone and language, and may be read without offence.

This can hardly be said of the chapter of Dr. Meigs's volume which treats of Contagion in Childbed Fever. There are expressions used in it which might well put a stop to all scientific discussions, were they to form the current coin in our exchange of opinions. I leave the "very young gentlemen," whose careful expositions of the results of practice in more than six thousand cases are characterized as "the jejune and fizenless dreamings of sophomore writers," to the sympathies of those "dear young friends," and "dear young gentlemen," who will judge how much to value their instructor's counsel to think for themselves, knowing what they are to expect if they happen not to think as he does.

One unpalatable expression I suppose the laws of construction oblige me to appropriate to myself, as my reward for a certain amount of labor bestowed on the investigation of a very important question of evidence, and a statement of my own practical conclusions. I take no offence, and attempt no retort. No man makes a quarrel with me over the counterpane that covers a mother, with her new-born infant at her breast. There is no epithet in the vocabulary of slight and sarcasm that can reach my personal sensibilities in such a controversy. Only just so far as a disrespectful phrase may turn the student aside from the examination of the evidence, by discrediting or dishonoring the witness, does it call for any word of notice.

I appeal from the disparaging language by which the Professor in the Jefferson School of Philadelphia would dispose of my claims to be listened to. I appeal, not to the vote of the Society for Medical Improvement, although this was an unusual evidence of interest in the paper in question, for it was a vote passed among my own townsmen; nor to the opinion of any American, for none know better than the Professors in the great Schools of Philadelphia how cheaply the praise of native contemporary criticism is obtained. I appeal to the recorded opinions of those whom I do not know, and who do not know me, nor care for me, except for the truth that I may have uttered; to Copland, in his "Medical Dictionary," who has spoken of my Essay in phrases to which the pamphlets of American "scribblers" are seldom used from European authorities; to Ramsbotham, whose compendious eulogy is all that self-love could ask; to the "Fifth Annual Report" of the Registrar-General of England, in which the second-hand abstract of my Essay figures largely, and not without favorable comment, in an important appended paper. These testimonies, half forgotten until this circumstance recalled them, are dragged into the light, not in a paroxysm of vanity, but to show that there may be food for thought in the small pamphlet which the Philadelphia Teacher treats so lightly. They were at least unsought for, and would never have been proclaimed but for the sake of securing the privilege of a decent and unprejudiced hearing.

I will take it for granted that they have so far counterpoised the depreciating language of my fellow-countryman and fellow-teacher as to gain me a reader here and there among the youthful class of students I am now addressing. It is only for their sake that I think it necessary to analyze, or explain, or illustrate, or corroborate any portion of the following Essay. But I know that nothing can be made too plain for beginners; and as I do not expect the practitioner, or even the more mature student, to take the trouble to follow me through an Introduction which I consider wholly unnecessary and superfluous for them, I shall not hesitate to stoop to the most elementary simplicity for the benefit of the younger student. I do this more willingly because it affords a good opportunity, as it seems to me, of exercising the untrained mind in that medical logic which does not seem to have been either taught or practised in our schools of late, to the extent that might be desired.

I will now exhibit, in a series of propositions reduced to their simplest expression, the same essential statements and conclusions as are contained in the Essay, with such commentaries and explanations as may be profitable to the inexperienced class of readers addressed.

I. It has been long believed, by many competent observers, that Puerperal Fever (so called) is sometimes carried from patient to patient by medical assistants.

II. The express object of this Essay is to prove that it is so carried.

III. In order to prove this point, it is not necessary to consult any medical theorist as to whether or not it is consistent with his preconceived notions that such a mode of transfer should exist.

IV. If the medical theorist insists on being consulted, and we see fit to indulge him, he cannot be allowed to assume that the alleged laws of contagion, deduced from observation in other diseases, shall be cited to disprove the alleged laws deduced from observation in this. Science would never make progress under such conditions. Neither the long incubation of hydrophobia, nor the protecting power of vaccination, would ever have been admitted, if the results of observation in these affections had been rejected as contradictory to the previously ascertained laws of contagion.

V. The disease in question is not a common one; producing, on the average, about three deaths in a thousand births, according to the English Registration returns which I have examined.

VI. When an unusually large number of cases of this disease occur about the same time, it is inferred, therefore, that there exists some special cause for this increased frequency. If the disease prevails extensively over a wide region of country, it is attributed without dispute to an epidemic influence. If it prevails in a single locality, as in a hospital, and not elsewhere, this is considered proof that some local cause is there

active in its production.

VII. When a large number of cases of this disease occur in rapid succession, in one individual's ordinary practice, and few or none elsewhere, these cases appearing in scattered localities, in patients of the same average condition as those who escape under the care of others, there is the same reason for connecting the cause of the disease with the person in this instance, as with the place in that last mentioned.

VIII. Many series of cases, answering to these conditions, are given in this Essay, and many others will be referred to which have occurred since it was written.

IX. The alleged results of observation may be set aside; first, because the so-called facts are in their own nature equivocal; secondly, because they stand on insufficient authority; thirdly, because they are not sufficiently numerous. But, in this case, the disease is one of striking and well-marked character; the witnesses are experts, interested in denying and disbelieving the facts; the number of consecutive cases in many instances frightful, and the number of series of cases such that I have no room for many of them except by mere reference.

X. These results of observation, being admitted, may, we will suppose, be interpreted in different methods. Thus the coincidences may be considered the effect of chance. I have had the chances calculated by a competent person, that a given practitioner, A., shall have sixteen fatal cases in a month, on the following data: A. to average attendance upon two hundred and fifty births in a year; three deaths in one thousand births to be assumed as the average from puerperal fever; no epidemic to be at the time prevailing. It follows, from the answer given me, that if we suppose every one of the five hundred thousand annual births of England to have been recorded during the last half-century, there would not be one chance in a million million million millions that one such series should be noted. No possible fractional error in this calculation can render the chance a working probability. Applied to dozens of series of various lengths, it is obviously an absurdity. Chance, therefore, is out of the question as an explanation of the admitted coincidences.

XI. There is, therefore, some relation of cause and effect between the physician's presence and the patient's disease.

XII. Until it is proved to what removable condition attaching to the attendant the disease is owing, he is bound to stay away from his patients so soon as he finds himself singled out to be tracked by the disease. How long, and with what other precautions, I have suggested, without dictating, at the close of my Essay. If the physician does not at once act on any reasonable suspicion of his being the medium of transfer, the families where he is engaged, if they are allowed to know the facts, should decline his services for the time. His feelings on the occasion, however interesting to himself, should not be even named in this connection. A physician who talks about ceremony and gratitude, and services rendered, and the treatment he got, surely forgets himself; it is impossible that he should seriously think of these small matters where there is even a question whether he may not carry disease, and death, and bereavement into any one of "his families," as they are sometimes called.

I will now point out to the young student the mode in which he may relieve his mind of any confusion, or possibly, if very young, any doubt, which the perusal of Dr. Meigs's Sixth Letter may have raised in his mind.

The most prominent ideas of the Letter are, first, that the transmissible nature of puerperal fever appears improbable, and, secondly, that it would be very inconvenient to the writer. Dr. Woodville, Physician to the Small-Pox and Inoculation Hospital in London, found it improbable, and exceedingly inconvenient to himself, that cow pox should prevent small-pox; but Dr. Jenner took the liberty to prove the fact, notwithstanding.

I will first call the young student's attention to the show of negative facts (exposure without subsequent disease), of which much seems to be thought. And I may at the same time refer him to Dr. Hodge's Lecture, where he will find the same kind of facts and reasoning. Let him now take up Watson's Lectures, the good sense and spirit of which have made his book a universal favorite, and open to the chapter on Continued Fever. He will find a paragraph containing the following sentence: "A man might say, 'I was in the battle of Waterloo, and saw many men around me fall down and die, and it was said that they were struck down by musket-balls; but I know better than that, for I was there all the time, and so were many of my friends, and we were never hit by any musket-balls. Musket-balls, therefore, could not have been the cause of the deaths we witnessed.' And if, like contagion, they were not palpable to the senses, such a person might go on to affirm that no proof existed of there being any such thing as musket-balls." Now let the student turn back to the chapter on Hydrophobia in the same volume. He will find that John Hunter knew a case in which, of twenty-one persons bitten, only one died of the disease. He will find that one dog at Charenton was bitten at different times by thirty different mad dogs, and outlived it all. Is there no such thing, then, as hydrophobia? Would one take no especial precautions if his wife, about to become a mother, had been bitten by a rabid animal, because so many escape? Or let him look at "Underwood on Diseases of Children," [Philadelphia, 1842, p. 244, note.] and he will find the case of a young woman who was inoculated eight times in thirty days, at the same time attending several children with smallpox, and yet was not infected. But seven weeks afterwards she took the disease and died.

It would seem as if the force of this argument could hardly fail to be seen, if it were granted that every one of these series of cases were so reported as to prove that there could have been no transfer of disease. There is not one of them so reported, in the Lecture or the Letter, as to prove that the disease may not have been carried by the practitioner. I strongly suspect that it was so carried in some of these cases, but from the character of the very imperfect evidence the question can never be settled without further disclosures.

Although the Letter is, as I have implied, principally taken up with secondary and collateral questions, and might therefore be set aside as in the main irrelevant, I am willing, for the student's sake, to touch some of these questions briefly, as an illustration of its logical character.

The first thing to be done, as I thought when I wrote my Essay, was to throw out all discussions of the word contagion, and this I did effectually by the careful wording of my statement of the subject to be discussed. My object was not to settle the etymology or definition of a word, but to show that women had often died in childbed, poisoned in some way by their medical attendants. On the other point, I, at least, have no controversy with anybody, and I think the student will do well to avoid it in this connection. If I must define

my position, however, as well as the term in question, I am contented with Worcester's definition; provided always this avowal do not open another side controversy on the merits of his Dictionary, which Dr. Meigs has not cited, as compared with Webster's, which he has.

I cannot see the propriety of insisting that all the laws of the eruptive fevers must necessarily hold true of this peculiar disease of puerperal women. If there were any such propriety, the laws of the eruptive fevers must at least be stated correctly. It is not true, for instance, as Dr. Meigs states, that contagion is "no respecter of persons;" that "it attacks all individuals alike." To give one example: Dr. Gregory, of the Small-Pox Hospital, who ought to know, says that persons pass through life apparently insensible to or unsusceptible of the small-pox virus, and that the same persons do not take the vaccine disease.

As to the short time of incubation, of which so much is made, we have no right to decide beforehand whether it shall be long or short, in the cases we are considering. A dissection wound may produce symptoms of poisoning in six hours; the bite of a rabid animal may take as many months.

After the student has read the case in Dr. Meigs's 136th paragraph, and the following one, in which he exclaims against the idea of contagion, because the patient, delivered on the 26th of December, was attacked in twenty-four hours, and died on the third day, let him read what happened at the "Black Assizes" of 1577 and 1750. In the first case, six hundred persons sickened the same night of the exposure, and three hundred more in three days. [Elliotson's Practice, p. 298.] Of those attacked in the latter year, the exposure being on the 11th of May, Alderman Lambert died on the 13th, Under-Sheriff Cox on the 14th, and many of note before the 20th. But these are old stories. Let the student listen then to Dr. Gerhard, whose reputation as a cautious observer he may be supposed to know. "The nurse was shaving a man, who died in a few hours after his entrance; he inhaled his breath, which had a nauseous taste, and in an hour afterwards was taken with nausea, cephalalgia, and ringing of the ears. From that moment the attack began, and assumed a severe character. The assistant was supporting another patient, who died soon afterwards; he felt the pungent heat upon his skin, and was taken immediately with the symptoms of typhus." [Am. Jour. Med. Sciences, Feb. 1837, p. 299.] It is by notes of cases, rather than notes of admiration, that we must be guided, when we study the Revised Statutes of Nature, as laid down from the curule chairs of Medicine.

Let the student read Dr. Meigs's 140th paragraph soberly, and then remember, that not only does he infer, suspect, and surmise, but he actually asserts (page 154), "there was poison in the house," because three out of five patients admitted into a ward had puerperal fever and died. Have I not as much right to draw a positive inference from "Dr. A.'s" seventy exclusive cases as he from the three cases in the ward of the Dublin Hospital? All practical medicine, and all action in common affairs, is founded on inferences. How does Dr. Meigs know that the patients he bled in puerperal fever would not have all got well if he had not bled them?

"You see a man discharge a gun at another; you see the flash, you hear the report, you see the person fall a lifeless corpse; and you infer, from all these circumstances, that there was a ball discharged from the gun, which entered his body and caused his death, because such is the usual and natural cause of such an effect. But you did not see the ball leave the gun, pass through the air, and enter the body of the slain; and your testimony to the fact of killing is, therefore, only inferential,—in other words, circumstantial. It is possible that no ball was in the gun; and we infer that there was, only because we cannot account for death on any other supposition." [Chief Justice Gibson, in Am. Law Journal, vol. vi. p. 123.]

"The question always comes to this: Is the circumstance of intercourse with the sick followed by the appearance of the disease in a proportion of cases so much greater than any other circumstance common to any portion of the inhabitants of the place under observation, as to make it inconceivable that the succession of cases occurring in persons having that intercourse should have been the result of chance? If so, the inference is unavoidable, that that intercourse must have acted as a cause of the disease. All observations which do not bear strictly on that point are irrelevant, and, in the case of an epidemic first appearing in a town or district, a succession of two cases is sometimes sufficient to furnish evidence which, on the principle I have stated, is nearly irresistible."

Possibly an inexperienced youth may be awe-struck by the quotation from Cuvier. These words, or their equivalent, are certainly to be found in his Introduction. So are the words "top not come down"! to be found in the Bible, and they were as much meant for the ladies' head-dresses as the words of Cuvier were meant to make clinical observation wait for a permit from anybody to look with its eyes and count on its fingers. Let the inquiring youth read the whole Introduction, and he will see what they mean.

I intend no breach of courtesy, but this is a proper place to warn the student against skimming the prefaces and introductions of works for mottoes and embellishments to his thesis. He cannot learn anatomy by thrusting an exploring needle into the body. He will be very liable to misquote his author's meaning while he is picking off his outside sentences. He may make as great a blunder as that simple prince who praised the conductor of his orchestra for the piece just before the overture; the musician was too good a courtier to tell him that it was only the tuning of the instruments.

To the six propositions in the 142d paragraph, and the remarks about "specific" diseases, the answer, if any is necessary, seems very simple. An inflammation of a serous membrane may give rise to secretions which act as a poison, whether that be a "specific" poison or not, as Dr. Homer has told his young readers, and as dissectors know too well; and that poison may produce its symptoms in a few hours after the system has received it, as any may see in Druitt's "Surgery," if they care to look. Puerperal peritonitis may produce such a poison, and puerperal women may be very sensible to its influences, conveyed by contact or exhalation. Whether this is so or not, facts alone can determine, and to facts we have had recourse to settle it.

The following statement is made by Dr. Meigs in his 142d paragraph, and developed more at length, with rhetorical amplifications, in the 134th. "No human being, save a pregnant or parturient woman, is susceptible to the poison." This statement is wholly incorrect, as I am sorry to have to point out to a Teacher in Dr. Meigs's position. I do not object to the erudition which quotes Willis and Fernelius, the last of whom was pleasantly said to have "preserved the dregs of the Arabs in the honey of his Latinity." But I could wish that more modern authorities had not been overlooked. On this point, for instance, among the numerous facts disproving the statement, the "American Journal of Medical Sciences," published not far from his lecture-

room, would have presented him with a respectable catalog of such cases. Thus he might refer to Mr. Storrs's paper "On the Contagious Effects of Puerperal Fever on the Male Subject; or on Persons not Childbearing" (Jan. 1846), or to Dr. Reid's case (April, 1846), or to Dr. Barron's statement of the children's dying of peritonitis in an epidemic of puerperal fever at the Philadelphia Hospital (Oct. 1842), or to various instances cited in Dr. Kneeland's article (April, 186). Or, if he would have referred to the "New York Journal," he might have seen Prof. Austin Flint's cases. Or, if he had honored my Essay so far, he might have found striking instances of the same kind in the first of the new series of cases there reported and elsewhere. I do not see the bearing of his proposition, if it were true. But it is one of those assertions that fall in a moment before a slight examination of the facts; and I confess my surprise, that a professor who lectures on the Diseases of Women should have ventured to make it.

Nearly seven pages are devoted to showing that I was wrong in saying I would not be "understood to imply that there exists a doubt in the mind of any well-informed member of the medical profession as to the fact that puerperal fever is sometimes communicated from one person to another, both directly and indirectly." I will devote seven lines to these seven pages, which seven lines, if I may say it without offence, are, as it seems to me, six more than are strictly necessary.

The following authors are cited as sceptics by Dr. Meigs: Dewees.—I cited the same passage. Did not know half the facts. Robert Lee.—Believes the disease is sometimes communicable by contagion. Tonnelle, Baudelocque. Both cited by me. Jacquemier.—Published three years after my Essay. Kiwisch. "Behindhand in knowledge of Puerperal Fever." [B. & F. Med. Rev. Jan. 1842.] Paul Dubois.—Scanzoni.

These Continental writers not well informed on this point.[See Dr. Simpson's Remarks at Meeting of Edin. Med. Chir. Soc. (Am. Jour. Oct. 1851.)]

The story of Von Busch is of interest and value, but there is nothing in it which need perplex the student. It is not pretended that the disease is always, or even, it may be, in the majority of cases, carried about by attendants; only that it is so carried in certain cases. That it may have local and epidemic causes, as well as that depending on personal transmission, is not disputed. Remember how small-pox often disappears from a community in spite of its contagious character, and the necessary exposure of many persons to those suffering from it; in both diseases contagion is only one of the coefficients of the disease.

I have already spoken of the possibility that Dr. Meigs may have been the medium of transfer of puerperal fever in some of the cases he has briefly catalogued. Of Dr. Rutter's cases I do not know how to speak. I only ask the student to read the facts stated by Dr. Condie, as given in my Essay, and say whether or not a man should allow his wife to be attended by a practitioner in whose hands "scarcely a female that has been delivered for weeks past has escaped an attack," "while no instance of the disease has occurred in the patients of any other accoucheur practising in the same district." If I understand Dr. Meigs and Dr. Hodge, they would not warn the physician or spare the patient under such circumstances. They would "go on," if I understand them, not to seven, or seventy, only, but to seventy times seven, if they could find patients. If this is not what they mean, may we respectfully ask them to state what they do mean, to their next classes, in the name of humanity, if not of science!

I might repeat the question asked concerning Dr. Rutter's cases, with reference to those reported by Dr. Robertson. Perhaps, however, the student would like to know the opinion of a person in the habit of working at matters of this kind in a practical point of view. To satisfy him on this ground, I addressed the following question to the President of one of our principal Insurance Companies, leaving Dr. Meigs's book and my Essay in his hands at the same time.

Question. "If such facts as Robertson's cases were before you, and the attendant had had ten, or even five fatal cases, or three, or two even, would you, or would you not, if insuring the life of the next patient to be taken care of by that attendant, expect an extra premium over that of an average case of childbirth?"

Answer. "Of course I should require a very large extra premium, if I would take take risk at all."

But I do not choose to add the expressions of indignation which the examination of the facts before him called out. I was satisfied from the effect they produced on him, that if all the hideous catalogues of cases now accumulated were fully brought to the knowledge of the public, nothing, since the days of Burke and Hare, has raised such a cry of horror as would be shrieked in the ears of the Profession.

Dr. Meigs has elsewhere invoked "Providence" as the alternative of accident, to account for the "coincidences." ("Obstetrics," Phil. 1852, p. 631.) If so, Providence either acts through the agency of secondary causes, as in other diseases, or not. If through such causes, let us find out what they are, as we try to do in other cases. It may be true that offences, or diseases, will come, but "woe unto him through whom they come," if we catch him in the voluntary or careless act of bringing them! But if Providence does not act through secondary causes in this particular sphere of etiology, then why does Dr. Meigs take such pains to reason so extensively about the laws of contagion, which, on that supposition, have no more to do with this case than with the plague which destroyed the people after David had numbered them? Above all, what becomes of the theological aspect of the question, when he asserts that a practitioner was "only unlucky in meeting with the epidemic cases?" (Op. cit. p. 633.) We do not deny that the God of battles decides the fate of nations; but we like to have the biggest squadrons on our side, and we are particular that our soldiers should not only say their prayers, but also keep their powder dry. We do not deny the agency of Providence in the disaster at Norwalk, but we turn off the engineer, and charge the Company five thousand dollars apiece for every life that is sacrificed.

Why a grand jury should not bring in a bill against a physician who switches off a score of women one after the other along his private track, when he knows that there is a black gulf at the end of it, down which they are to plunge, while the great highway is clear, is more than I can answer. It is not by laying the open draw to Providence that he is to escape the charge of manslaughter.

To finish with all these lesser matters of question, I am unable to see why a female must necessarily be unattended in her confinement, because she declines the services of a particular practitioner. In all the series of cases mentioned, the death-carrying attendant was surrounded by others not tracked by disease and its consequences. Which, I would ask, is worse,—to call in another, even a rival practitioner, or to submit an

unsuspecting female to a risk which an Insurance Company would have nothing to do with?

I do not expect ever to return to this subject. There is a point of mental saturation, beyond which argument cannot be forced without breeding impatient, if not harsh, feelings towards those who refuse to be convinced. If I have so far manifested neither, it is well to stop here, and leave the rest to those younger friends who may have more stomach for the dregs of a stale argument.

The extent of my prefatory remarks may lead some to think that I attach too much importance to my own Essay. Others may wonder that I should expend so many words upon the two productions referred to, the Letter and the Lecture. I do consider my Essay of much importance so long as the doctrine it maintains is treated as a question, and so long as any important part of the defence of that doctrine is thought to rest on its evidence or arguments. I cannot treat as insignificant any opinions bearing on life, and interests dearer than life, proclaimed yearly to hundreds of young men, who will carry them to their legitimate results in practice.

The teachings of the two Professors in the great schools of Philadelphia are sure to be listened to, not only by their immediate pupils, but by the Profession at large. I am too much in earnest for either humility or vanity, but I do entreat those who hold the keys of life and death to listen to me also for this once. I ask no personal favor; but I beg to be heard in behalf of the women whose lives are at stake, until some stronger voice shall plead for them.

I trust that I have made the issue perfectly distinct and intelligible. And let it be remembered that this is no subject to be smoothed over by nicely adjusted phrases of half-assent and half-censure divided between the parties. The balance must be struck boldly and the result declared plainly. If I have been hasty, presumptuous, ill-informed, illogical; if my array of facts means nothing; if there is no reason for any caution in the view of these facts; let me be told so on such authority that I must believe it, and I will be silent henceforth, recognizing that my mind is in a state of disorganization. If the doctrine I have maintained is a mournful truth; if to disbelieve it, and to practise on this disbelief, and to teach others so to disbelieve and practise, is to carry desolation, and to charter others to carry it, into confiding families, let it be proclaimed as plainly what is to be thought of the teachings of those who sneer at the alleged dangers, and scout the very idea of precaution. Let it be remembered that persons are nothing in this matter; better that twenty pamphleteers should be silenced, or as many professors unseated, than that one mother's life should be taken. There is no quarrel here between men, but there is deadly incompatibility and exterminating warfare between doctrines. Coincidences meaning nothing, though a man have a monopoly of the disease for weeks or months; or cause and effect, the cause being in some way connected with the person; this is the question. If I am wrong, let me be put down by such a rebuke as no rash declaimer has received since there has been a public opinion in the medical profession of America; if I am right, let doctrines which lead to professional homicide be no longer taught from the chairs of those two great Institutions. Indifference will not do here; our Journalists and Committees have no right to take up their pages with minute anatomy and tediously detailed cases, while it is a question whether or not the "blackdeath" of child-bed is to be scattered broadcast by the agency of the mother's friend and adviser. Let the men who mould opinions look to it; if there is any voluntary blindness, any interested oversight, any culpable negligence, even, in such a matter, and the facts shall reach the public ear; the pestilence-carrier of the lying-in chamber must look to God for pardon, for man will never forgive him.

THE CONTAGIOUSNESS OF PUERPERAL FEVER.

In collecting, enforcing, and adding to the evidence accumulated upon this most serious subject, I would not be understood to imply that there exists a doubt in the mind of any well-informed member of the medical profession as to the fact that puerperal fever is sometimes communicated from one person to another, both directly and indirectly. In the present state of our knowledge upon this point I should consider such doubts merely as a proof that the sceptic had either not examined the evidence, or, having examined it, refused to accept its plain and unavoidable consequences. I should be sorry to think, with Dr. Rigby, that it was a case of "oblique vision;" I should be unwilling to force home the argumentum ad hominem of Dr. Blundell, but I would not consent to make a question of a momentous fact which is no longer to be considered as a subject for trivial discussions, but to be acted upon with silent promptitude. It signifies nothing that wise and experienced practitioners have sometimes doubted the reality of the danger in question; no man has the right to doubt it any longer. No negative facts, no opposing opinions, be they what they may, or whose they may, can form any answer to the series of cases now within the reach of all who choose to explore the records of medical science.

If there are some who conceive that any important end would be answered by recording such opinions, or by collecting the history of all the cases they could find in which no evidence of the influence of contagion existed, I believe they are in error. Suppose a few writers of authority can be found to profess a disbelief in contagion,—and they are very few compared with those who think differently,—is it quite clear that they formed their opinions on a view of all the facts, or is it not apparent that they relied mostly on their own solitary experience? Still further, of those whose names are quoted, is it not true that scarcely a single one could by any possibility have known the half or the tenth of the facts bearing on the subject which have reached such a frightful amount within the last few years? Again, as to the utility of negative facts, as we may briefly call them,—instances, namely, in which exposure has not been followed by disease,—although, like other truths, they may be worth knowing, I do not see that they are like to shed any important light upon the subject before us. Every such instance requires a good deal of circumstantial explanation before it can be accepted. It is not enough that a practitioner should have had a single case of puerperal fever not followed by others. It must be known whether he attended others while this case was in progress, whether he went directly from one chamber to others, whether he took any, and what precautions. It is important to know that several women were exposed to infection derived from the patient, so that allowance may be made for want of predisposition. Now if of negative facts so sifted there could be accumulated a hundred for every one plain instance of communication here recorded, I trust it need not be said that we are bound to guard and watch over the hundredth tenant of our fold, though the ninety and nine may be sure of escaping the wolf at its

entrance. If any one is disposed, then, to take a hundred instances of lives endangered or sacrificed out of those I have mentioned, and make it reasonably clear that within a similar time and compass ten thousand escaped the same exposure, I shall thank him for his industry, but I must be permitted to hold to my own practical conclusions, and beg him to adopt or at least to examine them also. Children that walk in calico before open fires are not always burned to death; the instances to the contrary may be worth recording; but by no means if they are to be used as arguments against woollen frocks and high fenders.

I am not sure that this paper will escape another remark which it might be wished were founded in justice. It may be said that the facts are too generally known and acknowledged to require any formal argument or exposition, that there is nothing new in the positions advanced, and no need of laying additional statements before the Profession. But on turning to two works, one almost universally, and the other extensively appealed to as authority in this country, I see ample reason to overlook this objection. In the last edition of Dewees's Treatise on the "Diseases of Females," it is expressly said, "In this country, under no circumstance that puerperal fever has appeared hitherto, does it afford the slightest ground for the belief that it is contagious." In the "Philadelphia Practice of Midwifery" not one word can be found in the chapter devoted to this disease which would lead the reader to suspect that the idea of contagion had ever been entertained. It seems proper, therefore, to remind those who are in the habit of referring to these works for guidance, that there may possibly be some sources of danger they have slighted or omitted, quite as important as a trifling irregularity of diet, or a confined state of the bowels, and that whatever confidence a physician may have in his own mode of treatment, his services are of questionable value whenever he carries the bane as well as the antidote about his person.

The practical point to be illustrated is the following:

The disease known as Puerperal Fever is so far contagious as to be frequently carried from patient to patient by physicians and nurses.

Let me begin by throwing out certain incidental questions, which, without being absolutely essential, would render the subject more complicated, and by making such concessions and assumptions as may be fairly supposed to be without the pale of discussion.

1. It is granted that all the forms of what is called puerperal fever may not be, and probably are not, equally contagious or infectious. I do not enter into the distinctions which have been drawn by authors, because the facts do not appear to me sufficient to establish any absolute line of demarcation between such forms as may be propagated by contagion and those which are never so propagated. This general result I shall only support by the authority of Dr. Ramsbotham, who gives, as the result of his experience, that the same symptoms belong to what he calls the infectious and the sporadic forms of the disease, and the opinion of Armstrong in his original Essay. If others can show any such distinction, I leave it to them to do it. But there are cases enough that show the prevalence of the disease among the patients of a single practitioner when it was in no degree epidemic, in the proper sense of the term. I may refer to those of Mr. Robertson and of Dr. Peirson, hereafter to be cited, as examples.

2. I shall not enter into any dispute about the particular mode of infection, whether it be by the atmosphere the physician carries about him into the sick-chamber, or by the direct application of the virus to the absorbing surfaces with which his hand comes in contact. Many facts and opinions are in favor of each of these modes of transmission. But it is obvious that in the majority of cases it must be impossible to decide by which of these channels the disease is conveyed, from the nature of the intercourse between the physician and the patient.

3. It is not pretended that the contagion of puerperal fever must always be followed by the disease. It is true of all contagious diseases, that they frequently spare those who appear to be fully submitted to their influence. Even the vaccine virus, fresh from the subject, fails every day to produce its legitimate effect, though every precaution is taken to insure its action. This is still more remarkably the case with scarlet fever and some other diseases.

4. It is granted that the disease may be produced and variously modified by many causes besides contagion, and more especially by epidemic and endemic influences. But this is not peculiar to the disease in question. There is no doubt that small-pox is propagated to a great extent by contagion, yet it goes through the same periods of periodical increase and diminution which have been remarked in puerperal fever. If the question is asked how we are to reconcile the great variations in the mortality of puerperal fever in different seasons and places with the supposition of contagion, I will answer it by another question from Mr. Farr's letter to the Registrar-General. He makes the statement that "five die weekly of small-pox in the metropolis when the disease is not epidemic,"—and adds, "The problem for solution is,—Why do the five deaths become 10, 15, 20, 31, 58, 88, weekly, and then progressively fall through the same measured steps?"

5. I take it for granted, that if it can be shown that great numbers of lives have been and are sacrificed to ignorance or blindness on this point, no other error of which physicians or nurses may be occasionally suspected will be alleged in palliation of this; but that whenever and wherever they can be shown to carry disease and death instead of health and safety, the common instincts of humanity will silence every attempt to explain away their responsibility.

The treatise of Dr. Gordon of Aberdeen was published in the year 1795, being among the earlier special works upon the disease. Apart of his testimony has been occasionally copied into other works, but his expressions are so clear, his experience is given with such manly distinctness and disinterested honesty, that it may be quoted as a model which might have been often followed with advantage.

"This disease seized such women only as were visited, or delivered by a practitioner, or taken care of by a nurse, who had previously attended patients affected with the disease."

"I had evident proofs of its infectious nature, and that the infection was as readily communicated as that of the small-pox or measles, and operated more speedily than any other infection with which I am acquainted."

"I had evident proofs that every person who had been with a patient in the puerperal fever became charged with an atmosphere of infection, which was communicated to every pregnant woman who happened to come within its sphere. This is not an assertion, but a fact, admitting of demonstration, as may be seen by a perusal

of the foregoing table,"—referring to a table of seventy-seven cases, in many of which the channel of propagation was evident.

He adds, "It is a disagreeable declaration for me to mention, that I myself was the means of carrying the infection to a great number of women." He then enumerates a number of instances in which the disease was conveyed by midwives and others to the neighboring villages, and declares that "these facts fully prove that the cause of the puerperal fever, of which I treat, was a specific contagion, or infection, altogether unconnected with a noxious constitution of the atmosphere."

But his most terrible evidence is given in these words: "I ARRIVED AT THAT CERTAINTY IN THE MATTER, THAT I COULD VENTURE TO FORETELL WHAT WOMEN WOULD BE AFFECTED WITH THE DISEASE, UPON HEARING BY WHAT MIDWIFE THEY WERE TO BE DELIVERED, OR BY WHAT NURSE THEY WERE TO BE ATTENDED, DURING THEIR LYING-IN: AND ALMOST IN EVERY INSTANCE, MY PREDICTION WAS VERIFIED."

Even previously to Gordon, Mr. White of Manchester had said, "I am acquainted with two gentlemen in another town, where the whole business of midwifery is divided betwixt them, and it is very remarkable that one of them loses several patients every year of the puerperal fever, and the other never so much as meets with the disorder,"—a difference which he seems to attribute to their various modes of treatment. [On the Management of Lying-in Women, p. 120.]

Dr. Armstrong has given a number of instances in his Essay on Puerperal Fever, of the prevalence of the disease among the patients of a single practitioner. At Sunderland, "in all, forty-three cases occurred from the 1st of January to the 1st of October, when the disease ceased; and of this number forty were witnessed by Mr. Gregson and his assistant, Mr. Gregory, the remainder having been separately seen by three accoucheurs." There is appended to the London edition of this Essay, a letter from Mr. Gregson, in which that gentleman says, in reference to the great number of cases occurring in his practice, "The cause of this I cannot pretend fully to explain, but I should be wanting in common liberality if I were to make any hesitation in asserting, that the disease which appeared in my practice was highly contagious, and communicable from one puerperal woman to another." "It is customary among the lower and middle ranks of people to make frequent personal visits to puerperal women resident in the same neighborhood, and I have ample evidence for affirming that the infection of the disease was often carried about in that manner; and, however painful to my feelings, I must in candor declare, that it is very probable the contagion was conveyed, in some instances, by myself, though I took every possible care to prevent such a thing from happening, the moment that I ascertained that the distemper was infectious." Dr. Armstrong goes on to mention six other instances within his knowledge, in which the disease had at different times and places been limited, in the same singular manner, to the practice of individuals, while it existed scarcely if at all among the patients of others around them. Two of the gentlemen became so convinced of their conveying the contagion, that they withdrew for a time from practice.

I find a brief notice, in an American Journal, of another series of cases, first mentioned by Mr. Davies, in the "Medical Repository." This gentleman stated his conviction that the disease is contagious.

"In the autumn of 1822 he met with twelve cases, while his medical friends in the neighborhood did not meet with any, 'or at least very few.' He could attribute this circumstance to no other cause than his having been present at the examination, after death, of two cases, some time previous, and of his having imparted the disease to his patients, notwithstanding every precaution."

Dr. Gooch says, "It is not uncommon for the greater number of cases to occur in the practice of one man, whilst the other practitioners of the neighborhood, who are not more skilful or more busy, meet with few or none. A practitioner opened the body of a woman who had died of puerperal fever, and continued to wear the same clothes. A lady whom he delivered a few days afterwards was attacked with and died of a similar disease; two more of his lying-in patients, in rapid succession, met with the same fate; struck by the thought, that he might have carried contagion in his clothes, he instantly changed them, and 'met with no more cases of the kind.' A woman in the country, who was employed as washerwoman and nurse, washed the linen of one who had died of puerperal fever; the next lying-in patient she nursed died of the same disease; a third nursed by her met with the same fate, till the neighborhood, getting afraid of her, ceased to employ her."

In the winter of the year 1824, "Several instances occurred of its prevalence among the patients of particular practitioners, whilst others who were equally busy met with few or none. One instance of this kind was very remarkable. A general practitioner, in large midwifery practice, lost so many patients from puerperal fever, that he determined to deliver no more for some time, but that his partner should attend in his place. This plan was pursued for one month, during which not a case of the disease occurred in their practice. The elder practitioner, being then sufficiently recovered, returned to his practice, but the first patient he attended was attacked by the disease and died. A physician, who met him in consultation soon afterwards, about a case of a different kind, and who knew nothing of his misfortune, asked him whether puerperal fever was at all prevalent in his neighborhood, on which he burst into tears, and related the above circumstances.

"Among the cases which I saw this season in consultation, four occurred in one month in the practice of one medical man, and all of them terminated fatally." [Lond. Med. Gaz. May 2, 1835.]

Dr. Ramsbotham asserted, in a Lecture at the London Hospital, that he had known the disease spread through a particular district, or be confined to the practice of a particular person, almost every patient being attacked with it, while others had not a single case. It seemed capable, he thought, of conveyance, not only by common modes; but through the dress of the attendants upon the patient.

In a letter to be found in the "London Medical Gazette" for January, 1840, Mr. Robertson of Manchester makes the statement which I here give in a somewhat condensed form.

A midwife delivered a woman on the 4th of December, 1830, who died soon after with the symptoms of puerperal fever. In one month from this date the same midwife delivered thirty women, residing in different parts of an extensive suburb, of which number sixteen caught the disease and all died. These were the only cases which had occurred for a considerable time in Manchester. The other midwives connected with the

same charitable institution as the woman already mentioned are twenty-five in number, and deliver, on an average, ninety women a week, or about three hundred and eighty a month. None of these women had a case of puerperal fever. "Yet all this time this woman was crossing the other midwives in every direction, scores of the patients of the charity being delivered by them in the very same quarters where her cases of fever were happening."

Mr. Robertson remarks, that little more than half the women she delivered during this month took the fever; that on some days all escaped, on others only one or more out of three or four; a circumstance similar to what is seen in other infectious maladies.

Dr. Blundell says, "Those who have never made the experiment can have but a faint conception how difficult it is to obtain the exact truth respecting any occurrence in which feelings and interests are concerned. Omitting particulars, then, I content myself with remarking, generally, that from more than one district I have received accounts of the prevalence of puerperal fever in the practice of some individuals, while its occurrence in that of others, in the same neighborhood, was not observed. Some, as I have been told, have lost ten, twelve, or a greater number of patients, in scarcely broken succession; like their evil genius, the puerperal fever has seemed to stalk behind them wherever they went. Some have deemed it prudent to retire for a time from practice. In fine, that this fever may occur spontaneously, I admit; that its infectious nature may be plausibly disputed, I do not deny; but I add, considerately, that in my own family I had rather that those I esteemed the most should be delivered, unaided, in a stable, by the manger-side, than that they should receive the best help, in the fairest apartment, but exposed to the vapors of this pitiless disease. Gossiping friends, wet-nurses, monthly nurses, the practitioner himself, these are the channels by which, as I suspect, the infection is principally conveyed."

At a meeting of the Royal Medical and Chirurgical Society, Dr. King mentioned that some years since a practitioner at Woolwich lost sixteen patients from puerperal fever in the same year. He was compelled to give up practice for one or two years, his business being divided among the neighboring practitioners. No case of puerperal fever occurred afterwards, neither had any of the neighboring surgeons any cases of this disease.

At the same meeting Mr. Hutchinson mentioned the occurrence of three consecutive cases of puerperal fever, followed subsequently by two others, all in the practice of one accoucheur. [Lancet, May 2, 1840.]

Dr. Lee makes the following statement: "In the last two weeks of September, 1827, five fatal cases of uterine inflammation came under our observation. All the individuals so attacked had been attended in labor by the same midwife, and no example of a febrile or inflammatory disease of a serious nature occurred during that period among the other patients of the Westminster General Dispensary, who had been attended by the other midwives belonging to that institution."

The recurrence of long series of cases like those I have cited, reported by those most interested to disbelieve in contagion, scattered along through an interval of half a century, might have been thought sufficient to satisfy the minds of all inquirers that here was something more than a singular coincidence. But if, on a more extended observation, it should be found that the same ominous groups of cases clustering about individual practitioners were observed in a remote country, at different times, and in widely separated regions, it would seem incredible that any should be found too prejudiced or indolent to accept the solemn truth knelled into their ears by the funeral bells from both sides of the ocean,—the plain conclusion that the physician and the disease entered, hand in hand, into the chamber of the unsuspecting patient.

That such series of cases have been observed in this country, and in this neighborhood, I proceed to show.

In Dr. Francis's "Notes to Denman's Midwifery," a passage is cited from Dr. Hosack, in which he refers to certain puerperal cases which proved fatal to several lying-in women, and in some of which the disease was supposed to be conveyed by the accoucheurs themselves.

A writer in the "New York Medical and Physical Journal" for October, 1829, in speaking of the occurrence of puerperal fever, confined to one man's practice, remarks, "We have known cases of this kind occur, though rarely, in New York."

I mention these little hints about the occurrence of such cases, partly because they are the first I have met with in American medical literature, but more especially because they serve to remind us that behind the fearful array of published facts there lies a dark list of similar events, unwritten in the records of science, but long remembered by many a desolated fireside.

Certainly nothing can be more open and explicit than the account given by Dr. Peirson of Salem, of the cases seen by him. In the first nineteen days of January, 1829, he had five consecutive cases of puerperal fever, every patient he attended being attacked, and the three first cases proving fatal. In March of the same year he had two moderate cases, in June, another case, and in July, another, which proved fatal. "Up to this period," he remarks, "I am not informed that a single case had occurred in the practice of any other physician. Since that period I have had no fatal case in my practice, although I have had several dangerous cases. I have attended in all twenty cases of this disease, of which four have been fatal. I am not aware that there has been any other case in the town of distinct puerperal peritonitis, although I am willing to admit my information may be very defective on this point. I have been told of some 'mixed cases,' and 'morbid affections after delivery.'"

In the "Quarterly Summary of the Transactions of the College of Physicians of Philadelphia" may be found some most extraordinary developments respecting a series of cases occurring in the practice of a member of that body.

Dr. Condie called the attention of the Society to the prevalence, at the present time, of puerperal fever of a peculiarly insidious and malignant character. "In the practice of one gentleman extensively engaged as an obstetrician, nearly every female he has attended in confinement, during several weeks past, within the above limits" (the southern sections and neighboring districts), "had been attacked by the fever."

"An important query presents itself, the Doctor observed, in reference to the particular form of fever now prevalent. Is it, namely, capable of being propagated by contagion, and is a physician who has been in attendance upon a case of the disease warranted in continuing, without interruption, his practice as an

obstetrician? Dr. C., although not a believer in the contagious character of many of those affections generally supposed to be propagated in this manner, has nevertheless become convinced by the facts that have fallen under his notice, that the puerperal fever now prevailing is capable of being communicated by contagion. How otherwise can be explained the very curious circumstance of the disease in one district being exclusively confined to the practice of a single physician, a Fellow of this College, extensively engaged in obstetrical practice,—while no instance of the disease has occurred in the patients under the care of any other accoucheur practising within the same district; scarcely a female that has been delivered for weeks past has escaped an attack?"

Dr. Rutter, the practitioner referred to, "observed that, after the occurrence of a number of cases of the disease in his practice, he had left the city and remained absent for a week, but on returning, no article of clothing he then wore having been used by him before, one of the very first cases of parturition he attended was followed by an attack of the fever, and terminated fatally; he cannot, readily, therefore, believe in the transmission of the disease from female to female, in the person or clothes of the physician."

The meeting at which these remarks were made was held on the 3d of May, 1842. In a letter dated December 20, 1842, addressed to Dr. Meigs, and to be found in the "Medical Examiner," he speaks of "those horrible cases of puerperal fever, some of which you did me the favor to see with me during the past summer," and talks of his experience in the disease, "now numbering nearly seventy cases, all of which have occurred within less than a twelvemonth past."

And Dr. Meigs asserts, on the same page, "Indeed, I believe that his practice in that department of the profession was greater than that of any other gentleman, which was probably the cause of his seeing a greater number of the cases." This from a professor of midwifery, who some time ago assured a gentleman whom he met in consultation, that the night on which they met was the eighteenth in succession that he himself had been summoned from his repose, seems hardly satisfactory.

I must call the attention of the inquirer most particularly to the Quarterly Report above referred to, and the letters of Dr. Meigs and Dr. Rutter, to be found in the "Medical Examiner." Whatever impression they may produce upon his mind, I trust they will at least convince him that there is some reason for looking into this apparently uninviting subject.

At a meeting of the College of Physicians just mentioned, Dr. Warrington stated, that a few days after assisting at an autopsy of puerperal peritonitis, in which he laded out the contents of the abdominal cavity with his hands, he was called upon to deliver three women in rapid succession. All of these women were attacked with different forms of what is commonly called puerperal fever. Soon after these he saw two other patients, both on the same day, with the same disease. Of these five patients two died.

At the same meeting, Dr. West mentioned a fact related to him by Dr. Samuel Jackson of Northumberland. Seven females, delivered by Dr. Jackson in rapid succession, while practising in Northumberland County, were all attacked with puerperal fever, and five of them died. "Women," he said, "who had expected me to attend upon them, now becoming alarmed, removed out of my reach, and others sent for a physician residing several miles distant. These women, as well as those attended by midwives; all did well; nor did we hear of any deaths in child-bed within a radius of fifty miles, excepting two, and these I afterwards ascertained to have been caused by other diseases." He underwent, as he thought, a thorough purification, and still his next patient was attacked with the disease and died. He was led to suspect that the contagion might have been carried in the gloves which he had worn in attendance upon the previous cases. Two months or more after this he had two other cases. He could find nothing to account for these, unless it were the instruments for giving enemata, which had been used in two of the former cases, and were employed by these patients. When the first case occurred, he was attending and dressing a limb extensively mortified from erysipelas, and went immediately to the accouchement with his clothes and gloves most thoroughly imbued with its efluvia. And here I may mention, that this very Dr. Samuel Jackson of Northumberland is one of Dr. Dewees's authorities against contagion.

The three following statements are now for the first time given to the public. All of the cases referred to occurred within this State, and two of the three series in Boston and its immediate vicinity.

I. The first is a series of cases which took place during the last spring in a town at some distance from this neighborhood. A physician of that town, Dr. C., had the following consecutive cases.

*No. 1, delivered March 20, died March 24.
" 2, " April 9, " April 14.
" 3, " " 10, " " 14.
" 4, " " 11, " " 18.
" 5, " " 27, " May 3.
" 6, " " 28, had some symptoms, (recovered.)
" 7, " May 8, had some symptoms, (also recovered.)*

These were the only cases attended by this physician during the period referred to. "They were all attended by him until their termination, with the exception of the patient No. 6, who fell into the hands of another physician on the 2d of May. (Dr. C. left town for a few days at this time.) Dr. C. attended cases immediately before and after the above-named periods, none of which, however, presented any peculiar symptoms of the disease."

About the 1st of July he attended another patient in a neighboring village, who died two or three days after delivery.

The first patient, it is stated, was delivered on the 20th of March. "On the 19th, Dr. C. made the autopsy of a man who died suddenly, sick only forty-eight hours; had oedema of the thigh, and gangrene extending from a little above the ankle into the cavity of the abdomen." Dr. C. wounded himself, very slightly, in the right hand during the autopsy. The hand was quite painful the night following, during his attendance on the patient No. 1. He did not see this patient after the 20th, being confined to the house, and very sick from the wound just mentioned, from this time until the 3d of April.

Several cases of erysipelas occurred in the house where the autopsy mentioned above took place, soon after

the examination. There were also many cases of erysipelas in town at the time of the fatal puerperal cases which have been mentioned.

The nurse who laid out the body of the patient No. 3 was taken on the evening of the same day with sore throat and erysipelas, and died in ten days from the first attack.

The nurse who laid out the body of the patient No. 4 was taken on the day following with symptoms like those of this patient, and died in a week, without any external marks of erysipelas.

"No other cases of similar character with those of Dr. C. occurred in the practice of any of the physicians in the town or vicinity at the time. Deaths following confinement have occurred in the practice of other physicians during the past year, but they were not cases of puerperal fever. No post-mortem examinations were held in any of these puerperal cases."

Some additional statements in this letter are deserving of insertion.

"A physician attended a woman in the immediate neighborhood of the cases numbered 2, 3, and 4. This patient was confined the morning of March 1st, and died on the night of March 7th. It is doubtful whether this should be considered a case of puerperal fever. She had suffered from canker, indigestion, and diarrhoea for a year previous to her delivery. Her complaints were much aggravated for two or three months previous to delivery; she had become greatly emaciated, and weakened to such an extent that it had not been expected that she would long survive her confinement, if indeed she reached that period. Her labor was easy enough; she flowed a good deal, seemed exceedingly prostrated, had ringing in the ears, and other symptoms of exhaustion; the pulse was quick and small. On the second and third day there was some tenderness and tumefaction of the abdomen, which increased somewhat on the fourth and fifth. He had cases in midwifery before and after this, which presented nothing peculiar."

It is also mentioned in the same letter, that another physician had a case during the last summer and another last fall, both of which recovered.

Another gentleman reports a case last December, a second case five weeks, and another three weeks since. All these recovered. A case also occurred very recently in the practice of a physician in the village where the eighth patient of Dr. C. resides, which proved fatal. "This patient had some patches of erysipelas on the legs and arms. The same physician has delivered three cases since, which have all done well. There have been no other cases in this town or its vicinity recently. There have been some few cases of erysipelas." It deserves notice that the partner of Dr. C., who attended the autopsy of the man above mentioned and took an active part in it; who also suffered very slightly from a prick under the thumb-nail received during the examination, had twelve cases of midwifery between March 26th and April 12th, all of which did well, and presented no peculiar symptoms. It should also be stated, that during these seventeen days he was in attendance on all the cases of erysipelas in the house where the autopsy had been performed.

I owe these facts to the prompt kindness of a gentleman whose intelligence and character are sufficient guaranty for their accuracy.

The two following letters were addressed to my friend Dr. Scorer, by the gentleman in whose practice the cases of puerperal fever occurred. His name renders it unnecessary to refer more particularly to these gentlemen, who on their part have manifested the most perfect freedom and courtesy in affording these accounts of their painful experience.

"January 28, 1843.

II.... "The time to which you allude was in 1830. The first case was in February, during a very cold time. She was confined the 4th, and died the 12th. Between the 10th and 28th of this month, I attended six women in labor, all of whom did well except the last, as also two who were confined March 1st and 5th. Mrs. E., confined February 28th, sickened, and died March 8th. The next day, 9th, I inspected the body, and the night after attended a lady, Mrs. B., who sickened, and died 16th. The 10th, I attended another, Mrs. G., who sickened, but recovered. March 16th, I went from Mrs. G.'s room to attend a Mrs. H., who sickened, and died 21st. The 17th, I inspected Mrs. B. On the 19th, I went directly from Mrs. H.'s room to attend another lady, Mrs. G., who also sickened, and died 22d. While Mrs. B. was sick, on 15th, I went directly from her room a few rods, and attended another woman, who was not sick. Up to 20th of this month I wore the same clothes. I now refused to attend any labor, and did not till April 21st, when, having thoroughly cleansed myself, I resumed my practice, and had no more puerperal fever.

"The cases were not confined to a narrow space. The two nearest were half a mile from each other, and half that distance from my residence. The others were from two to three miles apart, and nearly that distance from my residence. There were no other cases in their immediate vicinity which came to my knowledge. The general health of all the women was pretty good, and all the labors as good as common, except the first. This woman, in consequence of my not arriving in season, and the child being half-born at some time before I arrived, was very much exposed to the cold at the time of confinement, and afterwards, being confined in a very open, cold room. Of the six cases you perceive only one recovered.

"In the winter of 1817 two of my patients had puerperal fever, one very badly, the other not so badly. Both recovered. One other had swelled leg, or phlegmasia dolens, and one or two others did not recover as well as usual.

"In the summer of 1835 another disastrous period occurred in my practice. July 1st, I attended a lady in labor, who was afterwards quite ill and feverish; but at the time I did not consider her case a decided puerperal fever. On the 8th, I attended one who did well. On the 12th, one who was seriously sick. This was also an equivocal case, apparently arising from constipation and irritation of the rectum. These women were ten miles apart and five from my residence. On 15th and 20th, two who did well. On 25th, I attended another. This was a severe labor, and followed by unequivocal puerperal fever, or peritonitis. She recovered. August 2d and 3d, in about twenty-four hours I attended four persons. Two of them did very well; one was attacked with some of the common symptoms, which however subsided in a day or two, and the other had decided puerperal fever, but recovered. This woman resided five miles from me. Up to this time I wore the same coat. All my other clothes had frequently been changed. On 6th, I attended two women, one of whom was not sick at all; but the other, Mrs. L., was afterwards taken ill. On 10th, I attended a lady, who did very well. I had

previously changed all my clothes, and had no garment on which had been in a puerperal room. On 12th, I was called to Mrs. S., in labor. While she was ill, I left her to visit Mrs. L., one of the ladies who was confined on 6th. Mrs. L. had been more unwell than usual, but I had not considered her case anything more than common till this visit. I had on a surtout at this visit, which, on my return to Mrs. S., I left in another room. Mrs. S. was delivered on 13th with forceps. These women both died of decided puerperal fever.

"While I attended these women in their fevers, I changed my clothes, and washed my hands in a solution of chloride of lime after each visit. I attended seven women in labor during this period, all of whom recovered without sickness.

"In my practice I have had several single cases of puerperal fever, some of whom have died and some have recovered. Until the year 1830 I had no suspicion that the disease could be communicated from one patient to another by a nurse or midwife; but I now think the foregoing facts strongly favor that idea. I was so much convinced of this fact, that I adopted the plan before related.

"I believe my own health was as good as usual at each of the above periods. I have no recollections to the contrary.

"I believe I have answered all your questions. I have been more particular on some points perhaps than necessary; but I thought you could form your own opinion better than to take mine. In 1830 I wrote to Dr. Charming a more particular statement of my cases. If I have not answered your questions sufficiently, perhaps Dr. C. may have my letter to him, and you can find your answer there." [In a letter to myself, this gentleman also stated, "I do not recollect that there was any erysipelas or any other disease particularly prevalent at the time."]

"BOSTON, February 3, 1843.

III. "MY DEAR SIR,—I received a note from you last evening, requesting me to answer certain questions therein proposed, touching the cases of puerperal fever which came under my observation the past summer. It gives me pleasure to comply with your request, so far as it is in my power so to do, but, owing to the hurry in preparing for a journey, the notes of the cases I had then taken were lost or mislaid. The principal facts, however, are too vivid upon my recollection to be soon forgotten. I think, therefore, that I shall be able to give you all the information you may require.

"All the cases that occurred in my practice took place between the 7th of May and the 17th of June 1842.

"They were not confined to any particular part of the city. The first two cases were patients residing at the South End, the next was at the extreme North End, one living in Sea Street and the other in Roxbury. The following is the order in which they occurred:

"Case 1. Mrs. _____ was confined on the 7th of May, at 5 o'clock, P. M., after a natural labor of six hours. At 12 o'clock at night, on the 9th (thirty-one hours after confinement), she was taken with severe chill, previous to which she was as comfortable as women usually are under the circumstances. She died on the 10th.

"Case 2. Mrs. _____ was confined on the 10th of June (four weeks after Mrs. C.), at 11 A. M., after a natural, but somewhat severe labor of five hours. At 7 o'clock, on the morning of the 11th, she had a chill. Died on the 12th.

"Case 3. Mrs. _____, confined on the 14th of June, was comfortable until the 18th, when symptoms of puerperal fever were manifest. She died on the 20th.

"Case 4. Mrs. _____, confined June 17th, at 5 o'clock, A. M., was doing well until the morning of the 19th. She died on the evening of the 21st.

"Case 5. Mrs. _____ was confined with her fifth child on the 17th of June, at 6 o'clock in the evening. This patient had been attacked with puerperal fever, at three of her previous confinements, but the disease yielded to depletion and other remedies without difficulty. This time, I regret to say, I was not so fortunate. She was not attacked, as were the other patients, with a chill, but complained of extreme pain in abdomen, and tenderness on pressure, almost from the moment of her confinement. In this as in the other cases, the disease resisted all remedies, and she died in great distress on the 22d of the same month. Owing to the extreme heat of the season, and my own indisposition, none of the subjects were examined after death. Dr. Channing, who was in attendance with me on the three last cases, proposed to have a post-mortem examination of the subject of case No. 5, but from some cause which I do not now recollect it was not obtained.

"You wish to know whether I wore the same clothes when attending the different cases. I cannot positively say, but I should think I did not, as the weather became warmer after the first two cases; I therefore think it probable that I made a change of at least a part of my dress. I have had no other case of puerperal fever in my own practice for three years, save those above related, and I do not remember to have lost a patient before with this disease. While absent, last July, I visited two patients sick with puerperal fever, with a friend of mine in the country. Both of them recovered.

"The cases that I have recorded were not confined to any particular constitution or temperament, but it seized upon the strong and the weak, the old and the young,—one being over forty years, and the youngest under eighteen years of age.... If the disease is of an erysipelatos nature, as many suppose, contagionists may perhaps find some ground for their belief in the fact, that, for two weeks previous to my first case of puerperal fever, I had been attending a severe case of erysipelas, and the infection may have been conveyed through me to the patient; but, on the other hand, why is not this the case with other physicians, or with the same physician at all times, for since my return from the country I have had a more inveterate case of erysipelas than ever before, and no difficulty whatever has attended any of my midwifery cases?"

I am assured, on unquestionable authority, that "About three years since, a gentleman in extensive midwifery business, in a neighboring State, lost in the course of a few weeks eight patients in child-bed, seven of them being undoubted cases of puerperal fever. No other physician of the town lost a single patient of this disease during the same period." And from what I have heard in conversation with some of our most experienced practitioners, I am inclined to think many cases of the kind might be brought to light by extensive inquiry.

This long catalogue of melancholy histories assumes a still darker aspect when we remember how kindly nature deals with the parturient female, when she is not immersed in the virulent atmosphere of an impure lying-in hospital, or poisoned in her chamber by the unsuspected breath of contagion. From all causes together, not more than four deaths in a thousand births and miscarriages happened in England and Wales during the period embraced by the first "Report of the Registrar-General." In the second Report the mortality was shown to be about five in one thousand. In the Dublin Lying-in Hospital, during the seven years of Dr. Collins's mastership, there was one case of puerperal fever to 178 deliveries, or less than six to the thousand, and one death from this disease in 278 cases, or between three and four to the thousand a yet during this period the disease was endemic in the hospital, and might have gone on to rival the horrors of the pestilence of the Maternite, had not the poison been destroyed by a thorough purification.

In private practice, leaving out of view the cases that are to be ascribed to the self-acting system of propagation, it would seem that the disease must be far from common. Mr. White of Manchester says, "Out of the whole number of lying-in patients whom I have delivered (and I may safely call it a great one), I have never lost one, nor to the best of my recollection has one been greatly endangered, by the puerperal, miliary, low nervous, putrid malignant, or milk fever." Dr. Joseph Clarke informed Dr. Collins, that in the course of forty-five years' most extensive practice he lost but four patients from this disease. One of the most eminent practitioners of Glasgow, who has been engaged in very extensive practice for upwards of a quarter of a century, testifies that he never saw more than twelve cases of real puerperal fever. [Lancet, May 4, 1833]

I have myself been told by two gentlemen practising in this city, and having for many years a large midwifery business, that they had neither of them lost a patient from this disease, and by one of them that he had only seen it in consultation with other physicians. In five hundred cases of midwifery, of which Dr. Storer has given an abstract in the first number of this Journal, there was only one instance of fatal puerperal peritonitis.

In the view of these facts, it does appear a singular coincidence, that one man or woman should have ten, twenty, thirty, or seventy cases of this rare disease following his or her footsteps with the keenness of a beagle, through the streets and lanes of a crowded city, while the scores that cross the same paths on the same errands know it only by name. It is a series of similar coincidences which has led us to consider the dagger, the musket, and certain innocent-looking white powders as having some little claim to be regarded as dangerous. It is the practical inattention to similar coincidences which has given rise to the unpleasant but often necessary documents called indictments, which has sharpened a form of the cephalotome sometimes employed in the case of adults, and adjusted that modification of the fillet which delivers the world of those who happen to be too much in the way while such striking coincidences are taking place.

I shall now mention a few instances in which the disease appears to have been conveyed by the process of direct inoculation.

Dr. Campbell of Edinburgh states that in October, 1821, he assisted at the post-mortem examination of a patient who died with puerperal fever. He carried the pelvic viscera in his pocket to the class-room. The same evening he attended a woman in labor without previously changing his clothes; this patient died. The next morning he delivered a woman with the forceps; she died also, and of many others who were seized with the disease within a few weeks, three shared the same fate in succession.

In June, 1823, he assisted some of his pupils at the autopsy of a case of puerperal fever. He was unable to wash his hands with proper care, for want of the necessary accommodations. On getting home he found that two patients required his assistance. He went without further ablution, or changing his clothes; both these patients died with puerperal fever. This same Dr. Campbell is one of Dr. Churchill's authorities against contagion.

Mr. Robertson says that in one instance within his knowledge a practitioner passed the catheter for a patient with puerperal fever late in the evening; the same night he attended a lady who had the symptoms of the disease on the second day. In another instance a surgeon was called while in the act of inspecting the body of a woman who had died of this fever, to attend a labor; within forty-eight hours this patient was seized with the fever.'

On the 16th of March, 1831, a medical practitioner examined the body of a woman who had died a few days after delivery, from puerperal peritonitis. On the evening of the 17th he delivered a patient, who was seized with puerperal fever on the 19th, and died on the 24th. Between this period and the 6th of April, the same practitioner attended two other patients, both of whom were attacked with the same disease and died.

In the autumn of 1829 a physician was present at the examination of a case of puerperal fever, dissected out the organs, and assisted in sewing up the body. He had scarcely reached home when he was summoned to attend a young lady in labor. In sixteen hours she was attacked with the symptoms of puerperal fever, and narrowly escaped with her life.

In December, 1830, a midwife, who had attended two fatal cases of puerperal fever at the British Lying-in Hospital, examined a patient who had just been admitted, to ascertain if labor had commenced. This patient remained two days in the expectation that labor would come on, when she returned home and was then suddenly taken in labor and delivered before she could set out for the hospital. She went on favorably for two days, and was then taken with puerperal fever and died in thirty-six hours.

"A young practitioner, contrary to advice, examined the body of a patient who had died from puerperal fever; there was no epidemic at the time; the case appeared to be purely sporadic. He delivered three other women shortly afterwards; they all died with puerperal fever, the symptoms of which broke out very soon after labor. The patients of his colleague did well, except one, where he assisted to remove some coagula from the uterus; she was attacked in the same manner as those whom he had attended, and died also." The writer in the "British and Foreign Medical Review," from whom I quote this statement,—and who is no other than Dr. Rigby, adds, "We trust that this fact alone will forever silence such doubts, and stamp the well-merited epithet of 'criminal,' as above quoted, upon such attempts." [Brit. and For. Medical Review for Jan. 1842, p. 112.]

From the cases given by Mr. Ingleby, I select the following. Two gentlemen, after having been engaged in

conducting the post-mortem examination of a case of puerperal fever, went in the same dress, each respectively, to a case of midwifery. "The one patient was seized with the rigor about thirty hours afterwards. The other patient was seized with a rigor the third morning after delivery. One recovered, one died." [Edin. Med. and Surg. Journal, April, 1838.] One of these same gentlemen attended another woman in the same clothes two days after the autopsy referred to. "The rigor did not take place until the evening of the fifth day from the first visit. Result fatal." These cases belonged to a series of seven, the first of which was thought to have originated in a case of erysipelas. "Several cases of a mild character followed the foregoing seven, and their nature being now most unequivocal, my friend declined visiting all midwifery cases for a time, and there was no recurrence of the disease." These cases occurred in 1833. Five of them proved fatal. Mr. Ingleby gives another series of seven cases which occurred to a practitioner in 1836, the first of which was also attributed to his having opened several erysipelatous abscesses a short time previously.

I need not refer to the case lately read before this Society, in which a physician went, soon after performing an autopsy of a case of puerperal fever, to a woman in labor, who was seized with the same disease and perished. The forfeit of that error has been already paid.

At a meeting of the Medical and Chirurgical Society before referred to, Dr. Merriman related an instance occurring in his own practice, which excites a reasonable suspicion that two lives were sacrificed to a still less dangerous experiment. He was at the examination of a case of puerperal fever at two o'clock in the afternoon. He took care not to touch the body. At nine o'clock the same evening he attended a woman in labor; she was so nearly delivered that he had scarcely anything to do. The next morning she had severe rigors, and in forty-eight hours she was a corpse. Her infant had erysipelas and died in two days. [Lancet, May 2, 1840.]

In connection with the facts which have been stated, it seems proper to allude to the dangerous and often fatal effects which have followed from wounds received in the post-mortem examination of patients who have died of puerperal fever. The fact that such wounds are attended with peculiar risk has been long noticed. I find that Chaussier was in the habit of cautioning his students against the danger to which they were exposed in these dissections. [Stein, L'Art d'Accoucher, 1794; Dict. des Sciences Medicales, art. "Puerperal."] The head pharmacien of the Hotel Dieu, in his analysis of the fluid effused in puerperal peritonitis, says that practitioners are convinced of its deleterious qualities, and that it is very dangerous to apply it to the denuded skin. [Journal de Pharmacie, January, 1836.] Sir Benjamin Brodie speaks of it as being well known that the inoculation of lymph or pus from the peritoneum of a puerperal patient is often attended with dangerous and even fatal symptoms. Three cases in confirmation of this statement, two of them fatal, have been reported to this Society within a few months.

Of about fifty cases of injuries of this kind, of various degrees of severity, which I have collected from different sources, at least twelve were instances of infection from puerperal peritonitis. Some of the others are so stated as to render it probable that they may have been of the same nature. Five other cases were of peritoneal inflammation; three in males. Three were what was called enteritis, in one instance complicated with erysipelas; but it is well known that this term has been often used to signify inflammation of the peritoneum covering the intestines. On the other hand, no case of typhus or typhoid fever is mentioned as giving rise to dangerous consequences, with the exception of the single instance of an undertaker mentioned by Mr. Travers, who seems to have been poisoned by a fluid which exuded from the body. The other accidents were produced by dissection, or some other mode of contact with bodies of patients who had died of various affections. They also differed much in severity, the cases of puerperal origin being among the most formidable and fatal. Now a moment's reflection will show that the number of cases of serious consequences ensuing from the dissection of the bodies of those who had perished of puerperal fever is so vastly disproportioned to the relatively small number of autopsies made in this complaint as compared with typhus or pneumonia (from which last disease not one case of poisoning happened), and still more from all diseases put together, that the conclusion is irresistible that a most fearful morbid poison is often generated in the course of this disease. Whether or not it is sui generis, confined to this disease, or produced in some others, as, for instance, erysipelas, I need, not stop to inquire.

In connection with this may be taken the following statement of Dr. Rigby. "That the discharges from a patient under puerperal fever are in the highest degree contagious we have abundant evidence in the history of lying-in hospitals. The puerperal abscesses are also contagious, and may be communicated to healthy lying-in women by washing with the same sponge; this fact has been repeatedly proved in the Vienna Hospital; but they are equally communicable to women not pregnant; on more than one occasion the women engaged in washing the soiled bed-linen of the General Lying-in Hospital have been attacked with abscess in the fingers or hands, attended with rapidly spreading inflammation of the cellular tissue."

Now add to all this the undisputed fact, that within the walls of lying-in hospitals there is often generated a miasm, palpable as the chlorine used to destroy it, tenacious so as in some cases almost to defy extirpation, deadly in some institutions as the plague; which has killed women in a private hospital of London so fast that they were buried two in one coffin to conceal its horrors; which enabled Tonnelle to record two hundred and twenty-two autopsies at the Maternite of Paris; which has led Dr. Lee to express his deliberate conviction that the loss of life occasioned by these institutions completely defeats the objects of their founders; and out of this train of cumulative evidence, the multiplied groups of cases clustering about individuals, the deadly results of autopsies, the inoculation by fluids from the living patient, the murderous poison of hospitals,—does there not result a conclusion that laughs all sophistry to scorn, and renders all argument an insult?

I have had occasion to mention some instances in which there was an apparent relation between puerperal fever and erysipelas. The length to which this paper has extended does not allow me to enter into the consideration of this most important subject. I will only say, that the evidence appears to me altogether satisfactory that some most fatal series of puerperal fever have been produced by an infection originating in the matter or effluvia of erysipelas. In evidence of some connection between the two diseases, I need not go back to the older authors, as Pouteau or Gordon, but will content myself with giving the following references, with their dates; from which it will be seen that the testimony has been constantly coming before the profession for the last few years.

"London Cyclopaedia of Practical Medicine," article Puerperal Fever, 1833.

Mr. Ceeley's Account of the Puerperal Fever at Aylesbury. "Lancet," 1835.

Dr. Ramsbotham's Lecture. "London Medical Gazette," 1835.

Mr. Yates Ackerly's Letter in the same Journal, 1838.

Mr. Ingleby on Epidemic Puerperal Fever. "Edinburgh Medical and Surgical Journal," 1838.

Mr. Paley's Letter. "London Medical Gazette," 1839.

Remarks at the Medical and Chirurgical Society. "Lancet," 1840.

Dr. Rigby's "System of Midwifery." 1841.

"Nunneley on Erysipelas,"—a work which contains a large number of references on the subject. 1841.

"British and Foreign Quarterly Review," 1842.

Dr. S. Jackson of Northumberland, as already quoted from the Summary of the College of Physicians, 1842.

And lastly, a startling series of cases by Mr. Storrs of Doncaster, to be found in the "American Journal of the Medical Sciences" for January, 1843.

The relation of puerperal fever with other continued fevers would seem to be remote and rarely obvious. Hey refers to two cases of synochus occurring in the Royal Infirmary of Edinburgh, in women who had attended upon puerperal patients. Dr. Collins refers to several instances in which puerperal fever has appeared to originate from a continued proximity to patients suffering with typhus.

Such occurrences as those just mentioned, though most important to be remembered and guarded against, hardly attract our notice in the midst of the gloomy facts by which they are surrounded. Of these facts, at the risk of fatiguing repetitions, I have summoned a sufficient number, as I believe, to convince the most incredulous that every attempt to disguise the truth which underlies them all is useless.

It is true that some of the historians of the disease, especially Hulme, Hull, and Leake, in England; Tonnelle, Duges, and Baudelocque, in France, profess not to have found puerperal fever contagious. At the most they give us mere negative facts, worthless against an extent of evidence which now overlaps the widest range of doubt, and doubles upon itself in the redundancy of superfluous demonstration. Examined in detail, this and much of the show of testimony brought up to stare the daylight of conviction out of countenance, proves to be in a great measure unmeaning and inapplicable, as might be easily shown were it necessary. Nor do I feel the necessity of enforcing the conclusion which arises spontaneously from the facts which have been enumerated, by formally citing the opinions of those grave authorities who have for the last half-century been sounding the unwelcome truth it has cost so many lives to establish.

"It is to the British practitioner," says Dr. Rigby, "that we are indebted for strongly insisting upon this important and dangerous character of puerperal fever."

The names of Gordon, John Clarke, Denman, Burns, Young, Hamilton, Haighton, Good, Waller; Blundell, Gooch, Ramsbotham, Douglas, Lee, Ingleby, Locock, Abercrombie, Alison, Travers, Rigby, and Watson, many of whose writings I have already referred to, may have some influence with those who prefer the weight of authorities to the simple deductions of their own reason from the facts laid before them. A few Continental writers have adopted similar conclusions. It gives me pleasure to remember, that while the doctrine has been unceremoniously discredited in one of the leading Journals, and made very light of by teachers in two of the principal Medical Schools, of this country, Dr. Channing has for many years inculcated, and enforced by examples, the danger to be apprehended and the precautions to be taken in the disease under consideration.

I have no wish to express any harsh feeling with regard to the painful subject which has come before us. If there are any so far excited by the story of these dreadful events that they ask for some word of indignant remonstrance to show that science does not turn the hearts of its followers into ice or stone, let me remind them that such words have been uttered by those who speak with an authority I could not claim. It is as a lesson rather than as a reproach that I call up the memory of these irreparable errors and wrongs. No tongue can tell the heart-breaking calamity they have caused; they have closed the eyes just opened upon a new world of love and happiness; they have bowed the strength of manhood into the dust; they have cast the helplessness of infancy into the stranger's arms, or bequeathed it, with less cruelty, the death of its dying parent. There is no tone deep enough for regret, and no voice loud enough for warning. The woman about to become a mother, or with her new-born infant upon her bosom, should be the object of trembling care and sympathy wherever she bears her tender burden, or stretches her aching limbs. The very outcast of the streets has pity upon her sister in degradation, when the seal of promised maternity is impressed upon her. The remorseless vengeance of the law, brought down upon its victim by a machinery as sure as destiny, is arrested in its fall at a word which reveals her transient claim for mercy. The solemn prayer of the liturgy singles out her sorrows from the multiplied trials of life, to plead for her in the hour of peril. God forbid that any member of the profession to which she trusts her life, doubly precious at that eventful period, should hazard it negligently, unadvisedly, or selfishly!

There may be some among those whom I address who are disposed to ask the question, What course are we to follow in relation to this matter? The facts are before them, and the answer must be left to their own judgment and conscience. If any should care to know my own conclusions, they are the following; and in taking the liberty to state them very freely and broadly, I would ask the inquirer to examine them as freely in the light of the evidence which has been laid before him.

1. A physician holding himself in readiness to attend cases of midwifery should never take any active part in the post-mortem examination of cases of puerperal fever.

2. If a physician is present at such autopsies, he should use thorough ablution, change every article of dress, and allow twenty-four hours or more to elapse before attending to any case of midwifery. It may be well to extend the same caution to cases of simple peritonitis.

3. Similar precautions should be taken after the autopsy or surgical treatment of cases of erysipelas, if the physician is obliged to unite such offices with his obstetrical duties, which is in the highest degree inexpedient.

4. On the occurrence of a single case of puerperal fever in his practice, the physician is bound to consider the next female he attends in labor, unless some weeks at least have elapsed, as in danger of being infected by him, and it is his duty to take every precaution to diminish her risk of disease and death.

5. If within a short period two cases of puerperal fever happen close to each other, in the practice of the same physician, the disease not existing or prevailing in the neighborhood, he would do wisely to relinquish his obstetrical practice for at least one month, and endeavor to free himself by every available means from any noxious influence he may carry about with him.

6. The occurrence of three or more closely connected cases, in the practice of one individual, no others existing in the neighborhood, and no other sufficient cause being alleged for the coincidence, is *prima facie* evidence that he is the vehicle of contagion.

7. It is the duty of the physician to take every precaution that the disease shall not be introduced by nurses or other assistants, by making proper inquiries concerning them, and giving timely warning of every suspected source of danger.

8. Whatever indulgence may be granted to those who have heretofore been the ignorant causes of so much misery, the time has come when the existence of a private pestilence in the sphere of a single physician should be looked upon, not as a misfortune, but a crime; and in the knowledge of such occurrences the duties of the practitioner to his profession should give way to his paramount obligations to society. ADDITIONAL REFERENCES AND CASES.

Fifth Annual Report of the Registrar-General of England.

1843. Appendix. Letter from William Farr, Esq.—Several new series of cases are given in the Letter of Mr. Stows, contained in the Appendix to this Report. Mr. Stows suggests precautions similar to those I have laid down, and these precautions are strongly enforced by Mr. Farr, who is, therefore, obnoxious to the same criticisms as myself.

Arneth. Paper read before the National Academy of Medicine. *Annales d'Hygiene*, Tome LXV. 2e Partie. (Means of Disinfection proposed by M. "Semmelweis" (Semmelweiss.) Lotions of chloride of lime and use of nail-brush before admission to lying-in wards. Alleged sudden and great decrease of mortality from puerperal fever. Cause of disease attributed to inoculation with cadaveric matters.) See also Routh's paper, mentioned above.

Moir. Remarks at a meeting of the Edinburgh Medico-Chirurgical Society. Refers to cases of Dr. Kellie, of Leith. Sixteen in succession, all fatal. Also to several instances of individual pupils having had a succession of cases in various quarters of the town, while others, practising as extensively in the same localities, had none. Also to several special cases not mentioned elsewhere. *Am. Jour. Med. Se.* for October, 1851. (From *New Monthly Journal of Med. Science*.)

Simpson.—Observations at a Meeting of the Edinburgh Obstetrical Society. (An "eminent gentleman," according to Dr. Meigs, whose "name is as well known in America as in (his) native land." *Obstetrics*. *Phil.* 1852, pp. 368, 375.) The student is referred to this paper for a valuable resume of many of the facts, and the necessary inferences, relating to this subject. Also for another series of cases, Mr. Sidey's, five or six in rapid succession. Dr. Simpson attended the dissection of two of Dr. Sidey's cases, and freely handled the diseased parts. His next four child-bed patients were affected with puerperal fever, and it was the first time he had seen it in practice. As Dr. Simpson is a gentleman (Dr. Meigs, as above), and as "a gentleman's hands are clean" (Dr. Meigs' Sixth Letter), it follows that a gentleman with clean hands may carry the disease. *Am. Jour. Med. Sc.*, October, 1851.

Peddle.—The five or six cases of Dr. Sidey, followed by the four of Dr. Simpson, did not end the series. A practitioner in Leith having examined in Dr. Simpson's house, a portion of the uterus obtained from one of the patients, had immediately afterwards three fatal cases of puerperal fever. Dr. Veddle referred to two distinct series of consecutive cases in his own practice. He had since taken precautions, and not met with any such cases. *Am. Jour. Med. Sc.*, October, 1851.

Copland. Considers it proved that puerperal fever maybe propagated by the hands and the clothes, or either, of a third person, the bed-clothes or body-clothes of a patient. Mentions a new series of cases, one of which he saw, with the practitioner who had attended them. She was the sixth he had had within a few days. All died. Dr. Copland insisted that contagion had caused these cases; advised precautionary measures, and

the practitioner had no other cases for a considerable time. Considers it criminal, after the evidence adduced, —which he could have quadrupled,—and the weight of authority brought forward, for a practitioner to be the medium of transmitting contagion and death to his patients. Dr. Copland lays down rules similar to those suggested by myself, and is therefore entitled to the same epithet for so doing. Medical Dictionary, New York, 1852. Article, Puerperal States and Diseases.

If there is any appetite for facts so craving as to be yet unappeased,—Lesotho, necdum satiata,—more can be obtained. Dr. Hodge remarks that “the frequency and importance of this singular circumstance (that the disease is occasionally more prevalent with one practitioner than another) has been exceedingly overrated.” More than thirty strings of cases, more than two hundred and fifty sufferers from puerperal fever, more than one hundred and thirty deaths appear as the results of a sparing estimate of such among the facts I have gleaned as could be numerically valued. These facts constitute, we may take it for granted, but a small fraction of those that have actually occurred. The number of them might be greater, but “’t is enough, ’t will serve,” in Mercutio’s modest phrase, so far as frequency is concerned. For a just estimate of the importance of the singular circumstance, it might be proper to consult the languid survivors, the widowed husbands, and the motherless children, as well as “the unfortunate accoucheur.”

CURRENTS AND COUNTER-CURRENTS IN MEDICAL SCIENCE

An Address delivered before the Massachusetts Medical Society, at the Annual Meeting, May 30, 1860.

“Facultate magis quam violentia.”
HIPPOCRATES.

Our Annual Meeting never fails to teach us at least one lesson. The art whose province it is to heal and to save cannot protect its own ranks from the inroads of disease and the waste of the Destroyer.

Seventeen of our associates have been taken from us since our last Anniversary. Most of them followed their calling in the villages or towns that lie among the hills or along the inland streams. Only those who have lived the kindly, mutually dependent life of the country, can tell how near the physician who is the main reliance in sickness of all the families throughout a thinly settled region comes to the hearts of the people among whom he labors, how they value him while living, how they cherish his memory when dead. For these friends of ours who have gone before, there is now no more toil; they start from their slumbers no more at the cry of pain; they sally forth no more into the storms; they ride no longer over the lonely roads that knew them so well; their wheels are rusting on their axles or rolling with other burdens; their watchful eyes are closed to all the sorrows they lived to soothe. Not one of these was famous in the great world; some were almost unknown beyond their own immediate circle. But they have left behind them that loving remembrance which is better than fame, and if their epitaphs are chiselled briefly in stone, they are written at full length on living tablets in a thousand homes to which they carried their ever-welcome aid and sympathy.

One whom we have lost, very widely known and honored, was a leading practitioner of this city. His image can hardly be dimmed in your recollection, as he stood before you only three years ago, filling the same place with which I am now honored. To speak of him at all worthily, would be to write the history of professional success, won without special aid at starting, by toil, patience, good sense, pure character, and pleasing manners; won in a straight uphill ascent, without one breathing-space until he sat down, not to rest, but to die. If prayers could have shielded him from the stroke, if love could have drawn forth the weapon, and skill could have healed the wound, this passing tribute might have been left to other lips and to another generation.

Let us hope that our dead have at last found that rest which neither summer nor winter, nor day nor night, had granted to their unending earthly labors! And let us remember that our duties to our brethren do not cease when they become unable to share our toils, or leave behind them in want and woe those whom their labor had supported. It is honorable to the Profession that it has organized an Association for the relief of its suffering members and their families; it owes this tribute to the ill-rewarded industry and sacrifices of its less fortunate brothers who wear out health and life in the service of humanity. I have great pleasure in referring to this excellent movement, which gives our liberal profession a chance to show its liberality, and serves to unite us all, the successful and those whom fortune has cast down, in the bonds of a true brotherhood.

A medical man, as he goes about his daily business after twenty years of practice, is apt to suppose that he treats his patients according to the teachings of his experience. No doubt this is true to some extent; to what extent depending much on the qualities of the individual. But it is easy to prove that the prescriptions of even wise physicians are very commonly founded on something quite different from experience. Experience must be based on the permanent facts of nature. But a glance at the prevalent modes of treatment of any two successive generations will show that there is a changeable as well as a permanent element in the art of healing; not merely changeable as diseases vary, or as new remedies are introduced, but changeable by the going out of fashion of special remedies, by the decadence of a popular theory from which their fitness was deduced, or other cause not more significant. There is no reason to suppose that the present time is essentially different in this respect from any other. Much, therefore, which is now very commonly considered to be the result of experience, will be recognized in the next, or in some succeeding generation, as no such result at all, but as a foregone conclusion, based on some prevalent belief or fashion of the time.

There are, of course, in every calling, those who go about the work of the day before them, doing it according to the rules of their craft, and asking no questions of the past or of the future, or of the aim and end to which their special labor is contributing. These often consider and call themselves practical men. They pull the oars of society, and have no leisure to watch the currents running this or that way; let theorists and

philosophers attend to them. In the mean time, however, these currents are carrying the practical men, too, and all their work may be thrown away, and worse than thrown away, if they do not take knowledge of them and get out of the wrong ones and into the right ones as soon as they may. Sir Edward Parry and his party were going straight towards the pole in one of their arctic expeditions, travelling at the rate of ten miles a day. But the ice over which they travelled was drifting straight towards the equator, at the rate of twelve miles a day, and yet no man among them would have known that he was travelling two miles a day backward unless he had lifted his eyes from the track in which he was plodding. It is not only going backward that the plain practical workman is liable to, if he will not look up and look around; he may go forward to ends he little dreams of. It is a simple business for a mason to build up a niche in a wall; but what if, a hundred years afterwards when the wall is torn down, the skeleton of a murdered man drop out of the niche? It was a plain practical piece of carpentry for a Jewish artisan to fit two pieces of timber together according to the legal pattern in the time of Pontius Pilate; he asked no questions, perhaps, but we know what burden the cross bore on the morrow! And so, with subtler tools than trowels or axes, the statesman who works in policy without principle, the theologian who works in forms without a soul, the physician who, calling himself a practical man, refuses to recognize the larger laws which govern his changing practice, may all find that they have been building truth into the wall, and hanging humanity upon the cross.

The truth is, that medicine, professedly founded on observation, is as sensitive to outside influences, political, religious, philosophical, imaginative, as is the barometer to the changes of atmospheric density. Theoretically it ought to go on its own straightforward inductive path, without regard to changes of government or to fluctuations of public opinion. But look a moment while I clash a few facts together, and see if some sparks do not reveal by their light a closer relation between the Medical Sciences and the conditions of Society and the general thought of the time, than would at first be suspected.

Observe the coincidences between certain great political and intellectual periods and the appearance of illustrious medical reformers and teachers. It was in the age of Pericles, of Socrates, of Plato, of Phidias, that Hippocrates gave to medical knowledge the form which it retained for twenty centuries. With the world-conquering Alexander, the world-embracing Aristotle, appropriating anatomy and physiology, among his manifold spoils of study, marched abreast of his royal pupil to wider conquests. Under the same Ptolemies who founded the Alexandrian Library and Museum, and ordered the Septuagint version of the Hebrew Scriptures, the infallible Herophilus [*"Contradicere Herophilo in anatomicis, est contradicere evangelium,"* was a saying of Fallopius.] made those six hundred dissections of which Tertullian accused him, and the sagacious Erasistratus introduced his mild antiphlogistic treatment in opposition to the polypharmacy and antidotal practice of his time. It is significant that the large-minded Galen should have been the physician and friend of the imperial philosopher Marcus Aurelius. The Arabs gave laws in various branches of knowledge to those whom their arms had invaded, or the terror of their spreading dominion had reached, and the point from which they started was, as Humboldt acknowledges, *"the study of medicine, by which they long ruled the Christian Schools,"* and to which they added the department of chemical pharmacy.

Look at Vesalius, the contemporary of Luther. Who can fail to see one common spirit in the radical ecclesiastic and the reforming court-physician? Both still to some extent under the dominion of the letter: Luther holding to the real presence; Vesalius actually causing to be drawn and engraved two muscles which he knew were not found in the human subject, because they had been described by Galen, from dissections of the lower animals. Both breaking through old traditions in the search of truth; one, knife in hand, at the risk of life and reputation, the other at the risk of fire and fagot, with that mightier weapon which all the devils could not silence, though they had been thicker than the tiles on the house-tops. How much the physician of the Catholic Charles V. had in common with the great religious destructive, may be guessed by the relish with which he tells the story how certain Pavian students exhumed the body of an *"elegans scortum,"* or lovely dame of ill repute, the favorite of a monk of the order of St. Anthony, who does not seem to have resisted temptation so well as the founder of his order. We have always ranked the physician Rabelais among the early reformers, but I do not know that Vesalius has ever been thanked for his hit at the morals of the religious orders, or for turning to the good of science what was intended for the *"benefit of clergy."*

Our unfortunate medical brother, Michael Servetus, the spiritual patient to whom the theological moxa was applied over the entire surface for the cure of his heresy, came very near anticipating Harvey. The same quickened thought of the time which led him to dispute the dogma of the Church, opened his mind to the facts which contradicted the dogmas of the Faculty.

Harvey himself was but the posthumous child of the great Elizabethan period. Bacon was at once his teacher and his patient. The founder of the new inductive philosophy had only been dead two years when the treatise on the Circulation, the first-fruit of the Restoration of Science, was given to the world.

And is it to be looked at as a mere accidental coincidence, that while Napoleon was modernizing the political world, Bichat was revolutionizing the science of life and the art that is based upon it; that while the young general was scaling the Alps, the young surgeon was climbing the steeper summits of unexplored nature; that the same year read the announcement of those admirable *"Researches on Life and Death,"* and the bulletins of the battle of Marengo?

If we come to our own country, who can fail to recognize that Benjamin Rush, the most conspicuous of American physicians, was the intellectual offspring of the movement which produced the Revolution? *"The same hand,"* says one of his biographers, *"which subscribed the declaration of the political independence of these States, accomplished their emancipation from medical systems formed in foreign countries, and wholly unsuitable to the state of diseases in America."*

Following this general course of remark, I propose to indicate in a few words the direction of the main intellectual current of the time, and to point out more particularly some of the eddies which tend to keep the science and art of medicine from moving with it, or even to carry them backwards.

The two dominant words of our time are law and average, both pointing to the uniformity of the order of being in which we live. Statistics have tabulated everything,—population, growth, wealth, crime, disease. We have shaded maps showing the geographical distribution of larceny and suicide. Analysis and classification have been at work upon all tangible and visible objects. The Positive Philosophy of Comte has only given

expression to the observing and computing mind of the nineteenth century.

In the mean time, the great stronghold of intellectual conservatism, traditional belief, has been assailed by facts which would have been indicted as blasphemy but a few generations ago. Those new tables of the law, placed in the hands of the geologist by the same living God who spoke from Sinai to the Israelites of old, have remodelled the beliefs of half the civilized world. The solemn scepticism of science has replaced the sneering doubts of witty philosophers. The more positive knowledge we gain, the more we incline to question all that has been received without absolute proof.

As a matter of course, this movement has its partial reactions. The province of faith is claimed as a port free of entry to unsupported individual convictions. The tendency to question is met by the unanalyzing instinct of reverence. The old church calls back its frightened truants. Some who have lost their hereditary religious belief find a resource in the revelations of Spiritualism. By a parallel movement, some of those who have become medical infidels pass over to the mystic band of believers in the fancied miracles of Homoeopathy.

Under these influences transmitted to, or at least shared by, the medical profession, the old question between "Nature," so called, and "Art," or professional tradition, has reappeared with new interest. I say the old question, for Hippocrates stated the case on the side of "Nature" more than two thousand years ago. Miss Florence Nightingale,—and if I name her next to the august Father of the Healing Art, its noblest daughter well deserves that place of honor,—Miss Florence Nightingale begins her late volume with a paraphrase of his statement. But from a very early time to this there has always been a strong party against "Nature." Themison called the practice of Hippocrates "a meditation upon death." Dr. Rush says: "It is impossible to calculate the mischief which Hippocrates has done, by first marking Nature with his name and afterwards letting her loose upon sick people. Millions have perished by her hands in all ages and countries." Sir John Forbes, whose defence of "Nature" in disease you all know, and to the testimonial in whose honor four of your Presidents have contributed, has been recently greeted, on retiring from the profession, with a wish that his retirement had been twenty years sooner, and the opinion that no man had done so much to destroy the confidence of the public in the medical profession.

In this Society we have had the Hippocratic and the Themisonic side fairly represented. The treatise of one of your early Presidents on the Mercurial Treatment is familiar to my older listeners. Others who have held the same office have been noted for the boldness of their practice, and even for partiality to the use of complex medication.

On the side of "Nature" we have had, first of all, that remarkable discourse on Self-Limited Diseases, [On Self-Limited Diseases. A Discourse delivered before the Massachusetts Medical Society, at their Annual Meeting, May 27, 1835 by Jacob Bigelow, M. D.] which has given the key-note to the prevailing medical tendency of this neighborhood, at least, for the quarter of a century since it was delivered. Nor have we forgotten the address delivered at Springfield twenty years later, [Search out the Secrets, of Nature. By Augustus A. Gould, M. D. Read at the Annual Meeting, June 27, 1855.] full of good sense and useful suggestions, to one of which suggestions we owe the learned, impartial, judicious, well-written Prize Essay of Dr. Worthington Hooker. [Rational Therapeutics. A Prize Essay. By Worthington Hooker, M. D., of New Haven. Boston. 1857.] We should not omit from the list the important address of another of our colleagues, [On the Treatment of Compound and Complicated Fractures. By William J. Walker, M. D. read at the Annual Meeting, May 29, 1845.] showing by numerous cases the power of Nature in healing compound fractures to be much greater than is frequently supposed,—affording, indeed, more striking illustrations than can be obtained from the history of visceral disease, of the supreme wisdom, forethought, and adaptive dexterity of that divine Architect, as shown in repairing the shattered columns which support the living temple of the body.

We who are on the side of "Nature" please ourselves with the idea that we are in the great current in which the true intelligence of the time is moving. We believe that some who oppose, or fear, or denounce our movement are themselves caught in various eddies that set back against the truth. And we do most earnestly desire and most actively strive, that Medicine, which, it is painful to remember, has been spoken of as "the withered branch of science" at a meeting of the British Association, shall be at length brought fully to share, if not to lead, the great wave of knowledge which rolls with the tides that circle the globe.

If there is any State or city which might claim to be the American headquarters of the nature-trusting heresy, provided it be one, that State is Massachusetts, and that city is its capital. The effect which these doctrines have upon the confidence reposed in the profession is a matter of opinion. For myself, I do not believe this confidence can be impaired by any investigations which tend to limit the application of troublesome, painful, uncertain, or dangerous remedies. Nay, I will venture to say this, that if every specific were to fail utterly, if the cinchona trees all died out, and the arsenic mines were exhausted, and the sulphur regions were burned up, if every drug from the vegetable, animal, and mineral kingdom were to disappear from the market, a body of enlightened men, organized as a distinct profession, would be required just as much as now, and respected and trusted as now, whose province should be to guard against the causes of disease, to eliminate them if possible when still present, to order all the conditions of the patient so as to favor the efforts of the system to right itself, and to give those predictions of the course of disease which only experience can warrant, and which in so many cases relieve the exaggerated fears of sufferers and their friends, or warn them in season of impending danger. Great as the loss would be if certain active remedies could no longer be obtained, it would leave the medical profession the most essential part of its duties, and all, and more than all, its present share of honors; for it would be the death-blow to charlatanism, which depends for its success almost entirely on drugs, or at least on a nomenclature that suggests them.

There is no offence, then, or danger in expressing the opinion, that, after all which has been said, the community is still overdosed: The best proof of it is, that "no families take so little medicine as those of doctors, except those of apothecaries, and that old practitioners are more sparing of active medicines than younger ones." [Dr. James Jackson has kindly permitted me to make the following extract from a letter just received by him from Sir James Clark, and dated May 26, 1860: "As a physician advances in age, he generally, I think, places less confidence in the ordinary medical treatment than he did, not only during his early, but even his middle period of life."] The conclusion from these facts is one which the least promising of

Dr. Howe's pupils in the mental department could hardly help drawing.

Part of the blame of over-medication must, I fear, rest with the profession, for yielding to the tendency to self-delusion, which seems inseparable from the practice of the art of healing. I need only touch on the common modes of misunderstanding or misapplying the evidence of nature.

First, there is the natural incapacity for sound observation, which is like a faulty ear in music. We see this in many persons who know a good deal about books, but who are not sharp-sighted enough to buy a horse or deal with human diseases.

Secondly, there is in some persons a singular inability to weigh the value of testimony; of which, I think, from a pretty careful examination of his books, Hahnemann affords the best specimen outside the walls of Bedlam.

The inveterate logical errors to which physicians have always been subject are chiefly these:

The mode of inference per enumerationem simplicem, in scholastic phrase; that is, counting only their favorable cases. This is the old trick illustrated in Lord Bacon's story of the gifts of the shipwrecked people, hung up in the temple.—Behold! they vowed these gifts to the altar, and the gods saved them. Ay, said a doubting bystander, but how many made vows of gifts and were shipwrecked notwithstanding? The numerical system is the best corrective of this and similar errors. The arguments commonly brought against its application to all matters of medical observation, treatment included, seem to apply rather to the tabulation of facts ill observed, or improperly classified, than to the method itself.

The post hoc ergo propter hoc error: he got well after taking my medicine; therefore in consequence of taking it.

The false induction from genuine facts of observation, leading to the construction of theories which are then deductively applied in the face of the results of direct observation. The school of Broussais has furnished us with a good example of this error.

And lastly, the error which Sir Thomas Browne calls giving "a reason of the golden tooth;" that is, assuming a falsehood as a fact, and giving reasons for it, commonly fanciful ones, as is constantly done by that class of incompetent observers who find their "golden tooth" in the fabulous effects of the homoeopathic materia medica,—which consists of sugar of milk and a nomenclature.

Another portion of the blame rests with the public itself, which insists on being poisoned. Somebody buys all the quack medicines that build palaces for the mushroom, say rather, the toadstool millionaires. Who is it? These people have a constituency of millions. The popular belief is all but universal that sick persons should feed on noxious substances. One of our members was called not long since to a man with a terribly sore mouth. On inquiry he found that the man had picked up a box of unknown pills, in Howard Street, and had proceeded to take them, on general principles, pills being good for people. They happened to contain mercury, and hence the trouble for which he consulted our associate.

The outside pressure, therefore, is immense upon the physician, tending to force him to active treatment of some kind. Certain old superstitions, still lingering in the mind of the public, and not yet utterly expelled from that of the profession, are at the bottom of this, or contribute to it largely. One of the most ancient is, that disease is a malignant agency, or entity, to be driven out of the body by offensive substances, as the smoke of the fish's heart and liver drove the devil out of Tobit's bridal chamber, according to the Apochrypha. Epileptics used to suck the blood from the wounds of dying gladiators. [Plinii Hist. Mundi. lib. xxviii. c. 4.] The Hon. Robert Boyle's little book was published some twenty or thirty years before our late President, Dr. Holyoke, was born. [A Collection of Choice and Safe Remedies. The Fifth Edition, corrected. London, 1712. Dr. Holyoke was born in 1728.] In it he recommends, as internal medicines, most of the substances commonly used as fertilizers of the soil. His "Album Graecum" is best left untranslated, and his "Zebethum Occidentale" is still more transcendently unmentionable except in a strange dialect. It sounds odiously to us to hear him recommend for dysentery a powder made from "the sole of an old shoe worn by some man that walks much." Perhaps nobody here ever heard of tying a stocking, which had been worn during the day, round the neck at night for a sore throat. The same idea of virtue in unlovely secretions! [The idea is very ancient. "Sordes hominis" "Sudore et oleo medicinam facientibus."—Plin. xxviii. 4.]

Even now the Homoeopaths have been introducing the venom of serpents, under the learned title of Lachesis, and outraging human nature with infusions of the pediculus capitis; that is, of course, as we understand their dilutions, the names of these things; for if a fine-tooth-comb insect were drowned in Lake Superior, we cannot agree with them in thinking that every drop of its waters would be impregnated with all the pedicular virtues they so highly value. They know what they are doing. They are appealing to the detestable old superstitious presumption in favor of whatever is nauseous and noxious as being good for the sick.

Again, we all occasionally meet persons stained with nitrate of silver, given for epilepsy. Read what Dr. Martin says, about the way in which it came to be used, in his excellent address before the Norfolk County Medical Society, and the evidence I can show, but have not time for now, and then say what you think of the practice which on such presumptions turns a white man as blue as the double-tattooed King of the Cannibal Islands! [Note A.]

If medical superstitions have fought their way down through all the rationalism and scepticism of the nineteenth century, of course the theories of the schools, supported by great names, adopted into the popular belief and incorporated with the general mass of misapprehension with reference to disease, must be expected to meet us at every turn in the shape of bad practice founded on false doctrine. A French patient complains that his blood heats him, and expects his doctor to bleed him. An English or American one says he is bilious, and will not be easy without a dose of calomel. A doctor looks at a patient's tongue, sees it coated, and says the stomach is foul; his head full of the old saburral notion which the extreme inflammation-doctrine of Broussais did so much to root out, but which still leads, probably, to much needless and injurious wrong of the stomach and bowels by evacuants, when all they want is to be let alone. It is so hard to get anything out of the dead hand of medical tradition! The mortmain of theorists extinct in science clings as close as that of ecclesiastics defunct in law.

One practical hint may not be out of place here. It seems to be sometimes forgotten, by those who must know the fact, that the tongue is very different, anatomically and physiologically, from the stomach. Its condition does not in the least imply a similar one of the stomach, which is a very different structure, covered with a different kind of epithelium, and furnished with entirely different secretions. A silversmith will, for a dollar, make a small hoe, of solid silver, which will last for centuries, and will give a patient more comfort, used for the removal of the accumulated epithelium and fungous growths which constitute the "fur," than many a prescription with a split-footed Rx before it, addressed to the parts out of reach.

I think more of this little implement on account of its agency in saving the Colony at Plymouth in the year 1623. Edward Winslow heard that Massasoit was sick and like to die. He found him with a houseful of people about him, women rubbing his arms and legs, and friends "making such a hellish noise" as they probably thought would scare away the devil of sickness. Winslow gave him some conserve, washed his mouth, scraped his tongue, which was in a horrid state, got down some drink, made him some broth, dosed him with an infusion of strawberry leaves and sassafras root, and had the satisfaction of seeing him rapidly recover. Massasoit, full of gratitude, revealed the plot which had been formed to destroy the colonists, whereupon the Governor ordered Captain Miles Standish to see to them; who thereupon, as everybody remembers, stabbed Pecksuot with his own knife, broke up the plot, saved the colony, and thus rendered Massachusetts and the Massachusetts Medical Society a possibility, as they now are a fact before us. So much for this parenthesis of the tongue-scraper, which helped to save the young colony from a much more serious scrape, and may save the Union yet, if a Presidential candidate should happen to be taken sick as Massasoit was, and his tongue wanted cleaning,—which process would not hurt a good many politicians, with or without a typhoid fever.

Again, see how the "bilious" theory works in every-day life here and now, illustrated by a case from actual life. A youthful practitioner, whose last molars have not been a great while cut, meets an experienced and noted physician in consultation. This is the case. A slender, lymphatic young woman is suckling two lusty twins, the intervals of suction being occupied on her part with palpitations, headaches, giddiness, throbbing in the head, and various nervous symptoms, her cheeks meantime getting bloodless, and her strength running away in company with her milk. The old experienced physician, seeing the yellowish waxy look which is common in anaemic patients, considers it a "bilious" case, and is for giving a rousing emetic. Of course, he has to be wheedled out of this, a recipe is written for beefsteaks and porter, the twins are ignominiously expelled from the anaemic bosom, and forced to take prematurely to the bottle, and this prolific mother is saved for future usefulness in the line of maternity.

The practice of making a profit on the medicine ordered has been held up to reprobation by one at least of the orators who have preceded me. That the effect of this has been ruinous in English practice I cannot doubt, and that in this country the standard of practice was in former generations lowered through the same agency is not unlikely. I have seen an old account-book in which the physician charged an extra price for gilding his rich patients' pills. If all medicine were very costly, and the expense of it always came out of the physician's fee, it would really be a less objectionable arrangement than this other most pernicious one. He would naturally think twice before he gave an emetic or cathartic which evacuated his own pocket, and be sparing of the cholagogues that emptied the biliary ducts of his own wallet, unless he were sure they were needed. If there is any temptation, it should not be in favor of giving noxious agents, as it clearly must be in the case of English druggists and "General Practitioners." The complaint against the other course is a very old one. Pliny, inspired with as truly Roman horror of quackery as the elder Cato,—who declared that the Greek doctors had sworn to exterminate all barbarians, including the Romans, with their drugs, but is said to have physicked his own wife to death, notwithstanding,—Pliny says, in so many words, that the cerates and cataplasms, plasters, collyria, and antidotes, so abundant in his time, as in more recent days, were mere tricks to make money.

A pretty strong eddy, then, or rather many eddies, setting constantly back from the current of sober observation of nature, in the direction of old superstitions and fancies, of exploded theories, of old ways of making money, which are very slow to pass out of fashion.

But there are other special American influences which we are bound to take cognizance of. If I wished to show a student the difficulties of getting at truth from medical experience, I would give him the history of epilepsy to read. If I wished him to understand the tendencies of the American medical mind, its sanguine enterprise, its self-confidence, its audacious handling of Nature, its impatience with her old-fashioned ways of taking time to get a sick man well, I would make him read the life and writings of Benjamin Rush. Dr. Rush thought and said that there were twenty times more intellect and a hundred times more knowledge in the country in 1799 than before the Revolution. His own mind was in a perpetual state of exaltation produced by the stirring scenes in which he had taken a part, and the quickened life of the time in which he lived. It was not the state to favor sound, calm observation. He was impatient, and Nature is profoundly imperturbable. We may adjust the beating of our hearts to her pendulum if we will and can, but we may be very sure that she will not change the pendulum's rate of going because our hearts are palpitating. He thought he had mastered yellow-fever. "Thank God," he said, "out of one hundred patients whom I have visited or prescribed for this day, I have lost none." Where was all his legacy of knowledge when Norfolk was decimated? Where was it when the blue flies were buzzing over the coffins of the unburied dead piled up in the cemetery of New Orleans, at the edge of the huge trenches yawning to receive them?

One such instance will do as well as twenty. Dr. Rush must have been a charming teacher, as he was an admirable man. He was observing, rather than a sound observer; eminently observing, curious, even, about all manner of things. But he could not help feeling as if Nature had been a good deal shaken by the Declaration of Independence, and that American art was getting to be rather too much for her,—especially as illustrated in his own practice. He taught thousands of American students, he gave a direction to the medical mind of the country more than any other one man; perhaps he typifies it better than any other. It has clearly tended to extravagance in remedies and trust in remedies, as in everything else. How could a people which has a revolution once in four years, which has contrived the Bowie-knife and the revolver, which has chewed the juice out of all the superlatives in the language in Fourth of July orations, and so used up its epithets in the rhetoric of abuse that it takes two great quarto dictionaries to supply the demand; which insists in

sending out yachts and horses and boys to out-sail, out-run, out-fight, and checkmate all the rest of creation; how could such a people be content with any but "heroic" practice? What wonder that the stars and stripes wave over doses of ninety grains of sulphate of quinine, [More strictly, ninety-six grains in two hours. Dunglison's Practice, 1842, vol. ii. p. 520. Eighty grains in one dose. Ibid. p. 536. Ninety-six grains of sulphate of quinine are equal to eight ounces of good bark.—Wood & Bache.] and that the American eagle screams with delight to see three drachms of calomel given at a single mouthful?

Add to this the great number of Medical Journals, all useful, we hope, most of them necessary, we trust, many of them excellently well conducted, but which must find something to fill their columns, and so print all the new plans of treatment and new remedies they can get hold of, as the newspapers, from a similar necessity, print the shocking catastrophes and terrible murders.

Besides all this, here are we, the great body of teachers in the numberless medical schools of the Union, some of us lecturing to crowds who clap and stamp in the cities, some of us wandering over the country, like other professional fertilizers, to fecundate the minds of less demonstrative audiences at various scientific stations; all of us talking habitually to those supposed to know less than ourselves, and loving to claim as much for our art as we can, not to say for our own schools, and possibly indirectly for our own practical skill. Hence that annual crop of introductory lectures; the useful blossoming into the ornamental, as the cabbage becomes glorified in the cauliflower; that lecture-room literature of adjectives, that declamatory exaggeration, that splendid show of erudition borrowed from D'Israeli, and credited to Lord Bacon and the rest, which have suggested to our friends of the Medical Journals an occasional epigram at our expense. Hence the tendency in these productions, and in medical lectures generally, to overstate the efficacy of favorite methods of cure, and hence the premium offered for showy talkers rather than sagacious observers, for the men of adjectives rather than of nouns substantive in the more ambitious of these institutions.

Such are some of the eddies in which we are liable to become involved and carried back out of the broad stream of philosophical, or, in other words, truth-loving, investigations. The causes of disease, in the mean time, have been less earnestly studied in the eagerness of the search for remedies. Speak softly! Women have been borne out from an old-world hospital, two in one coffin, that the horrors of their prison-house might not be known, while the very men who were discussing the treatment of the disease were stupidly conveying the infection from bed to bed, as rat-killers carry their poisons from one household to another. Do not some of you remember that I have had to fight this private-pestilence question against a scepticism which sneered in the face of a mass of evidence such as the calm statisticians of the Insurance office could not listen to without horror and indignation? ["The Contagiousness of Puerperal Fever."—N. E. Quar. Jour. of Medicine and Surgery, April, 1843. Reprinted, with Additions. Boston: Ticknor & Fields. 1855.] Have we forgotten what is told in one of the books published under our own sanction, that a simple measure of ventilation, proposed by Dr. John Clark, had saved more than sixteen thousand children's lives in a single hospital? How long would it have taken small doses of calomel and rhubarb to save as many children? These may be useful in prudent hands, but how insignificant compared to the great hygienic conditions! Causes, causes, and again causes,—more and more we fall back on these as the chief objects of our attention. The shortest system of medical practice that I know of is the oldest, but not the worst. It is older than Hippocrates, older than Chiron the Centaur. Nature taught it to the first mother when she saw her first-born child putting some ugly pebble or lurid berry into its mouth. I know not in what language it was spoken, but I know that in English it would sound thus: Spit it out!

Art can do something more than say this. It can sometimes reach the pebble or berry after it has been swallowed. But the great thing is to keep these things out of children's mouths, and as soon as they are beyond our reach, to be reasonable and patient with Nature, who means well, but does not like to hurry, and who took nine calendar months, more or less, to every mother's son among us, before she thought he was fit to be shown to the public.

Suffer me now to lay down a few propositions, whether old or new it matters little, not for your immediate acceptance, nor yet for your hasty rejection, but for your calm consideration.

But first, there are a number of terms which we are in the habit of using in a vague though not unintelligible way, and which it is as well now to define. These terms are the tools with which we are to work, and the first thing is to sharpen them. It is nothing to us that they have been sharpened a thousand times before; they always get dull in the using, and every new workman has a right to carry them to the grindstone and sharpen them to suit himself.

Nature, in medical language, as opposed to Art, means trust in the reactions of the living system against ordinary normal impressions.

Art, in the same language, as opposed to Nature, means an intentional resort to extraordinary abnormal impressions for the relief of disease.

The reaction of the living system is the essence of both. Food is nothing, if there is no digestive act to respond to it. We cannot raise a blister on a dead man, or hope that a carminative forced between his lips will produce its ordinary happy effect.

Disease, dis-ease,—disturbed quiet, uncomfortableness,—means imperfect or abnormal reaction of the living system, and its more or less permanent results.

Food, in its largest sense, is whatever helps to build up the normal structures, or to maintain their natural actions.

Medicine, in distinction from food, is every unnatural or noxious agent applied for the relief of disease.

Physic means properly the Natural art, and Physician is only the Greek synonyme of Naturalist.

With these few explanations I proceed to unfold the propositions I have mentioned.

Disease and death, if we may judge by the records of creation, are inherently and essentially necessary in the present order of things. A perfect intelligence, trained by a perfect education, could do no more than keep the laws of the physical and spiritual universe. An imperfect intelligence, imperfectly taught,—and this is the condition of our finite humanity,—will certainly fail to keep all these laws perfectly. Disease is one of the

penalties of one of the forms of such failure. It is prefigured in the perturbations of the planets, in the disintegration of the elemental masses; it has left its traces in the fossil organisms of extinct creations. [Professor Agassiz has kindly handed me the following note: "There are abnormal structures in animals of all ages anterior to the creation of mankind. Malformed specimens of Crinoids are known from the Triassic and Jurassic deposits. Malformed and diseased bones of tertiary mammalia have been collected in the caverns of Gailenreuth with traces of healing."]

But it is especially the prerogative, I had almost said privilege, of educated and domesticated beings, from man down to the potato, serving to teach them, and such as train them, the laws of life, and to get rid of those who will not mind or cannot be kept subject to these laws.

Disease, being always an effect, is always in exact proportion to the sum of its causes, as much in the case of Spigelius, who dies of a scratch, as in that of the man who recovers after an iron bar has been shot through his brain. The one prevalent failing of the medical art is to neglect the causes and quarrel with the effect.

There are certain general facts which include a good deal of what is called and treated as disease. Thus, there are two opposite movements of life to be seen in cities and elsewhere, belonging to races which, from various persistent causes, are breeding down and tending to run out, and to races which are breeding up, or accumulating vital capital,—a descending and an ascending series. Let me give an example of each; and that I may incidentally remove a common impression about this country as compared with the Old World, an impression which got tipsy with conceit and staggered into the attitude of a formal proposition in the work of Dr. Robert Knox, I will illustrate the downward movement from English experience, and the upward movement from a family history belonging to this immediate neighborhood.

Miss Nightingale speaks of "the fact so often seen of a great-grandmother, who was a tower of physical vigor, descending into a grandmother perhaps a little less vigorous, but still sound as a bell, and healthy to the core, into a mother languid and confined to her carriage and house; and lastly into a daughter sickly and confined to her bed." So much for the descending English series; now for the ascending American series.

Something more than one hundred and thirty years ago there graduated at Harvard College a delicate youth, who lived an invalid life and died at the age of about fifty. His two children were both of moderate physical power, and one of them diminutive in stature. The next generation rose in physical development, and reached eighty years of age and more in some of its members. The fourth generation was of fair average endowment. The fifth generation, great-great-grandchildren of the slender invalid, are several of, them of extraordinary bodily and mental power; large in stature, formidable alike with their brains and their arms, organized on a more extensive scale than either of their parents.

This brief account illustrates incidentally the fallacy of the universal-degeneration theory applied to American life; the same on which one of our countrymen has lately brought some very forcible facts to bear in a muscular discussion of which we have heard rather more than is good for us. But the two series, American and English, ascending and descending, were adduced with the main purpose of showing the immense difference of vital endowments in different strains of blood; a difference to which all ordinary medication is in all probability a matter of comparatively trivial purport. Many affections which art has to strive against might be easily shown to be vital to the well-being of society. Hydrocephalus, tabes mesenterica, and other similar maladies, are natural agencies which cut off the children of races that are sinking below the decent minimum which nature has established as the condition of viability, before they reach the age of reproduction. They are really not so much diseases, as manifestations of congenital incapacity for life; the race would be ruined if art could ever learn always to preserve the individuals subject to them. We must do the best we can for them, but we ought also to know what these "diseases" mean.

Again, invalidism is the normal state of many organizations. It can be changed to disease, but never to absolute health by medicinal appliances. There are many ladies, ancient and recent, who are perpetually taking remedies for irremediable pains and aches. They ought to have headaches and back-aches and stomach-aches; they are not well if they do not have them. To expect them to live without frequent twinges is like expecting a doctor's old chaise to go without creaking; if it did, we might be sure the springs were broken. There is no doubt that the constant demand for medicinal remedies from patients of this class leads to their over-use; often in the case of cathartics, sometimes in that of opiates. I have been told by an intelligent practitioner in a Western town, that the constant prescription of opiates by certain physicians in his vicinity has rendered the habitual use of that drug in all that region very prevalent; more common, I should think, than alcoholic drunkenness in the most intemperate localities of which I have known anything. A frightful endemic demoralization betrays itself in the frequency with which the haggard features and drooping shoulders of the opium-drunkards are met with in the streets.

The next proposition I would ask you to consider is this: The presumption always is that every noxious agent, including medicines proper, which hurts a well man, hurts a sick one. [Note B.]

Let me illustrate this proposition before you decide upon it. If it were known that a prize-fighter were to have a drastic purgative administered two or three days before a contest, or a large blister applied to his back, no one will question that it would affect the betting on his side unfavorably; we will say to the amount of five per cent. Now the drain upon the resources of the system produced in such a case must be at its minimum, for the subject is a powerful man, in the prime of life, and in admirable condition. If the drug or the blister takes five per cent. from his force of resistance, it will take at least as large a fraction from any invalid. But this invalid has to fight a champion who strikes hard but cannot be hit in return, who will press him sharply for breath, but will never pant himself while the wind can whistle through his fleshless ribs. The suffering combatant is liable to want all his stamina, and five per cent. may lose him the battle.

All noxious agents, all appliances which are not natural food or stimuli, all medicines proper, cost a patient, on the average, five per cent. of his vital force, let us say. Twenty times as much waste of force produced by any of them, that is, would exactly kill him, nothing less than kill him, and nothing more. If this, or something like this, is true, then all these medications are, *prima facie*, injurious.

In the game of Life-or-Death, Rouge et Noir, as played between the Doctor and the Sexton, this five per cent., this certain small injury entering into the chances is clearly the sexton's prerequisite for keeping the

green table, over which the game is played, and where he hoards up his gains. Suppose a blister to diminish a man's pain, effusion or dyspnoea to the saving of twenty per cent. in vital force; his profit from it is fifteen, in that case, for it always hurts him five to begin with, according to our previous assumption.

Presumptions are of vast importance in medicine, as in law. A man is presumed innocent until he is proved guilty. A medicine—that is, a noxious agent, like a blister, a seton, an emetic, or a cathartic—should always be presumed to be hurtful. It always is directly hurtful; it may sometimes be indirectly beneficial. If this presumption were established, and disease always assumed to be the innocent victim of circumstances, and not punishable by medicines, that is, noxious agents, or poisons, until the contrary was shown, we should not so frequently hear the remark commonly, perhaps erroneously, attributed to Sir Astley Cooper, but often repeated by sensible persons, that, on the whole, more harm than good is done by medication. Throw out opium, which the Creator himself seems to prescribe, for we often see the scarlet poppy growing in the cornfields, as if it were foreseen that wherever there is hunger to be fed there must also be pain to be soothed; throw out a few specifics which our art did not discover, and is hardly needed to apply [Note C.]; throw out wine, which is a food, and the vapors which produce the miracle of anaesthesia, and I firmly believe that if the whole *materia medica*, as now used, could be sunk to the bottom of the sea, it would be all the better for mankind,—and all the worse for the fishes.

But to justify this proposition, I must add that the injuries inflicted by over-medication are to a great extent masked by disease. Dr. Hooker believes that the typhus syncopata of a preceding generation in New England “was often in fact a brandy and opium disease.” How is a physician to distinguish the irritation produced by his blister from that caused by the inflammation it was meant to cure? How can he tell the exhaustion produced by his evacuants from the collapse belonging to the disease they were meant to remove?

Lastly, medication without insuring favorable hygienic conditions is like amputation without ligatures. I had a chance to learn this well of old, when physician to the Broad Street district of the Boston Dispensary. There, there was no help for the utter want of wholesome conditions, and if anybody got well under my care, it must have been in virtue of the rough-and-tumble constitution which emerges from the struggle for life in the street gutters, rather than by the aid of my prescriptions.

But if the *materia medica* were lost overboard, how much more pains would be taken in ordering all the circumstances surrounding the patient (as can be done everywhere out of the crowded pauper districts), than are taken now by too many who think they do their duty and earn their money when they write a recipe for a patient left in an atmosphere of domestic malaria, or to the most negligent kind of nursing! I confess that I should think my chance of recovery from illness less with Hippocrates for my physician and Mrs. Gamp for my nurse, than if I were in the hands of Hahnemann himself, with Florence Nightingale or good Rebecca Taylor to care for me.

If I am right in maintaining that the presumption is always against the use of noxious agents in disease, and if any whom I might influence should adopt this as a principle of practice, they will often find themselves embarrassed by the imperative demand of patients and their friends for such agents where a case is not made out against this standing presumption. I must be permitted to say, that I think the French, a not wholly uncivilized people, are in advance of the English and ourselves in the art of prescribing for the sick without hurting them. And I do confess that I think their varied ptisans and syrups are as much preferable to the mineral regimen of bug-poison and ratsbane, so long in favor on the other side of the Channel, as their art of preparing food for the table to the rude cookery of those hard-feeding and much-dosing islanders. We want a reorganized cuisine of invalidism perhaps as much as the culinary, reform, for which our lyceum lecturers, and others who live much at hotels and taverns, are so urgent. Will you think I am disrespectful if I ask whether, even in Massachusetts, a dose of calomel is not sometimes given by a physician on the same principle as that upon which a landlord occasionally prescribes bacon and eggs,—because he cannot think of anything else quite so handy? I leave my suggestion of borrowing a hint from French practice to your mature consideration.

I may, however, call your attention, briefly, to the singular fact, that English and American practitioners are apt to accuse French medical practice of inertness, and French surgical practice of unnecessary activity. Thus, Dr. Bostock considers French medical treatment, with certain exceptions, as “decidedly less effective” than that of his own country. Mr. S. Cooper, again, defends the simple British practice of procuring union by the first intention against the attacks of M. Roux and Baron Larrey. [Cooper's Surg. Diet. art. “Wounds.” Yet Mr. John Bell gives the French surgeons credit for introducing this doctrine of adhesion, and accuses O'Halloran of “rudeness and ignorance,” and “bold, uncivil language,” in disputing their teaching. Princ. of Surgery, vol. i. p. 42. Mr. Hunter succeeded at last in naturalizing the doctrine and practice, but even he had to struggle against the perpetual jealousy of rivals, and died at length assassinated by an insult.] We have often heard similar opinions maintained by our own countrymen. While Anglo-American criticism blows hot or cold on the two departments of French practice, it is not, I hope, indecent to question whether all the wisdom is necessarily with us in both cases.

Our art has had two or three lessons which have a deep meaning to those who are willing to read them honestly. The use of water-dressings in surgery completed the series of reforms by which was abolished the “coarse and cruel practice” of the older surgeons, who with their dressings and acrid balsams, their tents and leaden tubes, “absolutely delayed the cure.” The doctrine of Broussais, transient as was its empire, reversed the practice of half of Christendom for a season, and taught its hasty disciples to shun their old favorite remedies as mortal poisons. This was not enough permanently to shift the presumption about drugs where it belonged, and so at last, just as the sympathetic powder and the Unguentum Armarium came in a superstitious age to kill out the abuses of external over-medication, the solemn farce of Homoeopathy was enacted in the face of our own too credulous civilization, that under shelter of its pretences the “inward bruises” of over-drugged viscera might be allowed to heal by the first intention. Its lesson we must accept, whether we will or not; its follies we are tired of talking about. The security of the medical profession against this and all similar fancies is in the average constitution of the human mind with regard to the laws of evidence.

My friends and brothers in Art! There is nothing to be feared from the utterance of any seeming heresy to

which you may have listened. I cannot compromise your collective wisdom. If I have strained the truth one hair's breadth for the sake of an epigram or an antithesis, you are accustomed to count the normal pulse-beats of sound judgment, and know full well how to recognize the fever-throbs of conceit and the nervous palpitations of rhetoric.

The freedom with which each of us speaks his thought in this presence, belongs in part to the assured position of the Profession in our Commonwealth, to the attitude of Science, which is always fearless, and to the genius of the soil on which we stand, from which Nature withheld the fatal gift of malaria only to fill it with exhalations that breed the fever of inquiry in our blood and in our brain. But mainly we owe the large license of speech we enjoy to those influences and privileges common to us all as self-governing Americans.

This Republic is the chosen home of minorities, of the less power in the presence of the greater. It is a common error to speak of our distinction as consisting in the rule of the majority. Majorities, the greater material powers, have always ruled before. The history of most countries has been that of majorities, mounted majorities, clad in iron, armed with death treading down the tenfold more numerous minorities. In the old civilizations they root themselves like oaks in the soil; men must live in their shadow or cut them down. With us the majority is only the flower of the passing noon, and the minority is the bud which may open in the next morning's sun. We must be tolerant, for the thought which stammers on a single tongue today may organize itself in the growing consciousness of the time, and come back to us like the voice of the multitudinous waves of the ocean on the morrow.

Twenty-five years have passed since one of your honored Presidents spoke to this Society of certain limitations to the power of our Art, now very generally conceded. Some were troubled, some were almost angry, thinking the Profession might suffer from such concessions. It has certainly not suffered here; if, as some affirm, it has lost respect anywhere, it was probably for other, and no doubt sufficient reasons.

Since that time the civilization of this planet has changed hands. Strike out of existence at this moment every person who was breathing on that day, May 27, 1835, and every institution of society, every art and every science would remain intact and complete in the living that would be left. Every idea the world then held has been since dissolved and recrystallized.

We are repeating the same process. Not to make silver shrines for our old divinities, even though by this craft we should have our wealth, was this Society organized and carried on by the good men and true who went before us. Not for this, but to melt the gold out of the past, though its dross should fly in dust to all the winds of heaven, to save all our old treasures of knowledge and mine deeply for new, to cultivate that mutual respect of which outward courtesy is the sign, to work together, to feel together, to take counsel together, and to stand together for the truth, now, always, here, everywhere; for this our fathers instituted, and we accept, the offices and duties of this time-honored Society.

BORDER LINES OF KNOWLEDGE IN SOME PROVINCES OF MEDICAL SCIENCE.

An Introductory Lecture delivered before the Medical Class of Harvard University, November 6, 1861.

[This Lecture appears as it would have been delivered had the time allowed been less strictly limited. Passages necessarily omitted have been restored, and points briefly touched have been more fully considered. A few notes have been added for the benefit of that limited class of students who care to track an author through the highways and by-ways of his reading. I owe my thanks to several of my professional brethren who have communicated with me on subjects with which they are familiar; especially to Dr. John Dean, for the opportunity of profiting by his unpublished labors, and to Dr. Hasket Derby, for information and references to recent authorities relating to the anatomy and physiology of the eye.]

The entrance upon a new course of Lectures is always a period of interest to instructors and pupils. As the birth of a child to a parent, so is the advent of a new class to a teacher. As the light of the untried world to the infant, so is the dawning of the light resting over the unexplored realms of science to the student. In the name of the Faculty I welcome you, Gentlemen of the Medical Class, new-born babes of science, or lustier nurslings, to this morning of your medical life, and to the arms and the bosom of this ancient University. Fourteen years ago I stood in this place for the first time to address those who occupied these benches. As I recall these past seasons of our joint labors, I feel that they have been on the whole prosperous, and not undeserving of their prosperity.

For it has been my privilege to be associated with a body of true and faithful workers; I cannot praise them freely to their faces, or I should be proud to discourse of the harmonious diligence and the noble spirit in which they have toiled together, not merely to teach their several branches, but to elevate the whole standard of teaching.

I may speak with less restraint of those gentlemen who have aided me in the most laborious part of my daily duties, the Demonstrators, to whom the successive classes have owed so much of their instruction. They rise before me, the dead and the living, in the midst of the most grateful recollections. The fair, manly face and stately figure of my friend, Dr. Samuel Parkman, himself fit for the highest offices of teaching, yet willing to be my faithful assistant in the time of need, come back to me with the long sigh of regret for his early loss to our earthly companionship. Every year I speak the eulogy of Dr. Ainsworth's patient toil as I show his elaborate preparations: When I take down my "American Cyclopaedia" and borrow instruction from the learned articles of Dr. Kneeland, I cease to regret that his indefatigable and intelligent industry was turned into a broader channel. And what can I say too cordial of my long associated companion and friend, Dr. Hodges, whose admirable skill, working through the swiftest and surest fingers that ever held a scalpel among us, has delighted class after class, and filled our Museum with monuments which will convey his name

to unborn generations?

This day belongs, however, not to myself and my recollections, but to all of us who teach and all of you who listen, whether experts in our specialties or aliens to their mysteries, or timid neophytes just entering the portals of the hall of science. Look in with me, then, while I attempt to throw some rays into its interior, which shall illuminate a few of its pillars and cornices, and show at the same time how many niches and alcoves remain in darkness.

SCIENCE is the topography of ignorance. From a few elevated points we triangulate vast spaces, inclosing infinite unknown details. We cast the lead, and draw up a little sand from abysses we may never reach with our dredges.

The best part of our knowledge is that which teaches us where knowledge leaves off and ignorance begins. Nothing more clearly separates a vulgar from a superior mind, than the confusion in the first between the little that it truly knows, on the one hand, and what it half knows and what it thinks it knows on the other.

That which is true of every subject is especially true of the branch of knowledge which deals with living beings. Their existence is a perpetual death and reanimation. Their identity is only an idea, for we put off our bodies many times during our lives, and dress in new suits of bones and muscles.

*"Thou art not thyself;
For thou exist'st on many a thousand grains
That issue out of dust."*

If it is true that we understand ourselves but imperfectly in health, this truth is more signally manifested in disease, where natural actions imperfectly understood, disturbed in an obscure way by half-seen causes, are creeping and winding along in the dark toward their destined issue, sometimes using our remedies as safe stepping-stones, occasionally, it may be, stumbling over them as obstacles.

I propose in this lecture to show you some points of contact between our ignorance and our knowledge in several of the branches upon the study of which you are entering. I may teach you a very little directly, but I hope much more from the trains of thought I shall suggest. Do not expect too much ground to be covered in this rapid survey. Our task is only that of sending out a few pickets under the starry flag of science to the edge of that dark domain where the ensigns of the obstinate rebel, Ignorance, are flying undisputed. We are not making a reconnoissance in force, still less advancing with the main column. But here are a few roads along which we have to march together, and we wish to see clearly how far our lines extend, and where the enemy's outposts begin.

Before touching the branches of knowledge that deal with organization and vital functions, let us glance at that science which meets you at the threshold of your study, and prepares you in some measure to deal with the more complex problems of the living laboratory.

CHEMISTRY includes the art of separating and combining the elements of matter, and the study of the changes produced by these operations. We can hardly say too much of what it has contributed to our knowledge of the universe and our power of dealing with its materials. It has given us a catalogue raisonne of the substances found upon our planet, and shown how everything living and dead is put together from them. It is accomplishing wonders before us every day, such as Arabian story-tellers used to string together in their fables. It spreads the sensitive film on the artificial retina which looks upon us through the optician's lens for a few seconds, and fixes an image that will outlive its original. It questions the light of the sun, and detects the vaporized metals floating around the great luminary,—iron, sodium, lithium, and the rest,—as if the chemist of our remote planet could fill his bell-glasses from its fiery atmosphere. It lends the power which flashes our messages in thrills that leave the lazy chariot of day behind them. It seals up a few dark grains in iron vases, and lo! at the touch of a single spark, rises in smoke and flame a mighty Afrit with a voice like thunder and an arm that shatters like an earthquake. The dreams of Oriental fancy have become the sober facts of our every-day life, and the chemist is the magician to whom we owe them.

To return to the colder scientific aspect of chemistry. It has shown us how bodies stand affected to each other through an almost boundless range of combinations. It has given us a most ingenious theory to account for certain fixed relations in these combinations. It has successfully eliminated a great number of proximate compounds, more or less stable, from organic structures. It has invented others which form the basis of long series of well-known composite substances. In fact, we are perhaps becoming overburdened with our list of proximate principles, demonstrated and hypothetical.

How much nearer have we come to the secret of force than Lully and Geber and the whole crew of juggling alchemists? We have learned a great deal about the how, what have we learned about the why?

Why does iron rust, while gold remains untarnished, and gold amalgamate, while iron refuses the alliance of mercury?

The alchemists called gold Sol, the sun, and iron Mars, and pleased themselves with fancied relations between these substances and the heavenly bodies, by which they pretended to explain the facts they observed. Some of their superstitions have lingered in practical medicine to the present day, but chemistry has grown wise enough to confess the fact of absolute ignorance.

What is it that makes common salt crystallize in the form of cubes, and saltpetre in the shape of six-sided prisms? We see no reason why it should not have been just the other way, salt in prisms and saltpetre in cubes, or why either should take an exact geometrical outline, any more than coagulating albumen.

But although we had given up attempting to explain the essential nature of affinities and of crystalline types, we might have supposed that we had at least fixed the identity of the substances with which we deal, and determined the laws of their combination. All at once we find that a simple substance changes face, puts off its characteristic qualities and resumes them at will;—not merely when we liquefy or vaporize a solid, or reverse the process; but that a solid is literally transformed into another solid under our own eyes. We thought we knew phosphorus. We warm a portion of it sealed in an empty tube, for about a week. It has become a brown infusible substance, which does not shine in the dark nor oxidate in the air. We heat it to 500

F., and it becomes common phosphorus again. We transmute sulphur in the same singular way. Nature, you know, gives us carbon in the shape of coal and in that of the diamond. It is easy to call these changes by the name allotropism, but not the less do they confound our hasty generalizations.

These facts of allotropism have some corollaries connected with them rather startling to us of the nineteenth century. There may be other transmutations possible besides those of phosphorus and sulphur. When Dr. Prout, in 1840, talked about azote and carbon being "formed" in the living system, it was looked upon as one of those freaks of fancy to which philosophers, like other men, are subject. But when Professor Faraday, in 1851, says, at a meeting of the British Association, that "his hopes are in the direction of proving that bodies called simple were really compounds, and may be formed artificially as soon as we are masters of the laws influencing their combinations,"—when he comes forward and says that he has tried experiments at transmutation, and means, if his life is spared, to try them again,—how can we be surprised at the popular story of 1861, that Louis Napoleon has established a gold-factory and is glutting the mints of Europe with bullion of his own making?

And so with reference to the law of combinations. The old maxim was, *Corpora non agunt nisi soluta*. If two substances, a and b, are inclosed in a glass vessel, c, we do not expect the glass to change them, unless a or b or the compound a b has the power of dissolving the glass. But if for a I take oxygen, for b hydrogen, and for c a piece of spongy platinum, I find the first two combine with the common signs of combustion and form water, the third in the mean time undergoing no perceptible change. It has played the part of the unwedded priest, who marries a pair without taking a fee or having any further relation with the parties. We call this catalysis, catalytic action, the action of presence, or by what learned name we choose. Give what name to it we will, it is a manifestation of power which crosses our established laws of combination at a very open angle of intersection. I think we may find an analogy for it in electrical induction, the disturbance of the equilibrium of the electricity of a body by the approach of a charged body to it, without interchange of electrical conditions between the two bodies. But an analogy is not an explanation, and why a few drops of yeast should change a saccharine mixture to carbonic acid and alcohol,—a little leaven leavening the whole lump,—not by combining with it, but by setting a movement at work, we not only cannot explain, but the fact is such an exception to the recognized laws of combination that Liebig is unwilling to admit the new force at all to which Berzelius had given the name so generally accepted.

The phenomena of isomerism, or identity of composition and proportions of constituents with difference of qualities, and of isomorphism, or identity of form in crystals which have one element substituted for another, were equally surprises to science; and although the mechanism by which they are brought about can be to a certain extent explained by a reference to the hypothetical atoms of which the elements are constituted, yet this is only turning the difficulty into a fraction with an infinitesimal denominator and an infinite numerator.

So far we have studied the working of force and its seeming anomalies in purely chemical phenomena. But we soon find that chemical force is developed by various other physical agencies,—by heat, by light, by electricity, by magnetism, by mechanical agencies; and, vice versa, that chemical action develops heat, light, electricity, magnetism, mechanical force, as we see in our matches, galvanic batteries, and explosive compounds. Proceeding with our experiments, we find that every kind of force is capable of producing all other kinds, or, in Mr. Faraday's language, that "the various forms under which the forces of matter are made manifest have a common origin, or, in other words, are so directly related and mutually dependent that they are convertible one into another."

Out of this doctrine naturally springs that of the conservation of force, so ably illustrated by Mr. Grove, Dr. Carpenter, and Mr. Faraday. This idea is no novelty, though it seems so at first sight. It was maintained and disputed among the giants of philosophy. Des Cartes and Leibnitz denied that any new motion originated in nature, or that any ever ceased to exist; all motion being in a circle, passing from one body to another, one losing what the other gained. Newton, on the other hand, believed that new motions were generated and existing ones destroyed. On the first supposition, there is a fixed amount of force always circulating in the universe. On the second, the total amount may be increasing or diminishing. You will find in the "Annual of Scientific Discovery" for 1858 a very interesting lecture by Professor Helmholtz of Bonn, in which it is maintained that a certain portion of force is lost in every natural process, being converted into unchangeable heat, so that the universe will come to a stand-still at last, all force passing into heat, and all heat into a state of equilibrium.

The doctrines of the convertibility or specific equivalence of the various forms of force, and of its conservation, which is its logical consequence, are very generally accepted, as I believe, at the present time, among physicists. We are naturally led to the question, What is the nature of force? The three illustrious philosophers just referred to agree in attributing the general movements of the universe to the immediate Divine action. The doctrine of "preestablished harmony" was an especial contrivance of Leibnitz to remove the Creator from unworthy association with the less divine acts of living beings. Obsolete as this expression sounds to our ears, the phrase laws of the universe, which we use so constantly with a wider application, appears to me essentially identical with it.

Force does not admit of explanation, nor of proper definition, any more than the hypothetical substratum of matter. If we assume the Infinite as omnipresent, omniscient, omnipotent, we cannot suppose Him excluded from any part of His creation, except from rebellious souls which voluntarily exclude Him by the exercise of their fatal prerogative of free-will. Force, then, is the act of immanent Divinity. I find no meaning in mechanical explanations. Newton's hypothesis of an ether filling the heavenly spaces does not, I confess, help my conceptions. I will, and the muscles of my vocal organs shape my speech. God wills, and the universe articulates His power, wisdom, and goodness. That is all I know. There is no bridge my mind can throw from the "immaterial" cause to the "material" effect.

The problem of force meets us everywhere, and I prefer to encounter it in the world of physical phenomena before reaching that of living actions. It is only the name for the incomprehensible cause of certain changes known to our consciousness, and assumed to be outside of it. For me it is the Deity Himself in action.

I can therefore see a large significance in the somewhat bold language of Burdach: "There is for me but one miracle, that of infinite existence, and but one mystery, the manner in which the finite proceeds from the

infinite. So soon as we recognize this incomprehensible act as the general and primordial miracle, of which our reason perceives the necessity, but the manner of which our intelligence cannot grasp, so soon as we contemplate the nature known to us by experience in this light, there is for us no other impenetrable miracle or mystery."

Let us turn to a branch of knowledge which deals with certainties up to the limit of the senses, and is involved in no speculations beyond them. In certain points of view, HUMAN ANATOMY may be considered an almost exhausted science. From time to time some small organ which had escaped earlier observers has been pointed out,—such parts as the tensor tarsi, the otic ganglion, or the Pacinian bodies; but some of our best anatomical works are those which have been classic for many generations. The plates of the bones in Vesalius, three centuries old, are still masterpieces of accuracy, as of art. The magnificent work of Albinus on the muscles, published in 1747, is still supreme in its department, as the constant references of the most thorough recent treatise on the subject, that of Theile, sufficiently show. More has been done in unravelling the mysteries of the fasciae, but there has been a tendency to overdo this kind of material analysis. Alexander Thomson split them up into cobwebs, as you may see in the plates to Velpeau's Surgical Anatomy. I well remember how he used to shake his head over the coarse work of Scarpa and Astley Cooper,—as if Denner, who painted the separate hairs of the beard and pores of the skin in his portraits, had spoken lightly of the pictures of Rubens and Vandyk.

Not only has little been added to the catalogue of parts, but some things long known had become half-forgotten. Louis and others confounded the solitary glands of the lower part of the small intestine with those which "the great Brunner," as Haller calls him, described in 1687 as being found in the duodenum. The display of the fibrous structure of the brain seemed a novelty as shown by Spurzheim. One is startled to find the method anticipated by Raymond Vieussens nearly two centuries ago. I can hardly think Gordon had ever looked at his figures, though he names their author, when he wrote the captious and sneering article which attracted so much attention in the pages of the "Edinburgh Review."

This is the place, if anywhere, to mention any observations I could pretend to have made in the course of my teaching the structure of the human body. I can make no better show than most of my predecessors in this well-reaped field. The nucleated cells found connected with the cancellated structure of the bones, which I first pointed out and had figured in 1847, and have shown yearly from that time to the present, and the fossa masseterica, a shallow concavity on the ramus of the lower jaw, for the lodgment of the masseter muscle, which acquires significance when examined by the side of the deep cavity on the corresponding part in some carnivora to which it answers, may perhaps be claimed as deserving attention. I have also pleased myself by making a special group of the six radiating muscles which diverge from the spine of the axis, or second cervical vertebra, and by giving to it the name *stella musciosa nuchae*. But this scanty catalogue is only an evidence that one may teach long and see little that has not been noted by those who have gone before him. Of course I do not think it necessary to include rare, but already described anomalies, such as the episternal bones, the rectus sternalis, and other interesting exceptional formations I have encountered, which have shown a curious tendency to present themselves several times in the same season, perhaps because the first specimen found calls our attention to any we may subsequently meet with.

The anatomy of the scalpel and the amphitheatre was, then, becoming an exhausted branch of investigation. But during the present century the study of the human body has changed its old aspect, and become fertile in new observations. This rejuvenescence was effected by means of two principal agencies,—new methods and a new instrument.

Descriptive anatomy, as known from an early date, is to the body what geography is to the planet. Now geography was pretty well known so long ago as when Arrowsmith, who was born in 1750, published his admirable maps. But in that same year was born Werner, who taught a new way of studying the earth, since become familiar to us all under the name of Geology.

What geology has done for our knowledge of the earth, has been done for our knowledge of the body by that method of study to which is given the name of General Anatomy. It studies, not the organs as such, but the elements out of which the organs are constructed. It is the geology of the body, as that is the general anatomy of the earth. The extraordinary genius of Bichat, to whom more than any other we owe this new method of study, does not require Mr. Buckle's testimony to impress the practitioner with the importance of its achievements. I have heard a very wise physician question whether any important result had accrued to practical medicine from Harvey's discovery of the circulation. But Anatomy, Physiology, and Pathology have received a new light from this novel method of contemplating the living structures, which has had a vast influence in enabling the practitioner at least to distinguish and predict the course of disease. We know as well what differences to expect in the habits of a mucous and of a serous membrane, as what mineral substances to look for in the chalk or the coal measures. You have only to read Cullen's description of inflammation of the lungs or of the bowels, and compare it with such as you may find in Laennec or Watson, to see the immense gain which diagnosis and prognosis have derived from general anatomy.

The second new method of studying the human structure, beginning with the labors of Scarpa, Burns, and Colles, grew up principally during the first third of this century. It does not deal with organs, as did the earlier anatomists, nor with tissues, after the manner of Bichat. It maps the whole surface of the body into an arbitrary number of regions, and studies each region successively from the surface to the bone, or beneath it. This hardly deserves the name of a science, although Velpeau has dignified it with that title, but it furnishes an admirable practical way for the surgeon who has to operate on a particular region of the body to study that region. If we are buying a farm, we are not content with the State map or a geological chart including the estate in question. We demand an exact survey of that particular property, so that we may know what we are dealing with. This is just what regional, or, as it is sometimes called, surgical anatomy, does for the surgeon with reference to the part on which his skill is to be exercised. It enables him to see with the mind's eye through the opaque tissues down to the bone on which they lie, as if the skin were transparent as the cornea, and the organs it covers translucent as the gelatinous pulp of a medusa.

It is curious that the Japanese should have anticipated Europe in a kind of rude regional anatomy. I have seen a manikin of Japanese make traced all over with lines, and points marking their intersection. By this

their doctors are guided in the performance of acupuncture, marking the safe places to thrust in needles, as we buoy out our ship-channels, and doubtless indicating to learned eyes the spots where incautious meddling had led to those little accidents of shipwreck to which patients are unfortunately liable.

A change of method, then, has given us General and Regional Anatomy. These, too, have been worked so thoroughly, that, if not exhausted, they have at least become to a great extent fixed and positive branches of knowledge. But the first of them, General Anatomy, would never have reached this positive condition but for the introduction of that instrument which I have mentioned as the second great aid to modern progress.

This instrument is the achromatic microscope. For the history of the successive steps by which it became the effective scientific implement we now possess, I must refer you to the work of Mr. Quekett, to an excellent article in the "Penny Cyclopaedia," or to that of Sir David Brewster in the "Encyclopaedia Britannica." It is a most interesting piece of scientific history, which shows how the problem which Biot in 1821 pronounced insolvable was in the course of a few years practically solved, with a success equal to that which Dollond had long before obtained with the telescope. It is enough for our purpose that we are now in possession of an instrument freed from all confusions and illusions, which magnifies a thousand diameters,—a million times in surface,—without serious distortion or discoloration of its object.

A quarter of a century ago, or a little more, an instructor would not have hesitated to put John Bell's "Anatomy" and Bostock's "Physiology" into a student's hands, as good authority on their respective subjects. Let us not be unjust to either of these authors. John Bell is the liveliest medical writer that I can remember who has written since the days of delightful old Ambrose Pare. His picturesque descriptions and bold figures are as good now as they ever were, and his book can never become obsolete. But listen to what John Bell says of the microscope:

"Philosophers of the last age had been at infinite pains to find the ultimate fibre of muscles, thinking to discover its properties in its form; but they saw just in proportion to the glasses which they used, or to their practice and skill in that art, which is now almost forsaken."

Dr. Bostock's work, neglected as it is, is one which I value very highly as a really learned compilation, full of original references. But Dr. Bostock says: "Much as the naturalist has been indebted to the microscope, by bringing into view many beings of which he could not otherwise have ascertained the existence, the physiologist has not yet derived any great benefit from the instrument."

These are only specimens of the manner in which the microscope and its results were generally regarded by the generation just preceding our own.

I have referred you to the proper authorities for the account of those improvements which about the year 1830 rendered the compound microscope an efficient and trustworthy instrument. It was now for the first time that a true general anatomy became possible. As early as 1816 Treviranus had attempted to resolve the tissues, of which Bichat had admitted no less than twenty-one, into their simple microscopic elements. How could such an attempt succeed, Henle well asks, at a time when the most extensively diffused of all the tissues, the areolar, was not at all understood? All that method could do had been accomplished by Bichat and his followers. It was for the optician to take the next step. The future of anatomy and physiology, as an enthusiastic micrologist of the time said, was in the hands of Messrs. Schieck and Pistor, famous opticians of Berlin.

In those earlier days of which I am speaking, all the points of minute anatomy were involved in obscurity. Some found globules everywhere, some fibres. Students disputed whether the conjunctiva extended over the cornea or not, and worried themselves over Gaultier de Claubry's stratified layers of the skin, or Breschet's blennogenous and chromatogenous organs. The dartos was a puzzle, the central spinal canal a myth, the decidua clothed in fable as much as the golden fleece. The structure of bone, now so beautifully made out,—even that of the teeth, in which old Leeuwenhoek, peeping with his octogenarian eyes through the minute lenses wrought with his own hands, had long ago seen the "pipes," as he called them,—was hardly known at all. The minute structure of the viscera lay in the mists of an uncertain microscopic vision. The intimate recesses of the animal system were to the students of anatomy what the anterior of Africa long was to geographers, and the stories of microscopic explorers were as much sneered at as those of Bruce or Du Chailly, and with better reason.

Now what have we come to in our own day? In the first place, the minute structure of all the organs has been made out in the most satisfactory way. The special arrangements of the vessels and the ducts of all the glands, of the air-tubes and vesicles of the lungs, of the parts which make up the skin and other membranes, all the details of those complex parenchymatous organs which had confounded investigation so long, have been lifted out of the invisible into the sight of all observers. It is fair to mention here, that we owe a great deal to the art of minute injection, by which we are enabled to trace the smallest vessels in the midst of the tissues where they are distributed. This is an old artifice of anatomists. The famous Ruysch, who died a hundred and thirty years ago, showed that each of the viscera has its terminal vessels arranged in its own peculiar way; the same fact which you may see illustrated in Gerber's figures after the minute injections of Berres. I hope to show you many specimens of this kind in the microscope, the work of English and American hands. Professor Agassiz allows me also to make use of a very rich collection of injected preparations sent him by Professor Hyrtl, formerly of Prague, now of Vienna, for the proper exhibition of which I had a number of microscopes made expressly, by Mr. Grunow, during the past season. All this illustrates what has been done for the elucidation of the intimate details of formation of the organs.

But the great triumph of the microscope as applied to anatomy has been in the resolution of the organs and the tissues into their simple constituent anatomical elements. It has taken up general anatomy where Bichat left it. He had succeeded in reducing the structural language of nature to syllables, if you will permit me to use so bold an image. The microscopic observers who have come after him have analyzed these into letters, as we may call them,—the simple elements by the combination of which Nature spells out successively tissues, which are her syllables, organs which are her words, systems which are her chapters, and so goes on from the simple to the complex, until she binds up in one living whole that wondrous volume of power and wisdom which we call the human body.

The alphabet of the organization is so short and simple, that I will risk fatiguing your attention by repeating it, according to the plan I have long adopted.

A. Cells, either floating, as in the blood, or fixed, like those in the cancellated structure of bone, already referred to. Very commonly they have undergone a change of figure, most frequently a flattening which reduces them to scales, as in the epidermis and the epithelium.

B. Simple, translucent, homogeneous solid, such as is found at the back of the cornea, or forming the intercellular substance of cartilage.

C. The white fibrous element, consisting of very delicate, tenacious threads. This is the long staple textile substance of the body. It is to the organism what cotton is pretended to be to our Southern States. It pervades the whole animal fabric as areolar tissue, which is the universal packing and wrapping material. It forms the ligaments which bind the whole frame-work together. It furnishes the sinews, which are the channels of power. It enfolds every muscle. It wraps the brain in its hard, insensible folds, and the heart itself beats in a purse that is made of it.

D. The yellow elastic, fibrous element, the caoutchouc of the animal mechanism, which pulls things back into place, as the India-rubber band shuts the door we have opened.

E. The striped muscular fibre,—the red flesh, which shortens itself in obedience to the will, and thus produces all voluntary active motion.

F. The unstriped muscular fibre, more properly the fusiform-cell fibre, which carries on the involuntary internal movements.

G. The nerve-cylinder, a glassy tube, with a pith of some firmness, which conveys sensation to the brain and the principle which induces motion from it.

H. The nerve-corpuscle, the centre of nervous power.

I. The mucous tissue, as Virchow calls it, common in embryonic structures, seen in the vitreous humor of the adult.

To these add X, granules, of indeterminate shape and size, Y, for inorganic matters, such as the salts of bone and teeth, and Z, to stand as a symbol of the fluids, and you have the letters of what I have ventured to call the alphabet of the body.

But just as in language certain diphthongs and syllables are frequently recurring, so we have in the body certain secondary and tertiary combinations, which we meet more frequently than the solitary elements of which they are composed.

Thus A B, or a collection of cells united by simple structureless solid, is seen to be extensively employed in the body under the name of cartilage. Out of this the surfaces of the articulations and the springs of the breathing apparatus are formed. But when Nature came to the buffers of the spinal column (intervertebral disks) and the washers of the joints (semilunar fibrocartilages of the knee, etc.), she required more tenacity than common cartilage possessed. What did she do? What does man do in a similar case of need? I need hardly tell you. The mason lays his bricks in simple mortar. But the plasterer works some hair into the mortar which he is going to lay in large sheets on the walls. The children of Israel complained that they had no straw to make their bricks with, though portions of it may still be seen in the crumbling pyramid of Darshour, which they are said to have built. I visited the old house on Witch Hill in Salem a year or two ago, and there I found the walls coated with clay in which straw was abundantly mingled;—the old Judaizing witch-hangers copied the Israelites in a good many things. The Chinese and the Corsicans blend the fibres of amianthus in their pottery to give it tenacity. Now to return to Nature. To make her buffers and washers hold together in the shocks to which they would be subjected, she took common cartilage and mingled the white fibrous tissue with it, to serve the same purpose as the hair in the mortar, the straw in the bricks and in the plaster of the old wall, and the amianthus in the earthen vessels. Thus we have the combination A B C, or fibro-cartilage. Again, the bones were once only gristle or cartilage, A B. To give them solidity they were infiltrated with stone, in the form of salts of lime, an inorganic element, so that bone would be spelt out by the letters A, B, and Y.

If from these organic syllables we proceed to form organic words, we shall find that Nature employs three principal forms; namely, Vessels, Membranes, and Parenchyma, or visceral tissue. The most complex of them can be resolved into a combination of these few simple anatomical constituents.

Passing for a moment into the domain of PATHOLOGICAL ANATOMY, we find the same elements in morbid growths that we have met with in normal structures. The pus-corpuscle and the white blood-corpuscle can only be distinguished by tracing them to their origin. A frequent form of so-called malignant disease proves to be only a collection of altered epithelium-cells. Even cancer itself has no specific anatomical element, and the diagnosis of a cancerous tumor by the microscope, though tolerably sure under the eye of an expert, is based upon accidental, and not essential points,—the crowding together of the elements, the size of the cell-nuclei, and similar variable characters.

Let us turn to PHYSIOLOGY. The microscope, which has made a new science of the intimate structure of the organs, has at the same time cleared up many uncertainties concerning the mechanism of the special functions. Up to the time of the living generation of observers, Nature had kept over all her inner workshops the forbidding inscription, No Admittance! If any prying observer ventured to spy through his magnifying tubes into the mysteries of her glands and canals and fluids, she covered up her work in blinding mists and bewildering halos, as the deities of old concealed their favored heroes in the moment of danger.

Science has at length sifted the turbid light of her lenses, and blanched their delusive rainbows.

Anatomy studies the organism in space. Physiology studies it also in time. After the study of form and composition follows close that of action, and this leads us along back to the first moment of the germ, and forward to the resolution of the living frame into its lifeless elements. In this way Anatomy, or rather that branch of it which we call Histology, has become inseparably blended with the study of function. The connection between the science of life and that of intimate structure on the one hand, and composition on the other, is illustrated in the titles of two recent works of remarkable excellence,—“the Physiological Anatomy”

of Todd and Bowman, and the "Physiological Chemistry" of Lehmann.

Let me briefly recapitulate a few of our acquisitions in Physiology, due in large measure to our new instruments and methods of research, and at the same time indicate the limits which form the permanent or the temporary boundaries of our knowledge. I will begin with the largest fact and with the most absolute and universally encountered limitation.

The "largest truth in Physiology" Mr. Paget considers to be "the development of ova through multiplication and division of their cells." I would state it more broadly as the agency of the cell in all living processes. It seems at present necessary to abandon the original idea of Schwann, that we can observe the building up of a cell from the simple granules of a blastema, or formative fluid. The evidence points rather towards the axiom, *Omnis cellula a cellula*; that is, the germ of a new cell is always derived from a preexisting cell. The doctrine of Schwann, as I remarked long ago (1844), runs parallel with the nebular theory in astronomy, and they may yet stand or fall together.

As we have seen Nature anticipating the plasterer in fibro-cartilage, so we see her beforehand with the glassblower in her dealings with the cell. The artisan blows his vitreous bubbles, large or small, to be used afterwards as may be wanted. So Nature shapes her hyaline vesicles and modifies them to serve the needs of the part where they are found. The artisan whirls his rod, and his glass bubble becomes a flattened disk, with its bull's-eye for a nucleus. These lips of ours are all glazed with microscopic tiles formed of flattened cells, each one of them with its nucleus still as plain and relatively as prominent, to the eye of the microscopist, as the bull's-eye in the old-fashioned windowpane. Everywhere we find cells, modified or unchanged. They roll in inconceivable multitudes (five millions and more to the cubic millimetre, according to Vierordt) as blood-disks through our vessels. A close-fitting mail of flattened cells coats our surface with a panoply of imbricated scales (more than twelve thousand millions), as Harting has computed, as true a defence against our enemies as the buckler of the armadillo or the carapace of the tortoise against theirs. The same little protecting organs pave all the great highways of the interior system. Cells, again, preside over the chemical processes which elaborate the living fluids; they change their form to become the agents of voluntary and involuntary motion; the soul itself sits on a throne of nucleated cells, and flashes its mandates through skeins of glassy filaments which once were simple chains of vesicles. And, as if to reduce the problem of living force to its simplest expression, we see the yolk of a transparent egg dividing itself in whole or in part, and again dividing and subdividing, until it becomes a mass of cells, out of which the harmonious diversity of the organs arranges itself, worm or man, as God has willed from the beginning.

This differentiation having been effected, each several part assumes its special office, having a life of its own adjusted to that of other parts and the whole. "Just as a tree constitutes a mass arranged in a definite manner, in which, in every single part, in the leaves as in the root, in the trunk as in the blossom, cells are discovered to be the ultimate elements, so is it also with the forms of animal life. Every animal presents itself as a sum of vital unities, every one of which manifests all the characteristics of life."

The mechanism is as clear, as unquestionable, as absolutely settled and universally accepted, as the order of movement of the heavenly bodies, which we compute backward to the days of the observatories on the plains of Shinar, and on the faith of which we regulate the movements of war and trade by the predictions of our ephemeris.

The mechanism, and that is all. We see the workman and the tools, but the skill that guides the work and the power that performs it are as invisible as ever. I fear that not every listener took the significance of those pregnant words in the passage I quoted from John Bell,—“thinking to discover its properties in its form.” We have discovered the working bee in this great hive of organization. We have detected the cell in the very act of forming itself from a nucleus, of transforming itself into various tissues, of selecting the elements of various secretions. But why one cell becomes nerve and another muscle, why one selects bile and another fat, we can no more pretend to tell, than why one grape sucks out of the soil the generous juice which princes hoard in their cellars, and another the wine which it takes three men to drink,—one to pour it down, another to swallow it, and a third to hold him while it is going down. Certain analogies between this selecting power and the phenomena of endosmosis in the elective affinities of chemistry we can find, but the problem of force remains here, as everywhere, unsolved and insolvable.

Do we gain anything by attempting to get rid of the idea of a special vital force because we find certain mutually convertible relations between forces in the body and out of it? I think not, any more than we should gain by getting rid of the idea and expression Magnetism because of its correlation with electricity. We may concede the unity of all forms of force, but we cannot overlook the fixed differences of its manifestations according to the conditions under which it acts. It is a mistake, however, to think the mystery is greater in an organized body than in any other. We see a stone fall or a crystal form, and there is nothing stranger left to wonder at, for we have seen the Infinite in action.

Just so far as we can recognize the ordinary modes of operation of the common forces of nature,—gravity, cohesion, elasticity, transudation, chemical action, and the rest,—we see the so-called vital acts in the light of a larger range of known facts and familiar analogies. Matteucci's well-remembered lectures contain many and striking examples of the working of physical forces in physiological processes. Wherever rigid experiment carries us, we are safe in following this lead; but the moment we begin to theorize beyond our strict observation, we are in danger of falling into those mechanical follies which true science has long outgrown.

Recognizing the fact, then, that we have learned nothing but the machinery of life, and are no nearer to its essence, what is it that we have gained by this great discovery of the cell formation and function?

It would have been reward enough to learn the method Nature pursues for its own sake. If the sovereign Artificer lets us into his own laboratories and workshops, we need not ask more than the privilege of looking on at his work. We do not know where we now stand in the hierarchy of created intelligences. We were made a little lower than the angels. I speak it not irreverently; as the lower animals surpass man in some of their attributes, so it may be that not every angel's eye can see as broadly and as deeply into the material works of God as man himself, looking at the firmament through an equatorial of fifteen inches' aperture, and searching into the tissues with a twelfth of an inch objective.

But there are other positive gains of a more practical character. Thus we are no longer permitted to place the seat of the living actions in the extreme vessels, which are only the carriers from which each part takes what it wants by the divine right of the omnipotent nucleated cell. The organism has become, in the words already borrowed from Virchow, "a sum of vital unities." The strictum and laxum, the increased and diminished action of the vessels, out of which medical theories and methods of treatment have grown up, have yielded to the doctrine of local cell-communities, belonging to this or that vascular district, from which they help themselves, as contractors are wont to do from the national treasury.

I cannot promise to do more than to select a few of the points of contact between our ignorance and our knowledge which present particular interest in the existing state of our physiological acquisitions. Some of them involve the microscopic discoveries of which I have been speaking, some belong to the domain of chemistry, and some have relations with other departments of physical science.

If we should begin with the digestive function, we should find that the long-agitated question of the nature of the acid of the gastric juice is becoming settled in favor of the lactic. But the whole solvent agency of the digestive fluid enters into the category of that exceptional mode of action already familiar to us in chemistry as catalysis. It is therefore doubly difficult of explanation; first, as being, like all reactions, a fact not to be accounted for except by the imaginative appeal to "affinity," and secondly, as being one of those peculiar reactions provoked by an element which stands outside and looks on without compromising itself.

The doctrine of Mulder, so widely diffused in popular and scientific belief, of the existence of a common base of all albuminous substances, the so-called protein, has not stood the test of rigorous analysis. The division of food into azotized and non-azotized is no doubt important, but the attempt to show that the first only is plastic or nutritive, while the second is simply calorific, or heat-producing, fails entirely in the face of the facts revealed by the study of man in different climates, and of numerous experiments in the feeding of animals. I must return to this subject in connection with the respiratory function.

The sugar-making faculty of the liver is another "catalytic" mystery, as great as the rest of them, and no greater. Liver-tissue brings sugar out of the blood, or out of its own substance;—why?

*Quia est in eo
Virtus saccharitiva.*

Just what becomes of the sugar beyond the fact of its disappearance before it can get into the general circulation and sweeten our tempers, it is hard to say.

The pancreatic fluid makes an emulsion of the fat contained in our food, but just how the fatty particles get into the villi we must leave Brucke and Kolliker to settle if they can.

No one has shown satisfactorily the process by which the blood-corpuscles are formed out of the lymph-corpuscles, nor what becomes of them. These two questions are like those famous household puzzles,—Where do the flies come from? and, Where do the pins go to?

There is a series of organs in the body which has long puzzled physiologists,—organs of glandular aspect, but having no ducts,—the spleen, the thyroid and thymus bodies, and the suprarenal capsules. We call them vascular glands, and we believe that they elaborate colored and uncolored blood-cells; but just what changes they effect, and just how they effect them, it has proved a very difficult matter to determine. So of the noted glandules which form Peyer's patches, their precise office, though seemingly like those of the lymphatic glands, cannot be positively assigned, so far as I know, at the present time. It is of obvious interest to learn it with reference to the pathology of typhoid fever. It will be remarked that the coincidence of their changes in this disease with enlargement of the spleen suggests the idea of a similarity of function in these two organs.

The theories of the production of animal heat, from the times of Black, Lavoisier, and Crawford to those of Liebig, are familiar to all who have paid any attention to physiological studies. The simplicity of Liebig's views, and the popular form in which they have been presented, have given them wide currency, and incorporated them in the common belief and language of our text-books. Direct oxidation or combustion of the carbon and hydrogen contained in the food, or in the tissues themselves; the division of alimentary substances into respiratory, or non-azotized, and azotized,—these doctrines are familiar even to the classes in our high-schools. But this simple statement is boldly questioned. Nothing proves that oxygen combines (in the system) with hydrogen and carbon in particular, rather than with sulphur and azote. Such is the well-grounded statement of Robin and Verdeil. "It is very probable that animal heat is entirely produced by the chemical actions which take place in the organism, but the phenomenon is too complex to admit of our calculating it according to the quality of oxygen consumed." These last are the words of Regnault, as cited by Mr. Lewes, whose intelligent discussion of this and many of the most interesting physiological problems I strongly recommend to your attention.

This single illustration covers a wider ground than the special function to which it belongs. We are learning that the chemistry of the body must be studied, not simply by its ingesta and egesta, but that there is a long intermediate series of changes which must be investigated in their own light, under their own special conditions. The expression "sum of vital unities" applies to the chemical actions, as well as to other actions localized in special parts; and when the distinguished chemists whom I have just cited entitle their work a treatise on the immediate principles of the body, they only indicate the nature of that profound and subtle analysis which must take the place of all hasty generalizations founded on a comparison of the food with residual products.

I will only call your attention to the fact, that the exceptional phenomenon of the laboratory is the prevailing law of the organism. Nutrition itself is but one great catalytic process. As the blood travels its rounds, each part selects its appropriate element and transforms it to its own likeness. Whether the appropriating agent be cell or nucleus, or a structureless solid like the intercellular substance of cartilage, the fact of its presence determines the separation of its proper constituents from the circulating fluid, so that even when we are wounded bone is replaced by bone, skin by skin, and nerve by nerve.

It is hardly without a smile that we resuscitate the old question of the 'vis insita' of the muscular fibre, so famous in the discussions of Haller and his contemporaries. Speaking generally, I think we may say that

Haller's doctrine is the one now commonly received; namely, that the muscles contract in virtue of their own inherent endowments. It is true that Kolliker says no perfectly decisive fact has been brought forward to prove that the striated muscles contract without having been acted on by nerves. Yet Mr. Bowman's observations on the contraction of isolated fibres appear decisive enough (unless we consider them invalidated by Dr. Lionel Beale's recent researches), tending to show that each elementary fibre is supplied with nerves; and as to the smooth muscular fibres, we have Virchow's statement respecting the contractility of those of the umbilical cord, where there is not a trace of any nerves.

In the investigation of the nervous system, anatomy and physiology have gone hand in hand. It is very singular that so important, and seemingly simple, a fact as the connection of the nerve-tubes, at their origin or in their course, with the nerve-cells, should have so long remained open to doubt, as you may see that it did by referring to the very complete work of Sharpey and Quain (edition of 1849), the histological portion of which is cordially approved by Kolliker himself.

Several most interesting points of the minute anatomy of the nervous centres have been laboriously and skilfully worked out by a recent graduate of this Medical School, in a monograph worthy to stand in line with those of Lockhart Clarke, Stilling, and Schroder van der Kolk. I have had the privilege of examining and of showing some of you a number of Dr. Dean's skilful preparations. I have no space to give even an abstract of his conclusions. I can only refer to his proof of the fact, that a single cell may send its processes into several different bundles of nerve-roots, and to his demonstration of the curved ascending and descending fibres from the posterior nerveroots, to reach what he has called the longitudinal columns of the cornea. I must also mention Dr. Dean's exquisite microscopic photographs from sections of the medulla oblongata, which appear to me to promise a new development, if not a new epoch, in anatomical art.

It having been settled that the nerve-tubes can very commonly be traced directly to the nerve-cells, the object of all the observers in this department of anatomy is to follow these tubes to their origin. We have an infinite snarl of telegraph wires, and we may be reasonably sure, that, if we can follow them up, we shall find each of them ends in a battery somewhere. One of the most interesting problems is to find the ganglionic origin of the great nerves of the medulla oblongata, and this is the end to which, by the aid of the most delicate sections, colored so as to bring out their details, mounted so as to be imperishable, magnified by the best instruments, and now self-recorded in the light of the truth-telling sunbeam, our fellow-student is making a steady progress in a labor which I think bids fair to rank with the most valuable contributions to histology that we have had from this side of the Atlantic.

It is interesting to see how old questions are incidentally settled in the course of these new investigations. Thus, Mr. Clarke's dissections, confirmed by preparations of Mr. Dean's which I have myself examined, placed the fact of the decussation of the pyramids—denied by Haller, by Morgagni, and even by Stilling—beyond doubt. So the spinal canal, the existence of which, at least in the adult, has been so often disputed, appears as a coarse and unequivocal anatomical fact in many of the preparations referred to.

While these studies of the structure of the cord have been going on, the ingenious and indefatigable Brown-Sequard has been investigating the functions of its different parts with equal diligence. The microscopic anatomists had shown that the ganglionic corpuscles of the gray matter of the cord are connected with each other by their processes, as well as with the nerve-roots. M. Brown-Sequard has proved by numerous experiments that the gray substance transmits sensitive impressions and muscular stimulation. The oblique ascending and descending fibres from the posterior nerve-roots, joining the "longitudinal columns of the cornua," account for the results of Brown-Sequard's sections of the posterior columns. The physiological experimenter has also made it evident that the decussation of the conductors of sensitive impressions has its seat in the spinal core, and not in the encephalon, as had been supposed. Not less remarkable than these results are the facts, which I with others of my audience have had the opportunity of observing, as shown by M. Brown-Sequard, of the artificial production of epilepsy in animals by injuring the spinal cord, and the induction of the paroxysm by pinching a certain portion of the skin. I would also call the student's attention to his account of the relations of the nervous centres to nutrition and secretion, the last of which relations has been made the subject of an extended essay by our fellow countryman, Dr. H. F. Campbell of Georgia.

The physiology of the spinal cord seems a simple matter as you study it in Longet. The experiments of Brown-Sequard have shown the problem to be a complex one, and raised almost as many doubts as they have solved questions; at any rate, I believe all lecturers on physiology agree that there is no part of their task they dread so much as the analysis of the evidence relating to the special offices of the different portions of the medulla spinalis. In the brain we are sure that we do not know how to localize functions; in the spinal cord, we think we do know something; but there are so many anomalies, and seeming contradictions, and sources of fallacy, that beyond the facts of crossed paralysis of sensation, and the conducting agency of the gray substance, I am afraid we retain no cardinal principles discovered since the development of the reflex function took its place by Sir Charles Bell's great discovery.

By the manner in which I spoke of the brain, you will see that I am obliged to leave phrenology sub Jove,—out in the cold,—as not one of the household of science. I am not one of its haters; on the contrary, I am grateful for the incidental good it has done. I love to amuse myself in its plaster Golgothas, and listen to the glib professor, as he discovers by his manipulations

"All that disgraced my betters met in me."

I loved of old to see square-headed, heavy-jawed Spurzheim make a brain flower out into a corolla of marrowy filaments, as Vieussens had done before him, and to hear the dry-fibred but human-hearted George Combe teach good sense under the disguise of his equivocal system. But the pseudo-sciences, phrenology and the rest, seem to me only appeals to weak minds and the weak points of strong ones. There is a pica or false appetite in many intelligences; they take to odd fancies in place of wholesome truth, as girls gnaw at chalk and charcoal. Phrenology juggles with nature. It is so adjusted as to soak up all evidence that helps it, and shed all that harms it. It crawls forward in all weathers, like Richard Edgeworth's hygrometer. It does not stand at the boundary of our ignorance, it seems to me, but is one of the will-o'-the-wisps of its undisputed

central domain of bog and quicksand. Yet I should not have devoted so many words to it, did I not recognize the light it has thrown on human actions by its study of congenital organic tendencies. Its maps of the surface of the head are, I feel sure, founded on a delusion, but its studies of individual character are always interesting and instructive.

The "snapping-turtle" strikes after its natural fashion when it first comes out of the egg. Children betray their tendencies in their way of dealing with the breasts that nourish them; nay, lean venture to affirm, that long before they are born they teach their mothers something of their turbulent or quiet tempers.

*"Castor gaudet equis, ovo proanatus eodem
Pugnis."*

Strike out the false pretensions of phrenology; call it anthropology; let it study man the individual in distinction from man the abstraction, the metaphysical or theological lay-figure; and it becomes "the proper study of mankind," one of the noblest and most interesting of pursuits.

The whole physiology of the nervous system, from the simplest manifestation of its power in an insect up to the supreme act of the human intelligence working through the brain, is full of the most difficult yet profoundly interesting questions. The singular relations between electricity and nerve-force, relations which it has been attempted to interpret as meaning identity, in the face of palpable differences, require still more extended studies. You may be interested by Professor Faraday's statement of his opinion on the matter. "Though I am not satisfied that the nervous fluid is only electricity, still I think that the agent in the nervous system maybe an inorganic force; and if there be reason for supposing that magnetism is a higher relation of force than electricity, so it may well be imagined that the nervous power may be of a still more exalted character, and yet within the reach of experiment."

In connection with this statement, it is interesting to refer to the experiments of Helmholtz on the rapidity of transmission of the nervous actions. The rate is given differently in Valentin's report of these experiments and in that found in the "Scientific Annual" for 1858. One hundred and eighty to three hundred feet per second is the rate of movement assigned for sensation, but all such results must be very vaguely approximative. Boxers, fencers, players at the Italian game of morn, "prestidigitators," and all who depend for their success on rapidity of motion, know what differences there are in the personal equation of movement.

Reflex action, the mechanical sympathy, if I may so call it, of distant parts; Instinct, which is crystallized intelligence,—an absolute law with its invariable planes and angles introduced into the sphere of consciousness, as raphides are inclosed in the living cells of plants; Intellect,—the operation of the thinking principle through material organs, with an appreciable waste of tissue in every act of thought, so that our clergymen's blood has more phosphates to get rid of on Monday than on any other day of the week; Will,—theoretically the absolute determining power, practically limited in different degrees by the varying organization of races and individuals, annulled or perverted by different ill-understood organic changes; on all these subjects our knowledge is in its infancy, and from the study of some of them the interdict of the Vatican is hardly yet removed.

I must allude to one or two points in the histology and physiology of the organs of sense. The anterior continuation of the retina beyond the ora serrata has been a subject of much discussion. If H. Muller and Kolliker can be relied upon, this question is settled by recognizing that a layer of cells, continued from the retina, passes over the surface of the zonula Zinnii, but that no proper nervous element is so prolonged forward.

I observe that Kolliker calls the true nervous elements of the retina "the layer of gray cerebral substance." In fact, the ganglionic corpuscles of each eye may be considered as constituting a little brain, connected with the masses behind by the commissure, commonly called the optic nerve. We are prepared, therefore, to find these two little brains in the most intimate relations with each other, as we find the cerebral hemispheres. We know that they are directly connected by fibres that arch round through the chiasma.

I mention these anatomical facts to introduce a physiological observation of my own, first announced in one of the lectures before the Medical Class, subsequently communicated to the American Academy of Arts and Sciences, and printed in its "Transactions" for February 14, 1860. I refer to the apparent transfer of impressions from one retina to the other, to which I have given the name reflex vision. The idea was suggested to me in consequence of certain effects noticed in employing the stereoscope. Professor William B. Rodgers has since called the attention of the American Scientific Association to some facts bearing on the subject, and to a very curious experiment of Leonardo da Vinci's, which enables the observer to look through the palm of his hand (or seem to), as if it had a hole bored through it. As he and others hesitated to accept my explanation, I was not sorry to find recently the following words in the "Observations on Man" of that acute observer and thinker, David Hartley. "An impression made on the right eye alone by a single object may propagate itself into the left, and there raise up an image almost equal in vividness to itself; and consequently when we see with one eye only, we may, however, have pictures in both eyes." Hartley, in 1784, had anticipated many of the doctrines which have since been systematized into the theory of reflex actions, and with which I have attempted to associate this act of reflex vision. My sixth experiment, however, in the communication referred to, appears to me to be a crucial one, proving the correctness of my explanation, and I am not aware that it has been before instituted.

Another point of great interest connected with the physiology of vision, and involved for a long time in great obscurity, is that of the adjustment of the eye to different distances. Dr. Clay Wallace of New York, who published a very ingenious little book on the eye about twenty years ago, with vignettes reminding one of Bewick, was among the first, if not the first, to describe the ciliary muscle, to which the power of adjustment is generally ascribed. It is ascertained, by exact experiment with the phacueidoscope, that accommodation depends on change of form of the crystalline lens. Where the crystalline is wanting, as Mr. Ware long ago taught, no power of accommodation remains. The ciliary muscle is generally thought to effect the change of form of the crystalline. The power of accommodation is lost after the application of atropine, in consequence,

as is supposed, of the paralysis of this muscle. This, I believe, is the nearest approach to a demonstration we have on this point.

I have only time briefly to refer to Professor Draper's most ingenious theory as to the photographic nature of vision, for an account of which I must refer to his original and interesting Treatise on Physiology.

It were to be wished that the elaborate and very interesting researches of the Marquis Corti, which have revealed such singular complexity of structure in the cochlea of the ear, had done more to clear up its doubtful physiology; but I am afraid we have nothing but hypotheses for the special part it plays in the act of hearing, and that we must say the same respecting the office of the semicircular canals.

The microscope has achieved some of its greatest triumphs in teaching us the changes which occur in the development of the embryo. No more interesting discovery stands recorded in the voluminous literature of this subject than the one originally announced by Martin Barry, afterwards discredited, and still later confirmed by Mr. Newport and others; namely the fact that the fertilizing filament reaches the interior of the ovum in various animals;—a striking parallel to the action of the pollen-tube in the vegetable. But beyond the mechanical facts all is mystery in the movements of organization, as profound as in the fall of a stone or the formation of a crystal.

To the chemist and the microscopist the living body presents the same difficulties, arising from the fact that everything is in perpetual change in the organism. The fibrine of the blood puzzles the one as much as its globules puzzle the other. The difference between the branches of science which deal with space only, and those which deal with space and time, is this: we have no glasses that can magnify time. The figure I here show you was photographed from an object (*pleurosigma angulatum*) magnified a thousand diameters, or presenting a million times its natural surface. This other figure of the same object, enlarged from the one just shown, is magnified seven thousand diameters, or forty-nine million times in surface. When we can make the forty-nine millionth of a second as long as its integer, physiology and chemistry will approach nearer the completeness of anatomy.

Our reverence becomes more worthy, or, if you will, less unworthy of its Infinite Object in proportion as our intelligence is lifted and expanded to a higher and broader understanding of the Divine methods of action. If Galen called his heathen readers to admire, the power, the wisdom, the providence, the goodness of the "Framer of the animal body,"—if Mr. Boyle, the student of nature, as Addison and that friend of his who had known him for forty years tell us, never uttered the name of the Supreme Being without making a distinct pause in his speech, in token of his devout recognition of its awful meaning,—surely we, who inherit the accumulated wisdom of nearly two hundred years since the time of the British philosopher, and of almost two thousand since the Greek physician, may well lift our thoughts from the works we study to their great Artificer. These wonderful discoveries which we owe to that mighty little instrument, the telescope of the inner firmament with all its included worlds; these simple formulæ by which we condense the observations of a generation in a single axiom; these logical analyses by which we fence out the ignorance we cannot reclaim, and fix the limits of our knowledge,—all lead us up to the inspiration of the Almighty, which gives understanding to the world's great teachers. To fear science or knowledge, lest it disturb our old beliefs, is to fear the influx of the Divine wisdom into the souls of our fellow-men; for what is science but the piecemeal revelation,—uncovering,—of the plan of creation, by the agency of those chosen prophets of nature whom God has illuminated from the central light of truth for that single purpose?

The studies which we have glanced at are preliminary in your education to the practical arts which make use of them,—the arts of healing,—surgery and medicine. The more you examine the structure of the organs and the laws of life, the more you will find how resolutely each of the cell-republics which make up the *E pluribus unum* of the body maintains its independence. Guard it, feed it, air it, warm it, exercise or rest it properly, and the working elements will do their best to keep well or to get well. What do we do with ailing vegetables? Dr. Warren, my honored predecessor in this chair, bought a country-place, including half of an old orchard. A few years afterwards I saw the trees on his side of the fence looking in good health, while those on the other side were scraggy and miserable. How do you suppose this change was brought about? By watering them with Fowler's solution? By digging in calomel freely about their roots? Not at all; but by loosening the soil round them, and supplying them with the right kind of food in fitting quantities.

Now a man is not a plant, or, at least, he is a very curious one, for he carries his soil in his stomach, which is a kind—of portable flower-pot, and he grows round it, instead of out of it. He has, besides, a singularly complex nutritive apparatus and a nervous system. But recollect the doctrine already enunciated in the language of Virchow, that an animal, like a tree, is a sum of vital unities, of which the cell is the ultimate element. Every healthy cell, whether in a vegetable or an animal, necessarily performs its function properly so long as it is supplied with its proper materials and stimuli. A cell may, it is true, be congenitally defective, in which case disease is, so to speak, its normal state. But if originally sound and subsequently diseased, there has certainly been some excess, deficiency, or wrong quality in the materials or stimuli applied to it. You remove this injurious influence and substitute a normal one; remove the baked coal-ashes, for instance, from the roots of a tree, and replace them with loam; take away the salt meat from the patient's table, and replace it with fresh meat and vegetables, and the cells of the tree or the man return to their duty.

I do not know that we ever apply to a plant any element which is not a natural constituent of the vegetable structure, except perhaps externally, for the accidental purpose of killing parasites. The whole art of cultivation consists in learning the proper food and conditions of plants, and supplying them. We give them water, earths, salts of various kinds such as they are made of, with a chance to help themselves to air and light. The farmer would be laughed at who undertook to manure his fields or his trees with a salt of lead or of arsenic. These elements are not constituents of healthy plants. The gardener uses the waste of the arsenic furnaces to kill the weeds in his walks.

If the law of the animal cell, and of the animal organism, which is built up of such cells, is like that of the vegetable, we might expect that we should treat all morbid conditions of any of the vital unities belonging to an animal in the same way, by increasing, diminishing, or changing its natural food or stimuli.

That is an aliment which nourishes; whatever we find in the organism, as a constant and integral element,

either forming part of its structure, or one of the conditions of vital processes, that and that only deserves the name of aliment. I see no reason, therefore, why iron, phosphate of lime, sulphur, should not be considered food for man, as much as guano or poudrette for vegetables. Whether one or another of them is best in any given case,—whether they shall be taken alone or in combination, in large or small quantities, are separate questions. But they are elements belonging to the body, and even in moderate excess will produce little disturbance. There is no presumption against any of this class of substances, any more than against water or salt, provided they are used in fitting combinations, proportions, and forms.

But when it comes to substances alien to the healthy system, which never belong to it as normal constituents, the case is very different. There is a presumption against putting lead or arsenic into the human body, as against putting them into plants, because they do not belong there, any more than pounded glass, which, it is said, used to be given as a poison. The same thing is true of mercury and silver. What becomes of these alien substances after they get into the system we cannot always tell. But in the case of silver, from the accident of its changing color under the influence of light, we do know what happens. It is thrown out, in part at least, under the epidermis, and there it remains to the patient's dying day. This is a striking illustration of the difficulty which the system finds in dealing with non-assimilable elements, and justifies in some measure the vulgar prejudice against mineral poisons.

I trust the youngest student on these benches will not commit the childish error of confounding a presumption against a particular class of agents with a condemnation of them. Mercury, for instance, is alien to the system, and eminently disturbing in its influence. Yet its efficacy in certain forms of specific disease is acknowledged by all but the most sceptical theorists. Even the esprit moqueur of Ricord, the Voltaire of pelvic literature, submits to the time-honored constitutional authority of this great panacea in the class of cases to which he has devoted his brilliant intelligence. Still, there is no telling what evils have arisen from the abuse of this mineral. Dr. Armstrong long ago pointed out some of them, and they have become matters of common notoriety. I am pleased, therefore, when I find so able and experienced a practitioner as Dr. Williams of this city proving that iritis is best treated without mercury, and Dr. Vanderpoel showing the same thing to be true for pericarditis.

Whatever elements nature does not introduce into vegetables, the natural food of all animal life,—directly of herbivorous, indirectly of carnivorous animals,—are to be regarded with suspicion. Arsenic-eating may seem to improve the condition of horses for a time,—and even of human beings, if Tschudi's stories can be trusted,—but it soon appears that its alien qualities are at war with the animal organization. So of copper, antimony, and other non-alimentary simple substances; everyone of them is an intruder in the living system, as much as a constable would be, quartered in our household. This does not mean that they may not, any of them, be called in for a special need, as we send for the constable when we have good reason to think we have a thief under our roof; but a man's body is his castle, as well as his house, and the presumption is that we are to keep our alimentary doors bolted against these perturbing agents.

Now the feeling is very apt to be just contrary to this. The habit has been very general with well-taught practitioners, to have recourse to the introduction of these alien elements into the system on the occasion of any slight disturbance. The tongue was a little coated, and mercury must be given; the skin was a little dry, and the patient must take antimony. It was like sending for the constable and the posse comitatus when there is only a carpet to shake or a refuse-barrel to empty. [Dr. James Johnson advises persons not ailing to take five grains of blue pill with one or two of aloes twice a week for three or four months in the year, with half a pint of compound decoction of sarsaparilla every day for the same period, to preserve health and prolong life. Pract. Treatise on Dis. of Liver, etc. p. 272.] The constitution bears slow poisoning a great deal better than might be expected; yet the most intelligent men in the profession have gradually got out of the habit of prescribing these powerful alien substances in the old routine way. Mr. Metcalf will tell you how much more sparingly they are given by our practitioners at the present time, than when he first inaugurated the new era of pharmacy among us. Still, the presumption in favor of poisoning out every spontaneous reaction of outraged nature is not extinct in those who are trusted with the lives of their fellow-citizens. "On examining the file of prescriptions at the hospital, I discovered that they were rudely written, and indicated a treatment, as they consisted chiefly of tartar emetic, ipecacuanha, and epsom salts, hardly favorable to the cure of the prevailing diarrhoea and dysenteries." In a report of a poisoning case now on trial, where we are told that arsenic enough was found in the stomach to produce death in twenty-four hours, the patient is said to have been treated by arsenic, phosphorus, bryonia, aconite, nux vomica, and muriatic acid,—by a practitioner of what school it may be imagined.

The traditional idea of always poisoning out disease, as we smoke out vermin, is now seeking its last refuge behind the wooden cannon and painted port-holes of that unblushing system of false scientific pretences which I do not care to name in a discourse addressed to an audience devoted to the study of the laws of nature in the light of the laws of evidence. It is extraordinary to observe that the system which, by its reducing medicine to a name and a farce, has accustomed all who have sense enough to see through its thin artifices to the idea that diseases get well without being "cured," should now be the main support of the tottering poison-cure doctrine. It has unquestionably helped to teach wise people that nature heals most diseases without help from pharmaceutic art, but it continues to persuade fools that art can arrest them all with its specifics.

It is worse than useless to attempt in any way to check the freest expression of opinion as to the efficacy of any or all of the "heroic" means of treatment employed by practitioners of different schools and periods. Medical experience is a great thing, but we must not forget that there is a higher experience, which tries its results in a court of a still larger jurisdiction; that, namely, in which the laws of human belief are summoned to the witness-box, and obliged to testify to the sources of error which beset the medical practitioner. The verdict is as old as the father of medicine, who announces it in the words, "judgment is difficult." Physicians differed so in his time, that some denied that there was any such thing as an art of medicine.

One man's best remedies were held as mischievous by another. The art of healing was like soothsaying, so the common people said; "the same bird was lucky or unlucky, according as he flew to the right or left."

The practice of medicine has undergone great changes within the period of my own observation.

Venesection, for instance, has so far gone out of fashion, that, as I am told by residents of the New York Bellevue and the Massachusetts General Hospitals, it is almost obsolete in these institutions, at least in medical practice. The old Brunonian stimulating treatment has come into vogue again in the practice of Dr. Todd and his followers. The compounds of mercury have yielded their place as drugs of all work, and specifics for that very frequent subjective complaint, *nescio quid faciam*,—to compounds of iodine. [Sir Astley Cooper has the boldness,—or honesty,—to speak of medicines which “are given as much to assist the medical man as his patient.” Lectures (London, 1832), p. 14.] Opium is believed in, and quinine, and “rum,” using that expressive monosyllable to mean all alcoholic cordials. If Moliere were writing now, instead of *saignare*, *purgare*, and the other, he would be more like to say, *Stimulare*, *opium dare et potassio-iodizare*.

I have been in relation successively with the English and American evacuant and alterative practice, in which calomel and antimony figured so largely that, as you may see in Dr. Jackson's last “Letter,” Dr. Holyoke, a good representative of sterling old-fashioned medical art, counted them with opium and Peruvian bark as his chief remedies; with the moderately expectant practice of Louis; the blood-letting “*coup sur coup*” of Bouillaud; the contra-stimulant method of Rasori and his followers; the anti-irritant system of Broussais, with its leeching and gum-water; I have heard from our own students of the simple opium practice of the renowned German teacher, Oppolzer; and now I find the medical community brought round by the revolving cycle of opinion to that same old plan of treatment which John Brown taught in Edinburgh in the last quarter of the last century, and Miner and Tully fiercely advocated among ourselves in the early years of the present. The worthy physicians last mentioned, and their antagonist Dr. Gallup, used stronger language than we of these degenerate days permit ourselves. “The lancet is a weapon which annually slays more than the sword,” says Dr. Tully. “It is probable that, for forty years past, opium and its preparations have done seven times the injury they have rendered benefit, on the great scale of the world,” says Dr. Gallup.

What is the meaning of these perpetual changes and conflicts of medical opinion and practice, from an early antiquity to our own time? Simply this: all “methods” of treatment end in disappointment of those extravagant expectations which men are wont to entertain of medical art. The bills of mortality are more obviously affected by drainage, than by this or that method of practice. The insurance companies do not commonly charge a different percentage on the lives of the patients of this or that physician. In the course of a generation, more or less, physicians themselves are liable to get tired of a practice which has so little effect upon the average movement of vital decomposition. Then they are ready for a change, even if it were back again to a method which has already been tried, and found wanting.

Our practitioners, or many of them, have got back to the ways of old Dr. Samuel Danforth, who, as it is well known, had strong objections to the use of the lancet. By and by a new reputation will be made by some discontented practitioner, who, tired of seeing patients die with their skins full of whiskey and their brains muddy with opium, returns to a bold antiphlogistic treatment, and has the luck to see a few patients of note get well under it. So of the remedies which have gone out of fashion and been superseded by others. It can hardly be doubted that they will come into vogue again, more or less extensively, under the influence of that irresistible demand for change just referred to.

Then will come the usual talk about a change in the character of disease, which has about as much meaning as that concerning “old-fashioned snow-storms.” “Epidemic constitutions” of disease mean something, no doubt; a great deal as applied to malarious affections; but that the whole type of diseases undergoes such changes that the practice must be reversed from depleting to stimulating, and vice versa, is much less likely than that methods of treatment go out of fashion and come in again. If there is any disease which claims its percentage with reasonable uniformity, it is phthisis. Yet I remember that the reverend and venerable Dr. Prince of Salem told me one Commencement day, as I was jogging along towards Cambridge with him, that he recollected the time when that disease was hardly known; and in confirmation of his statement mentioned a case in which it was told as a great event, that somebody down on “the Cape” had died of “a consumption.” This story does not sound probable to myself, as I repeat it, yet I assure you it is true, and it shows how cautiously we must receive all popular stories of great changes in the habits of disease.

Is there no progress, then, but do we return to the same beliefs and practices which our forefathers wore out and threw away? I trust and believe that there is a real progress. We may, for instance, return in a measure to the Brunonian stimulating system, but it must be in a modified way, for we cannot go back to the simple Brunonian pathology, since we have learned too much of diseased action to accept its convenient dualism. So of other doctrines, each new Avatar strips them of some of their old pretensions, until they take their fitting place at last, if they have any truth in them, or disappear, if they were mere phantasms of the imagination.

In the mean time, while medical theories are coming in and going out, there is a set of sensible men who are never run away with by them, but practise their art sagaciously and faithfully in much the same way from generation to generation. From the time of Hippocrates to that of our own medical patriarch, there has been an apostolic succession of wise and good practitioners. If you will look at the first aphorism of the ancient Master you will see that before all remedies he places the proper conduct of the patient and his attendants, and the fit ordering of all the conditions surrounding him. The class of practitioners I have referred to have always been the most faithful in attending to these points. No doubt they have sometimes prescribed unwisely, in compliance with the prejudices of their time, but they have grown wiser as they have grown older, and learned to trust more in nature and less in their plans of interference. I believe common opinion confirms Sir James Clark's observation to this effect.

The experience of the profession must, I think, run parallel with that of the wisest of its individual members. Each time a plan of treatment or a particular remedy comes up for trial, it is submitted to a sharper scrutiny. When Cullen wrote his *Materia Medica*, he had seriously to assail the practice of giving burnt toad, which was still countenanced by at least one medical authority of note. I have read recently in some medical journal, that an American practitioner, whose name is known to the country, is prescribing the hoof of a horse for epilepsy. It was doubtless suggested by that old fancy of wearing a portion of elk's hoof hung round the neck or in a ring, for this disease. But it is hard to persuade reasonable people to swallow the abominations of a former period. The evidence which satisfied Fernelius will not serve one of our hospital physicians.

In this way those articles of the *Materia Medica* which had nothing but loathsomeness to recommend them have been gradually dropped, and are not like to obtain any general favor again with civilized communities. The next culprits to be tried are the poisons. I have never been in the least sceptical as to the utility of some of them, when properly employed. Though I believe that at present, taking the world at large, and leaving out a few powerful agents of such immense value that they rank next to food in importance, the poisons prescribed for disease do more hurt than good, I have no doubt, and never professed to have any, that they do much good in prudent and instructed hands. But I am very willing to confess a great jealousy of many agents, and I could almost wish to see the *Materia Medica* so classed as to call suspicion upon certain ones among them.

Thus the alien elements, those which do not properly enter into the composition of any living tissue, are the most to be suspected, —mercury, lead, antimony, silver, and the rest, for the reasons I have before mentioned. Even iodine, which, as it is found in certain plants, seems less remote from the animal tissues, gives unequivocal proofs from time to time that it is hostile to some portions of the glandular system.

There is, of course, less *prima facie* objection to those agents which consist of assimilable elements, such as are found making a part of healthy tissues. These are divisible into three classes,—foods, poisons, and inert, mostly because insoluble, substances. The food of one animal or of one human being is sometimes poison to another, and vice versa; inert substances may act mechanically, so as to produce the effect of poisons; but this division holds exactly enough for our purpose.

Strictly speaking, every poison consisting of assimilable elements may be considered as unwholesome food. It is rejected by the stomach, or it produces diarrhoea, or it causes vertigo or disturbance of the heart's action, or some other symptom for which the subject of it would consult the physician, if it came on from any other cause than taking it under the name of medicine. Yet portions of this unwholesome food which we call medicine, we have reason to believe, are assimilated; thus, castor-oil appears to be partially digested by infants, so that they require large doses to affect them medicinally. Even that deadliest of poisons, hydrocyanic acid, is probably assimilated, and helps to make living tissue, if it do not kill the patient, for the assimilable elements which it contains, given in the separate forms of amygdalin and emulsin, produce no disturbance, unless, as in Bernard's experiments, they are suffered to meet in the digestive organs. A medicine consisting of assimilable substances being then simply unwholesome food, we understand what is meant by those cumulative effects of such remedies often observed, as in the case of digitalis and strychnia. They are precisely similar to the cumulative effects of a salt diet in producing scurvy, or of spurred rye in producing dry gangrene. As the effects of such substances are a violence to the organs, we should exercise the same caution with regard to their use that we would exercise about any other kind of poisonous food,—partridges at certain seasons, for instance. Even where these poisonous kinds of food seem to be useful, we should still regard them with great jealousy. Digitalis lowers the pulse in febrile conditions. *Veratrum viride* does the same thing. How do we know that a rapid pulse is not a normal adjustment of nature to the condition it accompanies? Digitalis has gone out of favor; how sure are we that *Veratrum viride* will not be found to do more harm than good in a case of internal inflammation, taking the whole course of the disease into consideration? Think of the change of opinion with regard to the use of opium in delirium tremens (which you remember is sometimes called delirium vigilans), where it seemed so obviously indicated, since the publication of Dr. Ware's admirable essay. I respect the evidence of my contemporaries, but I cannot forget the sayings of the Father of medicine,—*Ars longa, judicium difficile*.

I am not presuming to express an opinion concerning *Veratrum viride*, which was little heard of when I was still practising medicine. I am only appealing to that higher court of experience which sits in judgment on all decisions of the lower medical tribunals, and which requires more than one generation for its final verdict.

Once change the habit of mind so long prevalent among practitioners of medicine; once let it be everywhere understood that the presumption is in favor of food, and not of alien substances, of innocuous, and not of unwholesome food, for the sick; that this presumption requires very strong evidence in each particular case to overcome it; but that, when such evidence is afforded, the alien substance or the unwholesome food should be given boldly, in sufficient quantities, in the same spirit as that with which the surgeon lifts his knife against a patient,—that is, with the same reluctance and the same determination,—and I think we shall have and hear much less of charlatanism in and out of the profession. The disgrace of medicine has been that colossal system of self-deception, in obedience to which mines have been emptied of their cankering minerals, the vegetable kingdom robbed of all its noxious growths, the entrails of animals taxed for their impurities, the poison-bags of reptiles drained of their venom, and all the inconceivable abominations thus obtained thrust down the throats of human beings suffering from some fault of organization, nourishment, or vital stimulation.

Much as we have gained, we have not yet thoroughly shaken off the notion that poison is the natural food of disease, as wholesome aliment is the support of health. Cowper's lines, in "The Task," show the matter-of-course practice of his time:

*"He does not scorn it, who has long endured
A fever's agonies, and fed on drugs."*

Dr. Kimball of Lowell, who has been in the habit of seeing a great deal more of typhoid fever than most practitioners, and whose surgical exploits show him not to be wanting in boldness or enterprise, can tell you whether he finds it necessary to feed his patients on drugs or not. His experience is, I believe, that of the most enlightened and advanced portion of the profession; yet I think that even in typhoid fever, and certainly in many other complaints, the effects of ancient habits and prejudices may still be seen in the practice of some educated physicians.

To you, young men, it belongs to judge all that has gone before you. You come nearer to the great fathers of modern medicine than some of you imagine. Three of my own instructors attended Dr. Rush's Lectures. The illustrious Haller mentions Rush's inaugural thesis in his "*Bibliotheca Anatomica*;" and this same Haller, brought so close to us, tells us he remembers Ruysch, then an old man, and used to carry letters between him

and Boerhaave. Look through the history of medicine from Boerhaave to this present day. You will see at once that medical doctrine and practice have undergone a long series of changes. You will see that the doctrine and practice of our own time must probably change in their turn, and that, if we can trust at all to the indications of their course, it will be in the direction of an improved hygiene and a simplified treatment. Especially will the old habit of violating the instincts of the sick give place to a judicious study of these same instincts. It will be found that bodily, like mental insanity, is best managed, for the most part, by natural soothing agencies. Two centuries ago there was a prescription for scurvy containing "stercoris taurini et anserini par, quantitas trium magnarum nucum," of the hell-broth containing which "quoties-cumque sitit oeger, large bibit." When I have recalled the humane common-sense of Captain Cook in the matter of preventing this disease; when I have heard my friend, Mr. Dana, describing the avidity with which the scurvy-stricken sailors snuffed up the earthy fragrance of fresh raw potatoes, the food which was to supply the elements wanting to their spongy tissues, I have recognized that the perfection of art is often a return to nature, and seen in this single instance the germ of innumerable beneficent future medical reforms.

I cannot help believing that medical curative treatment will by and by resolve itself in great measure into modifications of the food, swallowed and breathed, and of the natural stimuli, and that less will be expected from specifics and noxious disturbing agents, either alien or assimilable. The noted mineral-waters containing iron, sulphur, carbonic acid, supply nutritious or stimulating materials to the body as much as phosphate of lime and ammoniacal compounds do to the cereal plants. The effects of a milk and vegetable diet, of gluten bread in diabetes, of cod-liver oil in phthisis, even of such audacious innovations as the water-cure and the grape-cure, are only hints of what will be accomplished when we have learned to discover what organic elements are deficient or in excess in a case of chronic disease, and the best way of correcting the abnormal condition, just as an agriculturist ascertains the wants of his crops and modifies the composition of his soil. In acute febrile diseases we have long ago discovered that far above all drug-medication is the use of mild liquid diet in the period of excitement, and of stimulant and nutritious food in that of exhaustion. Hippocrates himself was as particular about his barley-ptisan as any Florence Nightingale of our time could be.

The generation to which you, who are just entering the profession, belong, will make a vast stride forward, as I believe, in the direction of treatment by natural rather than violent agencies. What is it that makes the reputation of Sydenham, as the chief of English physicians? His prescriptions consisted principally of simples. An aperient or an opiate, a "cardiac" or a tonic, may be commonly found in the midst of a somewhat fantastic miscellany of garden herbs. It was not by his pharmaceutic prescriptions that he gained his great name. It was by daring to order fresh air for small-pox patients, and riding on horseback for consumptives, in place of the smothering system, and the noxious and often loathsome rubbish of the established schools. Of course Sydenham was much abused by his contemporaries, as he frequently takes occasion to remind his reader. "I must needs conclude," he says, "either that I am void of merit, or that the candid and ingenuous part of mankind, who are formed with so excellent a temper of mind as to be no strangers to gratitude, make a very small part of the whole." If in the fearless pursuit of truth you should find the world as ungracious in the nineteenth century as he found it in the seventeenth, you may learn a lesson of self-reliance from another utterance of the same illustrious physician: "'T is none of my business to inquire what other persons think, but to establish my own observations; in order to which, I ask no favor of the reader but to peruse my writings with temper."

The physician has learned a great deal from the surgeon, who is naturally in advance of him, because he has a better opportunity of seeing the effects of his remedies. Let me shorten one of Ambroise Pare's stories for you. There had been a great victory at the pass of Susa, and they were riding into the city. The wounded cried out as the horses trampled them under their hoofs, which caused good Ambroise great pity, and made him wish himself back in Paris. Going into a stable he saw four dead soldiers, and three desperately wounded, placed with their backs against the wall. An old campaigner came up.—"Can these fellows get well?" he said. "No!" answered the surgeon. Thereupon, the old soldier walked up to them and cut all their throats, sweetly, and without wrath (*doulcement et sans cholere*). Ambroise told him he was a bad man to do such a thing. "I hope to God;" he said, "somebody will do as much for me if I ever get into such a scrape" (*accoustre de telle facon*). "I was not much salted in those days" (*bien doux de sel*), says Ambroise, "and little acquainted with the treatment of wounds." However, as he tells us, he proceeded to apply boiling oil of Sambuc (elder) after the approved fashion of the time,—with what torture to the patient may be guessed. At last his precious oil gave out, and he used instead an insignificant mixture of his own contrivance. He could not sleep that night for fear his patients who had not been scalded with the boiling oil would be poisoned by the gunpowder conveyed into their wounds by the balls. To his surprise, he found them much better than the others the next morning, and resolved never again to burn his patients with hot oil for gun-shot wounds.

This was the beginning, as nearly as we can fix it, of that reform which has introduced plain water-dressings in the place of the farrago of external applications which had been a source of profit to apothecaries and disgrace to art from, and before, the time when Pliny complained of them. A young surgeon who was at Sudley Church, laboring among the wounded of Bull Run, tells me they had nothing but water for dressing, and he (being also *doux de sel*) was astonished to see how well the wounds did under that simple treatment.

Let me here mention a fact or two which may be of use to some of you who mean to enter the public service. You will, as it seems, have gun-shot wounds almost exclusively to deal with. Three different surgeons, the one just mentioned and two who saw the wounded of Big Bethel, assured me that they found no sabrecuts or bayonet wounds. It is the rifle-bullet from a safe distance which pierces the breasts of our soldiers, and not the gallant charge of broad platoons and sweeping squadrons, such as we have been in the habit of considering the chosen mode of warfare of ancient and modern chivalry. [Sir Charles James Napier had the same experience in Virginia in 1813. "Potomac. We have nasty sort of fighting here, amongst creeks and bushes, and lose men without show." "Yankee never shows himself, he keeps in the thickest wood, fires and runs off."—"These five thousand in the open field might be attacked, but behind works it would be throwing away lives." He calls it "an inglorious warfare,"—says one of the leaders is "a little deficient in gumption,—but—still my opinion is, that if we tuck up our sleeves and lay our ears back we might thrash them; that is, if we caught them out of their trees, so as to slap at them with the bayonet."—Life, etc. vol. i. p. 218 et seq.]

Another fact parallels the story of the old campaigner, and may teach some of you caution in selecting your assistants. A chaplain told it to two of our officers personally known to myself. He overheard the examination of a man who wished to drive one of the "avalanche" wagons, as they call them. The man was asked if he knew how to deal with wounded men. "Oh yes," he answered; "if they're hit here," pointing to the abdomen, "knock 'em on the head,—they can't get well."

In art and outside of it you will meet the same barbarisms that Ambroise Pare met with,—for men differ less from century to century than we are apt to suppose; you will encounter the same opposition, if you attack any prevailing opinion, that Sydenham complained of. So far as possible, let not such experiences breed in you a contempt for those who are the subjects of folly or prejudice, or foster any love of dispute for its own sake. Should you become authors, express your opinions freely; defend them rarely. It is not often that an opinion is worth expressing, which cannot take care of itself. Opposition is the best mordant to fix the color of your thought in the general belief.

It is time to bring these crowded remarks to a close. The day has been when at the beginning of a course of Lectures I should have thought it fitting to exhort you to diligence and entire devotion to your tasks as students. It is not so now. The young man who has not heard the clarion-voices of honor and of duty now sounding throughout the land, will heed no word of mine. In the camp or the city, in the field or the hospital, under sheltering roof, or half-protecting canvas, or open sky, shedding our own blood or stanching that of our wounded defenders, students or teachers, whatever our calling and our ability, we belong, not to ourselves, but to our imperilled country, whose danger is our calamity, whose ruin would be our enslavement, whose rescue shall be our earthly salvation!

SCHOLASTIC AND BEDSIDE TEACHING.

An Introductory Lecture delivered before the Medical Class of Harvard University, November 6, 1867.

The idea is entertained by some of our most sincere professional brethren, that to lengthen and multiply our Winter Lectures will be of necessity to advance the cause of medical education. It is a fair subject for consideration whether they do not overrate the relative importance of that particular mode of instruction which forms the larger part of these courses.

As this School could only lengthen its lecture term at the expense of its "Summer Session," in which more direct, personal, and familiar teaching takes the place of our academic discourses, and in which more time can be given to hospitals, infirmaries, and practical instruction in various important specialties, whatever might be gained, a good deal would certainly be lost in our case by the exchange.

The most essential part of a student's instruction is obtained, as I believe, not in the lecture-room, but at the bedside. Nothing seen there is lost; the rhythms of disease are learned by frequent repetition; its unforeseen occurrences stamp themselves indelibly in the memory. Before the student is aware of what he has acquired, he has learned the aspects and course and probable issue of the diseases he has seen with his teacher, and the proper mode of dealing with them, so far as his master knows it. On the other hand, our ex cathedra prelections have a strong tendency to run into details which, however interesting they may be to ourselves and a few of our more curious listeners, have nothing in them which will ever be of use to the student as a practitioner. It is a perfectly fair question whether I and some other American Professors do not teach quite enough that is useless already. Is it not well to remind the student from time to time that a physician's business is to avert disease, to heal the sick, to prolong life, and to diminish suffering? Is it not true that the young man of average ability will find it as much as he can do to fit himself for these simple duties? Is it not best to begin, at any rate, by making sure of such knowledge as he will require in his daily walk, by no means discouraging him from any study for which his genius fits him when he once feels that he has become master of his chosen art.

I know that many branches of science are of the greatest value as feeders of our medical reservoirs. But the practising physician's office is to draw the healing waters, and while he gives his time to this labor he can hardly be expected to explore all the sources that spread themselves over the wide domain of science. The traveller who would not drink of the Nile until he had tracked it to its parent lakes, would be like to die of thirst; and the medical practitioner who would not use the results of many laborers in other departments without sharing their special toils, would find life far too short and art immeasurably too long.

We owe much to Chemistry, one of the most captivating as well as important of studies; but the medical man must as a general rule content himself with a clear view of its principles and a limited acquaintance with its facts; such especially as are pertinent to his pursuits. I am in little danger of underrating Anatomy or Physiology; but as each of these branches splits up into specialties, any one of which may take up a scientific life-time, I would have them taught with a certain judgment and reserve, so that they shall not crowd the more immediately practical branches. So of all the other ancillary and auxiliary kinds of knowledge, I would have them strictly subordinated to that particular kind of knowledge for which the community looks to its medical advisers.

A medical school is not a scientific school, except just so far as medicine itself is a science. On the natural history side, medicine is a science; on the curative side, chiefly an art. This is implied in Hufeland's aphorism: "The physician must generalize the disease and individualize the patient."

The coordinated and classified results of empirical observation, in distinction from scientific experiment, have furnished almost all we know about food, the medicine of health, and medicine, the food of sickness. We eat the root of the *Solanum tuberosum* and throw away its fruit; we eat the fruit of the *Solanum Lycopersicum* and throw away its root. Nothing but vulgar experience has taught us to reject the potato ball and cook the tomato. So of most of our remedies. The subchloride of mercury, calomel, is the great British

specific; the protochloride of mercury, corrosive sublimate, kills like arsenic, but no chemist could have told us it would be so.

From observations like these we can obtain certain principles from which we can argue deductively to facts of a like nature, but the process is limited, and we are suspicious of all reasoning in that direction applied to the processes of healthy and diseased life. We are continually appealing to special facts. We are willing to give Liebig's artificial milk when we cannot do better, but we watch the child anxiously whose wet-nurse is a chemist's pipkin. A pair of substantial mammary glands has the advantage over the two hemispheres of the most learned Professor's brain, in the art of compounding a nutritious fluid for infants.

The bedside is always the true centre of medical teaching. Certain branches must be taught in the lecture-room, and will necessarily involve a good deal that is not directly useful to the future practitioner. But the over ambitious and active student must not be led away by the seduction of knowledge for its own sake from his principal pursuit. The humble beginner, who is alarmed at the vast fields of knowledge opened to him, may be encouraged by the assurance that with a very slender provision of science, in distinction from practical skill, he may be a useful and acceptable member of the profession to which the health of the community is intrusted.

To those who are not to engage in practice, the various pursuits of science hardly require to be commended. Only they must not be disappointed if they find many subjects treated in our courses as a medical class requires, rather than as a scientific class would expect, that is, with special limitations and constant reference to practical ends. Fortunately they are within easy reach of the highest scientific instruction. The business of a school like this is to make useful working physicians, and to succeed in this it is almost as important not to overcrowd the mind of the pupil with merely curious knowledge as it is to store it with useful information.

In this direction I have written my lecture, not to undervalue any form of scientific labor in its place, an unworthy thought from which I hope I need not defend myself,—but to discourage any undue inflation of the scholastic programme, which even now asks more of the student than the teacher is able to obtain from the great majority of those who present themselves for examination. I wish to take a hint in education from the Secretary of the Massachusetts Board of Agriculture, who regards the cultivation of too much land as a great defect in our New England farming. I hope that our Medical Institutions may never lay themselves open to the kind of accusation Mr. Lowe brings against the English Universities, when he says that their education is made up “of words that few understand and most will shortly forget; of arts that can never be used, if indeed they can even be learnt; of histories inapplicable to our times; of languages dead and even mouldy; of grammatical rules that never had living use and are only post mortem examinations; and of statements fagoted with utter disregard of their comparative value.”

This general thought will be kept in view throughout my somewhat discursive address, which will begin with an imaginary clinical lesson from the lips of an historical personage, and close with the portrait from real life of one who, both as teacher and practitioner, was long loved and honored among us. If I somewhat overrun my hour, you must pardon me, for I can say with Pascal that I have not had the time to make my lecture shorter.

In the year 1647, that good man John Eliot, commonly called the Apostle Eliot, writing to Mr. Thomas Shepherd, the pious minister of Cambridge, referring to the great need of medical instruction for the Indians, used these words:

“I have thought in my heart that it were a singular good work, if the Lord would stirre up the hearts of some or other of his people in England to give some maintenance toward some Schoole or Collegiate exercise this way, wherein there should be Anatomies and other instructions that way, and where there might be some recompence given to any that should bring in any vegetable or other thing that is vertuous in the way of Physick.

“There is another reason which moves my thought and desires this way, namely that our young students in Physick may be trained up better then they yet bee, who have onely theoreticall knowledge, and are forced to fall to practise before ever they saw an Anatomy made, or duely trained up in making experiments, for we never had but one Anatomy in the countrey, which Mr. Giles Firman [Firmin] now in England, did make and read upon very well, but no more of that now.”

Since the time of the Apostle Eliot the Lord has stirred up the hearts of our people to the building of many Schools and Colleges where medicine is taught in all its branches. Mr. Giles Firmin's “Anatomy” may be considered the first ancestor of a long line of skeletons which have been dangling and rattling in our lecture-rooms for more than a century.

Teaching in New England in 1647 was a grave but simple matter. A single person, combining in many cases, as in that of Mr. Giles Firmin, the offices of physician and preacher, taught what he knew to a few disciples whom he gathered about him. Of the making of that “Anatomy” on which my first predecessor in the branch I teach “did read very well” we can know nothing. The body of some poor wretch who had swung upon the gallows, was probably conveyed by night to some lonely dwelling at the outskirts of the village, and there by the light of flaring torches hastily dissected by hands that trembled over the unwonted task. And ever and anon the master turned to his book, as he laid bare the mysteries of the hidden organs; to his precious Vesalius, it might be, or his figures repeated in the multifarious volume of Ambroise Pare; to the Aldine octavo in which Fallopius recorded his fresh observations; or that giant folio of Spigelius just issued from the press of Amsterdam, in which lovely ladies display their viscera with a coquettish grace implying that it is rather a pleasure than otherwise to show the lace-like omentum, and hold up their appendices epiploicae as if they were saying “these are our jewels.”

His teaching of medicine was no doubt chiefly clinical, and received with the same kind of faith as that which accepted his words from the pulpit. His notions of disease were based on what he had observed, seen always in the light of the traditional doctrines in which he was bred. His discourse savored of the weighty doctrines of Hippocrates, diluted by the subtle speculations of Galen, reinforced by the curious comments of the Arabian schoolmen as they were conveyed in the mellifluous language of Fernelius, blended, it may be,

with something of the lofty mysticism of Van Helmont, and perhaps stealing a flavor of that earlier form of Homoeopathy which had lately come to light in Sir Kenelm Digby's "Discourse concerning the Cure of Wounds by the Sympathetic Powder."

His Pathology was mythology. A malformed foetus, as the readers of Winthrop's Journal may remember, was enough to scare the colonists from their propriety, and suggest the gravest fears of portended disaster. The student of the seventeenth century opened his Licetus and saw figures of a lion with the head of a woman, and a man with the head of an elephant. He had offered to his gaze, as born of a human mother, the effigy of a winged cherub, a pteroccephalous specimen, which our Professor of Pathological Anatomy would hardly know whether to treat with the reverence due to its celestial aspect, or to imprison in one of his immortalizing jars of alcohol.

His pharmacopoeia consisted mainly of simples, such as the venerable "Herball" of Gerard describes and figures in abounding affluence. St. John's wort and Clown's All-heal, with Spurge and Fennel, Saffron and Parsley, Elder and Snake-root, with opium in some form, and roasted rhubarb and the Four Great Cold Seeds, and the two Resins, of which it used to be said that whatever the Tacamahaca has not cured, the Caranna will, with the more familiar Scammony and Jalap and Black Hellebore, made up a good part of his probable list of remedies. He would have ordered Iron now and then, and possibly an occasional dose of Antimony. He would perhaps have had a rheumatic patient wrapped in the skin of a wolf or a wild cat, and in case of a malignant fever with "purples" or petechiae, or of an obstinate king's evil, he might have prescribed a certain black powder, which had been made by calcining toads in an earthen pot; a choice remedy, taken internally, or applied to any outward grief.

Except for the toad-powder and the peremptory drastics, one might have borne up against this herb doctoring as well as against some more modern styles of medication. Barbeyrac and his scholar Sydenham had not yet cleansed the Pharmacopoeia of its perilous stuff, but there is no doubt that the more sensible physicians of that day knew well enough that a good honest herb-tea which amused the patient and his nurses was all that was required to carry him through all common disorders.

The student soon learned the physiognomy of disease by going about with his master; fevers, pleurisies, asthmas, dropsies, fluxes, small-pox, sore-throats, measles, consumptions. He saw what was done for them. He put up the medicines, gathered the herbs, and so learned something of materia medico and botany. He learned these few things easily and well, for he could give his whole attention to them. Chirurgery was a separate specialty. Women in child-birth were cared for by midwives. There was no chemistry deserving the name to require his study. He did not learn a great deal, perhaps, but what he did learn was his business, namely, how to take care of sick people.

Let me give you a picture of the old-fashioned way of instruction, by carrying you with me in imagination in the company of worthy Master Giles Firmin as he makes his round of visits among the good folk of Ipswich, followed by his one student, who shall answer to the scriptural name of Luke. It will not be for entertainment chiefly, but to illustrate the one mode of teaching which can never be superseded, and which, I venture to say, is more important than all the rest put together. The student is a green hand, as you will perceive.

In the first dwelling they come to, a stout fellow is bellowing with colic.

"He will die, Master, of a surety, methinks," says the timid youth in a whisper.

"Nay, Luke," the Master answers, "'t is but a dry belly-ache. Didst thou not mark that he stayed his roaring when I did press hard over the lesser bowels? Note that he hath not the pulse of them with fevers, and by what Dorcas telleth me there hath been no long shutting up of the vice naturales. We will steep certain comforting herbs which I will shew thee, and put them in a bag and lay them on his belly. Likewise he shall have my cordial julep with a portion of this confection which we do call Theriaca Andromachi, which hath juice of poppy in it, and is a great stayer of anguish. This fellow is at his prayers to-day, but I warrant thee he shall be swearing with the best of them to-morrow."

They jog along the bridle-path on their horses until they come to another lowly dwelling. They sit a while with a delicate looking girl in whom the ingenuous youth naturally takes a special interest. The good physician talks cheerfully with her, asks her a few questions. Then to her mother: "Good-wife, Margaret hath somewhat profited, as she telleth, by the goat's milk she hath taken night and morning. Do thou pluck a maniple—that is an handful—of the plant called Maidenhair, and make a syrup therewith as I have shewed thee. Let her take a cup full of the same, fasting, before she sleepeth, also before she riseth from her bed." And so they leave the house.

"What thinkest thou, Luke, of the maid we have been visiting?" "She seemeth not much ailing, Master, according to my poor judgment. For she did say she was better. And she had a red cheek and a bright eye, and she spake of being soon able to walk unto the meeting, and did seem greatly hopeful, but spare of flesh, methought, and her voice something hoarse, as of one that hath a defluxion, with some small coughing from a cold, as she did say. Speak I not truly, Master, that she will be well speedily?"

"Yea, Luke, I do think she shall be well, and mayhap speedily. But it is not here with us she shall be well. For that redness of the cheek is but the sign of the fever which, after the Grecians, we do call the hectic; and that shining of the eyes is but a sickly glazing, and they which do every day get better and likewise thinner and weaker shall find that way leadeth to the church-yard gate. This is the malady which the ancients did call tubes, or the wasting disease, and some do name the consumption. A disease whereof most that fall ailing do perish. This Margaret is not long for earth—but she knoweth it not, and still hopeth."

"Why, then, Master, didst thou give her of thy medicine, seeing that her ail is unto death?"

"Thou shalt learn, boy, that they which are sick must have somewhat wherewith to busy their thoughts. There be some who do give these tabid or consumptives a certain posset made with lime-water and anise and liquorice and raisins of the sun, and there be other some who do give the juice of craw-fishes boiled in barley-water with chicken-broth, but these be toys, as I do think, and ye shall find as good virtue, nay better, in this syrup of the simple called Maidenhair."

Something after this manner might Master Giles Firmin have delivered his clinical instructions. Somewhat in this way, a century and a half later, another New England physician, Dr. Edward Augustus Holyoke, taught

a young man who came to study with him, a very diligent and intelligent youth, James Jackson by name, the same whose portrait in his advanced years hangs upon this wall, long the honored Professor of Theory and Practice in this Institution, of whom I shall say something in this Lecture. Our venerated Teacher studied assiduously afterwards in the great London Hospitals, but I think he used to quote his "old Master" ten times where he quoted Mr. Cline or Dr. Woodville once.

When I compare this direct transfer of the practical experience of a wise man into the mind of a student,—every fact one that he can use in the battle of life and death,—with the far off, unserviceable "scientific" truths that I and some others are in the habit of teaching, I cannot help asking myself whether, if we concede that our forefathers taught too little, there is not—a possibility that we may sometimes attempt to teach too much. I almost blush when I think of myself as describing the eight several facets on two slender processes of the palate bone, or the seven little twigs that branch off from the minute tympanic nerve, and I wonder whether my excellent colleague feels in the same way when he pictures himself as giving the constitution of neurin, which as he and I know very well is that of the hydrate of trimethyle-oxethyle-ammonium, or the formula for the production of alloxan, which, though none but the Professors and older students can be expected to remember it, is $C_{10}H_4N_4O_6 + 2HO, NO_5 = C_8H_4N_2O_{10} + 2CO_2 + N_2 + NH_4O, NO_5$.

I can bear the voice of some rough iconoclast addressing the Anatomist and the Chemist in tones of contemptuous indignation: "What is this stuff with which you are cramming the brains of young men who are to hold the lives of the community in their hands? Here is a man fallen in a fit; you can tell me all about the eight surfaces of the two processes of the palate bone, but you have not had the sense to loosen that man's neck-cloth, and the old women are all calling you a fool? Here is a fellow that has just swallowed poison. I want something to turn his stomach inside out at the shortest notice. Oh, you have forgotten the dose of the sulphate of zinc, but you remember the formula for the production of alloxan!"

"Look you, Master Doctor,—if I go to a carpenter to come and stop a leak in my roof that is flooding the house, do you suppose I care whether he is a botanist or not? Cannot a man work in wood without knowing all about endogens and exogens, or must he attend Professor Gray's Lectures before he can be trusted to make a box-trap? If my horse casts a shoe, do you think I will not trust a blacksmith to shoe him until I have made sure that he is sound on the distinction between the sesquioxide and the protosesquioxide of iron?"

—But my scientific labor is to lead to useful results by and by, in the next generation, or in some possible remote future.—

"Diavolo!" as your Dr. Rabelais has it,—answers the iconoclast,—“what is that to me and my colic, to me and my strangury? I pay the Captain of the Cunard steamship to carry me quickly and safely to Liverpool, not to make a chart of the Atlantic for after voyagers! If Professor Peirce undertakes to pilot me into Boston Harbor and runs me on Cohasset rocks, what answer is it to tell me that he is Superintendent of the Coast Survey? No, Sir! I want a plain man in a pea-jacket and a sou'wester, who knows the channel of Boston Harbor, and the rocks of Boston Harbor, and the distinguished Professor is quite of my mind as to the matter, for I took the pains to ask him before I ventured to use his name in the way of illustration.”

I do not know how the remarks of the image-breaker may strike others, but I feel that they put me on my defence with regard to much of my teaching. Some years ago I ventured to show in an introductory Lecture how very small a proportion of the anatomical facts taught in a regular course, as delivered by myself and others, had any practical bearing whatever on the treatment of disease. How can I, how can any medical teacher justify himself in teaching anything that is not like to be of practical use to a class of young men who are to hold in their hands the balance in which life and death, ease and anguish, happiness and wretchedness are to be daily weighed?

I hope we are not all wrong. Oftentimes in finding how sadly ignorant of really essential and vital facts and rules were some of those whom we had been larding with the choicest scraps of science, I have doubted whether the old one-man system of teaching, when the one man was of the right sort, did not turn out better working physicians than our more elaborate method. The best practitioner I ever knew was mainly shaped to excellence in that way. I can understand perfectly the regrets of my friend Dr. John Brown of Edinburgh, for the good that was lost with the old apprenticeship system. I understand as well Dr. Latham's fear "that many men of the best abilities and good education will be deterred from prosecuting physic as a profession, in consequence of the necessity indiscriminately laid upon all for impossible attainments."

I feel therefore impelled to say a very few words in defence of that system of teaching adopted in our Colleges, by which we wish to supplement and complete the instruction given by private individuals or by what are often called Summer Schools.

The reason why we teach so much that is not practical and in itself useful, is because we find that the easiest way of teaching what is practical and useful. If we could in any way eliminate all that would help a man to deal successfully with disease, and teach it by itself so that it should be as tenaciously rooted in the memory, as easily summoned when wanted, as fertile in suggestion of related facts, as satisfactory to the peremptory demands of the intelligence as if taught in its scientific connections, I think it would be our duty so to teach the momentous truths of medicine, and to regard all useless additions as an intrusion on the time which should be otherwise occupied.

But we cannot successfully eliminate and teach by itself that which is purely practical. The easiest and surest way of acquiring facts is to learn them in groups, in systems, and systematized knowledge is science. You can very often carry two facts fastened together more easily than one by itself, as a housemaid can carry two pails of water with a hoop more easily than one without it. You can remember a man's face, made up of many features, better than you can his nose or his mouth or his eye-brow. Scores of proverbs show you that you can remember two lines that rhyme better than one without the jingle. The ancients, who knew the laws of memory, grouped the seven cities that contended for the honor of being Homer's birthplace in a line thus given by Aulus Gellius:

Smurna, Rodos, Colophon, Salamin, Ios, Argos, Athenai.

I remember, in the earlier political days of Martin Van Buren, that Colonel Stone, of the "New York Commercial," or one of his correspondents, said that six towns of New York would claim in the same way to

have been the birth-place of the "Little Magician," as he was then called; and thus he gave their names, any one of which I should long ago have forgotten, but which as a group have stuck tight in my memory from that day to this;

Catskill, Saugerties, Redhook, Kinderhook, Scaghticoke, Schodac.

If the memory gains so much by mere rhythmical association, how much more will it gain when isolated facts are brought together under laws and principles, when organs are examined in their natural connections, when structure is coupled with function, and healthy and diseased action are studied as they pass one into the other! Systematic, or scientific study is invaluable as supplying a natural kind of mnemonics, if for nothing else. You cannot properly learn the facts you want from Anatomy and Chemistry in any way so easily as by taking them in their regular order, with other allied facts, only there must be common sense exercised in leaving out a great deal which belongs to each of the two branches as pure science. The dullest of teachers is the one who does not know what to omit.

The larger aim of scientific training is to furnish you with principles to which you will be able to refer isolated facts, and so bring these within the range of recorded experience. See what the "London Times" said about the three Germans who cracked open John Bull Chatwood's strong-box at the Fair the other day, while the three Englishmen hammered away in vain at Brother Jonathan Herring's. The Englishmen represented brute force. The Germans had been trained to appreciate principle. The Englishman "knows his business by rote and rule of thumb"—science, which would "teach him to do in an hour what has hitherto occupied him two hours," "is in a manner forbidden to him." To this cause the "Times" attributes the falling off of English workmen in comparison with those of the Continent.

Granting all this, we must not expect too much from "science" as distinguished from common experience. There are ten thousand experimenters without special apparatus for every one in the laboratory. Accident is the great chemist and toxicologist. Battle is the great vivisector. Hunger has instituted researches on food such as no Liebig, no Academic Commission has ever recorded.

Medicine, sometimes impertinently, often ignorantly, often carelessly called "allopathy," appropriates everything from every source that can be of the slightest use to anybody who is ailing in any way, or like to be ailing from any cause. It learned from a monk how to use antimony, from a Jesuit how to cure agues, from a friar how to cut for stone, from a soldier how to treat gout, from a sailor how to keep off scurvy, from a postmaster how to sound the Eustachian tube, from a dairy-maid how to prevent small-pox, and from an old market-woman how to catch the itch-insect. It borrowed acupuncture and the moxa from the Japanese heathen, and was taught the use of lobelia by the American savage. It stands ready to-day to accept anything from any theorist, from any empiric who can make out a good case for his discovery or his remedy. "Science" is one of its benefactors, but only one, out of many. Ask the wisest practising physician you know, what branches of science help him habitually, and what amount of knowledge relating to each branch he requires for his professional duties. He will tell you that scientific training has a value independent of all the special knowledge acquired. He will tell you that many facts are explained by studying them in the wider range of related facts to which they belong. He will gratefully recognize that the anatomist has furnished him with indispensable data, that the physiologist has sometimes put him on the track of new modes of treatment, that the chemist has isolated the active principles of his medicines, has taught him how to combine them, has from time to time offered him new remedial agencies, and so of others of his allies. But he will also tell you, if I am not mistaken, that his own branch of knowledge is so extensive and so perplexing that he must accept most of his facts ready made at their hands. He will own to you that in the struggle for life which goes on day and night in our thoughts as in the outside world of nature, much that he learned under the name of science has died out, and that simple homely experience has largely taken the place of that scholastic knowledge to which he and perhaps some of his instructors once attached a paramount importance.

This, then, is my view of scientific training as conducted in courses such as you are entering on. Up to a certain point I believe in set Lectures as excellent adjuncts to what is far more important, practical instruction at the bedside, in the operating room, and under the eye of the Demonstrator. But I am so far from wishing these courses extended, that I think some of them—suppose I say my own—would almost bear curtailing. Do you want me to describe more branches of the sciatic and crural nerves? I can take Fischer's plates, and lecturing on that scale fill up my whole course and not finish the nerves alone. We must stop somewhere, and for my own part I think the scholastic exercises of our colleges have already claimed their full share of the student's time without our seeking to extend them.

I trust I have vindicated the apparent inconsequence of teaching young students a good deal that seems at first sight profitless, but which helps them to learn and retain what is profitable. But this is an inquisitive age, and if we insist on piling up beyond a certain height knowledge which is in itself mere trash and lumber to a man whose life is to be one long fight with death and disease, there will be some sharp questions asked by and by, and our quick-witted people will perhaps find they can get along as well without the professor's cap as without the bishop's mitre and the monarch's crown.

I myself have nothing to do with clinical teaching. Yet I do not hesitate to say it is more essential than all the rest put together, so far as the ordinary practice of medicine is concerned; and this is by far the most important thing to be learned, because it deals with so many more lives than any other branch of the profession. So of personal instruction, such as we give and others give in the interval of lectures, much of it at the bedside, some of it in the laboratory, some in the microscope-room, some in the recitation-room, I think it has many advantages of its own over the winter course, and I do not wish to see it shortened for the sake of prolonging what seems to me long enough already.

If I am jealous of the tendency to expand the time given to the acquisition of curious knowledge, at the expense of the plain old-fashioned bedside teachings, I only share the feeling which Sydenham expressed two hundred years ago, using an image I have already borrowed. "He would be no honest and successful pilot who was to apply himself with less industry to avoid rocks and sands and bring his vessel safely home, than to search into the causes of the ebbing and flowing of the sea, which, though very well for a philosopher, is foreign to him whose business it is to secure the ship. So neither will a physician, whose province it is to cure diseases, be able to do so, though he be a person of great genius, who bestows less time on the hidden and

intricate method of nature, and adapting his means thereto, than on curious and subtle speculation."

"Medicine is my wife and Science is my mistress," said Dr. Rush. I do not think that the breach of the seventh commandment can be shown to have been of advantage to the legitimate owner of his affections. Read what Dr. Elisha Bartlett says of him as a practitioner, or ask one of our own honored ex-professors, who studied under him, whether Dr. Rush had ever learned the meaning of that saying of Lord Bacon, that man is the minister and interpreter of Nature, or whether he did not speak habitually of Nature as an intruder in the sick room, from which his art was to expel her as an incompetent and a meddler.

All a man's powers are not too much for such a profession as Medicine. "He is a learned man," said old Parson Emmons of Franklin, "who understands one subject, and he is a very learned man who understands two subjects." Schonbein says he has been studying oxygen for thirty years. Mitscherlich said it took fourteen years to establish a new fact in chemistry. Aubrey says of Harvey, the discoverer of the circulation, that "though all his profession would allow him to be an excellent anatomist, I have never heard of any who admired his therapeutic way." My learned and excellent friend before referred to, Dr. Brown of Edinburgh, from whose very lively and sensible Essay, "Locke and Sydenham," I have borrowed several of my citations, contrasts Sir Charles Bell, the discoverer, the man of science, with Dr. Abercrombie, the master in the diagnosis and treatment of disease. It is through one of the rarest of combinations that we have in our Faculty a teacher on whom the scientific mantle of Bell has fallen, and who yet stands preeminent in the practical treatment of the class of diseases which his inventive and ardent experimental genius has illustrated. M. Brown-Sequard's example is as eloquent as his teaching in proof of the advantages of well directed scientific investigation. But those who emulate his success at once as a discoverer and a practitioner must be content like him to limit their field of practice. The highest genius cannot afford in our time to forget the ancient precept, *Divide et impera*.

"I suppose I must go and earn this guinea," said a medical man who was sent for while he was dissecting an animal. I should not have cared to be his patient. His dissection would do me no good, and his thoughts would be too much upon it. I want a whole man for my doctor, not a half one. I would have sent for a humbler practitioner, who would have given himself entirely to me, and told the other—who was no less a man than John Hunter—to go on and finish the dissection of his tiger.

Sydenham's "Read Don Quixote" should be addressed not to the student, but to the Professor of today. Aimed at him it means, "Do not be too learned."

Do not think you are going to lecture to picked young men who are training themselves to be scientific discoverers. They are of fair average capacity, and they are going to be working doctors.

These young men are to have some very serious vital facts to deal with. I will mention a few of them.

Every other resident adult you meet in these streets is or will be more or less tuberculous. This is not an extravagant estimate, as very nearly one third of the deaths of adults in Boston last year were from phthisis. If the relative number is less in our other northern cities, it is probably in a great measure because they are more unhealthy; that is, they have as much, or nearly as much, consumption, but they have more fevers or other fatal diseases.

These heavy-eyed men with the alcoholized brains, these pallid youths with the nicotized optic ganglia and thinking-marrows brown as their own meerschaums, of whom you meet too many,—will ask all your wisdom to deal with their poisoned nerves and their enfeebled wills.

Nearly seventeen hundred children under five years of age died last year in this city. A poor human article, no doubt, in many cases, still, worth an attempt to save them, especially when we remember the effect of Dr. Clarke's suggestion at the Dublin Hospital, by which some twenty-five or thirty thousand children's lives have probably been saved in a single city.

Again, the complaint is often heard that the native population is not increasing so rapidly as in former generations. The breeding and nursing period of American women is one of peculiar delicacy and frequent infirmity. Many of them must require a considerable interval between the reproductive efforts, to repair damages and regain strength. This matter is not to be decided by an appeal to unschooled nature. It is the same question as that of the deformed pelvis,—one of degree. The facts of mal-vitalization are as much to be attended to as those of mal-formation. If the woman with a twisted pelvis is to be considered an exempt, the woman with a defective organization should be recognized as belonging to the invalid corps. We shudder to hear what is alleged as to the prevalence of criminal practices; if back of these there can be shown organic incapacity or overtaxing of too limited powers, the facts belong to the province of the practical physician, as well as of the moralist and the legislator, and require his gravest consideration.

Take the important question of bleeding. Is venesection done with forever? Six years ago it was said here in an introductory Lecture that it would doubtless come back again sooner or later. A fortnight ago I found myself in the cars with one of the most sensible and esteemed practitioners in New England. He took out his wallet and showed me two lancets, which he carried with him; he had never given up their use. This is a point you will have to consider.

Or, to mention one out of many questionable remedies, shall you give *Veratrum Viride* in fevers and inflammations? It makes the pulse slower in these affections. Then the presumption would naturally be that it does harm. The caution with reference to it on this ground was long ago recorded in the Lecture above referred to. See what Dr. John Hughes Bennett says of it in the recent edition of his work on Medicine. Nothing but the most careful clinical experience can settle this and such points of treatment.

These are all practical questions—questions of life and death, and every day will be full of just such questions. Take the problem of climate. A patient comes to you with asthma and wants to know where he can breathe; another comes to you with phthisis and wants to know where he can live. What boy's play is nine tenths of all that is taught in many a pretentious course of lectures, compared with what an accurate and extensive knowledge of the advantages and disadvantages of different residences in these and other complaints would be to a practising physician.

I saw the other day a gentleman living in Canada, who had spent seven successive winters in Egypt, with the entire relief of certain obscure thoracic symptoms which troubled him while at home. I saw, two months

ago, another gentleman from Minnesota, an observer and a man of sense, who considered that State as the great sanatorium for all pulmonary complaints. If half our grown population are or will be more or less tuberculous, the question of colonizing Florida assumes a new aspect. Even within the borders of our own State, the very interesting researches of Dr. Bowditch show that there is a great variation in the amount of tuberculous disease in different towns, apparently connected with local conditions. The hygienic map of a State is quite as valuable as its geological map, and it is the business of every practising physician to know it thoroughly. They understand this in England, and send a patient with a dry irritating cough to Torquay or Penzance, while they send another with relaxed bronchial membranes to Clifton or Brighton. Here is another great field for practical study.

So as to the all-important question of diet. "Of all the means of cure at our command," says Dr. Bennett, "a regulation of the quantity and quality of the diet is by far the most powerful." Dr. MacCormac would perhaps except the air we breathe, for he thinks that impure air, especially in sleeping rooms, is the great cause of tubercle. It is sufficiently proved that the American,—the New Englander,—the Bostonian, can breed strong and sound children, generation after generation,—nay, I have shown by the record of a particular family that vital losses may be retrieved, and a feeble race grow to lusty vigor in this very climate and locality. Is not the question why our young men and women so often break down, and how they can be kept from breaking down, far more important for physicians to settle than whether there is one cranial vertebra, or whether there are four, or none?

—But I have a taste for the homologies, I want to go deeply into the subject of embryology, I want to analyze the protonihilates precipitated from pigeon's milk by the action of the lunar spectrum,—shall I not follow my star,—shall I not obey my instinct,—shall I not give myself to the lofty pursuits of science for its own sake?

Certainly you may, if you like. But take down your sign, or never put it up. That is the way Dr. Owen and Dr. Huxley, Dr. Agassiz and Dr. Jeffries Wyman, Dr. Gray and Dr. Charles T. Jackson settled the difficulty. We all admire the achievements of this band of distinguished doctors who do not practise. But we say of their work and of all pure science, as the French officer said of the charge of the six hundred at Balaclava, "*C'est magnifique, mais ce n'est pas la guerre,*"—it is very splendid, but it is not a practising doctor's business. His patient has a right to the cream of his life and not merely to the thin milk that is left after "science" has skimmed it off. The best a physician can give is never too good for the patient.

It is often a disadvantage to a young practitioner to be known for any accomplishment outside of his profession. Haller lost his election as Physician to the Hospital in his native city of Berne, principally on the ground that he was a poet. In his later years the physician may venture more boldly. Astruc was sixty-nine years old when he published his "Conjectures," the first attempt, we are told, to decide the authorship of the Pentateuch showing anything like a discerning criticism. Sir Benjamin Brodie was seventy years old before he left his physiological and surgical studies to indulge in psychological speculations. The period of pupilage will be busy enough in acquiring the knowledge needed, and the season of active practice will leave little leisure for any but professional studies.

Dr. Graves of Dublin, one of the first clinical teachers of our time, always insisted on his students' beginning at once to visit the hospital. At the bedside the student must learn to treat disease, and just as certainly as we spin out and multiply our academic prelections we shall work in more and more stuffing, more and more rubbish, more and more irrelevant, useless detail which the student will get rid of just as soon as he leaves us. Then the next thing will be a new organization, with an examining board of first-rate practical men, who will ask the candidate questions that mean business,—who will make him operate if he is to be a surgeon, and try him at the bedside if he is to be a physician,—and not puzzle him with scientific conundrums which not more than one of the questioners could answer himself or ever heard of since he graduated.

Or these women who are hammering at the gates on which is written "No admittance for the mothers of mankind," will by and by organize an institution, which starting from that skilful kind of nursing which Florence Nightingale taught so well, will work backwards through anodynes, palliatives, curatives, preventives, until with little show of science it imparts most of what is most valuable in those branches of the healing art it professes to teach. When that time comes, the fitness of women for certain medical duties, which Hecquet advocated in 1708, which Douglas maintained in 1736, which Dr. John Ware, long the honored Professor of Theory and Practice in this Institution, upheld within our own recollection in the face of his own recorded opinion to the contrary, will very possibly be recognized.

My advice to every teacher less experienced than myself would be, therefore: Do not fret over the details you have to omit; you probably teach altogether too many as it is. Individuals may learn a thing with once hearing it, but the only way of teaching a whole class is by enormous repetition, representation, and illustration in all possible forms. Now and then you will have a young man on your benches like the late Waldo Burnett,—not very often, if you lecture half a century. You cannot pretend to lecture chiefly for men like that,—a Mississippi raft might as well take an ocean-steamer in tow. To meet his wants you would have to leave the rest of your class behind and that you must not do. President Allen of Jefferson College says that his instruction has been successful in proportion as it has been elementary. It may be a humiliating statement, but it is one which I have found true in my own experience.

To the student I would say, that however plain and simple may be our teaching, he must expect to forget much which he follows intelligently in the lecture-room. But it is not the same as if he had never learned it. A man must get a thing before he can forget it. There is a great world of ideas we cannot voluntarily recall,—they are outside the limits of the will. But they sway our conscious thought as the unseen planets influence the movements of those within the sphere of vision. No man knows how much he knows,—how many ideas he has,—any more than he knows how many blood-globules roll in his veins. Sometimes accident brings back here and there one, but the mind is full of irrevocable remembrances and unthinkable thoughts, which take a part in all its judgments as indestructible forces. Some of you must feel your scientific deficiencies painfully after your best efforts. But every one can acquire what is most essential. A man of very moderate ability may be a good physician, if he devotes himself faithfully to the work. More than this, a positively dull man, in the ordinary acceptation of the term, sometimes makes a safer practitioner than one who has, we will say, five

per cent. more brains than his average neighbor, but who thinks it is fifty per cent. more. Skulls belonging to this last variety of the human race are more common, I may remark, than specimens like the Neanderthal cranium, a cast of which you will find on the table in the Museum.

Whether the average talent be high or low, the Colleges of the land must make the best commodity they can out of such material as the country and the cities furnish them. The community must have Doctors as it must have bread. It uses up its Doctors just as it wears out its shoes, and requires new ones. All the bread need not be French rolls, all the shoes need not be patent leather ones; but the bread must be something that can be eaten, and the shoes must be something that can be worn. Life must somehow find food for the two forces that rub everything to pieces, or burn it to ashes,—friction and oxygen. Doctors are oxydable products, and the schools must keep furnishing new ones as the old ones turn into oxyds; some of first-rate quality that burn with a great light, some of a lower grade of brilliancy, some honestly, unmistakably, by the grace of God, of moderate gifts, or in simpler phrase, dull.

The public will give every honest and reasonably competent worker in the healing art a hearty welcome. It is on the whole very loyal to the Medical Profession. Three successive years have borne witness to the feeling with which this Institution, representing it in its educational aspect, is regarded by those who are themselves most honored and esteemed. The great Master of Natural Science bade the last year's class farewell in our behalf, in those accents which delight every audience. The Head of our ancient University honored us in the same way in the preceding season. And how can we forget that other occasion when the Chief Magistrate of the Commonwealth, that noble citizen whom we have just lost, large-souled, sweet-natured, always ready for every kind office, came among us at our bidding, and talked to us of our duties in words as full of wisdom as his heart was of goodness?

You have not much to fear, I think, from the fancy practitioners. The vulgar quackeries drop off, atrophied, one after another. Homoeopathy has long been encysted, and is carried on the body medical as quietly as an old wen. Every year gives you a more reasoning and reasonable people to deal with. See how it is in Literature. The dynasty of British dogmatists, after lasting a hundred years and more, is on its last legs. Thomas Carlyle, third in the line of descent, finds an audience very different from those which listened to the silver speech of Samuel Taylor Coleridge and the sonorous phrases of Samuel Johnson. We read him, we smile at his clotted English, his "swarmery" and other picturesque expressions, but we lay down his tirade as we do one of Dr. Cumming's interpretations of prophecy, which tells us that the world is coming to an end next week or next month, if the weather permits,—not otherwise,—feeling very sure that the weather will be unfavorable.

It is the same common-sense public you will appeal to. The less pretension you make, the better they will like you in the long run. I hope we shall make everything as plain and as simple to you as we can. I would never use a long word, even, where a short one would answer the purpose. I know there are professors in this country who "ligate" arteries. Other surgeons only tie them, and it stops the bleeding just as well. It is the familiarity and simplicity of bedside instruction which makes it so pleasant as well as so profitable. A good clinical teacher is himself a Medical School. We need not wonder that our young men are beginning to announce themselves not only as graduates of this or that College, but also as pupils of some one distinguished master.

I wish to close this Lecture, if you will allow me a few moments longer, with a brief sketch of an instructor and practitioner whose character was as nearly a model one in both capacities as I can find anywhere recorded.

Dr. JAMES JACKSON, Professor of the Theory and Practice of Medicine in this University from 1812 to 1846, and whose name has been since retained on our rolls as Professor Emeritus, died on the 27th of August last, in the ninetieth year of his age. He studied his profession, as I have already mentioned, with Dr. Holyoke of Salem, one of the few physicians who have borne witness to their knowledge of the laws of life by living to complete their hundredth year. I think the student took his Old Master, as he always loved to call him, as his model; each was worthy of the other, and both were bright examples to all who come after them.

I remember that in the sermon preached by Dr. Grazer after Dr. Holyoke's death, one of the points most insisted upon as characteristic of that wise and good old man was the perfect balance of all his faculties. The same harmonious adjustment of powers, the same symmetrical arrangement of life, the same complete fulfilment of every day's duties, without haste and without needless delay, which characterized the master, equally distinguished the scholar. A glance at the life of our own Old Master, if I can do any justice at all to his excellences, will give you something to carry away from this hour's meeting not unworthy to be remembered.

From December, 1797, to October, 1799, he remained with Dr. Holyoke as a student, a period which he has spoken of as a most interesting and most gratifying part of his life. After this he passed eight months in London, and on his return, in October, 1800, he began business in Boston.

He had followed Mr. Cline, as I have mentioned, and was competent to practise Surgery. But he found Dr. John Collins Warren had already occupied the ground which at that day hardly called for more than one leading practitioner, and wisely chose the Medical branch of the profession. He had only himself to rely upon, but he had confidence in his prospects, conscious, doubtless, of his own powers, knowing his own industry and determination, and being of an eminently cheerful and hopeful disposition. No better proof of his spirit can be given than that, just a year from the time when he began to practise as a physician, he took that eventful step which in such a man implies that he sees his way clear to a position; he married a lady blessed with many gifts, but not bringing him a fortune to paralyze his industry.

He had not miscalculated his chances in life. He very soon rose into a good practice, and began the founding of that reputation which grew with his years, until he stood by general consent at the head of his chosen branch of the profession, to say the least, in this city and in all this region of country. His skill and wisdom were the last tribunal to which the sick and suffering could appeal. The community trusted and loved him, the profession recognized him as the noblest type of the physician. The young men whom he had taught wandered through foreign hospitals; where they learned many things that were valuable, and many that were

curious; but as they grew older and began to think more of their ability to help the sick than their power of talking about phenomena, they began to look back to the teaching of Dr. Jackson, as he, after his London experience, looked back to that of Dr. Holyoke. And so it came to be at last that the bare mention of his name in any of our medical assemblies would call forth such a tribute of affectionate regard as is only yielded to age when it brings with it the record of a life spent in well doing.

No accident ever carries a man to eminence such as his in the medical profession. He who looks for it must want it earnestly and work for it vigorously; Nature must have qualified him in many ways, and education must have equipped him with various knowledge, or his reputation will evaporate before it reaches the noon-day blaze of fame. How did Dr. Jackson gain the position which all conceded to him? In the answer to this question some among you may find a key that shall unlock the gate opening on that fair field of the future of which all dream but which not all will ever reach.

First of all, he truly loved his profession. He had no intellectual ambitions outside of it, literary, scientific or political. To him it was occupation enough to apply at the bedside the best of all that he knew for the good of his patient; to protect the community against the inroads of pestilence; to teach the young all that he himself had been taught, with all that his own experience had added; to leave on record some of the most important results of his long observation.

With his patients he was so perfect at all points that it is hard to overpraise him. I have seen many noted British and French and American practitioners, but I never saw the man so altogether admirable at the bedside of the sick as Dr. James Jackson. His smile was itself a remedy better than the potable gold and the dissolved pearls that comforted the praecordia of mediaeval monarchs. Did a patient, alarmed without cause, need encouragement, it carried the sunshine of hope into his heart and put all his whims to flight, as David's harp cleared the haunted chamber of the sullen king. Had the hour come, not for encouragement, but for sympathy, his face, his voice, his manner all showed it, because his heart felt it. So gentle was he, so thoughtful, so calm, so absorbed in the case before him, not to turn round and look for a tribute to his sagacity, not to bolster himself in a favorite theory, but to find out all he could, and to weigh gravely and cautiously all that he found, that to follow him in his morning visit was not only to take a lesson in the healing art, it was learning how to learn, how to move, how to look, how to feel, if that can be learned. To visit with Dr. Jackson was a medical education.

He was very firm, with all his kindness. He would have the truth about his patients. The nurses found it out; and the shrewder ones never ventured to tell him anything but a straight story. A clinical dialogue between Dr. Jackson and Miss Rebecca Taylor, sometime nurse in the Massachusetts General Hospital, a mistress in her calling, was as good questioning and answering as one would be like to hear outside of the court-room.

Of his practice you can form an opinion from his book called "Letters to a Young Physician." Like all sensible men from the days of Hippocrates to the present, he knew that diet and regimen were more important than any drug or than all drugs put together. Witness his treatment of phthisis and of epilepsy. He retained, however, more confidence in some remedial agents than most of the younger generation would concede to them. Yet his materia medica was a simple one.

"When I first went to live with Dr. Holyoke," he says, "in 1797, showing me his shop, he said, 'There seems to you to be a great variety of medicines here, and that it will take you long to get acquainted with them, but most of them are unimportant. There are four which are equal to all the rest, namely, Mercury, Antimony, Bark and Opium.'" And Dr. Jackson adds, "I can only say of his practice, the longer I have lived, I have thought better and better of it." When he thought it necessary to give medicine, he gave it in earnest. He hated half-practice—giving a little of this or that, so as to be able to say that one had done something, in case a consultation was held, or a still more ominous event occurred. He would give opium, for instance, as boldly as the late Dr. Fisher of Beverly, but he followed the aphorism of the Father of Medicine, and kept extreme remedies for extreme cases.

When it came to the "non-naturals," as he would sometimes call them, after the old physicians,—namely, air, meat and drink, sleep and watching, motion and rest, the retentions and excretions, and the affections of the mind,—he was, as I have said, of the school of sensible practitioners, in distinction from that vast community of quacks, with or without the diploma, who think the chief end of man is to support apothecaries, and are never easy until they can get every patient upon a regular course of something nasty or noxious. Nobody was so precise in his directions about diet, air, and exercise, as Dr. Jackson. He had the same dislike to the a peu pres, the about so much, about so often, about so long, which I afterwards found among the punctilious adherents of the numerical system at La Pitie.

He used to insist on one small point with a certain philological precision, namely, the true meaning of the word "cure." He would have it that to cure a patient was simply to care for him. I refer to it as showing what his idea was of the relation of the physician to the patient. It was indeed to care for him, as if his life were bound up in him, to watch his incomings and outgoings, to stand guard at every avenue that disease might enter, to leave nothing to chance; not merely to throw a few pills and powders into one pan of the scales of Fate, while Death the skeleton was seated in the other, but to lean with his whole weight on the side of life, and shift the balance in its favor if it lay in human power to do it. Such devotion as this is only to be looked for in the man who gives himself wholly up to the business of healing, who considers Medicine itself a Science, or if not a science, is willing to follow it as an art,—the noblest of arts, which the gods and demigods of ancient religions did not disdain to practise and to teach.

The same zeal made him always ready to listen to any new suggestion which promised to be useful, at a period of life when many men find it hard to learn new methods and accept new doctrines. Few of his generation became so accomplished as he in the arts of direct exploration; coming straight from the Parisian experts, I have examined many patients with him, and have had frequent opportunities of observing his skill in percussion and auscultation.

One element in his success, a trivial one compared with others, but not to be despised, was his punctuality. He always carried two watches,—I doubt if he told why, any more than Dr. Johnson told what he did with the orange-peel,—but probably with reference to this virtue. He was as much to be depended upon at the

appointed time as the solstice or the equinox. There was another point I have heard him speak of as an important rule with him; to come at the hour when he was expected; if he had made his visit for several days successively at ten o'clock, for instance, not to put it off, if he could possibly help it, until eleven, and so keep a nervous patient and an anxious family waiting for him through a long, weary hour.

If I should attempt to characterize his teaching, I should say that while it conveyed the best results of his sagacious and extended observation, it was singularly modest, cautious, simple, sincere. Nothing was for show, for self-love; there was no rhetoric, no declamation, no triumphant "I told you so," but the plain statement of a clear-headed honest man, who knows that he is handling one of the gravest subjects that interest humanity. His positive instructions were full of value, but the spirit in which he taught inspired that loyal love of truth which lies at the bottom of all real excellence.

I will not say that, during his long career, Dr. Jackson never made an enemy. I have heard him tell how, in his very early days, old Dr. Danforth got into a towering passion with him about some professional consultation, and exploded a monosyllable or two of the more energetic kind on the occasion. I remember that that somewhat peculiar personage, Dr. Waterhouse, took it hardly when Dr. Jackson succeeded to his place as Professor of Theory and Practice. A young man of Dr. Jackson's talent and energy could hardly take the position that belonged to him without crowding somebody in a profession where three in a bed is the common rule of the household. But he was a peaceful man and a peace-maker all his days. No man ever did more, if so much, to produce and maintain the spirit of harmony for which we consider our medical community as somewhat exceptionally distinguished.

If this harmony should ever be threatened, I could wish that every impatient and irritable member of the profession would read that beautiful, that noble Preface to the "Letters," addressed to John Collins Warren. I know nothing finer in the medical literature of all time than this Prefatory Introduction. It is a golden prelude, fit to go with the three great Prefaces which challenge the admiration of scholars,—Calvin's to his Institutes, De Thou's to his History, and Casaubon's to his Polybius,—not because of any learning or rhetoric, though it is charmingly written, but for a spirit flowing through it to which learning and rhetoric are but as the breath that is wasted on the air to the Mood that warms the heart.

Of a similar character is this short extract which I am permitted to make from a private letter of his to a dear young friend. He was eighty-three years old at the time of writing it.

"I have not loved everybody whom I have known, but I have striven to see the good points in the characters of all men and women. At first I must have done this from something in my own nature, for I was not aware of it, and yet was doing it without any plan, when one day, sixty years ago, a friend whom I loved and respected said this to me, 'Ah, James, I see that you are destined to succeed in the world, and to make friends, because you are so ready to see the good point in the characters of those you meet.'"

I close this imperfect notice of some features in the character of this most honored and beloved of physicians by applying to him the words which were written of William Heberden, whose career was not unlike his own, and who lived to the same patriarchal age.

"From his early youth he had always entertained a deep sense of religion, a consummate love of virtue, an ardent thirst after knowledge, and an earnest desire to promote the welfare and happiness of all mankind. By these qualities, accompanied with great sweetness of manners, he acquired the love and esteem of all good men, in a degree which perhaps very few have experienced; and after passing an active life with the uniform testimony of a good conscience, he became an eminent example of its influence, in the cheerfulness and serenity of his latest age."

Such was the man whom I offer to you as a model, young gentlemen, at the outset of your medical career. I hope that many of you will recognize some traits of your own special teachers scattered through various parts of the land in the picture I have drawn. Let me assure you that whatever you may learn in this or any other course of public lectures,—and I trust you will learn a great deal,—the daily guidance, counsel, example, of your medical father, for such the Oath of Hippocrates tells you to consider your preceptor, will, if he is in any degree like him of whom I have spoken, be the foundation on which all that we teach is reared, and perhaps outlive most of our teachings, as in Dr. Jackson's memory the last lessons that remained with him were those of his Old Master.

THE MEDICAL PROFESSION IN MASSACHUSETTS.

A Lecture of a Course by members of the Massachusetts Historical Society, delivered before the Lowell Institute, January 29, 1869.

The medical history of eight generations, told in an hour, must be in many parts a mere outline. The details I shall give will relate chiefly to the first century. I shall only indicate the leading occurrences, with the more prominent names of the two centuries which follow, and add some considerations suggested by the facts which have been passed in review.

A geographer who was asked to describe the tides of Massachusetts Bay, would have to recognize the circumstance that they are a limited manifestation of a great oceanic movement. To consider them apart from this, would be to localize a planetary phenomenon, and to provincialize a law of the universe. The art of healing in Massachusetts has shared more or less fully and readily the movement which, with its periods of ebb and flow, has been raising its level from age to age throughout the better part of Christendom. Its practitioners brought with them much of the knowledge and many of the errors of the Old World; they have always been in communication with its wisdom and its folly; it is not without interest to see how far the new conditions in which they found themselves have been favorable or unfavorable to the growth of sound medical

knowledge and practice.

The state of medicine is an index of the civilization of an age and country,—one of the best, perhaps, by which it can be judged. Surgery invokes the aid of all the mechanical arts. From the rude violences of the age of stone,—a relic of which we may find in the practice of Zipporah, the wife of Moses,—to the delicate operations of to-day upon patients lulled into temporary insensibility, is a progress which presupposes a skill in metallurgy and in the labors of the workshop and the laboratory it has taken uncounted generations to accumulate. Before the morphia which deadens the pain of neuralgia, or the quinine which arrests the fit of an ague, can find their place in our pharmacies, commerce must have perfected its machinery, and science must have refined its processes, through periods only to be counted by the life of nations. Before the means which nature and art have put in the hands of the medical practitioner can be fairly brought into use, the prejudices of the vulgar must be overcome, the intrusions of false philosophy must be fenced out, and the partnership with the priesthood dissolved. All this implies that freedom and activity of thought which belong only to the most advanced conditions of society; and the progress towards this is by gradations as significant of wide-spread changes, as are the varying states of the barometer of far-extended conditions of the atmosphere.

Apart, then, from its special and technical interest, my subject has a meaning which gives a certain importance, and even dignity, to details in themselves trivial and almost unworthy of record. A medical entry in Governor Winthrop's journal may seem at first sight a mere curiosity; but, rightly interpreted, it is a key to his whole system of belief as to the order of the universe and the relations between man and his Maker. Nothing sheds such light on the superstitions of an age as the prevailing interpretation and treatment of disease. When the touch of a profligate monarch was a cure for one of the most inveterate of maladies, when the common symptoms of hysteria were prayed over as marks of demoniacal possession, we might well expect the spiritual realms of thought to be peopled with still stranger delusions.

Let us go before the Pilgrims of the Mayflower, and look at the shores on which they were soon to land. A wasting pestilence had so thinned the savage tribes that it was sometimes piously interpreted as having providentially prepared the way for the feeble band of exiles. Cotton Mather, who, next to the witches, hated the "tawnies," "wild beasts," "blood-hounds," "rattlesnakes," "infidels," as in different places he calls the unhappy Aborigines, describes the condition of things in his lively way, thus: "The Indians in these Parts had newly, even about a Year or Two before, been visited with such a prodigious Pestilence; as carried away not a Tenth, but Nine Parts of Ten (yea't is said Nineteen of Twenty) among them so that the Woods were almost cleared of those pernicious Creatures to make Room for a better Growth."

What this pestilence was has been much discussed. It is variously mentioned by different early writers as "the plague," "a great and grievous plague," "a sore consumption," as attended with spots which left unhealed places on those who recovered, as making the "whole surface yellow as with a garment." Perhaps no disease answers all these conditions so well as smallpox. We know from different sources what frightful havoc it made among the Indians in after years,—in 1631, for instance, when it swept away the aboriginal inhabitants of "whole towns," and in 1633. We have seen a whole tribe, the Mandans, extirpated by it in our own day. The word "plague" was used very vaguely, as in the description of the "great sickness" found among the Indians by the expedition of 1622. This same great sickness could hardly have been yellow fever, as it occurred in the month of November. I cannot think, therefore, that either the scourge of the East or our Southern malarial pestilence was the disease that wasted the Indians. As for the yellowness like a garment, that is too familiar to the eyes of all who have ever looked on the hideous mask of confluent variola.

Without the presence or the fear of these exotic maladies, the forlorn voyagers of the Mayflower had sickness enough to contend with. At their first landing at Cape Cod, gaunt and hungry and longing for fresh food, they found upon the sandy shore "great mussels, and very fat and full of sea-pearl." Sailors and passengers indulged in the treacherous delicacy; which seems to have been the sea-clam; and found that these mollusks, like the shell the poet tells of, remembered their august abode, and treated the way-worn adventurers to a gastric reminiscence of the heaving billows. In the mean time it blew and snowed and froze. The water turned to ice on their clothes, and made them many times like coats of iron. Edward Tilley had like to have "sounded" with cold. The gunner, too, was sick unto death, but "hope of trucking" kept him on his feet,—a Yankee, it should seem, when he first touched the shore of New England. Most, if not all, got colds and coughs, which afterwards turned to scurvy, whereof many died.

How can we wonder that the crowded and tempest-tossed voyagers, many of them already suffering, should have fallen before the trials of the first winter in Plymouth? Their imperfect shelter, their insufficient supply of bread, their salted food, now in unwholesome condition, account too well for the diseases and the mortality that marked this first dreadful season; weakness, swelling of the limbs, and other signs of scurvy, betrayed the want of proper nourishment and protection from the elements. In December six of their number died, in January eight, in February, seventeen, in March thirteen. With the advance of spring the mortality diminished, the sick and lame began to recover, and the colonists, saddened but not disheartened, applied themselves to the labors of the opening year.

One of the most pressing needs of the early colonists must have been that of physicians and surgeons. In Mr. Savage's remarkable Genealogical Dictionary of the first settlers who came over before 1692 and their descendants to the third generation, I find scattered through the four crowded volumes the names of one hundred and thirty-four medical practitioners. Of these, twelve, and probably many more, practised surgery; three were barber-surgeons. A little incident throws a glimmer from the dark lantern of memory upon William Direly, one of these practitioners with the razor and the lancet. He was lost between Boston and Roxbury in a violent tempest of wind and snow; ten days afterwards a son was born to his widow, and with a touch of homely sentiment, I had almost said poetry, they called the little creature "Fathergone" Direly. Six or seven, probably a larger number, were ministers as well as physicians, one of whom, I am sorry to say, took to drink and tumbled into the Connecticut River, and so ended. One was not only doctor, but also schoolmaster and poet. One practised medicine and kept a tavern. One was a butcher, but calls himself a surgeon in his will, a union of callings which suggests an obvious pleasantry. One female practitioner, employed by her own sex,—Ann Moore,—was the precursor of that intrepid sisterhood whose cause it has long been my pleasure and

privilege to advocate on all fitting occasions.

Outside of this list I must place the name of Thomas Wilkinson, who was complained of, in 1676, for practising contrary to law.

Many names in the catalogue of these early physicians have been associated, in later periods, with the practice of the profession,—among them, Boylston, Clark, Danforth, Homan, Jeffrey, Kittredge, Oliver, Peaslee, Randall, Shattuck, Thacher, Wellington, Williams, Woodward. Touton was a Huguenot, Burchsted a German from Silesia, Lunerus a German or a Pole; “Pighogg Churrergeon,” I hope, for the honor of the profession, was only Peacock disguised under this alias, which would not, I fear, prove very attractive to patients.

What doctrines and practice were these colonists likely to bring, with them?

Two principal schools of medical practice prevailed in the Old World during the greater part of the seventeenth century. The first held to the old methods of Galen: its theory was that the body, the microcosm, like the macrocosm, was made up of the four elements—fire, air, water, earth; having respectively the qualities hot, dry, moist, cold. The body was to be preserved in health by keeping each of these qualities in its natural proportion; heat, by the proper temperature; moisture, by the due amount of fluid; and so as to the rest. Diseases which arose from excess of heat were to be attacked by cooling remedies; those from excess of cold, by heating ones; and so of the other derangements of balance. This was truly the principle of contraries contrariis, which ill-informed persons have attempted to make out to be the general doctrine of medicine, whereas there is no general dogma other than this: disease is to be treated by anything that is proved to cure it. The means the Galenist employed were chiefly diet and vegetable remedies, with the use of the lancet and other depleting agents. He attributed the four fundamental qualities to different vegetables, in four different degrees; thus chicory was cold in the fourth degree, pepper was hot in the fourth, endive was cold and dry in the second, and bitter almonds were hot in the first and dry in the second degree. When we say “cool as a cucumber,” we are talking Galenism. The seeds of that vegetable ranked as one of “the four greater cold seeds” of this system.

Galenism prevailed mostly in the south of Europe and France. The readers of Moliere will have no difficulty in recalling some of its favorite modes of treatment, and the abundant mirth he extracted from them.

These Galenists were what we should call “herb-doctors” to-day. Their insignificant infusions lost credit after a time; their absurdly complicated mixtures excited contempt, and their nauseous prescriptions provoked loathing and disgust. A simpler and bolder practice found welcome in Germany, depending chiefly on mineral remedies, mercury, antimony, sulphur, arsenic, and the use, sometimes the secret use, of opium. Whatever we think of Paracelsus, the chief agent in the introduction of these remedies, and whatever limits we may assign to the use of these long-trusted mineral drugs, there can be no doubt that the chemical school, as it was called, did a great deal towards the expurgation of the old, overloaded, and repulsive pharmacopoeia. We shall find evidence in the practice of our New-England physicians of the first century, that they often employed chemical remedies, and that, by the early part of the following century, their chief trust was in the few simple, potent drugs of Paracelsus.

We have seen that many of the practitioners of medicine, during the first century of New England, were clergymen. This relation between medicine and theology has existed from a very early period; from the Egyptian priest to the Indian medicine-man, the alliance has been maintained in one form or another. The partnership was very common among our British ancestors. Mr. Ward, the Vicar of Stratford-on-Avon, himself a notable example of the union of the two characters, writing about 1660, says,

“The Saxons had their blood-letters, but under the Normans physicke, begunne in England; 300 years agoe itt was not a distinct profession by itself, but practised by men in orders, witness Nicholas de Ternham, the chief English physician and Bishop of Durham; Hugh of Evesham, a physician and cardinal; Grysant, physician and pope; John Chambers, Dr. of Physick, was the first Bishop of Peterborough; Paul Bush, a bachelor of divinitie in Oxford, was a man well read in physick as well as divinitie, he was the first bishop of Bristol.”

“Again in King Richard the Second's time physicians and divines were not distinct professions; for one Tydeman, Bishop of Landaph and Worcester, was physician to King Richard the Second.”

This alliance may have had its share in creating and keeping up the many superstitions which have figured so largely in the history of medicine. It is curious to see that a medical work left in manuscript by the Rev. Cotton Mather and hereafter to be referred to, is running over with follies and superstitious fancies; while his contemporary and fellow-townsmen, William Douglass, relied on the same few simple remedies which, through Dr. Edward Holyoke and Dr. James Jackson, have come down to our own time, as the most important articles of the materia medica.

Let us now take a general glance at some of the conditions of the early settlers; and first, as to the healthfulness of the climate. The mortality of the season that followed the landing of the Pilgrims at Plymouth has been sufficiently accounted for. After this, the colonists seem to have found the new country agreeing very well with their English constitutions. Its clear air is the subject of eulogy. Its dainty springs of sweet water are praised not only by Higginson and Wood, but even the mischievous Morton says, that for its delicate waters “Canaan came not near this country.” There is a tendency to dilate on these simple blessings, which reminds one a little of the Marchioness in Dickens's story, with her orange-peel-and-water beverage. Still more does one feel the warmth of coloring,—such as we expect from converts to a new faith, and settlers who want to entice others over to their clearings, when Winslow speaks, in 1621, of “abundance of roses, white, red, and damask; single, but very sweet indeed;” a most of all, however, when, in the same connection, he says, “Here are grapes white and red, and very sweet and strong also.” This of our wild grape, a little vegetable Indian, which scalps a civilized man's mouth, as his animal representative scalps his cranium. But there is something quite charming in Winslow's picture of the luxury in which they are living. Lobsters, oysters, eels, mussels, fish and fowl, delicious fruit, including the grapes aforesaid,—if they only had “kine, horses, and sheep,” he makes no question but men would live as contented here as in any part of the world. We cannot help admiring the way in which they took their trials, and made the most of their blessings.

"And how Content they were," says Cotton Mather, "when an Honest Man, as I have heard, inviting his Friends to a Dish of Clams, at the Table gave Thanks to Heaven, who had given them to suck the abundance of the Seas, and of the Treasures Hid in the Sands!"

Strangely enough, as it would seem, except for this buoyant determination to make the best of everything, they hardly appear to recognize the difference of the climate from that which they had left. After almost three years' experience, Winslow says, he can scarce distinguish New England from Old England, in respect of heat and cold, frost, snow, rain, winds, etc. The winter, he thinks (if there is a difference), is sharper and longer; but yet he may be deceived by the want of the comforts he enjoyed at home. He cannot conceive any climate to agree better with the constitution of the English, not being oppressed with extremity of heats, nor nipped by biting cold:

"By which means, blessed be God, we enjoy our health, notwithstanding those difficulties we have undergone, in such a measure as would have been admired, if we had lived in England with the like means."

Edward Johnson, after mentioning the shifts to which they were put for food, says,—

"And yet, methinks, our children are as cheerful, fat, and lusty, with feeding upon those mussels, clams, and other fish, as they were in England with their fill of bread."

Higginson, himself a dyspeptic, "continually in physick," as he says, and accustomed to dress in thick clothing, and to comfort his stomach with drink that was "both strong and stale,"—the "jolly good ale and old," I suppose, of free and easy Bishop Still's song,—found that he both could and did oftentimes drink New England water very well,—which he seems to look upon as a remarkable feat. He could go as lightclad as any, too, with only a light stuff cassock upon his shirt, and stuff breeches without linings. Two of his children were sickly: one,—little misshapen Mary,—died on the passage, and, in her father's words, "was the first in our ship that was buried in the bowels of the great Atlantic sea;" the other, who had been "most lamentably handled" by disease, recovered almost entirely "by the very wholesomeness of the air, altering, digesting, and drying up the cold and crude humors of the body." Wherefore, he thinks it a wise course for all cold complexions to come to take physick in New England, and ends with those often quoted words, that "a sup of New England's air is better than a whole draught of Old England's ale." Mr. Higginson died, however, "of a hectic fever," a little more than a year after his arrival.

The medical records which I shall cite show that the colonists were not exempt from the complaints of the Old World. Besides the common diseases to which their descendants are subject, there were two others, to say nothing of the dreaded small-pox, which later medical science has disarmed,—little known among us at the present day, but frequent among the first settlers. The first of these was the scurvy, already mentioned, of which Winthrop speaks in 1630, saying, that it proved fatal to those who fell into discontent, and lingered after their former conditions in England; the poor homesick creatures in fact, whom we so forget in our florid pictures of the early times of the little band in the wilderness. Many who were suffering from scurvy got well when the Lyon arrived from England, bringing store of juice of lemons. The Governor speaks of another case in 1644; and it seems probable that the disease was not of rare occurrence.

The other complaint from which they suffered, but which has nearly disappeared from among us, was intermittent fever, or fever and ague. I investigated the question as to the prevalence of this disease in New England, in a dissertation, which was published in a volume with other papers, in the year 1838. I can add little to the facts there recorded. One which escaped me was, that Joshua Scottow, in "Old Men's Tears," dated 1691, speaks of "shaking agues," as among the trials to which they had been subjected. The outline map of New England, accompanying the dissertation above referred to, indicates all the places where I had evidence that the disease had originated. It was plain enough that it used to be known in many localities where it has long ceased to be feared. Still it was and is remarkable to see what a clean bill of health in this particular respect our barren soil inherited with its sterility. There are some malarious spots on the edge of Lake Champlain, and there have been some temporary centres of malaria, within the memory of man, on one or more of our Massachusetts rivers, but these are harmless enough, for the most part, unless the millers dam them, when they are apt to retaliate with a whiff from their meadows, that sets the whole neighborhood shaking with fever and ague.

The Pilgrims of the Mayflower had with them a good physician, a man of standing, a deacon of their church, one whom they loved and trusted, Dr. Samuel Fuller. But no medical skill could keep cold and hunger and bad food, and, probably enough, desperate homesickness in some of the feebler sort, from doing their work. No detailed record remains of what they suffered or what was attempted for their relief during the first sad winter. The graves of those who died were levelled and sowed with grain that the losses of the little band might not be suspected by the savage tenants of the wilderness, and their story remains untold.

Of Dr. Fuller's practice, at a later period, we have an account in a letter of his to Governor Bradford, dated June, 1630. "I have been to Matapan" (now Dorchester), he says, "and let some twenty of those people blood." Such wholesale depletion as this, except with avowed homicidal intent, is quite unknown in these days; though I once saw the noted French surgeon, Lisfranc, in a fine phlebotomizing frenzy, order some ten or fifteen patients, taken almost indiscriminately, to be bled in a single morning.

Dr. Fuller's two visits to Salem, at the request of Governor Endicott, seem to have been very satisfactory to that gentleman. Morton, the wild fellow of Merry Mount, gives a rather questionable reason for the Governor's being so well pleased with the physician's doings. The names under which he mentions the two personages, it will be seen, are not intended to be complimentary. "Dr. Noddy did a great cure for Captain Littleworth. He cured him of a disease called a wife." William Gager, who came out with Winthrop, is spoken of as "a right godly man and skilful chyrurgeon, but died of a malignant fever not very long after his arrival."

Two practitioners of the ancient town of Newbury are entitled to special notice, for different reasons. The first is Dr. John Clark, who is said by tradition to have been the first regularly educated physician who resided in New England. His portrait, in close-fitting skull-cap, with long locks and venerable flowing beard, is familiar to our eyes on the wall of our Society's antechamber. His left hand rests upon a skull, his right hand holds an instrument which deserves a passing comment. It is a trephine, a surgical implement for cutting round pieces out of broken skulls, so as to get at the fragments which have been driven in, and lift them up. It

has a handle like that of a gimlet, with a claw like a hammer, to lift with, I suppose, which last contrivance I do not see figured in my books. But the point I refer to is this: the old instrument, the trepan, had a handle like a wimble, what we call a brace or bit-stock. The trephine is not mentioned at all in Peter Lowe's book, London, 1634; nor in Wiseman's great work on Surgery, London, 1676; nor in the translation of Dionis, published by Jacob Tonson, in 1710. In fact it was only brought into more general use by Cheselden and Sharpe so late as the beginning of the last century. As John Clark died in 1661, it is remarkable to see the last fashion in the way of skull-sawing contrivances in his hands,—to say nothing of the claw on the handle, and a Hey's saw, so called in England, lying on the table by him, and painted there more than a hundred years before Hey was born. This saw is an old invention, perhaps as old as Hippocrates, and may be seen figured in the "Armamentarium Chirurgicum" of Scultetus, or in the Works of Ambroise Pare.

Dr. Clark is said to have received a diploma before he came, for skill in lithotomy. He loved horses, as a good many doctors do, and left a good property, as they all ought to do. His grave and noble presence, with the few facts concerning him, told with more or less traditional authority, give us the feeling that the people of Newbury, and afterwards of Boston, had a wise and skilful medical adviser and surgeon in Dr. John Clark.

The venerable town of Newbury had another physician who was less fortunate. The following is a court record of 1652:

"This is to certify whom it may concern, that we the subscribers, being called upon to testify against doctor William Snelling for words by him uttered, affirm that being in way of merry discourse, a health being drank to all friends, he answered,

*"I'll pledge my friends,
And for my foes
A plague for their heels
And, '—*

[a similar malediction on the other extremity of their feet.]

"Since when he hath affirmed that he only intended the proverb used in the west country, nor do we believe he intended otherwise.

"[Signed] WILLIAM THOMAS.

"THOMAS MILWARD."

"March 12th 1651, All which I acknowledge, and am sorry I did not expresse my intent, or that I was so weak as to use so foolish a proverb.

"[Signed] GULIELMUS SNELLING."

Notwithstanding this confession and apology, the record tells us that "William Snelling in his presentment for cursing is fined ten shillings and the fees of court."

I will mention one other name among those of the Fathers of the medical profession in New England. The "apostle" Eliot says, writing in 1647, "We never had but one anatomy in the country, which Mr. Giles Firman, now in England, did make and read upon very well."

Giles Firmin, as the name is commonly spelled, practised physic in this country for a time. He seems to have found it a poor business; for, in a letter to Governor Winthrop, he says, "I am strongly sett upon to studye divinitie: my studyes else must be lost, for physick is but a meene helpe."

Giles Firmin's Lectures on Anatomy were the first scientific teachings of the New World. While the Fathers were enlightened enough to permit such instructions, they were severe in dealing with quackery; for, in 1631, our court records show that one Nicholas Knopp, or Knapp, was sentenced to be fined or whipped "for taking upon him to cure the scurvey by a water of noe worth nor value, which he solde att a very deare rate." Empty purses or sore backs would be common with us to-day if such a rule were enforced.

Besides the few worthies spoken of, and others whose names I have not space to record, we must remember that there were many clergymen who took charge of the bodies as well as the souls of their patients, among them two Presidents of Harvard College, Charles Chauncy and Leonard Hoar,—and Thomas Thacher, first minister of the "Old South," author of the earliest medical treatises printed in the country, [A Brief Rule to Guide the Common People in Small pox and Measles. 1674.] whose epitaph in Latin and Greek, said to have been written by Eleazer, an "Indian Youth" and a member of the Senior Class of Harvard College, may be found in the "Magnalia." I miss this noble savage's name in our triennial catalogue; and as there is many a slip between the cup and lip, one is tempted to guess that he may have lost his degree by some display of his native instinct,—possibly a flourish of the tomahawk or scalping-knife. However this may have been, the good man he celebrated was a notable instance of the Angelical Conjunction, as the author of the "Magnalia" calls it, of the offices of clergyman and medical practitioner.

Michael Wigglesworth, author of the "Day of Doom," attended the sick, "not only as a Pastor, but as a Physician too, and this, not only in his own town, but also in all those of the vicinity." Mather says of the sons of Charles Chauncy, "All of these did, while they had Opportunity, Preach the Gospel; and most, if not all of them, like their excellent Father before them, had an eminent skill in physick added unto their other accomplishments," etc. Roger Williams is said to have saved many in a kind of pestilence which swept away many Indians.

To these names must be added, as sustaining a certain relation to the healing art, that of the first Governor Winthrop, who is said by John Cotton to have been "Help for our Bodies by Physick [and] for our Estates by Law," and that of his son, the Governor of Connecticut, who, as we shall see, was as much physician as magistrate.

I had submitted to me for examination, in 1862, a manuscript found among the Winthrop Papers, marked with the superscription, "For my worthy friend Mr. Winthrop," dated in 1643, London, signed Edward Stafford, and containing medical directions and prescriptions. It may be remembered by some present that I wrote a report on this paper, which was published in the "Proceedings" of this Society. Whether the paper was written for Governor John Winthrop of Massachusetts, or for his son, Governor John of Connecticut, there is no positive evidence that I have been able to obtain. It is very interesting, however, as giving short and

simple practical directions, such as would be most like to be wanted and most useful, in the opinion of a physician in repute of that day.

The diseases prescribed for are plague, small-pox, fevers, king's evil, insanity, falling-sickness, and the like; with such injuries as broken bones, dislocations, and burning with gunpowder. The remedies are of three kinds: simples, such as St. John's wort, Clown's all-heal, elder, parsley, maidenhair, mineral drugs, such as lime, saltpetre, Armenian bole, crocus metallorum, or sulphuret of antimony; and thaumaturgic or mystical, of which the chief is, "My black powder against the plague, small-pox; purples, all sorts of feavers; Poyson; either, by Way of Prevention or after Infection." This marvellous remedy was made by putting live toads into an earthen pot so as to half fill it, and baking and burning them "in the open ayre, not in an house,"—concerning which latter possibility I suspect Madam Winthrop would have had something to say,—until they could be reduced by pounding, first into a brown, and then into a black, powder. Blood-letting in some inflammations, fasting in the early stage of fevers, and some of those peremptory drugs with which most of us have been well acquainted in our time, the infragant memories of which I will not pursue beyond this slight allusion, are among his remedies.

The Winthrops, to one of whom Dr. Stafford's directions were addressed, were the medical as well as the political advisers of their fellow-citizens for three or four successive generations. One of them, Governor John of Connecticut, practised so extensively, that, but for his more distinguished title in the State, he would have been remembered as the Doctor. The fact that he practised in another colony, for the most part, makes little difference in the value of the records we have of his medical experience, which have fortunately been preserved, and give a very fair idea, in all probability, of the way in which patients were treated in Massachusetts, when they fell into intelligent and somewhat educated hands, a little after the middle of the seventeenth century:

I have before me, while writing, a manuscript collection of the medical cases treated by him, and recorded at the time in his own hand, which has been intrusted to me by our President, his descendant.

They are generally marked Hartford, and extend from the year 1657 to 1669. From these, manuscripts, and from the letters printed in the Winthrop Papers published by our Society, I have endeavored to obtain some idea of the practice of Governor John Winthrop, Junior. The learned eye of Mr. Pulsifer would have helped me, no doubt, as it has done in other cases; but I have ventured this time to attempt finding my own way among the hieroglyphics of these old pages. By careful comparison of many prescriptions, and by the aid of Schroder, Salmon, Culpeper, and other old compilers, I have deciphered many of his difficult paragraphs with their mysterious recipes.

The Governor employed a number of the simples dear to ancient women, —elecampane and elder and wormwood and anise and the rest; but he also employed certain mineral remedies, which he almost always indicates by their ancient symbols, or by a name which should leave them a mystery to the vulgar. I am now prepared to reveal the mystic secrets of the Governor's beneficent art, which rendered so many good and great as well as so many poor and dependent people his debtors,—at least, in their simple belief,—for their health and their lives.

His great remedy, which he gave oftener than any other, was nitre; which he ordered in doses of twenty or thirty grains to adults, and of three grains to infants. Measles, colics, sciatica, headache, giddiness, and many other ailments, all found themselves treated, and I trust bettered, by nitre; a pretty safe medicine in moderate doses, and one not likely to keep the good Governor awake at night, thinking whether it might not kill, if it did not cure. We may say as much for spermaceti, which he seems to have considered "the sovereign'st thing on earth" for inward bruises, and often prescribes after falls and similar injuries.

One of the next remedies, in point of frequency, which he was in the habit of giving, was (probably diaphoretic) antimony; a mild form of that very active metal, and which, mild as it was, left his patients very commonly with a pretty strong conviction that they had been taking something that did not exactly agree with them. Now and then he gave a little iron or sulphur or calomel, but very rarely; occasionally, a good, honest dose of rhubarb or jalap; a taste of stinging horseradish, oftener of warming guaiacum; sometimes an anodyne, in the shape of mithridate,—the famous old farrago, which owed its virtue to poppy juice; [This is the remedy which a Boston divine tried to simplify. See *Electuarium Novum Alexipharmacum*, by Rev. Thomas Harward, lecturer at the Royal Chappell. Boston, 1732. This tract is in our Society's library.] very often, a harmless powder of coral; less frequently, an inert prescription of pleasing amber; and (let me say it softly within possible hearing of his honored descendant), twice or oftener,—let us hope as a last resort,—an electuary of millipedes,—sowbugs, if we must give them their homely English name. One or two other prescriptions, of the many unmentionable ones which disgraced the pharmacopoeia of the seventeenth century, are to be found, but only in very rare instances, in the faded characters of the manuscript.

The excellent Governor's accounts of diseases are so brief, that we get only a very general notion of the complaints for which he prescribed. Measles and their consequences are at first more prominent than any other one affection, but the common infirmities of both sexes and of all ages seem to have come under his healing hand. Fever and ague appears to have been of frequent occurrence.

His published correspondence shows that many noted people were in communication with him as his patients. Roger Williams wants a little of his medicine for Mrs. Weekes's daughter; worshipful John Haynes is in receipt of his powders; troublesome Captain Underhill wants "a little white vitterall" for his wife, and something to cure his wife's friend's neuralgia, (I think his wife's friend's husband had a little rather have had it sent by the hands of Mrs. Underhill, than by those of the gallant and discursive captain); and pious John Davenport says, his wife "tooke but one halfe of one of the papers" (which probably contained the medicine he called rubila), "but could not beare the taste of it, and is discouraged from taking any more;" and honored William Leete asks for more powders for his "poore little daughter Graciana," though he found it "hard to make her take it," delicate, and of course sensitive, child as she was, languishing and dying before her time, in spite of all the bitter things she swallowed,—God help all little children in the hands of dosing doctors and howling dervishes! Restless Samuel Gorton, now tamed by the burden of fourscore and two years, writes so touching an account of his infirmities, and expresses such overflowing gratitude for the relief he has obtained from the Governor's prescriptions, wondering how "a thing so little in quantity, so little in sent, so little in

taste, and so little to sence in operation, should beget and bring forth such effects," that we repent our hasty exclamation, and bless the memory of the good Governor, who gave relief to the worn-out frame of our long-departed brother, the sturdy old heretic of Rhode Island.

What was that medicine which so frequently occurs in the printed letters under the name of "rubila"? It is evidently a secret remedy, and, so far as I know, has not yet been made out. I had almost given it up in despair, when I found what appears to be a key to the mystery. In the vast multitude of prescriptions contained in the manuscripts, most of them written in symbols, I find one which I thus interpret:

"Four grains of (diaphoretic) antimony, with twenty grains of nitre, with a little salt of tin, making rubila." Perhaps something was added to redden the powder, as he constantly speaks of "rubifying" or "viridating" his prescriptions; a very common practice of prescribers, when their powders look a little too much like plain salt or sugar.

Waitstill Winthrop, the Governor's son, "was a skilful physician," says Mr. Sewall, in his funeral sermon; "and generously gave, not only his advice, but also his Medicines, for the healing of the Sick, which, by the Blessing of God, were made successful for the recovery of many." "His son John, a member of the Royal Society, speaks of himself as 'Dr. Winthrop,' and mentions one of his own prescriptions in a letter to Cotton Mather." Our President tells me that there was an heirloom of the ancient skill in his family, within his own remembrance, in the form of a certain precious eye-water, to which the late President John Quincy Adams ascribed rare virtue, and which he used to obtain from the possessor of the ancient recipe.

These inherited prescriptions are often treasured in families, I do not doubt, for many generations. When I was yet of trivial age, and suffering occasionally, as many children do, from what one of my Cambridgeport schoolmates used to call the "ager,"—meaning thereby toothache or face-ache,—I used to get relief from a certain plaster which never went by any other name in the family than "Dr. Oliver."

Dr. James Oliver was my great-great-grandfather, graduated in 1680, and died in 1703. This was, no doubt, one of his nostrums; for nostrum, as is well known, means nothing more than our own or my own particular medicine, or other possession or secret, and physicians in old times used to keep their choice recipes to themselves a good deal, as we have had occasion to see.

Some years ago I found among my old books a small manuscript marked "James Oliver. This Book Begun Aug. 12, 1685." It is a rough sort of account-book, containing among other things prescriptions for patients, and charges for the same, with counter-charges for the purchase of medicines and other matters. Dr. Oliver practised in Cambridge, where may be seen his tomb with inscriptions, and with sculptured figures that look more like Diana of the Ephesians, as given in Calmet's Dictionary, than like any angels admitted into good society here or elsewhere.

I do not find any particular record of what his patients suffered from, but I have carefully copied out the remedies he mentions, and find that they form a very respectable catalogue. Besides the usual simples, elder, parsley, fennel, saffron, snake-root, wormwood, I find the Elixir Proprietatis, with other elixire and cordials, as if he rather fancied warming medicines; but he called in the aid of some of the more energetic remedies, including iron, and probably mercury, as he bought two pounds of it at one time.

The most interesting item is his bill against the estate of Samuel Pason of Roxbury, for services during his last illness. He attended this gentleman,—for such he must have been, by the amount of physic which he took, and which his heirs paid for,—from June 4th, 1696, to September 3d of the same year, three months. I observe he charges for visits as well as for medicines, which is not the case in most of his bills. He opens the attack with a carminative appeal to the visceral conscience, and follows it up with good hard-hitting remedies for dropsy,—as I suppose the disease would have been called,—and finishes off with a rallying dose of hartshorn and iron.

It is a source of honest pride to his descendant that his bill, which was honestly paid, as it seems to have been honorably earned, amounted to the handsome total of seven pounds and two shillings. Let me add that he repeatedly prescribes plaster, one of which was very probably the "Dr. Oliver" that soothed my infant griefs, and for which I blush to say that my venerated ancestor received from Goodman Hancock the painfully exiguous sum of no pounds, no shillings, and sixpence.

I have illustrated the practice of the first century, from the two manuscripts I have examined, as giving an impartial idea of its every-day methods. The Governor, Johannes Secundus, it is fair to remember, was an amateur practitioner, while my ancestor was a professed physician. Comparing their modes of treatment with the many scientific follies still prevailing in the Old World, and still more with the extraordinary theological superstitions of the community in which they lived, we shall find reason, I think, to consider the art of healing as in a comparatively creditable state during the first century of New England.

In addition to the evidence as to methods of treatment furnished by the manuscripts I have cited, I subjoin the following document, to which my attention was called by Dr. Shurtleff, our present Mayor. This is a letter of which the original is to be found in vol. lxxix. page 10 of the "Archives" preserved at the State House in Boston. It will be seen that what the surgeon wanted consisted chiefly of opiates, stimulants, cathartics, plasters, and materials for bandages. The complex and varied formulæ have given place to simpler and often more effective forms of the same remedies; but the list and the manner in which it is made out are proofs of the good sense and schooling of the surgeon, who, it may be noted, was in such haste that he neglected all his stops. He might well be in a hurry, as on the very day upon which he wrote, a great body of Indians—supposed to be six or seven hundred—appeared before Hatfield; and twenty-five resolute young men of Hadley, from which town he wrote, crossed the river and drove them away.

HADLY May 30: 76

Mr RAWSON Sr

What we have recd by Tho: Houey the past month is not the chiefest of our wants as you have love for poor wounded I pray let us not want for these following medicines if you have not a speedy conveyance of them I pray send on purpose they are those things mentioned in my former letter but to prevent future mistakes I have wrote them att large wee have great want with the greatest halt and speed let us be supplied. Sr Yr Sert WILL LOCHS.

(Endorsed)

Mr. Lockes Letter Recd from the Governor 13 Jane & acquainted ye Council with it but could not obtaine any thing to be sent in answer thereto. 13 June 1676.

I have given some idea of the chief remedies used by our earlier physicians, which were both Galenic and chemical; that is, vegetable and mineral. They, of course, employed the usual perturbing medicines which Montaigne says are the chief reliance of their craft. There were, doubtless, individual practitioners who employed special remedies with exceptional boldness and perhaps success. Mr. Eliot is spoken of, in a letter of William Leete to Winthrop, Junior, as being under Mr. Greenland's mercurial administrations. The latter was probably enough one of these specialists.

There is another class of remedies which appears to have been employed occasionally, but, on the whole, is so little prominent as to imply a good deal of common sense among the medical practitioners, as compared with the superstitions prevailing around them. I have said that I have caught the good Governor, now and then, prescribing the electuary of millipedes; but he is entirely excused by the almost incredible fact that they were retained in the materia medica so late as when Rees's Cyclopaedia was published, and we there find the directions formerly given by the College of Edinburgh for their preparation. Once or twice we have found him admitting still more objectionable articles into his materia medica; in doing which, I am sorry to say that he could plead grave and learned authority. But these instances are very rare exceptions in a medical practice of many years, which is, on the whole, very respectable, considering the time and circumstances.

Some remedies of questionable though not odious character appear occasionally to have been employed by the early practitioners, but they were such as still had the support of the medical profession. Governor John Winthrop, the first, sends for East Indian bezoar, with other commodities he is writing for. Governor Endicott sends him one he had of Mr. Humfrey. I hope it was genuine, for they cheated infamously in the matter of this concretion, which ought to come out of an animal's stomach, but the real history of which resembles what is sometimes told of modern sausages.

There is a famous law-case of James the First's time, in which a goldsmith sold a hundred pounds' worth of what he called bezoar, which was proved to be false, and the purchaser got a verdict against him. Governor Endicott also sends Winthrop a unicorn's horn, which was the property of a certain Mrs. Beggarly, who, in spite of her name, seems to have been rich in medical knowledge and possessions. The famous Thomas Bartholinus wrote a treatise on the virtues of this fabulous-sounding remedy, which was published in 1641, and republished in 1678.

The "antimonial cup," a drinking vessel made of that metal, which, like our quassia-wood cups, might be filled and emptied in saecula saeculorum without exhausting its virtues, is mentioned by Matthew Cradock, in a letter to the elder Winthrop, but in a doubtful way, as it was thought, he says, to have shortened the days of Sir Nathaniel Riche; and Winthrop himself, as I think, refers to its use, calling it simply "the cup." An antimonial cup is included in the inventory of Samuel Seabury, who died 1680, and is valued at five shillings. There is a treatise entitled "The Universall Remedy, or the Vertues of the Antimoniall Cup, By John Evans, Minister and Preacher of God's Word, London, 1634," in our own Society's library.

One other special remedy deserves notice, because of native growth. I do not know when Culver's root, *Leptandra Virginica* of our National Pharmacopoeia, became noted, but Cotton Mather, writing in 1716 to John Winthrop of New London, speaks of it as famous for the cure of consumptions, and wishes to get some of it, through his mediation, for Katharine, his eldest daughter. He gets it, and gives it to the "poor damsel," who is languishing, as he says, and who dies the next month,—all the sooner, I have little doubt, for this uncertain and violent drug, with which the meddlesome pedant tormented her in that spirit of well-meant but restless quackery, which could touch nothing without making mischief, not even a quotation, and yet proved at length the means of bringing a great blessing to our community, as we shall see by and by; so does Providence use our very vanities and infirmities for its wise purposes.

Externally, I find the practitioners on whom I have chiefly relied used the plasters of Paracelsus, of melilot, diachylon, and probably diaphoenicon, all well known to the old pharmacopoeias, and some of them to the modern ones,—to say nothing of "my yellow salve," of Governor John, the second, for the composition of which we must apply to his respected descendant.

The authors I find quoted are Barbette's Surgery, Camerarius on Gout, and Wecherus, of all whom notices may be found in the pages of Haller and Vanderlinden; also, Reed's Surgery, and Nicholas Culpeper's Practice of Physic and Anatomy, the last as belonging to Samuel Seabury, surgeon, before mentioned. Nicholas Culpeper was a shrewd charlatan, and as impudent a varlet as ever prescribed for a colic; but knew very well what he was about, and badgers the College with great vigor. A copy of Spigelius's famous Anatomy, in the Boston Athenaeum, has the names of Increase and Samuel Mather written in it, and was doubtless early overhauled by the youthful Cotton, who refers to the great anatomist's singular death, among his curious stories in the "Magnalia," and quotes him among nearly a hundred authors whom he cites in his manuscript "The Angel of Bethesda." Dr. John Clark's "books and instruments, with several chirurgery materials in the closet," were valued in his inventory at sixty pounds; Dr. Matthew Fuller, who died in 1678, left a library valued at ten pounds; and a surgeon's chest and drugs valued at sixteen pounds.'

Here we leave the first century and all attempts at any further detailed accounts of medicine and its practitioners. It is necessary to show in a brief glance what had been going on in Europe during the latter part of that century, the first quarter of which had been made illustrious in the history of medical science by the discovery of the circulation.

Charles Barbeyrac, a Protestant in his religion, was a practitioner and teacher of medicine at Montpellier. His creed was in the way of his obtaining office; but the young men followed his instructions with enthusiasm. Religious and scientific freedom breed in and in, until it becomes hard to tell the family of one from that of the other. Barbeyrac threw overboard the old complex medical farragos of the pharmacopoeias, as his church had disburdened itself of the popish ceremonies.

Among the students who followed his instructions were two Englishmen: one of them, John Locke, afterwards author of an "Essay on the Human Understanding," three years younger than his teacher; the

other, Thomas Sydenham, five years older. Both returned to England. Locke, whose medical knowledge is borne witness to by Sydenham, had the good fortune to form a correct opinion on a disease from which the Earl of Shaftesbury was suffering, which led to an operation that saved his life. Less felicitous was his experience with a certain ancilla culinaria virgo,—which I am afraid would in those days have been translated kitchen-wench, instead of lady of the culinary department,—who turned him off after she had got tired of him, and called in another practitioner. [Locke and Sydenham, p. 124. By John Brown, M. D. Edinburgh, 1866.] This helped, perhaps, to spoil a promising doctor, and make an immortal metaphysician. At any rate, Locke laid down the professional wig and cane, and took to other studies.

The name of Thomas Sydenham is as distinguished in the history of medicine as that of John Locke in philosophy. As Barbeyrac was found in opposition to the established religion, as Locke took the rational side against orthodox Bishop Stillingfleet, so Sydenham went with Parliament against Charles, and was never admitted a Fellow by the College of Physicians, which, after he was dead, placed his bust in their hall by the side of that of Harvey.

What Sydenham did for medicine was briefly this: he studied the course of diseases carefully, and especially as affected by the particular season; to patients with fever he gave air and cooling drinks, instead of smothering and heating them, with the idea of sweating out their disease; he ordered horseback exercise to consumptives; he, like his teacher, used few and comparatively simple remedies; he did not give any drug at all, if he thought none was needed, but let well enough alone. He was a sensible man, in short, who applied his common sense to diseases which he had studied with the best light of science that he could obtain.

The influence of the reform he introduced must have been more or less felt in this country, but not much before the beginning of the eighteenth century, as his great work was not published until 1675, and then in Latin. I very strongly suspect that there was not so much to reform in the simple practice of the physicians of the new community, as there was in that of the learned big-wigs of the "College," who valued their remedies too much in proportion to their complexity, and the extravagant and fantastic ingredients which went to their making.

During the memorable century which bred and bore the Revolution, the medical profession gave great names to our history. But John Brooks belonged to the State, and Joseph Warren belongs to the country and mankind, and to speak of them would lead me beyond my limited subject. There would be little pleasure in dwelling on the name of Benjamin Church; and as for the medical politicians, like Elisha Cooke in the early part of the century, or Charles Jarvis, the bald eagle of Boston, in its later years, whether their practice was heroic or not, their patients were, for he is a bold man who trusts one that is making speeches and coaxing voters, to meddle with the internal politics of his corporeal republic.

One great event stands out in the medical history of this eighteenth century; namely, the introduction of the practice of inoculation for small-pox. Six epidemics of this complaint had visited Boston in the course of a hundred years. Prayers had been asked in the churches for more than a hundred sick in a single day, and this many times. About a thousand persons had died in a twelvemonth, we are told, and, as we may infer, chiefly from this cause.

In 1721, this disease, after a respite of nineteen years, again appeared as an epidemic. In that year it was that Cotton Mather, browsing, as was his wont, on all the printed fodder that came within reach of his ever-grinding mandibles, came upon an account of inoculation as practised in Turkey, contained in the "Philosophical Transactions." He spoke of it to several physicians, who paid little heed to his story; for they knew his medical whims, and had probably been bored, as we say now-a-days, many of them, with listening to his "Angel of Bethesda," and satiated with his speculations on the Nishmath Chajim.

The Reverend Mather,—I use a mode of expression he often employed when speaking of his honored brethren,—the Reverend Mather was right this time, and the irreverent doctors who laughed at him were wrong. One only of their number disputes his claim to giving the first impulse to the practice in Boston. This is what that person says: "The Small-Pox spread in Boston, New England, 1721, and the Reverend Dr. Cotton Mather, having had the use of these Communications from Dr. William Douglass (that is, the writer of these words); surreptitiously, without the knowledge of his Informer, that he might have the honour of a New fangled notion, sets an Undaunted Operator to work, and in this Country about 290 were inoculated."

All this has not deprived Cotton Mather of the credit of suggesting, and a bold and intelligent physician of the honor of carrying out, the new practice. On the twenty-seventh day of June, 1721, Zabdiel Boylston of Boston inoculated his only son for smallpox,—the first person ever submitted to the operation in the New World. The story of the fierce resistance to the introduction of the practice; of how Boylston was mobbed, and Mather had a hand-grenade thrown in at his window; of how William Douglass, the Scotchman, "always positive, and sometimes accurate," as was neatly said of him, at once depreciated the practice and tried to get the credit of suggesting it, and how Lawrence Dalhonde, the Frenchman, testified to its destructive consequences; of how Edmund Massey, lecturer at St. Albans, preached against sinfully endeavoring to alter the course of nature by presumptuous interposition, which he would leave to the atheist and the scoffer, the heathen and unbeliever, while in the face of his sermon, afterwards reprinted in Boston, many of our New England clergy stood up boldly in defence of the practice,—all this has been told so well and so often that I spare you its details. Set this good hint of Cotton Mather against that letter of his to John Richards, recommending the search after witch-marks, and the application of the water-ordeal, which means throw your grandmother into the water, if she has a mole on her arm;—if she swims, she is a witch and must be hanged; if she sinks, the Lord have mercy on her soul!

Thus did America receive this great discovery, destined to save thousands of lives, via Boston, from the hands of one of our own Massachusetts physicians.

The year 1735 was rendered sadly memorable by the epidemic of the terrible disease known as "throat distemper," and regarded by many as the same as our "diphtheria." Dr. Holyoke thinks the more general use of mercurials in inflammatory complaints dates from the time of their employment in this disease, in which they were thought to have proved specially useful.

At some time in the course of this century medical practice had settled down on four remedies as its chief

reliance. I must repeat an incident which I have related in another of these Essays. When Dr. Holyoke, nearly seventy years ago, received young Mr. James Jackson as his student, he showed him the formidable array of bottles, jars, and drawers around his office, and then named the four remedies referred to as being of more importance than all the rest put together. These were "Mercury, Antimony, Opium, and Peruvian Bark." I doubt if either of them remembered that, nearly seventy years before, in 1730, Dr. William Douglass, the disputatious Scotchman, mentioned those same four remedies, in the dedication of his quarrelsome essay on inoculation, as the most important ones in the hands of the physicians of his time.

In the "Proceedings" of this Society for the year 1863 is a very pleasant paper by the late Dr. Ephraim Eliot, giving an account of the leading physicians of Boston during the last quarter of the last century. The names of Lloyd, Gardiner, Welsh, Rand, Bulfinch, Danforth, John Warren, Jeffries, are all famous in local history, and are commemorated in our medical biographies. One of them, at least, appears to have been more widely known, not only as one of the first aerial voyagers, but as an explorer in the almost equally hazardous realm of medical theory. Dr. John Jeffries, the first of that name, is considered by Broussais as a leader of medical opinion in America, and so referred to in his famous "Examen des Doctrines Medicales."

Two great movements took place in this eighteenth century, the effect of which has been chiefly felt in our own time; namely, the establishment of the Massachusetts Medical Society, and the founding of the Medical School of Harvard University.

The third century of our medical history began with the introduction of the second great medical discovery of modern times,—of all time up to that date, I may say,—once more via Boston, if we count the University village as its suburb, and once more by one of our Massachusetts physicians. In the month of July, 1800, Dr. Benjamin Waterhouse of Cambridge submitted four of his own children to the new process of vaccination,—the first persons vaccinated, as Dr. Zabdiel Boylston's son had been the first person inoculated in the New World.

A little before the first half of this century was completed, in the autumn of 1846, the great discovery went forth from the Massachusetts General Hospital, which repaid the debt of America to the science of the Old World, and gave immortality to the place of its origin in the memory and the heart of mankind. The production of temporary insensibility at will—*tuto, cito, jucunde, safely, quickly, pleasantly*—is one of those triumphs over the infirmities of our mortal condition which change the aspect of life ever afterwards. Rhetoric can add nothing to its glory; gratitude, and the pride permitted to human weakness, that our Bethlehem should have been chosen as the birthplace of this new embodiment of the divine mercy, are all we can yet find room for.

The present century has seen the establishment of all those great charitable institutions for the cure of diseases of the body and of the mind, which our State and our city have a right to consider as among the chief ornaments of their civilization.

The last century had very little to show, in our State, in the way of medical literature. The worthies who took care of our grandfathers and great-grandfathers, like the Revolutionary heroes, fought (with disease) and bled (their patients) and died (in spite of their own remedies); but their names, once familiar, are heard only at rare intervals. Honored in their day, not unremembered by a few solitary students of the past, their memories are going sweetly to sleep in the arms of the patient old dry-nurse, whose "blackdrop" is the never-failing anodyne of the restless generations of men. Except the lively controversy on inoculation, and floating papers in journals, we have not much of value for that long period, in the shape of medical records.

But while the trouble with the last century is to find authors to mention, the trouble of this would be to name all that we find. Of these, a very few claim unquestioned preeminence.

Nathan Smith, born in Rehoboth, Mass., a graduate of the Medical School of our University, did a great work for the advancement of medicine and surgery in New England, by his labors as teacher and author, greater, it is claimed by some, than was ever done by any other man. The two Warrens, of our time, each left a large and permanent record of a most extended surgical practice. James Jackson not only educated a whole generation by his lessons of wisdom, but bequeathed some of the most valuable results of his experience to those who came after him, in a series of letters singularly pleasant and kindly as well as instructive. John Ware, keen and cautious, earnest and deliberate, wrote the two remarkable essays which have identified his name, for all time, with two important diseases, on which he has shed new light by his original observations.

I must do violence to the modesty of the living by referring to the many important contributions to medical science by Dr. Jacob Bigelow, and especially to his discourse on "Self-limited Diseases," an address which can be read in a single hour, but the influence of which will be felt for a century.

Nor would the profession forgive me if I forgot to mention the admirable museum of pathological anatomy, created almost entirely by the hands of Dr. John Barnard Swett Jackson, and illustrated by his own printed descriptive catalogue, justly spoken of by a distinguished professor in the University of Pennsylvania as the most important contribution which had ever been made in this country to the branch to which it relates.

When we look at the literature of mental disease, as seen in hospital reports and special treatises, we can mention the names of Wyman, Woodward, Brigham, Bell, and Ray, all either natives of Massachusetts or placed at the head of her institutions for the treatment of the insane.

We have a right to claim also one who is known all over the civilized world as a philanthropist, to us as a townsman and a graduate of our own Medical School, Dr. Samuel Gridley Howe, the guide and benefactor of a great multitude who were born to a world of inward or of outward darkness.

I cannot pass over in silence the part taken by our own physicians in those sanitary movements which are assuming every year greater importance. Two diseases especially have attracted attention, above all others, with reference to their causes and prevention; cholera, the "black death" of the nineteenth century, and consumption, the white plague of the North, both of which have been faithfully studied and reported on by physicians of our own State and city. The cultivation of medical and surgical specialties, which is fast becoming prevalent, is beginning to show its effects in the literature of the profession, which is every year growing richer in original observations and investigations.

To these benefactors who have labored for us in their peaceful vocation, we must add the noble army of

surgeons, who went with the soldiers who fought the battles of their country, sharing many of their dangers, not rarely falling victims to fatigue, disease, or the deadly volleys to which they often exposed themselves in the discharge of their duties.

The pleasant biographies of the venerable Dr. Thacher, and the worthy and kind-hearted gleaner, Dr. Stephen W. Williams, who came after him, are filled with the names of men who served their generation well, and rest from their labors, followed by the blessing of those for whom they endured the toils and fatigues inseparable from their calling. The hardworking, intelligent country physician more especially deserves the gratitude of his own generation, for he rarely leaves any permanent record in the literature of his profession. Books are hard to obtain; hospitals, which are always centres of intelligence, are remote; thoroughly educated and superior men are separated by wide intervals; and long rides, though favorable to reflection, take up much of the time which might otherwise be given to the labors of the study. So it is that men of ability and vast experience, like the late Dr. Twitchell, for instance, make a great and deserved reputation, become the oracles of large districts, and yet leave nothing, or next to nothing, by which their names shall be preserved from blank oblivion.

One or two other facts deserve mention, as showing the readiness of our medical community to receive and adopt any important idea or discovery. The new science of Histology, as it is now called, was first brought fully before the profession of this country by the translation of Bichat's great work, "Anatomie Generale," by the late Dr. George Hayward.

The first work printed in this country on Auscultation,—that wonderful art of discovering disease, which, as it were, puts a window in the breast, through which the vital organs can be seen, to all intents and purposes, was the manual published anonymously by "A Member of the Massachusetts Medical Society."

We are now in some slight measure prepared to weigh the record of the medical profession in Massachusetts, and pass our judgment upon it. But in order to do justice to the first generation of practitioners, we must compare what we know of their treatment of disease with the state of the art in England, and the superstitions which they saw all around them in other departments of knowledge or belief.

English medical literature must have been at a pretty low ebb when Sydenham recommended Don Quixote to Sir Richard Blackmore for professional reading. The College Pharmacopoeia was loaded with the most absurd compound mixtures, one of the most complex of which (the same which the Reverend Mr. Harward, "Lecturer at the Royal Chappel in Boston," tried to simplify), was not dropped until the year 1801. Sir Kenelm Digby was playing his fantastic tricks with the Sympathetic powder, and teaching Governor Winthrop, the second, how to cure fever and ague, which some may like to know. "Pare the patient's nails; put the parings in a little bag, and hang the bag round the neck of a live eel, and put him in a tub of water. The eel will die, and the patient will recover."

Wiseman, the great surgeon, was discoursing eloquently on the efficacy of the royal touch in scrofula. The founder of the Ashmolean Museum at Oxford, consorting with alchemists and astrologers, was treasuring the manuscripts of the late pious Dr. Richard Napier, in which certain letters (Rx Ris) were understood to mean Responsum Raphaelis,—the answer of the angel Raphael to the good man's medical questions. The illustrious Robert Boyle was making his collection of choice and safe remedies, including the sole of an old shoe, the thigh bone of a hanged man, and things far worse than these, as articles of his materia medica. Dr. Stafford, whose paper of directions to his "friend, Mr. Wintrop," I cited, was probably a man of standing in London; yet toad-powder was his sovereign remedy.

See what was the state of belief in other matters among the most intelligent persons of the colonies, magistrates and clergymen. Jonathan Brewster, son of the church-elder, writes the wildest letters to John Winthrop about alchemy,—"mad for making gold as the Lynn rock-borers are for finding it."

Remember the theology and the diabolology of the time. Mr. Cotton's Theocracy was a royal government, with the King of kings as its nominal head, but with an upper chamber of saints, and a tremendous opposition in the lower house; the leader of which may have been equalled, but cannot have been surpassed by any of our earth-born politicians. The demons were prowling round the houses every night, as the foxes were sneaking about the hen-roosts. The men of Gloucester fired whole flasks of gunpowder at devils disguised as Indians and Frenchmen.

How deeply the notion of miraculous interference with the course of nature was rooted, is shown by the tenacity of the superstition about earthquakes. We can hardly believe that our Professor Winthrop, father of the old judge and the "squire," whom many of us Cambridge people remember so well, had to defend himself against the learned and excellent Dr. Prince, of the Old South Church, for discussing their phenomena as if they belonged to the province of natural science.

Not for the sake of degrading the aspect of the noble men who founded our State, do I refer to their idle beliefs and painful delusions, but to show against what influences the common sense of the medical profession had to assert itself.

Think, then, of the blazing stars, that shook their horrid hair in the sky; the phantom ship, that brought its message direct from the other world; the story of the mouse and the snake at Watertown; of the mice and the prayer-book; of the snake in church; of the calf with two heads; and of the cabbage in the perfect form of a cutlash,—all which innocent occurrences were accepted or feared as alarming portents.

We can smile at these: but we cannot smile at the account of unhappy Mary Dyer's malformed offspring; or of Mrs. Hutchinson's domestic misfortune of similar character, in the story of which the physician, Dr. John Clark of Rhode Island, alone appears to advantage; or as we read the Rev. Samuel Willard's fifteen alarming pages about an unfortunate young woman suffering with hysteria. Or go a little deeper into tragedy, and see poor Dorothy Talby, mad as Ophelia, first admonished, then whipped; at last, taking her own little daughter's life; put on trial, and standing mute, threatened to be pressed to death, confessing, sentenced, praying to be beheaded; and none the less pitilessly swung from the fatal ladder.

The cooper's crazy wife—crazy in the belief that she has committed the unpardonable sin—tries to drown her child, to save it from misery; and the poor lunatic, who would be tenderly cared for to-day in a quiet asylum, is judged to be acting under the instigation of Satan himself. Yet, after all, what can we say, who put

Bunyan's "Pilgrim's Progress," full of nightmare dreams of horror, into all our children's hands; a story in which the awful image of the man in the cage might well turn the nursery where it is read into a madhouse?

The miserable delusion of witchcraft illustrates, in a still more impressive way, the false ideas which governed the supposed relation of men with the spiritual world. I have no doubt many physicians shared in these superstitions. Mr. Upham says they—that is, some of them—were in the habit of attributing their want of success to the fact, that an "evil hand" was on their patient. The temptation was strong, no doubt, when magistrates and ministers and all that followed their lead were contented with such an explanation. But how was it in Salem, according to Mr. Upham's own statement? Dr. John Swinnerton was, he says, for many years the principal physician of Salem. And he says, also, "The Swinnerton family were all along opposed to Mr. Parris, and kept remarkably clear from the witchcraft delusion." Dr. John Swinnerton—the same, by the way, whose memory is illuminated by a ray from the genius of Hawthorne—died the very year before the great witchcraft explosion took place. But who can doubt that it was from him that the family had learned to despise and to resist the base superstition; or that Bridget Bishop, whose house he rented, as Mr. Upham tells me, the first person hanged in the time of the delusion, would have found an efficient protector in her tenant, had he been living, to head the opposition of his family to the misguided clergymen and magistrates?

I cannot doubt that our early physicians brought with them many Old-World medical superstitions, and I have no question that they were more or less involved in the prevailing errors of the community in which they lived. But, on the whole, their record is a clean one, so far as we can get at it; and where it is questionable we must remember that there must have been many little-educated persons among them; and that all must have felt, to some extent, the influence of those sincere and devoted but unsafe men, the physic-practising clergymen, who often used spiritual means as a substitute for temporal ones, who looked upon a hysteric patient as possessed by the devil, and treated a fractured skull by prayers and plasters, following the advice of a ruling elder in opposition to the "unanimous opinion of seven surgeons."

To what results the union of the two professions was liable to lead, may be seen by the example of a learned and famous person, who has left on record the product of his labors in the double capacity of clergyman and physician.

I have had the privilege of examining a manuscript of Cotton Mather's relating to medicine, by the kindness of the librarian of the American Antiquarian Society, to which society it belongs. A brief notice of this curious document may prove not uninteresting.

It is entitled "The Angel of Bethesda: an Essay upon the Common Maladies of Mankind, offering, first, the sentiments of Piety," etc., etc., and "a collection of plain but potent and Approved REMEDIES for the Maladies." There are sixty-six "Capsula's," as he calls them, or chapters, in his table of contents; of which, five—from the fifteenth to the nineteenth, inclusive—are missing. This is a most unfortunate loss, as the eighteenth capsula treated of agues, and we could have learned from it something of their degree of frequency in this part of New England. There is no date to the manuscript; which, however, refers to a case observed Nov. 14, 1724.

The divine takes precedence of the physician in this extraordinary production. He begins by preaching a sermon at his unfortunate patient. Having thrown him into a cold sweat by his spiritual sudorific, he attacks him with his material remedies, which are often quite as unpalatable. The simple and cleanly practice of Sydenham, with whose works he was acquainted, seems to have been thrown away upon him. Everything he could find mentioned in the seventy or eighty authors he cites, all that the old women of both sexes had ever told him of, gets into his text, or squeezes itself into his margin.

Evolving disease out of sin, he hates it, one would say, as he hates its cause, and would drive it out of the body with all noisome appliances. "Sickness is in Fact Flagellum Dei pro peccatis mundi." So saying, he encourages the young mother whose babe is wasting away upon her breast with these reflections:

"Think; oh the grievous Effects of Sin! This wretched Infant has not arrived unto years of sense enough, to sin after the similitude of the transgression committed by Adam. Nevertheless the Transgression of Adam, who had all mankind Foederally, yea, Naturally, in him, has involved this Infant in the guilt of it. And the poison of the old serpent, which infected Adam when he fell into his Transgression, by hearkening to the Tempter, has corrupted all mankind, and is a seed unto such diseases as this Infant is now laboring under. Lord, what are we, and what are our children, but a Generation of Vipers?"

Many of his remedies are at least harmless, but his pedantry and utter want of judgment betray themselves everywhere. He piles his prescriptions one upon another, without the least discrimination. He is run away with by all sorts of fancies and superstitions. He prescribes euphrasia, eye-bright, for disease of the eyes; appealing confidently to the strange old doctrine of signatures, which inferred its use from the resemblance of its flower to the organ of vision. For the scattering of wens, the efficacy of a Dead Hand has been out of measure wonderful. But when he once comes to the odious class of remedies, he revels in them like a scarabeus. This allusion will bring us quite near enough to the inconceivable abominations with which he proposed to outrage the sinful stomachs of the unhappy confederates and accomplices of Adam.

It is well that the treatise was never printed, yet there are passages in it worth preserving. He speaks of some remedies which have since become more universally known:

"Among the plants of our soyl, Sir William Temple singles out Five [Six] as being of the greatest virtue and most friendly to health: and his favorite plants, Sage, Rue, Saffron, Alehoof, Garlick, and Elder."

"But these Five [Six] plants may admitt of some competitors. The QUINQUINA—How celebrated: Immoderately, Hyperbolically celebrated!"

Of Ipecacuanha, he says,—"This is now in its reign; the most fashionable vomit."

"I am not sorry that antimonial emetics begin to be disused."

He quotes "Mr. Lock" as recommending red poppy-water and abstinence from flesh as often useful in children's diseases.

One of his "Capsula's" is devoted to the animalcular origin of diseases, at the end of which he says, speaking of remedies for this supposed source of our distempers:

"Mercury we know thee: But we are afraid thou wilt kill us too, if we employ thee to kill them that kill us.

"And yett, for the cleansing of the small Blood Vessels, and making way for the free circulation of the Blood and Lymph—there is nothing like Mercurial Deobstruents."

From this we learn that mercury was already in common use, and the subject of the same popular prejudice as in our own time.

His poetical turn shows itself here and there:

"O Nightingale, with a Thorn at thy Breast; Under the trouble of a Cough, what can be more proper than such thoughts as these?"...

If there is pathos in this, there is bathos in his apostrophe to the millipede, beginning "Poor sowbug!" and eulogizing the healing virtues of that odious little beast; of which he tells us to take "half a pound, putt 'em alive into a quart or two of wine," with saffron and other drugs, and take two ounces twice a day.

The "Capsula" entitled "Nishmath Chajim" was printed in 1722, at New London, and is in the possession of our own Society. He means, by these words, something like the Archxus of Van Helmont, of which he discourses in a style wonderfully resembling that of Mr. Jenkinson in the "Vicar of Wakefield." "Many of the Ancients thought there was much of a Real History in the Parable, and their Opinion was that there is, DIAPHORA KATA TAS MORPHAS, A Distinction (and so a Resemblance) of men as to their Shapes after Death." And so on, with Ireaeus, Tertullian, Thespesius, and "the TA TONE PSEUCONE CROMATA," in the place of "Sanconiathon, Manetho, Berosus," and "Anarchon ara kai ateleutaion to pan."

One other passage deserves notice, as it relates to the single medical suggestion which does honor to Cotton Mather's memory. It does not appear that he availed himself of the information which he says he obtained from his slave, for such I suppose he was.

In his appendix to "Variolae Triumphatae," he says,—

"There has been a wonderful practice lately used in several parts of the world, which indeed is not yet become common in our nation.

"I was first informed of it by a Garamantee servant of my own, long before I knew that any Europeans or Asiaticks had the least acquaintance with it, and some years before I was enriched with the communications of the learned Foreigners, whose accounts I found agreeing with what I received of my servant, when he shewed me the Scar of the Wound made for the operation; and said, That no person ever died of the smallpox, in their country, that had the courage to use it.

"I have since met with a considerable Number of these Africans, who all agree in one story; That in their country grandy-many dy of the small-pox: But now they learn this way: people take juice of smallpox and cutty-skin and put in a Drop; then by'nd by a little sicky, sicky: then very few little things like small-pox; and nobody dy of it; and nobody have small-pox any more. Thus, in Africa, where the poor creatures dy of the smallpox like Rotten Sheep, a merciful God has taught them an Infalible preservative. 'T is a common practice, and is attended with a constant success."

What has come down to us of the first century of medical practice, in the hands of Winthrop and Oliver, is comparatively simple and reasonable. I suspect that the conditions of rude, stern life, in which the colonists found themselves in the wilderness, took the nonsense out of them, as the exigencies of a campaign did out of our physicians and surgeons in the late war. Good food and enough of it, pure air and water, cleanliness, good attendance, an anaesthetic, an opiate, a stimulant, quinine, and two or three common drugs, proved to be the marrow of medical treatment; and the fopperies of the pharmacopoeia went the way of embroidered shirts and white kid gloves and malacca joints, in their time of need. "Good wine is the best cordial for her," said Governor John Winthrop, Junior, to Samuel Symonds, speaking of that gentleman's wife,—just as Sydenham, instead of physic, once ordered a roast chicken and a pint of canary for his patient in male hysterics.

But the profession of medicine never could reach its full development until it became entirely separated from that of divinity. The spiritual guide, the consoler in affliction, the confessor who is admitted into the secrets of our souls, has his own noble sphere of duties; but the healer of men must confine himself solely to the revelations of God in nature, as he sees their miracles with his own eyes. No doctrine of prayer or special providence is to be his excuse for not looking straight at secondary causes, and acting, exactly so far as experience justifies him, as if he were himself the divine agent which antiquity fabled him to be. While pious men were praying—humbly, sincerely, rightly, according to their knowledge—over the endless succession of little children dying of spasms in the great Dublin Hospital, a sagacious physician knocked some holes in the walls of the ward, let God's blessed air in on the little creatures, and so had already saved in that single hospital, as it was soberly calculated thirty years ago, more than sixteen thousand lives of these infant heirs of immortality. [Collins's Midwifery, p. 312. Published by order of the Massachusetts Medical Society. Boston, 1841.]

Let it be, if you will, that the wise inspiration of the physician was granted in virtue of the clergyman's supplications. Still, the habit of dealing with things seen generates another kind of knowledge, and another way of thought, from that of dealing with things unseen; which knowledge and way of thought are special means granted by Providence, and to be thankfully accepted.

The mediaeval ecclesiastics expressed a great truth in that saying, so often quoted, as carrying a reproach with it: "Ubi tres medici, duo athei,"—"Where there are three physicians, there are two atheists."

It was true then, it is true to-day, that the physician very commonly, if not very generally, denies and repudiates the deity of ecclesiastical commerce. The Being whom Ambroise Pare meant when he spoke those memorable words, which you may read over the professor's chair in the French School of Medicine, "Te le pensay, et Dieu le guarit," "I dressed his wound, and God healed it,"—is a different being from the God that scholastic theologians have projected from their consciousness, or shaped even from the sacred pages which have proved so plastic in their hands. He is a God who never leaves himself without witness, who repenteth him of the evil, who never allows a disease or an injury, compatible with the enjoyment of life, to take its course without establishing an effort, limited by certain fixed conditions, it is true, but an effort, always, to

restore the broken body or the shattered mind. In the perpetual presence of this great Healing Agent, who stays the bleeding of wounds, who knits the fractured bone, who expels the splinter by a gentle natural process, who walls in the inflammation that might involve the vital organs, who draws a cordon to separate the dead part from the living, who sends his three natural anaesthetics to the over-tasked frame in due order, according to its need,—sleep, fainting, death; in this perpetual presence, it is doubtless hard for the physician to realize the theological fact of a vast and permanent sphere of the universe, where no organ finds itself in its natural medium, where no wound heals kindly, where the executive has abrogated the pardoning power, and mercy forgets its errand; where the omnipotent is unfelt save in malignant agencies, and the omnipresent is unseen and unrepresented; hard to accept the God of Dante's "Inferno," and of Bunyan's caged lunatic. If this is atheism, call three, instead of two of the trio, atheists, and it will probably come nearer the truth.

I am not disposed to deny the occasional injurious effect of the materializing influences to which the physician is subjected. A spiritual guild is absolutely necessary to keep him, to keep us all, from becoming the "fingering slaves" that Wordsworth treats with such shrivelling scorn. But it is well that the two callings have been separated, and it is fitting that they remain apart. In settling the affairs of the late concern, I am afraid our good friends remain a little in our debt. We lent them our physician Michael Servetus in fair condition, and they returned him so damaged by fire as to be quite useless for our purposes. Their Reverend Samuel Willard wrote us a not over-wise report of a case of hysteria; and our Jean Astruc gave them (if we may trust Dr. Smith's Dictionary of the Bible) the first discerning criticism on the authorship of the Pentateuch. Our John Locke enlightened them with his letters concerning toleration; and their Cotton Mather obscured our twilight with his "Nishmath Chajim."

Yet we must remember that the name of Basil Valentine, the monk, is associated with whatever good and harm we can ascribe to antimony; and that the most remarkable of our specifics long bore the name of "Jesuit's Bark," from an old legend connected with its introduction. "Frere Jacques," who taught the lithotomists of Paris, owes his ecclesiastical title to courtesy, as he did not belong to a religious order.

Medical science, and especially the study of mental disease, is destined, I believe, to react to much greater advantage on the theology of the future than theology has acted on medicine in the past. The liberal spirit very generally prevailing in both professions, and the good understanding between their most enlightened members, promise well for the future of both in a community which holds every point of human belief, every institution in human hands, and every word written in a human dialect, open to free discussion today, tomorrow, and to the end of time. Whether the world at large will ever be cured of trusting to specifics as a substitute for observing the laws of health, and to mechanical or intellectual formula as a substitute for character, may admit of question. Quackery and idolatry are all but immortal.

We can find most of the old beliefs alive amongst us to-day, only having changed their dresses and the social spheres in which they thrive. We think the quarrels of Galenists and chemists belong to the past, forgetting that Thomsonism has its numerous apostles in our community; that it is common to see remedies vaunted as purely vegetable, and that the prejudice against "mineral poisons," especially mercury, is as strong in many quarters now as it was at the beginning of the seventeenth century. Names are only air, and blow away with a change of wind; but beliefs are rooted in human wants and weakness, and die hard. The oaks of Dodona are prostrate, and the shrine of Delphi is desolate; but the Pythoness and the Sibyl may be consulted in Lowell Street for a very moderate compensation. Nostradamus and Lilly seem impossible in our time; but we have seen the advertisements of an astrologer in our Boston papers year after year, which seems to imply that he found believers and patrons. You smiled when I related Sir Kenelm Digby's prescription with the live eel in it; but if each of you were to empty his or her pockets, would there not roll out, from more than one of them, a horse-chestnut, carried about as a cure for rheumatism? The brazen head of Roger Bacon is mute; but is not "Planchette" uttering her responses in a hundred houses of this city? We think of palmistry or chiromancy as belonging to the days of Albertus Magnus, or, if existing in our time, as given over to the gypsies; but a very distinguished person has recently shown me the line of life, and the line of fortune, on the palm of his hand, with a seeming confidence in the sanguine predictions of his career which had been drawn from them. What shall we say of the plausible and well-dressed charlatans of our own time, who trade in false pretences, like Nicholas Knapp of old, but without any fear of being fined or whipped; or of the many follies and inanities, imposing on the credulous part of the community, each of them gaping with eager, open mouth for a gratuitous advertisement by the mention of its foolish name in any respectable connection?

I turn from this less pleasing aspect of the common intelligence which renders such follies possible, to close the honorable record of the medical profession in this, our ancient Commonwealth.

We have seen it in the first century divided among clergymen, magistrates, and regular practitioners; yet, on the whole, for the time, and under the circumstances, respectable, except where it invoked supernatural agencies to account for natural phenomena.

In the second century it simplified its practice, educated many intelligent practitioners, and began the work of organizing for concerted action, and for medical teaching.

In this, our own century, it has built hospitals, perfected and multiplied its associations and educational institutions, enlarged and created museums, and challenged a place in the world of science by its literature.

In reviewing the whole course of its history we read a long list of honored names, and a precious record written in private memories, in public charities, in permanent contributions to medical science, in generous sacrifices for the country. We can point to our capital as the port of entry for the New World of the great medical discoveries of two successive centuries, and we can claim for it the triumph over the most dreaded foe that assails the human body,—a triumph which the annals of the race can hardly match in three thousand years of medical history.

[A Valedictory Address delivered to the Graduating Class of the Bellevue Hospital College, March 2, 1871.]

The occasion which calls us together reminds us not a little of that other ceremony which unites a man and woman for life. The banns have already been pronounced which have wedded our young friends to the profession of their choice. It remains only to address to them some friendly words of cheering counsel, and to bestow upon them the parting benediction.

This is not the time for rhetorical display or ambitious eloquence. We must forget ourselves, and think only of them. To us it is an occasion; to them it is an epoch. The spectators at the wedding look curiously at the bride and bridegroom; at the bridal veil, the orange-flower garland, the giving and receiving of the ring; they listen for the tremulous "I will," and wonder what are the mysterious syllables the clergyman whispers in the ear of the married maiden. But to the newly-wedded pair what meaning in those words, "for better, for worse," "in sickness and in health," "till death us do part!" To the father, to the mother, who know too well how often the deadly nightshade is interwoven with the wreath of orange-blossoms, how empty the pageant, how momentous the reality!

You will not wonder that I address myself chiefly to those who are just leaving academic life for the sterner struggle and the larger tasks of matured and instructed manhood. The hour belongs to them; if others find patience to listen, they will kindly remember that, after all, they are but as the spectators at the wedding, and that the priest is thinking less of them than of their friends who are kneeling at the altar.

I speak more directly to you, then, gentlemen of the graduating class. The days of your education, as pupils of trained instructors, are over. Your first harvest is all garnered. Henceforth you are to be sowers as well as reapers, and your field is the world. How does your knowledge stand to-day? What have you gained as a permanent possession? What must you expect to forget? What remains for you yet to learn? These are questions which it may interest you to consider.

There is another question which must force itself on the thoughts of many among you: "How am I to obtain patients and to keep their confidence?" You have chosen a laborious calling, and made many sacrifices to fit yourselves for its successful pursuit. You wish to be employed that you may be useful, and that you may receive the reward of your industry. I would take advantage of these most receptive moments to give you some hints which may help you to realize your hopes and expectations. Such is the outline of the familiar talk I shall offer you.

Your acquaintance with some of the accessory branches is probably greater now than it will be in a year from now,—much greater than it will be ten years from now. The progress of knowledge, it may be feared, or hoped, will have outrun the text-books in which you studied these branches. Chemistry, for instance, is very apt to spoil on one's hands. "Nous avons change tout cela" might serve as the standing motto of many of our manuals. Science is a great traveller, and wears her shoes out pretty fast, as might be expected.

You are now fresh from the lecture-room and the laboratory. You can pass an examination in anatomy, physiology, chemistry, materia medica, which the men in large practice all around you would find a more potent sudorific than any in the Pharmacopoeia. These masters of the art of healing were once as ready with their answers as you are now, but they have got rid of a great deal of the less immediately practical part of their acquisitions, and you must undergo the same depleting process. Hard work will train it off, as sharp exercise trains off the fat of a prize-fighter.

Yet, pause a moment before you infer that your teachers must have been in fault when they furnished you with mental stores not directly convertible to practical purposes, and likely in a few years to lose their place in your memory. All systematic knowledge involves much that is not practical, yet it is the only kind of knowledge which satisfies the mind, and systematic study proves, in the long-run, the easiest way of acquiring and retaining facts which are practical. There are many things which we can afford to forget, which yet it was well to learn. Your mental condition is not the same as if you had never known what you now try in vain to recall. There is a perpetual metempsychosis of thought, and the knowledge of to-day finds a soil in the forgotten facts of yesterday. You cannot see anything in the new season of the guano you placed last year about the roots of your climbing plants, but it is blushing and breathing fragrance in your trellised roses; it has scaled your porch in the bee-haunted honey-suckle; it has found its way where the ivy is green; it is gone where the woodbine expands its luxuriant foliage.

Your diploma seems very broad to-day with your list of accomplishments, but it begins to shrink from this hour like the Peau de Chagrin of Balzac's story. Do not worry about it, for all the while there will be making out for you an ampler and fairer parchment, signed by old Father Time himself as President of that great University in which experience is the one perpetual and all-sufficient professor.

Your present plethora of acquirements will soon cure itself. Knowledge that is not wanted dies out like the eyes of the fishes of the Mammoth Cave. When you come to handle life and death as your daily business, your memory will of itself bid good-by to such inmates as the well-known foramina of the sphenoid bone and the familiar oxides of methyl-ethylamyl-phenyl-ammonium. Be thankful that you have once known them, and remember that even the learned ignorance of a nomenclature is something to have mastered, and may furnish pegs to hang facts upon which would otherwise have strewed the floor of memory in loose disorder.

But your education has, after all, been very largely practical. You have studied medicine and surgery, not chiefly in books, but at the bedside and in the operating amphitheatre. It is the special advantage of large cities that they afford the opportunity of seeing a great deal of disease in a short space of time, and of seeing many cases of the same kind of disease brought together. Let us not be unjust to the claims of the schools remote from the larger centres of population. Who among us has taught better than Nathan Smith, better than Elisha Bartlett? who teaches better than some of our living contemporaries who divide their time between city and country schools? I am afraid we do not always do justice to our country brethren, whose merits are less conspicuously exhibited than those of the great city physicians and surgeons, such especially as have charge of large hospitals. There are modest practitioners living in remote rural districts who are gifted by nature with such sagacity and wisdom, trained so well in what is most essential to the practice of their art, taught so thoroughly by varied experience, forced to such manly self-reliance by their comparative isolation, that, from converse with them alone, from riding with them on their long rounds as they pass from

village to village, from talking over cases with them, putting up their prescriptions, watching their expedients, listening to their cautions, marking the event of their predictions, hearing them tell of their mistakes, and now and then glory a little in the detection of another's blunder, a young man would find himself better fitted for his real work than many who have followed long courses of lectures and passed a showy examination. But the young man is exceptionally fortunate who enjoys the intimacy of such a teacher. And it must be confessed that the great hospitals, infirmaries, and dispensaries of large cities, where men of well-sifted reputations are in constant attendance, are the true centres of medical education. No students, I believe, are more thoroughly aware of this than those who have graduated at this institution. Here, as in all our larger city schools, the greatest pains are taken to teach things as well as names. You have entered into the inheritance of a vast amount of transmitted skill and wisdom, which you have taken, warm, as it were, with the life of your well-schooled instructors. You have not learned all that art has to teach you, but you are safer practitioners to-day than were many of those whose names we hardly mention without a genuflection. I had rather be cared for in a fever by the best-taught among you than by the renowned Fernelius or the illustrious Boerhaave, could they come back to us from that better world where there are no physicians needed, and, if the old adage can be trusted, not many within call. I had rather have one of you exercise his surgical skill upon me than find myself in the hands of a resuscitated Fabricius Hildanus, or even of a wise Ambroise Pare, revisiting earth in the light of the nineteenth century.

You will not accuse me of underrating your accomplishments. You know what to do for a child in a fit, for an alderman in an apoplexy, for a girl that has fainted, for a woman in hysterics, for a leg that is broken, for an arm that is out of joint, for fevers of every color, for the sailor's rheumatism, and the tailor's cachexy. In fact you do really know so much at this very hour, that nothing but the searching test of time can fully teach you the limitations of your knowledge.

Of some of these you will permit me to remind you. You will never have outgrown the possibility of new acquisitions, for Nature is endless in her variety. But even the knowledge which you may be said to possess will be a different thing after long habit has made it a part of your existence. The *tactus eruditus* extends to the mind as well as to the finger-ends. Experience means the knowledge gained by habitual trial, and an expert is one who has been in the habit of trying. This is the kind of knowledge that made Ulysses wise in the ways of men. Many cities had he seen, and known the minds of those who dwelt in them. This knowledge it was that Chaucer's Shipman brought home with him from the sea—

"In many a tempest had his berd be shake."

This is the knowledge we place most confidence in, in the practical affairs of life.

Our training has two stages. The first stage deals with our intelligence, which takes the idea of what is to be done with the most charming ease and readiness. Let it be a game of billiards, for instance, which the marker is going to teach us. We have nothing to do but to make this ball glance from that ball and hit that other ball, and to knock that ball with this ball into a certain caecal sacculus or diverticulum which our professional friend calls a pocket. Nothing can be clearer; it is as easy as "playing upon this pipe," for which Hamlet gives Guildenstern such lucid directions. But this intelligent Me, who steps forward as the senior partner in our dual personality, turns out to be a terrible bungler. He misses those glancing hits which the hard-featured young professional person calls "carroms," and insists on pocketing his own ball instead of the other one.

It is the unintelligent Me, stupid as an idiot, that has to try a thing a thousand times before he can do it, and then never knows how he does it, that at last does it well. We have to educate ourselves through the pretentious claims of intellect, into the humble accuracy of instinct, and we end at last by acquiring the dexterity, the perfection, the certainty, which those masters of arts, the bee and the spider, inherit from Nature.

Book-knowledge, lecture-knowledge, examination-knowledge, are all in the brain. But work-knowledge is not only in the brain, it is in the senses, in the muscles, in the ganglia of the sympathetic nerves,—all over the man, as one may say, as instinct seems diffused through every part of those lower animals that have no such distinct organ as a brain. See a skilful surgeon handle a broken limb; see a wise old physician smile away a case that looks to a novice as if the sexton would soon be sent for; mark what a large experience has done for those who were fitted to profit by it, and you will feel convinced that, much as you know, something is still left for you to learn.

May I venture to contrast youth and experience in medical practice, something in the way the man painted the lion, that is, the lion under?

The young man knows the rules, but the old man knows the exceptions. The young man knows his patient, but the old man knows also his patient's family, dead and alive, up and down for generations. He can tell beforehand what diseases their unborn children will be subject to, what they will die of if they live long enough, and whether they had better live at all, or remain unrealized possibilities, as belonging to a stock not worth being perpetuated. The young man feels uneasy if he is not continually doing something to stir up his patient's internal arrangements. The old man takes things more quietly, and is much more willing to let well enough alone: All these superiorities, if such they are, you must wait for time to bring you. In the meanwhile (if we will let the lion be uppermost for a moment), the young man's senses are quicker than those of his older rival. His education in all the accessory branches is more recent, and therefore nearer the existing condition of knowledge. He finds it easier than his seniors to accept the improvements which every year is bringing forward. New ideas build their nests in young men's brains. "Revolutions are not made by men in spectacles," as I once heard it remarked, and the first whispers of a new truth are not caught by those who begin to feel the need of an ear-trumpet. Granting all these advantages to the young man, he ought, nevertheless, to go on improving, on the whole, as a medical practitioner, with every year, until he has ripened into a well-mellowed maturity. But, to improve, he must be good for something at the start. If you ship a poor cask of wine to India and back, if you keep it a half a century, it only grows thinner and sharper.

You are soon to enter into relations with the public, to expend your skill and knowledge for its benefit, and

find your support in the rewards of your labor. What kind of a constituency is this which is to look to you as its authorized champions in the struggle of life against its numerous enemies?

In the first place, the persons who seek the aid of the physician are very honest and sincere in their wish to get rid of their complaints, and, generally speaking, to live as long as they can. However attractively the future is painted to them, they are attached to the planet with which they are already acquainted. They are addicted to the daily use of this empirical and unchemical mixture which we call air; and would hold on to it as a tippler does to his alcoholic drinks. There is nothing men will not do, there is nothing they have not done, to recover their health and save their lives. They have submitted to be half-drowned in water, and half-choked with gases, to be buried up to their chins in earth, to be seared with hot irons like galley-slaves, to be crimped with knives, like cod-fish, to have needles thrust into their flesh, and bonfires kindled on their skin, to swallow all sorts of abominations, and to pay for all this, as if to be singed and scalded were a costly privilege, as if blisters were a blessing, and leeches were a luxury. What more can be asked to prove their honesty and sincerity?

This same community is very intelligent with respect to a great many subjects—commerce, mechanics, manufactures, politics. But with regard to medicine it is hopelessly ignorant and never finds it out. I do not know that it is any worse in this country than in Great Britain, where Mr. Huxley speaks very freely of “the utter ignorance of the simplest laws of their own animal life, which prevails among even the most highly educated persons.” And Cullen said before him “Neither the acutest genius nor the soundest judgment will avail in judging of a particular science, in regard to which they have not been exercised. I have been obliged to please my patients sometimes with reasons, and I have found that any will pass, even with able divines and acute lawyers; the same will pass with the husbands as with the wives.” If the community could only be made aware of its own utter ignorance, and incompetence to form opinions on medical subjects, difficult enough to those who give their lives to the study of them, the practitioner would have an easier task. But it will form opinions of its own, it cannot help it, and we cannot blame it, even though we know how slight and deceptive are their foundations.

This is the way it happens: Every grown-up person has either been ill himself or had a friend suffer from illness, from which he has recovered. Every sick person has done something or other by somebody's advice, or of his own accord, a little before getting better. There is an irresistible tendency to associate the thing done, and the improvement which followed it, as cause and effect. This is the great source of fallacy in medical practice. But the physician has some chance of correcting his hasty inference. He thinks his prescription cured a single case of a particular complaint; he tries it in twenty similar cases without effect, and sets down the first as probably nothing more than a coincidence. The unprofessional experimenter or observer has no large experience to correct his hasty generalization. He wants to believe that the means he employed effected his cure. He feels grateful to the person who advised it, he loves to praise the pill or potion which helped him, and he has a kind of monumental pride in himself as a living testimony to its efficacy. So it is that you will find the community in which you live, be it in town or country, full of brands plucked from the burning, as they believe, by some agency which, with your better training, you feel reasonably confident had nothing to do with it. Their disease went out of itself, and the stream from the medical fire-annihilator had never even touched it.

You cannot and need not expect to disturb the public in the possession of its medical superstitions. A man's ignorance is as much his private property, and as precious in his own eyes, as his family Bible. You have only to open your own Bible at the ninth chapter of St. John's Gospel, and you will find that the logic of a restored patient was very simple then, as it is now, and very hard to deal with. My clerical friends will forgive me for poaching on their sacred territory, in return for an occasional raid upon the medical domain of which they have now and then been accused.

A blind man was said to have been restored to sight by a young person whom the learned doctors of the Jewish law considered a sinner, and, as such, very unlikely to have been endowed with a divine gift of healing. They visited the patient repeatedly, and evidently teased him with their questions about the treatment, and their insinuations about the young man, until he lost his temper. At last he turned sharply upon them: “Whether he be a sinner or no, I know not: one thing I know, that, whereas I was blind, now I see.”

This is the answer that always has been and always will be given by most persons when they find themselves getting well after doing anything, no matter what,—recommended by anybody, no matter whom. Lord Bacon, Robert Boyle, Bishop Berkeley, all put their faith in panaceas which we should laugh to scorn. They had seen people get well after using them. Are we any wiser than those great men? Two years ago, in a lecture before the Massachusetts Historical Society, I mentioned this recipe of Sir Kenelm Digby for fever and ague: Pare the patient's nails; put the parings in a little bag, and hang the bag round the neck of a live eel, and place him in a tub of water. The eel will die, and the patient will recover.

Referring to this prescription in the course of the same lecture, I said: “You smiled when I related Sir Kenelm Digby's prescription, with the live eel in it; but if each of you were to empty his or her pockets, would there not roll out, from more than one of them, a horse-chestnut, carried about as a cure for rheumatism?” Nobody saw fit to empty his or her pockets, and my question brought no response. But two months ago I was in a company of educated persons, college graduates every one of them, when a gentleman, well known in our community, a man of superior ability and strong common-sense, on the occasion of some talk arising about rheumatism, took a couple of very shiny horse-chestnuts from his breeches-pocket, and laid them on the table, telling us how, having suffered from the complaint in question, he had, by the advice of a friend, procured these two horse-chestnuts on a certain time a year or more ago, and carried them about him ever since; from which very day he had been entirely free from rheumatism.

This argument, from what looks like cause and effect, whether it be so or not, is what you will have to meet wherever you go, and you need not think you can answer it. In the natural course of things some thousands of persons must be getting well or better of slight attacks of colds, of rheumatic pains, every week, in this city alone. Hundreds of them do something or other in the way of remedy, by medical or other advice, or of their own motion, and the last thing they do gets the credit of the recovery. Think what a crop of remedies this

must furnish, if it were all harvested!

Experience has taught, or will teach you, that most of the wonderful stories patients and others tell of sudden and signal cures are like Owen Glendower's story of the portents that announced his birth. The earth shook at your nativity, did it? Very likely, and

*"So it would have done,
At the same season, if your mother's cat
Had kittened, though yourself had ne'er been born."*

You must listen more meekly than Hotspur did to the babbling Welshman, for ignorance is a solemn and sacred fact, and, like infancy, which it resembles, should be respected. Once in a while you will have a patient of sense, born with the gift of observation, from whom you may learn something. When you find yourself in the presence of one who is fertile of medical opinions, and affluent in stories of marvellous cures,—of a member of Congress whose name figures in certificates to the value of patent medicines, of a voluble dame who discourses on the miracles she has wrought or seen wrought with the little jokers of the sugar-of-milk globule-box, take out your watch and count the pulse; also note the time of day, and charge the price of a visit for every extra fifteen, or, if you are not very busy, every twenty minutes. In this way you will turn what seems a serious dispensation into a double blessing, for this class of patients loves dearly to talk, and it does them a deal of good, and you feel as if you had earned your money by the dose you have taken, quite as honestly as by any dose you may have ordered.

You must take the community just as it is, and make the best of it. You wish to obtain its confidence; there is a short rule for doing this which you will find useful,—deserve it. But, to deserve it in full measure, you must unite many excellences, natural and acquired.

As the basis of all the rest, you must have all those traits of character which fit you to enter into the most intimate and confidential relations with the families of which you are the privileged friend and counsellor. Medical Christianity, if I may use such a term, is of very early date. By the oath of Hippocrates, the practitioner of ancient times bound himself to enter his patient's house with the sole purpose of doing him good, and so to conduct himself as to avoid the very appearance of evil. Let the physician of to-day begin by coming up to this standard, and add to it all the more recently discovered virtues and graces.

A certain amount of natural ability is requisite to make you a good physician, but by no means that disproportionate development of some special faculty which goes by the name of genius. A just balance of the mental powers is a great deal more likely to be useful than any single talent, even were it the power of observation, in excess. For a mere observer is liable to be too fond of facts for their own sake, so that, if he told the real truth, he would confess that he takes more pleasure in a post-mortem examination which shows him what was the matter with a patient, than in a case which insists on getting well and leaving him in the dark as to its nature. Far more likely to interfere with the sound practical balance of the mind is that speculative, theoretical tendency which has made so many men noted in their day, whose fame has passed away with their dissolving theories. Read Dr. Bartlett's comparison of the famous Benjamin Rush with his modest fellow-townsmen Dr. William Currie, and see the dangers into which a passion for grandiose generalizations betrayed a man of many admirable qualities.

I warn you against all ambitious aspirations outside of your profession. Medicine is the most difficult of sciences and the most laborious of arts. It will task all your powers of body and mind if you are faithful to it. Do not dabble in the muddy sewer of politics, nor linger by the enchanted streams of literature, nor dig in far-off fields for the hidden waters of alien sciences. The great practitioners are generally those who concentrate all their powers on their business. If there are here and there brilliant exceptions, it is only in virtue of extraordinary gifts, and industry to which very few are equal.

To get business a man must really want it; and do you suppose that when you are in the middle of a heated caucus, or half-way through a delicate analysis, or in the spasm of an unfinished ode, your eyes rolling in the fine frenzy of poetical composition, you want to be called to a teething infant, or an ancient person groaning under the griefs of a lumbago? I think I have known more than one young man whose doctor's sign proclaimed his readiness to serve mankind in that capacity, but who hated the sound of a patient's knock, and as he sat with his book or his microscope, felt exactly as the old party expressed himself in my friend Mr. Brownell's poem—

"All I axes is, let me alone."

The community soon finds out whether you are in earnest, and really mean business, or whether you are one of those diplomaed dilettanti who like the amusement of quasi medical studies, but have no idea of wasting their precious time in putting their knowledge in practice for the benefit of their suffering fellow-creatures.

The public is a very incompetent judge of your skill and knowledge, but it gives its confidence most readily to those who stand well with their professional brethren, whom they call upon when they themselves or their families are sick, whom they choose to honor in offices, whose writings and teachings they hold in esteem. A man may be much valued by the profession and yet have defects which prevent his becoming a favorite practitioner, but no popularity can be depended upon as permanent which is not sanctioned by the judgment of professional experts, and with these you will always stand on your substantial merits.

What shall I say of the personal habits you must form if you wish for success? Temperance is first upon the list. Intemperance in a physician partakes of the guilt of homicide, for the muddled brain may easily make a fatal blunder in a prescription and the unsteady hand transfix an artery in an operation. Tippling doctors have been too common in the history of medicine. Paracelsus was a sot, Radcliffe was much too fond of his glass, and Dr. James Hurlbut of Wethersfield, Connecticut, a famous man in his time, used to drink a square bottle of rum a day, with a corresponding allowance of opium to help steady his nerves. We commonly speak of a man as being the worse for liquor, but I was asking an Irish laborer one day about his doctor, who, as he said, was somewhat given to drink. "I like him best when he's a little that way," he said; "then I can spake to him."

I pitied the poor patient who could not venture to allude to his colic or his pleurisy until his physician was tipsy.

There are personal habits of less gravity than the one I have mentioned which it is well to guard against, or, if they are formed, to relinquish. A man who may be called at a moment's warning into the fragrant boudoir of suffering loveliness should not unsweeten its atmosphere with reminiscences of extinguished meerschaums. He should remember that the sick are sensitive and fastidious, that they love the sweet odors and the pure tints of flowers, and if his presence is not like the breath of the rose, if his hands are not like the leaf of the lily, his visit may be unwelcome, and if he looks behind him he may see a window thrown open after he has left the sick-chamber. I remember too well the old doctor who sometimes came to help me through those inward griefs to which childhood is liable. "Far off his coming"—shall I say "shone," and finish the Miltonic phrase, or leave the verb to the happy conjectures of my audience? Before him came a soul-subduing whiff of ipecacuanha, and after him lingered a shuddering consciousness of rhubarb. He had lived so much among his medicaments that he had at last become himself a drug, and to have him pass through a sick-chamber was a stronger dose than a conscientious disciple of Hahnemann would think it safe to administer.

Need I remind you of the importance of punctuality in your engagements, and of the worry and distress to patients and their friends which the want of it occasions? One of my old teachers always carried two watches, to make quite sure of being exact, and not only kept his appointments with the regularity of a chronometer, but took great pains to be at his patient's house at the time when he had reason to believe he was expected, even if no express appointment was made. It is a good rule; if you call too early, my lady's hair may not be so smooth as could be wished, and, if you keep her waiting too long, her hair may be smooth, but her temper otherwise.

You will remember, of course, always to get the weather-gage of your patient. I mean, to place him so that the light falls on his face and not on yours. It is a kind of, ocular duel that is about to take place between you; you are going to look through his features into his pulmonary and hepatic and other internal machinery, and he is going to look into yours quite as sharply to see what you think about his probabilities for time or eternity.

No matter how hard he stares at your countenance, he should never be able to read his fate in it. It should be cheerful as long as there is hope, and serene in its gravity when nothing is left but resignation. The face of a physician, like that of a diplomatist, should be impenetrable. Nature is a benevolent old hypocrite; she cheats the sick and the dying with illusions better than any anodynes. If there are cogent reasons why a patient should be undeceived, do it deliberately and advisedly, but do not betray your apprehensions through your tell-tale features.

We had a physician in our city whose smile was commonly reckoned as being worth five thousand dollars a year to him, in the days, too, of moderate incomes. You cannot put on such a smile as that any more than you can get sunshine without sun; there was a tranquil and kindly nature under it that irradiated the pleasant face it made one happier to meet on his daily rounds. But you can cultivate the disposition, and it will work its way through to the surface, nay, more,—you can try to wear a quiet and encouraging look, and it will react on your disposition and make you like what you seem to be, or at least bring you nearer to its own likeness.

Your patient has no more right to all the truth you know than he has to all the medicine in your saddlebags, if you carry that kind of cartridge-box for the ammunition that slays disease. He should get only just so much as is good for him. I have seen a physician examining a patient's chest stop all at once, as he brought out a particular sound with a tap on the collarbone, in the attitude of a pointer who has just come on the scent or sight of a woodcock. You remember the Spartan boy, who, with unmoved countenance, hid the fox that was tearing his vitals beneath his mantle. What he could do in his own suffering you must learn to do for others on whose vital organs disease has fastened its devouring teeth. It is a terrible thing to take away hope, even earthly hope, from a fellow-creature. Be very careful what names you let fall before your patient. He knows what it means when you tell him he has tubercles or Bright's disease, and, if he hears the word carcinoma, he will certainly look it out in a medical dictionary, if he does not interpret its dread significance on the instant. Tell him he has asthmatic symptoms, or a tendency to the gouty diathesis, and he will at once think of all the asthmatic and gouty old patriarchs he has ever heard of, and be comforted. You need not be so cautious in speaking of the health of rich and remote relatives, if he is in the line of succession.

Some shrewd old doctors have a few phrases always on hand for patients that will insist on knowing the pathology of their complaints without the slightest capacity of understanding the scientific explanation. I have known the term "spinal irritation" serve well on such occasions, but I think nothing on the whole has covered so much ground, and meant so little, and given such profound satisfaction to all parties, as the magnificent phrase "congestion of the portal system."

Once more, let me recommend you, as far as possible, to keep your doubts to yourself, and give the patient the benefit of your decision. Firmness, gentle firmness, is absolutely necessary in this and certain other relations. Mr. Rarey with Cruiser, Richard with Lady Ann, Pinel with his crazy people, show what steady nerves can do with the most intractable of animals, the most irresistible of despots, and the most unmanageable of invalids.

If you cannot acquire and keep the confidence of your patient, it is time for you to give place to some other practitioner who can. If you are wise and diligent, you can establish relations with the best of them which they will find it very hard to break. But, if they wish to employ another person, who, as they think, knows more than you do, do not take it as a personal wrong. A patient believes another man can save his life, can restore him to health, which, as he thinks, you have not the skill to do. No matter whether the patient is right or wrong, it is a great impertinence to think you have any property in him. Your estimate of your own ability is not the question, it is what the patient thinks of it. All your wisdom is to him like the lady's virtue in Raleigh's song:

*"If she seem not chaste to me,
What care I how chaste she be?"*

What I call a good patient is one who, having found a good physician, sticks to him till he dies. But there are many very good people who are not what I call good patients. I was once requested to call on a lady suffering from nervous and other symptoms. It came out in the preliminary conversational skirmish, half medical, half social, that I was the twenty-sixth member of the faculty into whose arms, professionally speaking, she had successively thrown herself. Not being a believer in such a rapid rotation of scientific crops, I gently deposited the burden, commending it to the care of number twenty-seven, and, him, whoever he might be, to the care of Heaven.

If there happened to be among my audience any person who wished to know on what principles the patient should choose his physician, I should give him these few precepts to think over:

Choose a man who is personally agreeable, for a daily visit from an intelligent, amiable, pleasant, sympathetic person will cost you no more than one from a sloven or a boor, and his presence will do more for you than any prescription the other will order.

Let him be a man of recognized good sense in other matters, and the chance is that he will be sensible as a practitioner.

Let him be a man who stands well with his professional brethren, whom they approve as honest, able, courteous.

Let him be one whose patients are willing to die in his hands, not one whom they go to for trifles, and leave as soon as they are in danger, and who can say, therefore, that he never loses a patient.

Do not leave the ranks of what is called the regular profession, unless you wish to go farther and fare worse, for you may be assured that its members recognize no principle which hinders their accepting any remedial agent proved to be useful, no matter from what quarter it comes. The difficulty is that the stragglers, organized under fantastic names in pretentious associations, or lurking in solitary dens behind doors left ajar, make no real contributions to the art of healing. When they bring forward a remedial agent like chloral, like the bromide of potassium, like ether, used as an anesthetic, they will find no difficulty in procuring its recognition.

Some of you will probably be more or less troubled by the pretensions of that parody of mediaeval theology which finds its dogma of hereditary depravity in the doctrine of psora, its miracle of transubstantiation in the mystery of its triturations and dilutions, its church in the people who have mistaken their century, and its priests in those who have mistaken their calling. You can do little with persons who are disposed to accept these curious medical superstitions. The saturation-point of individual minds with reference to evidence, and especially medical evidence, differs, and must always continue to differ, very widely. There are those whose minds are satisfied with the decillionth dilution of a scientific proof. No wonder they believe in the efficacy of a similar attenuation of bryony or pulsatilla. You have no fulcrum you can rest upon to lift an error out of such minds as these, often highly endowed with knowledge and talent, sometimes with genius, but commonly richer in the imaginative than the observing and reasoning faculties.

Let me return once more to the young graduate. Your relations to your professional brethren may be a source of lifelong happiness and growth in knowledge and character, or they may make you wretched and end by leaving you isolated from those who should be your friends and counsellors. The life of a physician becomes ignoble when he suffers himself to feed on petty jealousies and sours his temper in perpetual quarrels. You will be liable to meet an uncomfortable man here and there in the profession,—one who is so fond of being in hot water that it is a wonder all the albumen in his body is not coagulated. There are common barrators among doctors as there are among lawyers,—stirrers up of strife under one pretext and another, but in reality because they like it. They are their own worst enemies, and do themselves a mischief each time they assail their neighbors. In my student days I remember a good deal of this Donnybrook-Fair style of quarrelling, more especially in Paris, where some of the noted surgeons were always at loggerheads, and in one of our lively Western cities. Soon after I had set up an office, I had a trifling experience which may serve to point a moral in this direction. I had placed a lamp behind the glass in the entry to indicate to the passer-by where relief from all curable infirmities was to be sought and found. Its brilliancy attracted the attention of a devious youth, who dashed his fist through the glass and upset my modest luminary. All he got by his vivacious assault was that he left portions of integument from his knuckles upon the glass, had a lame hand, was very easily identified, and had to pay the glazier's bill. The moral is that, if the brilliancy of another's reputation excites your belligerent instincts, it is not worth your while to strike at it, without calculating which of you is likely to suffer most, if you do.

You may be assured that when an ill-conditioned neighbor is always complaining of a bad taste in his mouth and an evil atmosphere about him, there is something wrong about his own secretions. In such cases there is an alterative regimen of remarkable efficacy: it is a starvation-diet of letting alone. The great majority of the profession are peacefully inclined. Their pursuits are eminently humanizing, and they look with disgust on the personalities which intrude themselves into the placid domain of an art whose province it is to heal and not to wound.

The intercourse of teacher and student in a large school is necessarily limited, but it should be, and, so far as my experience goes, it is, eminently cordial and kindly. You will leave with regret, and hold in tender remembrance, those who have taken you by the hand at your entrance on your chosen path, and led you patiently and faithfully, until the great gates at its end have swung upon their hinges, and the world lies open before you. That venerable oath to which I have before referred bound the student to regard his instructor in the light of a parent, to treat his children like brothers, to succor him in his day of need. I trust the spirit of the oath of Hippocrates is not dead in the hearts of the students of to-day. They will remember with gratitude every earnest effort, every encouraging word, which has helped them in their difficult and laborious career of study. The names they read on their diplomas will recall faces that are like family-portraits in their memory, and the echo of voices they have listened to so long will linger in their memories far into the still evening of their lives.

One voice will be heard no more which has been familiar to many among you. It is not for me, a stranger to these scenes, to speak his eulogy. I have no right to sadden this hour by dwelling on the deep regrets of

friendship, or to bid the bitter tears of sorrow flow afresh. Yet I cannot help remembering what a void the death of such a practitioner as your late instructor must leave in the wide circle of those who leaned upon his counsel and assistance in their hour of need, in a community where he was so widely known and esteemed, in a school where he bore so important a part. There is no exemption from the common doom for him who holds the shield to protect others. The student is called from his bench, the professor from his chair, the practitioner in his busiest period hears a knock more peremptory than any patient's midnight summons, and goes on that unreturning visit which admits of no excuse, and suffers no delay. The call of such a man away from us is the bereavement of a great family. Nor can we help regretting the loss for him of a bright and cheerful earthly future; for the old age of a physician is one of the happiest periods of his life. He is loved and cherished for what he has been, and even in the decline of his faculties there are occasions when his experience is still appealed to, and his trembling hands are looked to with renewing hope and trust, as being yet able to stay the arm of the destroyer.

But if there is so much left for age, how beautiful, how inspiring is the hope of youth! I see among those whom I count as listeners one by whose side I have sat as a fellow-teacher, and by whose instructions I have felt myself not too old to profit. As we borrowed him from your city, I must take this opportunity of telling you that his zeal, intelligence, and admirable faculty as an instructor were heartily and universally recognized among us. We return him, as we trust, uninjured, to the fellow-citizens who have the privilege of claiming him as their own.

And now, gentlemen of the graduating class, nothing remains but for me to bid you, in the name of those for whom I am commissioned and privileged to speak, farewell as students, and welcome as practitioners. I pronounce the two benedictions in the same breath, as the late king's demise and the new king's accession are proclaimed by the same voice at the same moment. You would hardly excuse me if I stooped to any meaner dialect than the classical and familiar language of your prescriptions, the same in which your title to the name of physician is, if, like our own institution, you follow the ancient usage, engraved upon your diplomas.

Valete, JUVENES, artis medicae studiosi; valete, discipuli, valete, filii!

Salvete, VIRI, artis medicae magister; Salvete amici; salvete fratres!

MEDICAL LIBRARIES.

[Dedicatory Address at the opening of the Medical Library in Boston, December 3, 1878.]

It is my appointed task, my honorable privilege, this evening, to speak of what has been done by others. No one can bring his tribute of words into the presence of great deeds, or try with them to embellish the memory of any inspiring achievement, without feeling and leaving with others a sense of their insufficiency. So felt Alexander when he compared even his adored Homer with the hero the poet had sung. So felt Webster when he contrasted the phrases of rhetoric with the eloquence of patriotism and of self-devotion. So felt Lincoln when on the field of Gettysburg he spoke those immortal words which Pericles could not have bettered, which Aristotle could not have criticised. So felt he who wrote the epitaph of the builder of the dome which looks down on the crosses and weathercocks that glitter over London.

We are not met upon a battle-field, except so far as every laborious achievement means a victory over opposition, indifference, selfishness, faintheartedness, and that great property of mind as well as matter,—inertia. We are not met in a cathedral, except so far as every building whose walls are lined with the products of useful and ennobling thought is a temple of the Almighty, whose inspiration has given us understanding. But we have gathered within walls which bear testimony to the self-sacrificing, persevering efforts of a few young men, to whom we owe the origin and development of all that excites our admiration in this completed enterprise; and I might consider my task as finished if I contented myself with borrowing the last word of the architect's epitaph and only saying, Look around you!

The reports of the librarian have told or will tell you, in some detail, what has been accomplished since the 21st of December, 1874, when six gentlemen met at the house of Dr. Henry Ingersoll Bowditch to discuss different projects for a medical library. In less than four years from that time, by the liberality of associations and of individuals, this collection of nearly ten thousand volumes, of five thousand pamphlets, and of one hundred and twenty-five journals, regularly received,—all worthily sheltered beneath this lofty roof,—has come into being under our eyes. It has sprung up, as it were, in the night like a mushroom; it stands before us in full daylight as lusty as an oak, and promising to grow and flourish in the perennial freshness of an evergreen.

To whom does our profession owe this already large collection of books, exceeded in numbers only by four or five of the most extensive medical libraries in the country, and lodged in a building so well adapted to its present needs? We will not point out individually all those younger members of the profession who have accomplished what their fathers and elder brethren had attempted and partially achieved. We need not write their names on these walls, after the fashion of those civic dignitaries who immortalize themselves on tablets of marble and gates of iron. But their contemporaries know them well, and their descendants will not forget them,—the men who first met together, the men who have given their time and their money, the faithful workers, worthy associates of the strenuous agitator who gave no sleep to his eyes, no slumber to his eyelids, until he had gained his ends; the untiring, imperturbable, tenacious, irrepressible, all-subduing agitator who neither rested nor let others rest until the success of the project was assured. If, against his injunctions, I name Dr. James Read Chadwick, it is only my revenge for his having kept me awake so often and so long while he was urging on the undertaking in which he has been preeminently active and triumphantly successful.

We must not forget the various medical libraries which preceded this: that of an earlier period, when Boston contained about seventy regular practitioners, the collection afterwards transferred to the Boston Athenaeum; the two collections belonging to the University; the Treadwell Library at the Massachusetts General Hospital; the collections of the two societies, that for Medical Improvement and that for Medical Observation; and more especially the ten thousand volumes relating to medicine belonging to our noble public city library,—too many blossoms on the tree of knowledge, perhaps, for the best fruit to ripen. But the Massachusetts Medical Society now numbers nearly four hundred members in the city of Boston. The time had arrived for a new and larger movement. There was needed a place to which every respectable member of the medical profession could obtain easy access; where, under one roof, all might find the special information they were seeking; where the latest medical intelligence should be spread out daily as the shipping news is posted on the bulletins of the exchange; where men engaged in a common pursuit could meet, surrounded by the mute oracles of science and art; where the whole atmosphere should be as full of professional knowledge as the apothecary's shop is of the odor of his medicaments. This was what the old men longed for,—the prophets and kings of the profession, who

*"Desired it long,
But died without the sight."*

This is what the young men and those who worked under their guidance undertook to give us. And now such a library, such a reading-room, such an exchange, such an intellectual and social meeting place, we behold a fact, plain before us. The medical profession of our city, and, let us add, of all those neighboring places which it can reach with its iron arms, is united as never before by the commune vinculum, the common bond of a large, enduring, ennobling, unselfish interest. It breathes a new air of awakened intelligence. It marches abreast of the other learned professions, which have long had their extensive and valuable centralized libraries; abreast of them, but not promising to be content with that position. What glorifies a town like a cathedral? What dignifies a province like a university? What illuminates a country like its scholarship, and what is the nest that hatches scholars but a library?

The physician, some may say, is a practical man and has little use for all this book-learning. Every student has heard Sydenham's reply to Sir Richard Blackmore's question as to what books he should read,—meaning medical books. "Read Don Quixote," was his famous answer. But Sydenham himself made medical books and may be presumed to have thought those at least worth reading. Descartes was asked where was his library, and in reply held up the dissected body of an animal. But Descartes made books, great books, and a great many of them. A physician of common sense without erudition is better than a learned one without common sense, but the thorough master of his profession must have learning added to his natural gifts.

It is not necessary to maintain the direct practical utility of all kinds of learning. Our shelves contain many books which only a certain class of medical scholars will be likely to consult. There is a dead medical literature, and there is a live one. The dead is not all ancient, the live is not all modern. There is none, modern or ancient, which, if it has no living value for the student, will not teach him something by its autopsy. But it is with the live literature of his profession that the medical practitioner is first of all concerned.

Now there has come a great change in our time over the form in which living thought presents itself. The first printed books,—the incunabula,—were inclosed in boards of solid oak, with brazen clasps and corners; the boards by and by were replaced by pasteboard covered with calf or sheepskin; then cloth came in and took the place of leather; then the pasteboard was covered with paper instead of cloth; and at this day the quarterly, the monthly, the weekly periodical in its flimsy unsupported dress of paper, and the daily journal, naked as it came from the womb of the press, hold the larger part of the fresh reading we live upon. We must have the latest thought in its latest expression; the page must be newly turned like the morning bannock; the pamphlet must be newly opened like the ante-prandial oyster.

Thus a library, to meet the need of our time, must take, and must spread out in a convenient form, a great array of periodicals. Our active practitioners read these by preference over almost everything else. Our specialists, more particularly, depend on the month's product, on the yearly crop of new facts, new suggestions, new contrivances, as much as the farmer on the annual yield of his acres. One of the first wants, then, of the profession is supplied by our library in its great array of periodicals from many lands, in many languages. Such a number of medical periodicals no private library would have room for, no private person would pay for, or flood his tables with if they were sent him for nothing. These, I think, with the reports of medical societies and the papers contributed to them, will form the most attractive part of our accumulated medical treasures. They will be also one of our chief expenses, for these journals must be bound in volumes and they require a great amount of shelf-room; all this, in addition to the cost of subscription for those which are not furnished us gratuitously.

It is true that the value of old scientific periodicals is, other things being equal, in the inverse ratio of their age, for the obvious reason that what is most valuable in the earlier volumes of a series is drained off into the standard works with which the intelligent practitioner is supposed to be familiar. But no extended record of facts grows too old to be useful, provided only that we have a ready and sure way of getting at the particular fact or facts we are in search of.

And this leads me to speak of what I conceive to be one of the principal tasks to be performed by the present and the coming generation of scholars, not only in the medical, but in every department of knowledge. I mean the formation of indexes, and more especially of indexes to periodical literature.

This idea has long been working in the minds of scholars, and all who have had occasion to follow out any special subject. I have a right to speak of it, for I long ago attempted to supply the want of indexes in some small measure for my own need. I had a very complete set of the "American Journal of the Medical Sciences;" an entire set of the "North American Review," and many volumes of the reprints of the three leading British quarterlies. Of what use were they to me without general indexes? I looked them all through carefully and made classified lists of all the articles I thought I should most care to read. But they soon outgrew my lists.

The "North American Review" kept filling up shelf after shelf, rich in articles which I often wanted to consult, but what a labor to find them, until the index of Mr. Gushing, published a few months since, made the contents of these hundred and twenty volumes as easily accessible as the words in a dictionary! I had a copy of good Dr. Abraham Rees's Cyclopaedia, a treasure-house to my boyhood which has not lost its value for me in later years. But where to look for what I wanted? I wished to know, for instance, what Dr. Burney had to say about singing. Who would have looked for it under the Italian word *cantare*? I was curious to learn something of the etchings of Rembrandt, and where should I find it but under the head "Low Countries, Engravers of the,"—an elaborate and most valuable article of a hundred double-columned close-printed quarto pages, to which no reference, even, is made under the title Rembrandt.

There was nothing to be done, if I wanted to know where that which I specially cared for was to be found in my Rees's Cyclopaedia, but to look over every page of its forty-one quarto volumes and make out a brief list of matters of interest which I could not find by their titles, and this I did, at no small expense of time and trouble.

Nothing, therefore, could be more pleasing to me than to see the attention which has been given of late years to the great work of indexing. It is a quarter of a century since Mr. Poole published his "Index to Periodical Literature," which it is much to be hoped is soon to appear in a new edition, grown as it must be to formidable dimensions by the additions of so long a period. The "British and Foreign Medical Review," edited by the late Sir John Forties, contributed to by Huxley, Carpenter, Laycock, and others of the most distinguished scientific men of Great Britain, has an index to its twenty-four volumes, and by its aid I find this valuable series as manageable as a lexicon. The last edition of the "Encyclopaedia Britannica" had a complete index in a separate volume, and the publishers of Appletons' "American Cyclopaedia" have recently issued an index to their useful work, which must greatly add to its value. I have already referred to the index to the "North American Review," which to an American, and especially to a New Englander, is the most interesting and most valuable addition of its kind to our literary apparatus since the publication of Mr. Allibone's "Dictionary of Authors." I might almost dare to parody Mr. Webster's words in speaking of Hamilton, to describe what Mr. Gushing did for the solemn rows of back volumes of our honored old Review which had been long fossilizing on our shelves: "He touched the dead corpse of the 'North American,' and it sprang to its feet." A library of the best thought of the best American scholars during the greater portion of the century was brought to light by the work of the indexmaker as truly as were the Assyrian tablets by the labors of Layard.

A great portion of the best writing and reading—literary, scientific, professional, miscellaneous—comes to us now, at stated intervals, in paper covers. The writer appears, as it were, in his shirt-sleeves. As soon as he has delivered his message the book-binder puts a coat on his back, and he joins the forlorn brotherhood of "back volumes," than which, so long as they are unindexed, nothing can be more exasperating. Who wants a lock without a key, a ship without a rudder, a binnacle without a compass, a check without a signature, a greenback without a goldback behind it?

I have referred chiefly to the medical journals, but I would include with these the reports of medical associations, and those separate publications which, coming in the form of pamphlets, heap themselves into chaotic piles and bundles which are worse than useless, taking up a great deal of room, and frightening everything away but mice and mousing antiquarians, or possibly at long intervals some terebrating specialist.

Arranged, bound, indexed, all these at once become accessible and valuable. I will take the first instance which happens to suggest itself. How many who know all about osteoblasts and the experiments of Ollier, and all that has grown out of them, know where to go for a paper by the late Dr. A. L. Peirson of Salem, published in the year 1840, under the modest title, *Remarks on Fractures*? And if any practitioner who has to deal with broken bones does not know that most excellent and practical essay, it is a great pity, for it answers very numerous questions which will be sure to suggest themselves to the surgeon and the patient as no one of the recent treatises, on my own shelves, at least, can do.

But if indexing is the special need of our time in medical literature, as in every department of knowledge, it must be remembered that it is not only an immense labor, but one that never ends. It requires, therefore, the cooperation of a large number of individuals to do the work, and a large amount of money to pay for making its results public through the press. When it is remembered that the catalogue of the library of the British Museum is contained in nearly three thousand large folios of manuscript, and not all its books are yet included, the task of indexing any considerable branch of science or literature looks as if it were well nigh impossible. But many hands make light work. An "Index Society" has been formed in England, already numbering about one hundred and seventy members. It aims at "supplying thorough indexes to valuable works and collections which have hitherto lacked them; at issuing indexes to the literature of special subjects; and at gathering materials for a general reference index." This society has published a little treatise setting forth the history and the art of indexing, which I trust is in the hands of some of our members, if not upon our shelves.

Something has been done in the same direction by individuals in our own country, as we have already seen. The need of it in the department of medicine is beginning to be clearly felt. Our library has already an admirable catalogue with cross references, the work of a number of its younger members cooperating in the task. A very intelligent medical student, Mr. William D. Chapin, whose excellent project is indorsed by well-known New York physicians and professors, proposes to publish a yearly index to original communications in the medical journals of the United States, classified by authors and subjects. But it is from the National Medical Library at Washington that we have the best promise and the largest expectations. That great and growing collection of fifty thousand volumes is under the eye and hand of a librarian who knows books and how to manage them. For libraries are the standing armies of civilization, and an army is but a mob without a general who can organize and marshal it so as to make it effective. The "Specimen Fasciculus of a Catalogue of the National Medical Library," prepared under the direction of Dr. Billings, the librarian, would have excited the admiration of Haller, the master scholar in medical science of the last century, or rather of the profession in all centuries, and if carried out as it is begun will be to the nineteenth all and more than all that the three *Bibliothecae*—*Anatomica*, *Chirurgica*, and *Medicinae-Practicae*—were to the eighteenth century. I

cannot forget the story that Agassiz was so fond of telling of the king of Prussia and Fichte. It was after the humiliation and spoliation of the kingdom by Napoleon that the monarch asked the philosopher what could be done to regain the lost position of the nation. "Found a great university, Sire," was the answer, and so it was that in the year 1810 the world-renowned University of Berlin came into being. I believe that we in this country can do better than found a national university, whose professors shall be nominated in caucuses, go in and out, perhaps, like postmasters, with every change of administration, and deal with science in the face of their constituency as the courtier did with time when his sovereign asked him what o'clock it was: "Whatever hour your majesty pleases." But when we have a noble library like that at Washington, and a librarian of exceptional qualifications like the gentleman who now holds that office, I believe that a liberal appropriation by Congress to carry out a conscientious work for the advancement of sound knowledge and the bettering of human conditions, like this which Dr. Billings has so well begun, would redound greatly to the honor of the nation. It ought to be willing to be at some charge to make its treasures useful to its citizens, and, for its own sake, especially to that class which has charge of health, public and private. This country abounds in what are called "self-made men," and is justly proud of many whom it thus designates. In one sense no man is self-made who breathes the air of a civilized community. In another sense every man who is anything other than a phonograph on legs is self-made. But if we award his just praise to the man who has attained any kind of excellence without having had the same advantages as others whom, nevertheless, he has equalled or surpassed, let us not be betrayed into undervaluing the mechanic's careful training to his business, the thorough and laborious education of the scholar and the professional man.

Our American atmosphere is vocal with the flippant loquacity of half knowledge. We must accept whatever good can be got out of it, and keep it under as we do sorrel and mullein and witchgrass, by enriching the soil, and sowing good seed in plenty; by good teaching and good books, rather than by wasting our time in talking against it. Half knowledge dreads nothing but whole knowledge.

I have spoken of the importance and the predominance of periodical literature, and have attempted to do justice to its value. But the almost exclusive reading of it is not without its dangers. The journals contain much that is crude and unsound; the presumption, it might be maintained, is against their novelties, unless they come from observers of established credit. Yet I have known a practitioner,—perhaps more than one,—who was as much under the dominant influence of the last article he had read in his favorite medical journal as a milliner under the sway of the last fashion-plate. The difference between green and seasoned knowledge is very great, and such practitioners never hold long enough to any of their knowledge to have it get seasoned.

It is needless to say, then, that all the substantial and permanent literature of the profession should be represented upon our shelves. Much of it is there already, and as one private library after another falls into this by the natural law of gravitation, it will gradually acquire all that is most valuable almost without effort. A scholar should not be in a hurry to part with his books. They are probably more valuable to him than they can be to any other individual. What Swedenborg called "correspondence" has established itself between his intelligence and the volumes which wall him within their sacred inclosure. Napoleon said that his mind was as if furnished with drawers,—he drew out each as he wanted its contents, and closed it at will when done with them. The scholar's mind, to use a similar comparison, is furnished with shelves, like his library. Each book knows its place in the brain as well as against the wall or in the alcove. His consciousness is doubled by the books which encircle him, as the trees that surround a lake repeat themselves in its unruffled waters. Men talk of the nerve that runs to the pocket, but one who loves his books, and has lived long with them, has a nervous filament which runs from his sensorium to every one of them. Or, if I may still let my fancy draw its pictures, a scholar's library is to him what a temple is to the worshipper who frequents it. There is the altar sacred to his holiest experiences. There is the font where his new-born thought was baptized and first had a name in his consciousness. There is the monumental tablet of a dead belief, sacred still in the memory of what it was while yet alive. No visitor can read all this on the lettered backs of the books that have gathered around the scholar, but for him, from the Aldus on the lowest shelf to the Elzevir on the highest, every volume has a language which none but he can interpret. Be patient with the book-collector who loves his companions too well to let them go. Books are not buried with their owners, and the veriest book-miser that ever lived was probably doing far more for his successors than his more liberal neighbor who despised his learned or unlearned avarice. Let the fruit fall with the leaves still clinging round it. Who would have stripped Southey's walls of the books that filled them, when, his mind no longer capable of taking in their meaning, he would still pat and fondle them with the vague loving sense of what they had once been to him,—to him, the great scholar, now like a little child among his playthings?

We need in this country not only the scholar, but the virtuoso, who hoards the treasures which he loves, it may be chiefly for their rarity and because others who know more than he does of their value set a high price upon them. As the wine of old vintages is gently decanted out of its cobwebbed bottles with their rotten corks into clean new receptacles, so the wealth of the New World is quietly emptying many of the libraries and galleries of the Old World into its newly formed collections and newly raised edifices. And this process must go on in an accelerating ratio. No Englishman will be offended if I say that before the New Zealander takes his stand on a broken arch of London Bridge to sketch the ruins of St. Paul's in the midst of a vast solitude, the treasures of the British Museum will have found a new shelter in the halls of New York or Boston. No Catholic will think hardly of my saying that before the Coliseum falls, and with it the imperial city, whose doom prophecy has MEDlinked with that of the almost eternal amphitheatre, the marbles, the bronzes, the paintings, the manuscripts of the Vatican will have left the shores of the Tiber for those of the Potomac, the Hudson, the Mississippi, or the Sacramento. And what a delight in the pursuit of the rarities which the eager book-hunter follows with the scent of a beagle!

Shall I ever forget that rainy day in Lyons, that dingy bookshop, where I found the Aetius, long missing from my *Artis bledicae Principes*, and where I bought for a small pecuniary consideration, though it was marked rare, and was really tres rare, the *Aphorisms of Hippocrates*, edited by and with a preface from the hand of Francis Rabelais? And the vellum-bound *Tulpius*, which I came upon in Venice, afterwards my only reading when imprisoned in quarantine at Marseilles, so that the two hundred and twenty-eight cases he has recorded are, many of them, to this day still fresh in my memory. And the *Schenckius*,—the folio filled with

casus rariores, which had strayed in among the rubbish of the bookstall on the boulevard,—and the noble old Vesalius with its grand frontispiece not unworthy of Titian, and the fine old Ambroise Pare, long waited for even in Paris and long ago, and the colossal Spigelius with his eviscerated beauties, and Dutch Bidloo with its miracles of fine engraving and bad dissection, and Italian Mascagni, the despair of all would-be imitators, and pre-Adamite John de Ketam, and antediluvian Berengarius Carpensis,—but why multiply names, every one of which brings back the accession of a book which was an event almost like the birth of an infant?

A library like ours must exercise the largest hospitality. A great many books may be found in every large collection which remind us of those apostolic looking old men who figure on the platform at our political and other assemblages. Some of them have spoken words of wisdom in their day, but they have ceased to be oracles; some of them never had any particularly important message for humanity, but they add dignity to the meeting by their presence; they look wise, whether they are so or not, and no one grudges them their places of honor. Venerable figure-heads, what would our platforms be without you?

Just so with our libraries. Without their rows of folios in creamy vellum, or showing their black backs with antique lettering of tarnished gold, our shelves would look as insufficient and unbalanced as a column without its base, as a statue without its pedestal. And do not think they are kept only to be spanked and dusted during that dreadful period when their owner is but too thankful to become an exile and a wanderer from the scene of single combats between dead authors and living housemaids. Men were not all cowards before Agamemnon or all fools before the days of Virchow and Billroth. And apart from any practical use to be derived from the older medical authors, is there not a true pleasure in reading the accounts of great discoverers in their own words? I do not pretend to hoist up the *Bibliotheca Anatomica* of Mangetus and spread it on my table every day. I do not get out my great Albinus before every lecture on the muscles, nor disturb the majestic repose of Vesalius every time I speak of the bones he has so admirably described and figured. But it does please me to read the first descriptions of parts to which the names of their discoverers or those who have first described them have become so joined that not even modern science can part them; to listen to the talk of my old volume as Willis describes his circle and Fallopius his aqueduct and Varolius his bridge and Eustachius his tube and Monro his foramen,—all so well known to us in the human body; it does please me to know the very words in which Winslow described the opening which bears his name, and Glisson his capsule and De Graaf his vesicle; I am not content until I know in what language Harvey announced his discovery of the circulation, and how Spigelius made the liver his perpetual memorial, and Malpighi found a monument more enduring than brass in the corpuscles of the spleen and the kidney.

But after all, the readers who care most for the early records of medical science and art are the specialists who are dividing up the practice of medicine and surgery as they were parcelled out, according to Herodotus, by the Egyptians. For them nothing is too old, nothing is too new, for to their books of all others is applicable the saying of D'Alembert that the author kills himself in lengthening out what the reader kills himself in trying to shorten.

There are practical books among these ancient volumes which can never grow old. Would you know how to recognize "male hysteria" and to treat it, take down your Sydenham; would you read the experience of a physician who was himself the subject of asthma, and who, notwithstanding that, in the words of Dr. Johnson, "panted on till ninety," you will find it in the venerable treatise of Sir John Floyer; would you listen to the story of the King's Evil cured by the royal touch, as told by a famous surgeon who fully believed in it, go to Wiseman; would you get at first hand the description of the spinal disease which long bore his name, do not be startled if I tell you to go to Pott,—to Percival Pott, the great surgeon of the last century.

There comes a time for every book in a library when it is wanted by somebody. It is but a few weeks since one of the most celebrated physicians in the country wrote to me from a great centre of medical education to know if I had the works of Sanctorius, which he had tried in vain to find. I could have lent him the "*Medicina Statica*," with its frontispiece showing Sanctorius with his dinner on the table before him, in his balanced chair which sunk with him below the level of his banquet-board when he had swallowed a certain number of ounces,—an early foreshadowing of Pettenkofer's chamber and quantitative physiology,—but the "*Opera Omnia*" of Sanctorius I had never met with, and I fear he had to do without it.

I would extend the hospitality of these shelves to a class of works which we are in the habit of considering as being outside of the pale of medical science, properly so called, and sometimes of coupling with a disrespectful name. Such has always been my own practice. I have welcomed Culpeper and Salmon to my bookcase as willingly as Dioscorides or Quincy, or Paris or Wood and Bache. I have found a place for St. John Long, and read the story of his trial for manslaughter with as much interest as the laurel-water case in which John Hunter figured as a witness. I would give Samuel Hahnemann a place by the side of Samuel Thomson. Am I not afraid that some student of imaginative turn and not provided with the needful cerebral strainers without which all the refuse of gimcrack intelligences gets into the mental drains and chokes them up,—am I not afraid that some such student will get hold of the "*Organon*" or the "*Maladies Chroniques*" and be won over by their delusions, and so be lost to those that love him as a man of common sense and a brother in their high calling? Not in the least. If he showed any symptoms of infection I would for once have recourse to the principle of *similia similibus*. To cure him of Hahnemann I would prescribe my favorite homoeopathic antidote, Okie's Bonninghausen. If that failed, I would order Grauvogl as a heroic remedy, and if he survived that uncured, I would give him my blessing, if I thought him honest, and bid him depart in peace. For me he is no longer an individual. He belongs to a class of minds which we are bound to be patient with if their Maker sees fit to indulge them with existence. We must accept the conjuring ultra-ritualist, the dreamy second adventist, the erratic spiritualist, the fantastic homoeopathist, as not unworthy of philosophic study; not more unworthy of it than the squarers of the circle and the inventors of perpetual motion, and the other whimsical visionaries to whom De Morgan has devoted his most instructive and entertaining "*Budget of Paradoxes*." I hope, therefore, that our library will admit the works of the so-called Eclectics, of the Thomsonians, if any are in existence, of the Clairvoyants, if they have a literature, and especially of the Homoeopathists. This country seems to be the place for such a collection, which will by and by be curious and of more value than at present, for Homoeopathy seems to be following the pathological law of erysipelas, fading out where it originated as it spreads to new regions. At least I judge so by the following translated

extract from a criticism of an American work in the "Homoeopatische Rundschau" of Leipzig for October, 1878, which I find in the "Homoeopathic Bulletin" for the month of November just passed: "While we feel proud of the spread and rise of Homoeopathy across the ocean, and while the Homoeopathic works reaching us from there, and published in a style such as is unknown in Germany, bear eloquent testimony to the eminent activity of our transatlantic colleagues, we are overcome by sorrowful regrets at the position Homoeopathy occupies in Germany. Such a work [as the American one referred to] with us would be impossible; it would lack the necessary support."

By all means let our library secure a good representation of the literature of Homoeopathy before it leaves us its "sorrowful regrets" and migrates with its sugar of milk pellets, which have taken the place of the old pilulae micae panis, to Alaska, to "Nova Zembla, or the Lord knows where."

What shall I say in this presence of the duties of a Librarian? Where have they ever been better performed than in our own public city library, where the late Mr. Jewett and the living Mr. Winsor have shown us what a librarian ought to be,—the organizing head, the vigilant guardian, the seeker's index, the scholar's counsellor? His work is not merely that of administration, manifold and laborious as its duties are. He must have a quick intelligence and a retentive memory. He is a public carrier of knowledge in its germs. His office is like that which naturalists attribute to the bumble-bee,—he lays up little honey for himself, but he conveys the fertilizing pollen from flower to flower.

Our undertaking, just completed,—and just begun—has come at the right time, not a day too soon. Our practitioners need a library like this, for with all their skill and devotion there is too little genuine erudition, such as a liberal profession ought to be able to claim for many of its members. In reading the recent obituary notices of the late Dr. Geddings of South Carolina, I recalled what our lamented friend Dr. Coale used to tell me of his learning and accomplishments, and I could not help reflecting how few such medical scholars we had to show in Boston or New England. We must clear up this unilluminated atmosphere, and here,—here is the true electric light which will irradiate its darkness.

The public will catch the rays reflected from the same source of light, and it needs instruction on the great subjects of health and disease,—needs it sadly. It is preyed upon by every kind of imposition almost without hindrance. Its ignorance and prejudices react upon the profession to the great injury of both. The jealous feeling, for instance, with regard to such provisions for the study of anatomy as are sanctioned by the laws in this State and carried out with strict regard to those laws, threatens the welfare, if not the existence of institutions for medical instruction wherever it is not held in check by enlightened intelligence. And on the other hand the profession has just been startled by a verdict against a physician, ruinous in its amount,—enough to drive many a hard-working young practitioner out of house and home,—a verdict which leads to the fear that suits for malpractice may take the place of the panel game and child-stealing as a means of extorting money. If the profession in this State, which claims a high standard of civilization, is to be crushed and ground beneath the upper millstone of the dearth of educational advantages and the lower millstone of ruinous penalties for what the ignorant ignorantly shall decide to be ignorance, all I can say is

God save the Commonwealth of Massachusetts!

Once more, we cannot fail to see that just as astrology has given place to astronomy, so theology, the science of Him whom by searching no man can find out, is fast being replaced by what we may not improperly call theonomy, or the science of the laws according to which the Creator acts. And since these laws find their fullest manifestations for us, at least, in rational human natures, the study of anthropology is largely replacing that of scholastic divinity. We must contemplate our Maker indirectly in human attributes as we talk of Him in human parts of speech. And this gives a sacredness to the study of man in his physical, mental, moral, social, and religious nature which elevates the faithful students of anthropology to the dignity of a priesthood, and sheds a holy light on the recorded results of their labors, brought together as they are in such a collection as this which is now spread out before us.

Thus, then, our library is a temple as truly as the dome-crowned cathedral hallowed by the breath of prayer and praise, where the dead repose and the living worship. May it, with all its treasures, be consecrated like that to the glory of God, through the contributions it shall make to the advancement of sound knowledge, to the relief of human suffering, to the promotion of harmonious relations between the members of the two noble professions which deal with the diseases of the soul and with those of the body, and to the common cause in which all good men are working, the furtherance of the well-being of their fellow-creatures!

NOTE.—As an illustration of the statement in the last paragraph but one, I take the following notice from the "Boston Daily Advertiser," of December 4th, the day after the delivery of the address: "Prince Lucien Bonaparte is now living in London, and is devoting himself to the work of collecting the creeds of all religions and sects, with a view to their classification,—his object being simply scientific or anthropological."

Since delivering the address, also, I find a leading article in the "Cincinnati Lancet and Clinic" of November 30th, headed "The Decadence of Homoeopathy," abundantly illustrated by extracts from the "Homoeopathic Times," the leading American organ of that sect.

In the New York "Medical Record" of the same date, which I had not seen before the delivery of my address, is an account of the action of the Homoeopathic Medical Society of Northern New York, in which Hahnemann's theory of "dynamization" is characterized in a formal resolve as "unworthy the confidence of the Homoeopathic profession."

It will be a disappointment to the German Homoeopaths to read in the "Homoeopathic Times" such a statement as the following: "Whatever the influences have been which have checked the outward development of Homoeopathy, it is plainly evident that the Homoeopathic school, as regards the number of its openly avowed representatives, has attained its majority, and has begun to decline both in this country and in England."

All which is an additional reason for making a collection of the incredibly curious literature of Homoeopathy before that pseudological inanity has faded out like so many other delusions.

SOME OF MY EARLY TEACHERS

[A Farewell Address to the Medical School of Harvard University, November 28, 1882.]

I had intended that the recitation of Friday last should be followed by a few parting words to my class and any friends who might happen to be in the lecture-room. But I learned on the preceding evening that there was an expectation, a desire, that my farewell should take a somewhat different form; and not to disappoint the wishes of those whom I was anxious to gratify, I made up my mind to appear before you with such hasty preparation as the scanty time admitted.

There are three occasions upon which a human being has a right to consider himself as a centre of interest to those about him: when he is christened, when he is married, and when he is buried. Every one is the chief personage, the hero, of his own baptism, his own wedding, and his own funeral.

There are other occasions, less momentous, in which one may make more of himself than under ordinary circumstances he would think it proper to do; when he may talk about himself, and tell his own experiences, in fact, indulge in a more or less egotistic monologue without fear or reproach.

I think I may claim that this is one of those occasions. I have delivered my last anatomical lecture and heard my class recite for the last time. They wish to hear from me again in a less scholastic mood than that in which they have known me. Will you not indulge me in telling you something of my own story?

This is the thirty-sixth Course of Lectures in which I have taken my place and performed my duties as Professor of Anatomy. For more than half of my term of office I gave instruction in Physiology, after the fashion of my predecessors and in the manner then generally prevalent in our schools, where the physiological laboratory was not a necessary part of the apparatus of instruction. It was with my hearty approval that the teaching of Physiology was constituted a separate department and made an independent Professorship. Before my time, Dr. Warren had taught Anatomy, Physiology, and Surgery in the same course of Lectures, lasting only three or four months. As the boundaries of science are enlarged, new divisions and subdivisions of its territories become necessary. In the place of six Professors in 1847, when I first became a member of the Faculty, I count twelve upon the Catalogue before me, and I find the whole number engaged in the work of instruction in the Medical School amounts to no less than fifty.

Since I began teaching in this school, the aspect of many branches of science has undergone a very remarkable transformation. Chemistry and Physiology are no longer what they were, as taught by the instructors of that time. We are looking forward to the synthesis of new organic compounds; our artificial madder is already in the market, and the indigo-raisers are now fearing that their crop will be supplanted by the manufactured article. In the living body we talk of fuel supplied and work done, in movement, in heat, just as if we were dealing with a machine of our own contrivance.

A physiological laboratory of to-day is equipped with instruments of research of such ingenious contrivance, such elaborate construction, that one might suppose himself in a workshop where some exquisite fabric was to be wrought, such as Queens love to wear, and Kings do not always love to pay for. They are, indeed, weaving a charmed web, for these are the looms from which comes the knowledge that clothes the nakedness of the intellect. Here are the mills that grind food for its hunger, and "is not the life more than meat, and the body than raiment?"

But while many of the sciences have so changed that the teachers of the past would hardly know them, it has not been so with the branch I teach, or, rather, with that division of it which is chiefly taught in this amphitheatre. General anatomy, or histology, on the other hand, is almost all new; it has grown up, mainly, since I began my medical studies. I never saw a compound microscope during my years of study in Paris. Individuals had begun to use the instrument, but I never heard it alluded to by either Professors or students. In descriptive anatomy I have found little to unlearn, and not a great deal that was both new and important to learn. Trifling additions are made from year to year, not to be despised and not to be overvalued. Some of the older anatomical works are still admirable, some of the newer ones very much the contrary. I have had recent anatomical plates brought me for inspection, and I have actually button-holed the book-agent, a being commonly as hard to get rid of as the tar-baby in the negro legend, that I might put him to shame with the imperial illustrations of the bones and muscles in the great folio of Albinus, published in 1747, and the unapproached figures of the lymphatic system of Mascagni, now within a very few years of a century old, and still copied, or, rather, pretended to be copied, in the most recent works on anatomy.

I am afraid that it is a good plan to get rid of old Professors, and I am thankful to hear that there is a movement for making provision for those who are left in need when they lose their offices and their salaries. I remember one of our ancient Cambridge Doctors once asked me to get into his rickety chaise, and said to me, half humorously, half sadly, that he was like an old horse,—they had taken off his saddle and turned him out to pasture. I fear the grass was pretty short where that old servant of the public found himself grazing. If I myself needed an apology for holding my office so long, I should find it in the fact that human anatomy is much the same study that it was in the days of Vesalius and Fallopius, and that the greater part of my teaching was of such a nature that it could never become antiquated.

Let me begin with my first experience as a medical student. I had come from the lessons of Judge Story and Mr. Ashmun in the Law School at Cambridge. I had been busy, more or less, with the pages of Blackstone and Chitty, and other text-books of the first year of legal study. More or less, I say, but I am afraid it was less rather than more. For during that year I first tasted the intoxicating pleasure of authorship. A college periodical, conducted by friends of mine, still undergraduates, tempted me into print, and there is no form of lead-poisoning which more rapidly and thoroughly pervades the blood and bones and marrow than that which reaches the young author through mental contact with type-metal. Qui a bu, boira,—he who has once been a drinker will drink again, says the French proverb. So the man or woman who has tasted type is sure to return to his old indulgence sooner or later. In that fatal year I had my first attack of authors' lead-poisoning, and I

have never got quite rid of it from that day to this. But for that I might have applied myself more diligently to my legal studies, and carried a green bag in place of a stethoscope and a thermometer up to the present day.

What determined me to give up Law and apply myself to Medicine I can hardly say, but I had from the first looked upon that year's study as an experiment. At any rate, I made the change, and soon found myself introduced to new scenes and new companionships.

I can scarcely credit my memory when I recall the first impressions produced upon me by sights afterwards become so familiar that they could no more disturb a pulse-beat than the commonest of every-day experiences. The skeleton, hung aloft like a gibbeted criminal, looked grimly at me as I entered the room devoted to the students of the school I had joined, just as the fleshless figure of Time, with the hour-glass and scythe, used to glare upon me in my childhood from the "New England Primer." The white faces in the beds at the Hospital found their reflection in my own cheeks, which lost their color as I looked upon them. All this had to pass away in a little time; I had chosen my profession, and must meet its painful and repulsive aspects until they lost their power over my sensibilities.

The private medical school which I had joined was one established by Dr. James Jackson, Dr. Walter Channing, Dr. John Ware, Dr. Winslow Lewis, and Dr. George W. Otis. Of the first three gentlemen I have either spoken elsewhere or may find occasion to speak hereafter. The two younger members of this association of teachers were both graduates of our University, one of the year 1819, the other of 1818.

Dr. Lewis was a great favorite with students. He was a man of very lively temperament, fond of old books and young people, open-hearted, free-spoken, an enthusiast in teaching, and especially at home in that apartment of the temple of science where nature is seen in undress, the anthropotomic laboratory, known to common speech as the dissecting-room. He had that quality which is the special gift of the man born for a teacher,—the power of exciting an interest in that which he taught. While he was present the apartment I speak of was the sunniest of studios in spite of its mortuary spectacles. Of the students I met there I best remember James Jackson, Junior, full of zeal and playful as a boy, a young man whose early death was a calamity to the profession of which he promised to be a chief ornament; the late Reverend J. S. C. Greene, who, as the prefix to his name signifies, afterwards changed his profession, but one of whose dissections I remember looking upon with admiration; and my friend Mr. Charles Amory, as we call him, Dr. Charles Amory, as he is entitled to be called, then, as now and always, a favorite with all about him. He had come to us from the schools of Germany, and brought with him recollections of the teachings of Blumenbach and the elder Langenbeck, father of him whose portrait hangs in our Museum. Dr. Lewis was our companion as well as our teacher. A good demonstrator is,—I will not say as important as a good Professor in the teaching of Anatomy, because I am not sure that he is not more important. He comes into direct personal relations with the students,—he is one of them, in fact, as the Professor cannot be from the nature of his duties. The Professor's chair is an insulating stool, so to speak; his age, his knowledge, real or supposed, his official station, are like the glass legs which support the electrician's piece of furniture, and cut it off from the common currents of the floor upon which it stands. Dr. Lewis enjoyed teaching and made his students enjoy being taught. He delighted in those anatomical conundrums to answer which keeps the student's eyes open and his wits awake. He was happy as he dexterously performed the tour de maitre of the old barber-surgeons, or applied the spica bandage and taught his scholars to do it, so neatly and symmetrically that the aesthetic missionary from the older centre of civilization would bend over it in blissful contemplation, as if it were a sunflower. Dr. Lewis had many other tastes, and was a favorite, not only with students, but in a wide circle, professional, antiquarian, masonic, and social.

Dr. Otis was less widely known, but was a fluent and agreeable lecturer, and esteemed as a good surgeon.

I must content myself with this glimpse at myself and a few of my fellow-students in Boston. After attending two courses of Lectures in the school of the University, I went to Europe to continue my studies.

You may like to hear something of the famous Professors of Paris in the days when I was a student in the Ecole de Medicine, and following the great Hospital teachers.

I can hardly believe my own memory when I recall the old practitioners and Professors who were still going round the hospitals when I mingled with the train of students that attended the morning visits. See that bent old man who is groping his way through the wards of La Charity. That is the famous Baron Boyer, author of the great work on surgery in nine volumes, a writer whose clearness of style commends his treatise to general admiration, and makes it a kind of classic. He slashes away at a terrible rate, they say, when he gets hold of the subject of fistula in its most frequent habitat,—but I never saw him do more than look as if he wanted to cut a good dollop out of a patient he was examining. The short, square, substantial man with iron-gray hair, ruddy face, and white apron is Baron Larrey, Napoleon's favorite surgeon, the most honest man he ever saw,—it is reputed that he called him. To go round the Hotel des Invalides with Larrey was to live over the campaigns of Napoleon, to look on the sun of Austerlitz, to hear the cannons of Marengo, to struggle through the icy waters of the Beresina, to shiver in the snows of the Russian retreat, and to gaze through the battle smoke upon the last charge of the red lancers on the redder field of Waterloo. Larrey was still strong and sturdy as I saw him, and few portraits remain printed in livelier colors on the tablet of my memory.

Leave the little group of students which gathers about Larrey beneath the gilded dome of the Invalides and follow me to the Hotel Dieu, where rules and reigns the master-surgeon of his day, at least so far as Paris and France are concerned,—the illustrious Baron Dupuytren. No man disputed his reign, some envied his supremacy. Lisfranc shrugged his shoulders as he spoke of "ce grand homme de l'autre cote de la riviere," that great man on the other side of the river, but the great man he remained, until he bowed before the mandate which none may disobey. "Three times," said Bouillaud, "did the apoplectic thunderbolt fall on that robust brain,"—it yielded at last as the old bald cliff that is riven and crashes down into the valley. I saw him before the first thunderbolt had descended: a square, solid man, with a high and full-domed head, oracular in his utterances, indifferent to those around him, sometimes, it was said, very rough with them. He spoke in low, even tones, with quiet fluency, and was listened to with that hush of rapt attention which I have hardly seen in any circle of listeners unless when such men as ex-President John Quincy Adams or Daniel Webster were the speakers. I do not think that Dupuytren has left a record which explains his influence, but in point of fact he dominated those around him in a remarkable manner. You must have all witnessed something of the

same kind. The personal presence of some men carries command with it, and their accents silence the crowd around them, when the same words from other lips might fall comparatively unheeded.

As for Lisfranc, I can say little more of him than that he was a great drawer of blood and hewer of members. I remember his ordering a wholesale bleeding of his patients, right and left, whatever might be the matter with them, one morning when a phlebotomizing fit was on him. I recollect his regretting the splendid guardsmen of the old Empire,—for what? because they had such magnificent thighs to amputate. I got along about as far as that with him, when I ceased to be a follower of M. Lisfranc.

The name of Velpeau must have reached many of you, for he died in 1867, and his many works made his name widely known. Coming to Paris in wooden shoes, starving, almost, at first, he raised himself to great eminence as a surgeon and as an author, and at last obtained the Professorship to which his talents and learning entitled him. His example may be an encouragement to some of my younger hearers who are born, not with the silver spoon in their mouths, but with the two-tined iron fork in their hands. It is a poor thing to take up their milk porridge with in their young days, but in after years it will often transfix the solid dumplings that roll out of the silver spoon. So Velpeau found it. He had not what is called genius, he was far from prepossessing in aspect, looking as if he might have wielded the sledge-hammer (as I think he had done in early life) rather than the lancet, but he had industry, determination, intelligence, character, and he made his way to distinction and prosperity, as some of you sitting on these benches and wondering anxiously what is to become of you in the struggle for life will have done before the twentieth century has got halfway through its first quarter. A good sound head over a pair of wooden shoes is a great deal better than a wooden head belonging to an owner who cases his feet in calf-skin, but a good brain is not enough without a stout heart to fill the four great conduits which carry at once fuel and fire to that mightiest of engines.

How many of you who are before me are familiarly acquainted with the name of Broussais, or even with that of Andral? Both were lecturing at the Ecole de Medicine, and I often heard them. Broussais was in those days like an old volcano, which has pretty nearly used up its fire and brimstone, but is still boiling and bubbling in its interior, and now and then sends up a spirt of lava and a volley of pebbles. His theories of gastro-enteritis, of irritation and inflammation as the cause of disease, and the practice which sprang from them, ran over the fields of medicine for a time like flame over the grass of the prairies. The way in which that knotty-featured, savage old man would bring out the word irritation—with rattling and rolling reduplication of the resonant letter r—might have taught a lesson in articulation to Salvini. But Broussais's theory was languishing and well-nigh become obsolete, and this, no doubt, added vehemence to his defence of his cherished dogmas.

Old theories, and old men who cling to them, must take themselves out of the way as the new generation with its fresh thoughts and altered habits of mind comes forward to take the place of that which is dying out. This was a truth which the fiery old theorist found it very hard to learn, and harder to bear, as it was forced upon him. For the hour of his lecture was succeeded by that of a younger and far more popular professor. As his lecture drew towards its close, the benches, thinly sprinkled with students, began to fill up; the doors creaked open and banged back oftener and oftener, until at last the sound grew almost continuous, and the voice of the lecturer became a leonine growl as he strove in vain to be heard over the noise of doors and footsteps.

Broussais was now sixty-two years old. The new generation had outgrown his doctrines, and the Professor for whose hour the benches had filled themselves belonged to that new generation. Gabriel Andral was little more than half the age of Broussais, in the full prime and vigor of manhood at thirty-seven years. He was a rapid, fluent, fervid, and imaginative speaker, pleasing in aspect and manner,—a strong contrast to the harsh, vituperative old man who had just preceded him. His Clinique Medicale is still valuable as a collection of cases, and his researches on the blood, conducted in association with Gavarret, contributed new and valuable facts to science. But I remember him chiefly as one of those instructors whose natural eloquence made it delightful to listen to him. I doubt if I or my fellow-students did full justice either to him or to the famous physician of Hotel Dieu, Chomel. We had addicted ourselves almost too closely to the words of another master, by whom we were ready to swear as against all teachers that ever were or ever would be.

This object of our reverence, I might almost say idolatry, was one whose name is well known to most of the young men before me, even to those who may know comparatively little of his works and teachings. Pierre Charles Alexandre Louis, at the age of forty-seven, as I recall him, was a tall, rather spare, dignified personage, of serene and grave aspect, but with a pleasant smile and kindly voice for the student with whom he came into personal relations. If I summed up the lessons of Louis in two expressions, they would be these; I do not hold him answerable for the words, but I will condense them after my own fashion in French, and then give them to you, expanded somewhat, in English:

*Formez toujours des idees nettes.
Fuyez toujours les a peu pres.*

Always make sure that you form a distinct and clear idea of the matter you are considering.

Always avoid vague approximations where exact estimates are possible; about so many,—about so much, instead of the precise number and quantity.

Now, if there is anything on which the biological sciences have prided themselves in these latter years it is the substitution of quantitative for qualitative formulae. The “numerical system,” of which Louis was the great advocate, if not the absolute originator, was an attempt to substitute series of carefully recorded facts, rigidly counted and closely compared, for those never-ending records of vague, unverifiable conclusions with which the classics of the healing art were overloaded. The history of practical medicine had been like the story of the Danaides. “Experience” had been, from time immemorial, pouring its flowing treasures into buckets full of holes. At the existing rate of supply and leakage they would never be filled; nothing would ever be settled in medicine. But cases thoroughly recorded and mathematically analyzed would always be available for future use, and when accumulated in sufficient number would lead to results which would be trustworthy, and belong to science.

Your young men who are following the hospitals hardly know how much you are indebted to Louis. I say

nothing of his Researches on Phthisis or his great work on Typhoid Fever. But I consider his modest and brief Essay on Bleeding in some Inflammatory Diseases, based on cases carefully observed and numerically analyzed, one of the most important written contributions to practical medicine, to the treatment of internal disease, of this century, if not since the days of Sydenham. The lancet was the magician's wand of the dark ages of medicine. The old physicians not only believed in its general efficacy as a wonder-worker in disease, but they believed that each malady could be successfully attacked from some special part of the body,—the strategic point which commanded the seat of the morbid affection. On a figure given in the curious old work of John de Ketam, no less than thirty-eight separate places are marked as the proper ones to bleed from, in different diseases. Even Louis, who had not wholly given up venesection, used now and then to order that a patient suffering from headache should be bled in the foot, in preference to any other part.

But what Louis did was this: he showed by a strict analysis of numerous cases that bleeding did not strangle,—jugulate was the word then used,—acute diseases, more especially pneumonia. This was not a reform,—it was a revolution. It was followed up in this country by the remarkable Discourse of Dr. Jacob Bigelow upon Self-Limited Diseases, which has, I believe, done more than any other work or essay in our own language to rescue the practice of medicine from the slavery to the drugging system which was a part of the inheritance of the profession.

Yes, I say, as I look back on the long hours of the many days I spent in the wards and in the autopsy room of La Pitie, where Louis was one of the attending physicians,—yes, Louis did a great work for practical medicine. Modest in the presence of nature, fearless in the face of authority, unwearying in the pursuit of truth, he was a man whom any student might be happy and proud to claim as his teacher and his friend, and yet, as I look back on the days when I followed his teachings, I feel that I gave myself up too exclusively to his methods of thought and study.

There is one part of their business which certain medical practitioners are too apt to forget; namely, that what they should most of all try to do is to ward off disease, to alleviate suffering, to preserve life, or at least to prolong it if possible. It is not of the slightest interest to the patient to know whether three or three and a quarter cubic inches of his lung are hepatized. His mind is not occupied with thinking of the curious problems which are to be solved by his own autopsy,—whether this or that strand of the spinal marrow is the seat of this or that form of degeneration. He wants something to relieve his pain, to mitigate the anguish of dyspnea, to bring back motion and sensibility to the dead limb, to still the tortures of neuralgia. What is it to him that you can localize and name by some uncouth term the disease which you could not prevent and which you cannot cure? An old woman who knows how to make a poultice and how to put it on, and does it tuto, eito, jucunde, just when and where it is wanted, is better,—a thousand times better in many cases,—than a staring pathologist, who explores and thumps and doubts and guesses, and tells his patient he will be better tomorrow, and so goes home to tumble his books over and make out a diagnosis.

But in those days, I, like most of my fellow students, was thinking much more of “science” than of practical medicine, and I believe if we had not clung so closely to the skirts of Louis and had followed some of the courses of men like Trousseau,—therapeutists, who gave special attention to curative methods, and not chiefly to diagnosis,—it would have been better for me and others. One thing, at any rate, we did learn in the wards of Louis. We learned that a very large proportion of diseases get well of themselves, without any special medication,—the great fact formulated, enforced, and popularized by Dr. Jacob Bigelow in the Discourse referred to. We unlearned the habit of drugging for its own sake. This detestable practice, which I was almost proscribed for condemning somewhat too epigrammatically a little more than twenty years ago, came to us, I suspect, in a considerable measure from the English “general practitioners,” a sort of prescribing apothecaries. You remember how, when the city was besieged, each artisan who was called upon in council to suggest the best means of defence recommended the articles he dealt in: the carpenter, wood; the blacksmith, iron; the mason, brick; until it came to be a puzzle to know which to adopt. Then the shoemaker said, “Hang your walls with new boots,” and gave good reasons why these should be the best of all possible defences. Now the “general practitioner” charged, as I understand, for his medicine, and in that way got paid for his visit. Wherever this is the practice, medicine is sure to become a trade, and the people learn to expect drugging, and to consider it necessary, because drugs are so universally given to the patients of the man who gets his living by them.

It was something to have unlearned the pernicious habit of constantly giving poisons to a patient, as if they were good in themselves, of drawing off the blood which he would want in his struggle with disease, of making him sore and wretched with needless blisters, of turning his stomach with unnecessary nauseous draught and mixtures,—only because he was sick and something must be done. But there were positive as well as negative facts to be learned, and some of us, I fear, came home rich in the negatives of the expectant practice, poor in the resources which many a plain country practitioner had ready in abundance for the relief and the cure of disease. No one instructor can be expected to do all for a student which he requires. Louis taught us who followed him the love of truth, the habit of passionless listening to the teachings of nature, the most careful and searching methods of observation, and the sure means of getting at the results to be obtained from them in the constant employment of accurate tabulation. He was not a showy, or eloquent, or, I should say, a very generally popular man, though the favorite, almost the idol, of many students, especially Genevese and Bostonians. But he was a man of lofty and admirable scientific character, and his work will endure in its influences long after his name is lost sight of save to the faded eyes of the student of medical literature.

Many other names of men more or less famous in their day, and who were teaching while I was in Paris, come up before me. They are but empty sounds for the most part in the ears of persons of not more than middle age. Who of you knows anything of Richerand, author of a very popular work on Physiology, commonly put into the student's hands when I first began to ask for medical text-books? I heard him lecture once, and have had his image with me ever since as that of an old, worn-out man,—a venerable but dilapidated relic of an effete antiquity. To verify this impression I have just looked out the dates of his birth and death, and find that he was eighteen years younger than the speaker who is now addressing you. There is a terrible parallax between the period before thirty and that after threescore and ten, as two men of those ages look, one with

naked eyes, one through his spectacles, at the man of fifty and thereabout. Magendie, I doubt not you have all heard of. I attended but one of his lectures. I question if one here, unless some contemporary of my own has strayed into the amphitheatre,—knows anything about Marjolin. I remember two things about his lectures on surgery, the deep tones of his voice as he referred to his oracle,—the earlier writer, Jean Louis Petit,—and his formidable snuffbox. What he taught me lies far down, I doubt not, among the roots of my knowledge, but it does not flower out in any noticeable blossoms, or offer me any very obvious fruits. Where now is the fame of Bouillaud, Professor and Deputy, the Sangrado of his time? Where is the renown of Piorry, percussionist and poet, expert alike in the resonances of the thoracic cavity and those of the rhyming vocabulary?—I think life has not yet done with the vivacious Ricord, whom I remember calling the Voltaire of pelvic literature,—a sceptic as to the morality of the race in general, who would have submitted Diana to treatment with his mineral specifics, and ordered a course of blue pills for the vestal virgins.

Ricord was born at the beginning of the century, and Piorry some years earlier. Cruveilhier, who died in 1874, is still remembered by his great work on pathological anatomy; his work on descriptive anatomy has some things which I look in vain for elsewhere. But where is Civiale,—where are Orfila, Gendrin, Rostan, Biett, Alibert,—jolly old Baron Alibert, whom I remember so well in his broad-brimmed hat, worn a little jauntily on one side, calling out to the students in the court-yard of the Hospital St. Louis, “*Enfans de la methode naturelle, etes-vous tous ici?*” “Children of the natural method [his own method of classification of skin diseases,] are you all here?” All here, then, perhaps; all where, now?

My show of ghosts is over. It is always the same story that old men tell to younger ones, some few of whom will in their turn repeat the tale, only with altered names, to their children's children.

*Like phantoms painted on the magic slide,
Forth from the darkness of the past we glide,
As living shadows for a moment seen
In airy pageant on the eternal screen,
Traced by a ray from one unchanging flame,
Then seek the dust and stillness whence we came.*

Dr. Benjamin Waterhouse, whom I well remember, came back from Leyden, where he had written his Latin graduating thesis, talking of the learned Gaubius and the late illustrious Boerhaave and other dead Dutchmen, of whom you know as much, most of you, as you do of Noah's apothecary and the family physician of Methuselah, whose prescriptions seem to have been lost to posterity. Dr. Lloyd came back to Boston full of the teachings of Cheselden and Sharpe, William Hunter, Smellie, and Warner; Dr. James Jackson loved to tell of Mr. Cline and to talk of Mr. John Hunter; Dr. Reynolds would give you his recollections of Sir Astley Cooper and Mr. Abernethy; I have named the famous Frenchmen of my student days; Leyden, Edinburgh, London, Paris, were each in turn the Mecca of medical students, just as at the present day Vienna and Berlin are the centres where our young men crowd for instruction. These also must sooner or later yield their precedence and pass the torch they hold to other hands. Where shall it next flame at the head of the long procession? Shall it find its old place on the shores of the Gulf of Salerno, or shall it mingle its rays with the northern aurora up among the fiords of Norway,—or shall it be borne across the Atlantic and reach the banks of the Charles, where Agassiz and Wyman have taught, where Hagen still teaches, glowing like his own Lampyrus splendidula, with enthusiasm, where the first of American botanists and the ablest of American surgeons are still counted in the roll of honor of our great University?

Let me add a few words which shall not be other than cheerful, as I bid farewell to this edifice which I have known so long. I am grateful to the roof which has sheltered me, to the floors which have sustained me, though I have thought it safest always to abstain from anything like eloquence, lest a burst of too emphatic applause might land my class and myself in the cellar of the collapsing structure, and bury us in the fate of Korah, Dathan, and Abiram. I have helped to wear these stairs into hollows,—stairs which I trod when they were smooth and level, fresh from the plane. There are just thirty-two of them, as there were five and thirty years ago, but they are steeper and harder to climb, it seems to me, than they were then. I remember that in the early youth of this building, the late Dr. John K. Mitchell, father of our famous Dr. Weir Mitchell, said to me as we came out of the Demonstrator's room, that some day or other a whole class would go heels over head down this graded precipice, like the herd told of in Scripture story. This has never happened as yet; I trust it never will. I have never been proud of the apartment beneath the seats, in which my preparations for lecture were made. But I chose it because I could have it to myself, and I resign it, with a wish that it were more worthy of regret, into the hands of my successor, with my parting benediction. Within its twilight precincts I have often prayed for light, like Ajax, for the daylight found scanty entrance, and the gaslight never illuminated its dark recesses. May it prove to him who comes after me like the cave of the Sibyl, out of the gloomy depths of which came the oracles which shone with the rays of truth and wisdom!

This temple of learning is not surrounded by the mansions of the great and the wealthy. No stately avenues lead up to its facades and porticoes. I have sometimes felt, when conveying a distinguished stranger through its precincts to its door, that he might question whether star-eyed Science had not missed her way when she found herself in this not too attractive locality. I cannot regret that we—you, I should say—are soon to migrate to a more favored region, and carry on your work as teachers and as learners in ampler halls and under far more favorable conditions.

I hope that I may have the privilege of meeting you there, possibly may be allowed to add my words of welcome to those of my former colleagues, and in that pleasing anticipation I bid good-by to this scene of my long labors, and, for the present at least, to the friends with whom I have been associated.

APPENDUM

NOTES TO THE ADDRESS ON CURRENTS AND COUNTER CURRENTS IN MEDICAL SCIENCE.

Some passages contained in the original manuscript of the Address, and omitted in the delivery on account of its length, are restored in the text or incorporated with these Notes.

NOTE A.—

There is good reason to doubt whether the nitrate of silver has any real efficacy in epilepsy. It has seemed to cure many cases, but epilepsy is a very uncertain disease, and there is hardly anything which has not been supposed to cure it. Dr. Copland cites many authorities in its favor, most especially Lombard's cases. But De la Berge and Monneret (*Comp. de Med. Paris*), 1839, analyze these same cases, eleven in number, and can only draw the inference of a very questionable value in the supposed remedy. Dr. James Jackson says that relief of epilepsy is not to be attained by any medicine with which he is acquainted, but by diet. (*Letters to a Young Physician*, p. 67.) Guy Patin, Dean of the Faculty of Paris, Professor at the Royal College, Author of the *Antimonial Martyrology*, a wit and a man of sense and learning, who died almost two hundred years ago, had come to the same conclusion, though the chemists of his time boasted of their remedies. "Did, you ever see a case of epilepsy cured by nitrate of silver?" I said to one of the oldest and most experienced surgeons in this country. "Never," was his instant reply. Dr. Twitchell's experience was very similar. How, then, did nitrate of silver come to be given for epilepsy? Because, as Dr. Martin has so well reminded us, lunatics were considered formerly to be under the special influence of Luna, the moon (which Esquirol, be it observed, utterly denies), and lunar caustic, or nitrate of silver, is a salt of that metal which was called luna from its whiteness, and of course must be in the closest relations with the moon. It follows beyond all reasonable question that the moon's metal, silver, and its preparations, must be the specific remedy for moonblasted maniacs and epileptics!

Yet the practitioner who prescribes the nitrate of silver supposes he is guided by the solemn experience of the past, instead of by its idle fancies. He laughs at those old physicians who placed such confidence in the right hind hoof of an elk as a remedy for the same disease, and leaves the record of his own belief in a treatment quite as fanciful and far more objectionable, written in indelible ink upon a living tablet where he who runs may read it for a whole generation, if nature spares his walking advertisement so long.

NOTE B.—

The presumption that a man is innocent until he is proved guilty, does not mean that there are no rogues, but lays the onus probandi on the party to which it properly belongs. So with this proposition. A noxious agent should never be employed in sickness unless there is ample evidence in the particular case to overcome the general presumption against all such agents, and the evidence is very apt to be defective.

The miserable delusion of Homoeopathy builds itself upon an axiom directly the opposite of this; namely, that the sick are to be cured by poisons. *Similia similibus curantur* means exactly this. It is simply a theory of universal poisoning, nullified in practice by the infinitesimal contrivance. The only way to kill it and all similar fancies, and to throw every quack nostrum into discredit, is to root out completely the suckers of the old rotten superstition that whatever is odious or noxious is likely to be good for disease. The current of sound practice with ourselves is, I believe, setting fast in the direction I have indicated in the above proposition. To uphold the exhibition of noxious agents in disease, as the rule, instead of admitting them cautiously and reluctantly as the exception, is, as I think, an eddy of opinion in the direction of the barbarism out of which we believe our art is escaping. It is only through the enlightened sentiment and action of the Medical Profession that the community can be brought to acknowledge that drugs should always be regarded as evils.

It is true that some suppose, and our scientific and thoughtful associate, Dr. Gould, has half countenanced the opinion, that there may yet be discovered a specific for every disease. Let us not despair of the future, but let us be moderate in our expectations. When an oil is discovered that will make a bad watch keep good time; when a recipe is given which will turn an acephalous foetus into a promising child; when a man can enter the second time into his mother's womb and give her back the infirmities which twenty generations have stirred into her blood, and infused into his own through hers, we may be prepared to enlarge the National Pharmacopoeia with a list of specifics for everything but old age,—and possibly for that also.

NOTE C.—

The term specific is used here in its ordinary sense, without raising the question of the propriety of its application to these or other remedies.

The credit of introducing Cinchona rests between the Jesuits, the Countess of Chinchon, the Cardinal de Lugo, and Sir Robert Talbor, who employed it as a secret remedy. (Pereira.) Mercury as an internal specific remedy was brought into use by that impudent and presumptuous quack, as he was considered, Paracelsus. (*Encyc. Brit. art. "Paracelsus."*) Arsenic was introduced into England as a remedy for intermittents by Dr. Fowler, in consequence of the success of a patent medicine, the Tasteless Ague Drops, which were supposed, "probably with reason," to be a preparation of that mineral. (*Rees's Cyc. art. "Arsenic."*) Colchicum came into notice in a similar way, from the success of the Eau Medicinale of M. Husson, a French military officer. (Pereira.) Iodine was discovered by a saltpetre manufacturer, but applied by a physician in place of the old remedy, burnt sponge, which seems to owe its efficacy to it. (*Dunlison, New Remedies.*) As for Sulphur, "the common people have long used it as an ointment" for scabies. (*Rees's Cyc. art. "Scabies."*) The modern cantiscorbatic regimen is credited to Captain Cook. "To his sagacity we are indebted for the first impulse to those regulations by which scorbutus is so successfully prevented in our navy." (*Lond. Cyc. Prac. Med. art.*

"Scorbutus.") Iron and various salts which enter into the normal composition of the human body do not belong to the *materia medica* by our definition, but to the *materia alimentaria*.

For the first introduction of iron as a remedy, see Pereira, who gives a very curious old story.

The statement in the text concerning a portion of the *materia medica* stands exactly as delivered, and is meant exactly as it stands. No denunciation of drugs, as sparingly employed by a wise physician, was or is intended. If, however, as Dr. Gould stated in his "valuable and practical discourse" to which the Massachusetts Medical Society "listened with profit as well as interest," "Drugs, in themselves considered, may always be regarded as evils,"—any one who chooses may question whether the evils from their abuse are, on the whole, greater or less than the undoubted benefits obtained from their proper use. The large exception of opium, wine, specifics, and anaesthetics, made in the text, takes off enough from the useful side, as I fully believe, to turn the balance; so that a vessel containing none of these, but loaded with antimony, strychnine, acetate of lead, aloes, aconite, lobelia, lapis infernalis, stercus diaboli, tormentilla, and other approved, and, in skilful hands, really useful remedies, brings, on the whole, more harm than good to the port it enters.

It is a very narrow and unjust view of the practice of medicine, to suppose it to consist altogether in the use of powerful drugs, or of drugs of any kind. Far from it. "The physician may do very much for the welfare of the sick, more than others can do, although he does not, even in the major part of cases, undertake to control and overcome the disease by art. It was with these views that I never reported any patient cured at our hospital. Those who recovered their health were reported as well; not implying that they were made so by the active treatment they had received there. But it was to be understood that all patients received in that house were to be cured, that is, taken care of." (Letters to a Young Physician, by James Jackson, M. D., Boston, 1855.)

"Hygienic rules, properly enforced, fresh air, change of air, travel, attention to diet, good and appropriate food judiciously regulated, together with the administration of our tonics, porter, ale, wine, iron, etc., supply the diseased or impoverished system with what Mr. Gull, of St. Bartholomew's Hospital, aptly calls the 'raw material of the blood;' and we believe that if any real improvement has taken place in medical practice, independently of those truly valuable contributions we have before described, it is in the substitution of tonics, stimulants, and general management, for drastic cathartics, for bleeding, depressing agents, including mercury, tartar emetics, etc., so much in vogue during the early part even of this century." (F. P. Porcher, in Charleston Med. Journal and Review for January, 1860.)

JOHN LOTHROP MOTLEY

A MEMOIR, Complete

By Oliver Wendell Holmes, Sr.

NOTE.

The Memoir here given to the public is based on a biographical sketch prepared by the writer at the request of the Massachusetts Historical Society for its Proceedings. The questions involving controversies into which the Society could not feel called to enter are treated at considerable length in the following pages. Many details are also given which would have carried the paper written for the Society beyond the customary limits of such tributes to the memory of its deceased members. It is still but an outline which may serve a present need and perhaps be of some assistance to a future biographer.

APPENDIX.

I. 1814-1827. To AEt. 13.

BIRTH AND EARLY YEARS.

John Motley, the great-grandfather of the subject of this Memoir, came in the earlier part of the last century from Belfast in Ireland to Falmouth, now Portland, in the District, now the State of Maine. He was twice married, and had ten children, four of the first marriage and six of the last. Thomas, the youngest son by his first wife, married Emma, a daughter of John Wait, the first Sheriff of Cumberland County under the government of the United States. Two of their seven sons, Thomas and Edward, removed from Portland to Boston in 1802 and established themselves as partners in commercial business, continuing united and prosperous for nearly half a century before the firm was dissolved.

The earlier records of New England have preserved the memory of an incident which deserves mention as showing how the historian's life was saved by a quickwitted handmaid, more than a hundred years before he was born. On the 29th of August, 1708, the French and Indians from Canada made an attack upon the town of Haverhill, in Massachusetts. Thirty or forty persons were slaughtered, and many others were carried captive into Canada.

The minister of the town, Rev. Benjamin Rolfe, was killed by a bullet through the door of his house. Two of his daughters, Mary, aged thirteen, and Elizabeth, aged nine, were sleeping in a room with the maid-servant, Hagar. When Hagar heard the whoop of the savages she seized the children, ran with them into the cellar, and, after concealing them under two large washtubs, hid herself. The Indians ransacked the cellar, but missed the prey. Elizabeth, the younger of the two girls, grew up and married the Rev. Samuel Checkley, first minister of the "New South" Church, Boston. Her son, Rev. Samuel Checkley, Junior, was minister of the Second Church, and his successor, Rev. John Lothrop, or Lathrop, as it was more commonly spelled, married his daughter. Dr. Lothrop was great-grandson of Rev. John Lothrop, of Scituate, who had been imprisoned in England for nonconformity. The Checkleys were from Preston Capes, in Northamptonshire. The name is probably identical with that of the Chicheles or Chichleys, a well-known Northamptonshire family.

Thomas Motley married Anna, daughter of the Rev. John Lothrop, granddaughter of the Rev. Samuel Checkley, Junior, the two ministers mentioned above, both honored in their day and generation. Eight children were born of this marriage, of whom four are still living.

JOHN LOTHROP MOTLEY, the second of these children, was born in Dorchester, now a part of Boston, Massachusetts, on the 15th of April, 1814. A member of his family gives a most pleasing and interesting picture, from his own recollections and from what his mother told him, of the childhood which was to develop into such rich maturity. The boy was rather delicate in organization, and not much given to outdoor amusements, except skating and swimming, of which last exercise he was very fond in his young days, and in which he excelled. He was a great reader, never idle, but always had a book in his hand,—a volume of poetry or one of the novels of Scott or Cooper. His fondness for plays and declamation is illustrated by the story told by a younger brother, who remembers being wrapped up in a shawl and kept quiet by sweetmeats, while he figured as the dead Caesar, and his brother, the future historian, delivered the speech of Antony over his prostrate body. He was of a most sensitive nature, easily excited, but not tenacious of any irritated feelings, with a quick sense of honor, and the most entirely truthful child, his mother used to say, that she had ever seen. Such are some of the recollections of those who knew him in his earliest years and in the most intimate relations.

His father's family was at this time living in the house No. 7 Walnut Street, looking down Chestnut Street over the water to the western hills. Near by, at the corner of Beacon Street, was the residence of the family of the first mayor of Boston, and at a little distance from the opposite corner was the house of one of the fathers of New England manufacturing enterprise, a man of superior intellect, who built up a great name and fortune in our city. The children from these three homes naturally became playmates. Mr. Motley's house was a very hospitable one, and Lothrop and two of his young companions were allowed to carry out their schemes of amusement in the garden and the garret. If one with a prescient glance could have looked into that garret on some Saturday afternoon while our century was not far advanced in its second score of years, he might have found three boys in cloaks and doublets and plumed hats, heroes and bandits, enacting more or less impromptu melodramas. In one of the boys he would have seen the embryo dramatist of a nation's life history, John Lothrop Motley; in the second, a famous talker and wit who has spilled more good things on the wasteful air in conversation than would carry a "diner-out" through half a dozen London seasons, and waked up somewhat after the usual flowering-time of authorship to find himself a very agreeable and cordially welcomed writer,—Thomas Gold Appleton. In the third he would have recognized a champion of liberty known wherever that word is spoken, an orator whom to hear is to revive all the traditions of the grace, the address, the commanding sway of the silver-tongued eloquence of the most renowned speakers,—Wendell Phillips.

Both of young Motley's playmates have furnished me with recollections of him and of those around him at this period of his life, and I cannot do better than borrow freely from their communications. His father was a man of decided character, social, vivacious, witty, a lover of books, and himself not unknown as a writer, being the author of one or more of the well remembered "Jack Downing" letters. He was fond of having the boys read to him from such authors as Channing and Irving, and criticised their way of reading with discriminating judgment and taste. Mrs. Motley was a woman who could not be looked upon without admiration. I remember well the sweet dignity of her aspect, her "regal beauty," as Mr. Phillips truly styles it, and the charm of her serene and noble presence, which made her the type of a perfect motherhood. Her character corresponded to the promise of her gracious aspect. She was one of the fondest of mothers, but not thoughtlessly indulgent to the boy from whom she hoped and expected more than she thought it wise to let him know. The story used to be current that in their younger days this father and mother were the handsomest pair the town of Boston could show. This son of theirs was "rather tall," says Mr. Phillips, "lithe, very graceful in movement and gesture, and there was something marked and admirable in the set of his head on his shoulders,"—a peculiar elegance which was most noticeable in those later days when I knew him.

Lady Byron long afterwards spoke of him as more like her husband in appearance than any other person she had met; but Mr. Phillips, who remembers the first bloom of his boyhood and youth, thinks he was handsomer than any portrait of Byron represents the poet. "He could not have been eleven years old," says the same correspondent, "when he began writing a novel. It opened, I remember, not with one solitary horseman, but with two, riding up to an inn in the valley of the Housatonic. Neither of us had ever seen the Housatonic, but it sounded grand and romantic. Two chapters were finished."

There is not much remembered of the single summer he passed at Mr. Green's school at Jamaica Plain. From that school he went to Round Hill, Northampton, then under the care of Mr. Cogswell and Mr. Bancroft. The historian of the United States could hardly have dreamed that the handsome boy of ten years was to take his place at the side of his teacher in the first rank of writers in his own department. Motley came to Round Hill, as one of his schoolmates tells me, with a great reputation, especially as a declaimer. He had a remarkable facility for acquiring languages, excelled as a reader and as a writer, and was the object of general admiration for his many gifts. There is some reason to think that the flattery he received was for a time a hindrance to his progress and the development of his character. He obtained praise too easily, and learned to trust too much to his genius. He had everything to spoil him,—beauty, precocious intelligence, and a personal charm which might have made him a universal favorite. Yet he does not seem to have been generally popular at this period of his life. He was wilful, impetuous, sometimes supercilious, always fastidious. He would study as he liked, and not by rule. His school and college mates believed in his great possibilities through all his forming period, but it may be doubted if those who counted most confidently on his future could have supposed that he would develop the heroic power of concentration, the long-breathed tenacity of purpose, which in after years gave effect to his brilliant mental endowments. "I did wonder," says Mr. Wendell Phillips, "at the diligence and painstaking, the drudgery shown in his historical works. In early life he had no industry, not needing it. All he cared for in a book he caught quickly,—the spirit of it, and all his mind needed or would use. This quickness of apprehension was marvellous." I do not find from the recollections of his schoolmates at Northampton that he was reproached for any grave offences, though he may have wandered beyond the prescribed boundaries now and then, and studied according to his inclinations rather than by rule. While at that school he made one acquisition much less common then than now,—a knowledge of the German language and some degree of acquaintance with its literature, under the guidance of one of the few thorough German scholars this country then possessed, Mr. George Bancroft.

II. 1827-1831. AEt. 13-17.

COLLEGE LIFE.

Such then was the boy who at the immature, we might almost say the tender, age of thirteen entered Harvard College. Though two years after me in college standing, I remember the boyish reputation which he brought with him, especially that of a wonderful linguist, and the impression which his striking personal beauty produced upon us as he took his seat in the college chapel. But it was not until long after this period that I became intimately acquainted with him, and I must again have recourse to the classmates and friends who have favored me with their reminiscences of this period of his life. Mr. Phillips says:

"During our first year in college, though the youngest in the class, he stood third, I think, or second in college rank, and ours was an especially able class. Yet to maintain this rank he neither cared nor needed to make any effort. Too young to feel any responsibilities, and not yet awake to any ambition, he became so negligent that he was 'rusticated' [that is, sent away from college for a time]. He came back sobered, and worked rather more, but with no effort for college rank thenceforward."

I must finish the portrait of the collegian with all its lights and shadows by the help of the same friends from whom I have borrowed the preceding outlines.

He did not care to make acquaintances, was haughty in manner and cynical in mood, at least as he appeared to those in whom he felt no special interest. It is no wonder, therefore, that he was not a popular favorite, although recognized as having very brilliant qualities. During all this period his mind was doubtless fermenting with projects which kept him in a fevered and irritable condition. "He had a small writing-table," Mr. Phillips says, "with a shallow drawer; I have often seen it half full of sketches, unfinished poems, soliloquies, a scene or two of a play, prose portraits of some pet character, etc. These he would read to me, though he never volunteered to do so, and every now and then he burnt the whole and began to fill the drawer again."

My friend, Mr. John Osborne Sargent, who was a year before him in college, says, in a very interesting letter with which he has favored me:

"My first acquaintance with him [Motley] was at Cambridge, when he came from Mr. Cogswell's school at Round Hill. He then had a good deal of the shyness that was just pronounced enough to make him interesting, and which did not entirely wear off till he left college. . . I soon became acquainted with him, and we used to take long walks together, sometimes taxing each other's memory for poems or passages from poems that had struck our fancy. Shelley was then a great favorite of his, and I remember that Praed's verses then appearing in the 'New Monthly' he thought very clever and brilliant, and was fond of repeating them. You have forgotten, or perhaps never knew, that Motley's first appearance in print was in the

'Collegian.' He brought me one day, in a very modest mood, a translation from Goethe, which I was most happy to oblige him by inserting. It was very prettily done, and will now be a curiosity. . . . How it happened that Motley wrote only one piece I do not remember. I had the pleasure about that time of initiating him as a member of the Knights of the Square Table,—always my favorite college club, for the reason, perhaps, that I was a sometime Grand Master. He was always a genial and jovial companion at our supper-parties at Fresh Pond and Gallagher's."

We who live in the days of photographs know how many faces belong to every individual. We know too under what different aspects the same character appears to those who study it from different points of view and with different prepossessions. I do not hesitate, therefore, to place side by side the impressions of two of his classmates as to one of his personal traits as they observed him at this period of his youth.

"He was a manly boy, with no love for or leaning to girls' company; no care for dress; not a trace of personal vanity. . . . He was, or at least seemed, wholly unconscious of his rare beauty and of the fascination of his manner; not a trace of pretence, the simplest and most natural creature in the world."

Look on that picture and on this:—

"He seemed to have a passion for dress. But as in everything else, so in this, his fancy was a fitful one. At one time he would excite our admiration by the splendor of his outfit, and perhaps the next week he would seem to take equal pleasure in his slovenly or careless appearance."

It is not very difficult to reconcile these two portraiture. I recollect it was said by a witty lady of a handsome clergyman well remembered among us, that he had dressy eyes. Motley so well became everything he wore, that if he had sprung from his bed and slipped his clothes on at an alarm of fire, his costume would have looked like a prince's undress. His natural presentment, like that of Count D'Orsay, was of the kind which suggests the intentional effects of an elaborate toilet, no matter how little thought or care may have been given to make it effective. I think the "passion for dress" was really only a seeming, and that he often excited admiration when he had not taken half the pains to adorn himself that many a youth less favored by nature has wasted upon his unblest exterior only to be laughed at.

I gather some other interesting facts from a letter which I have received from his early playmate and school and college classmate, Mr. T. G. Appleton.

"In his Sophomore year he kept abreast of the prescribed studies, but his heart was out of bounds, as it often had been at Round Hill when chasing squirrels or rabbits through forbidden forests. Already his historical interest was shaping his life. A tutor coming-by chance, let us hope—to his room remonstrated with him upon the heaps of novels upon his table."

"'Yes,' said Motley, 'I am reading historically, and have come to the novels of the nineteenth century. Taken in the lump, they are very hard reading.'"

All Old Cambridge people know the Brattle House, with its gambrel roof, its tall trees, its perennial spring, its legendary fame of good fare and hospitable board in the days of the kindly old bon vivant, Major Brattle. In this house the two young students, Appleton and Motley, lived during a part of their college course.

"Motley's room was on the ground floor, the room to the left of the entrance. He led a very pleasant life there, tempering his college duties with the literature he loved, and receiving his friends amidst elegant surroundings, which added to the charm of his society. Occasionally we amused ourselves by writing for the magazines and papers of the day. Mr. Willis had just started a slim monthly, written chiefly by himself, but with the true magazine flavor. We wrote for that, and sometimes verses in the corner of a paper called 'The Anti-Masonic Mirror,' and in which corner was a woodcut of Apollo, and inviting to destruction ambitious youths by the legend underneath,—

'Much yet remains unsung.'

"These pieces were usually dictated to each other, the poet recumbent upon the bed and a classmate ready to carry off the manuscript for the paper of the following day. 'Blackwood's' was then in its glory, its pages redolent of 'mountain dew' in every sense; the humor of the Shepherd, the elegantly brutal onslaughts upon Whigs and Cockney poets by Christopher North, intoxicated us youths."

"It was young writing, and made for the young. The opinions were charmingly wrong, and its enthusiasm was half Glenlivet. But this delighted the boys. There were no reprints then, and to pass the paper-cutter up the fresh inviting pages was like swinging over the heather arm in arm with Christopher himself. It is a little singular that though we had a college magazine of our own, Motley rarely if ever wrote for it. I remember a translation from Goethe, 'The Ghost-Seer,' which he may have written for it, and a poem upon the White Mountains. Motley spoke at one of the college exhibitions an essay on Goethe so excellent that Mr. Joseph Cogswell sent it to Madam Goethe, who, after reading it, said, 'I wish to see the first book that young man will write.'"

Although Motley did not aim at or attain a high college rank, the rules of the Phi Beta Kappa Society, which confine the number of members to the first sixteen of each class, were stretched so as to include him,—a tribute to his recognized ability, and an evidence that a distinguished future was anticipated for him.

III. 1832-1833. AEt. 18-19.

STUDY AND TRAVEL IN EUROPE.

Of the two years divided between the Universities of Berlin and Gottingen I have little to record. That he studied hard I cannot doubt; that he found himself in pleasant social relations with some of his fellow-students seems probable from the portraits he has drawn in his first story, "Morton's Hope," and is rendered certain so far as one of his companions is concerned. Among the records of the past to which he referred during his last visit to this country was a letter which he took from a collection of papers and handed me to read one day when I was visiting him. The letter was written in a very lively and exceedingly familiar vein. It implied such intimacy, and called up in such a lively way the gay times Motley and himself had had together in their youthful days, that I was puzzled to guess who could have addressed him from Germany in that easy and off-hand fashion. I knew most of his old friends who would be likely to call him by his baptismal name in its most colloquial form, and exhausted my stock of guesses unsuccessfully before looking at the signature. I confess that I was surprised, after laughing at the hearty and almost boyish tone of the letter, to read at the bottom of the page the signature of Bismarck. I will not say that I suspect Motley of having drawn the portrait of his friend in one of the characters of "Morton's Hope," but it is not hard to point out traits in one of them which we can believe may have belonged to the great Chancellor at an earlier period of life than that at which the world contemplates his overshadowing proportions.

Hoping to learn something of Motley during the two years while we had lost sight of him, I addressed a letter to His Highness Prince Bismarck, to which I received the following reply:—

FOREIGN OFFICE, BERLIN, March 11, 1878.

SIR,—I am directed by Prince Bismarck to acknowledge the receipt of your letter of the 1st of January, relating to the biography of the late Mr. Motley. His Highness deeply regrets that the state of his health and pressure of business do not allow him to contribute personally, and as largely as he would be delighted to do, to your depicting of a friend whose memory will be ever dear to him. Since I had the pleasure of making the acquaintance of Mr. Motley at Varzin, I have been intrusted with communicating to you a few details I have gathered from the mouth of the Prince. I enclose them as they are jotted down, without any attempt of digestion.

*I have the honor to be
Your obedient servant,
LOTHAIR BUCHER.*

"Prince Bismarck said:—

"I met Motley at Gottingen in 1832, I am not sure if at the beginning of Easter Term or Michaelmas Term. He kept company with German students, though more addicted to study than we members of the fighting clubs (corps). Although not having mastered yet the German language, he exercised a marked attraction by a conversation sparkling with wit, humor, and originality. In autumn of 1833, having both of us migrated from Gottingen to Berlin for the prosecution of our studies, we became fellow-lodgers in the house No. 161 Friedrich Strasse. There we lived in the closest intimacy, sharing meals and outdoor exercise. Motley by that time had arrived at talking German fluently; he occupied himself not only in translating Goethe's poem "Faust," but tried his hand even in composing German verses. Enthusiastic admirer of Shakespeare, Byron, Goethe, he used to spice his conversation abundantly with quotations from these his favorite authors. A pertinacious arguer, so much so that sometimes he watched my awakening in order to continue a discussion on some topic of science, poetry, or practical life, cut short by the chime of the small hours, he never lost his mild and amiable temper. Our faithful companion was Count Alexander Keyserling, a native of Courland, who has since achieved distinction as a botanist.

"Motley having entered the diplomatic service of his country, we had frequently the opportunity of renewing our friendly intercourse; at Frankfort he used to stay with me, the welcome guest of my wife; we also met at Vienna, and, later, here. The last time I saw him was in 1872 at Varzin, at the celebration of my "silver wedding," namely, the twenty-fifth anniversary.

"The most striking feature of his handsome and delicate appearance was uncommonly large and beautiful eyes. He never entered a drawing-room without exciting the curiosity and sympathy of the ladies."

It is but a glimpse of their young life which the great statesman gives us, but a bright and pleasing one. Here were three students, one of whom was to range in the flowery fields of the loveliest of the sciences,

another to make the dead past live over again in his burning pages, and a third to extend an empire as the botanist spread out a plant and the historian laid open a manuscript.

IV. 1834-1839. 2ET. 20-25.

RETURN TO AMERICA.—STUDY OF LAW.—MARRIAGE.—HIS FIRST NOVEL, "MORTON'S HOPE."

Of the years passed in the study of law after his return from Germany I have very little recollection, and nothing of importance to record. He never became seriously engaged in the practice of the profession he had chosen. I had known him pleasantly rather than intimately, and our different callings tended to separate us. I met him, however, not very rarely, at one house where we were both received with the greatest cordiality, and where the attractions brought together many both young and old to enjoy the society of its charming and brilliant inmates. This was at No. 14 Temple Place, where Mr. Park Benjamin was then living with his two sisters, both in the bloom of young womanhood. Here Motley found the wife to whom his life owed so much of its success and its happiness. Those who remember Mary Benjamin find it hard to speak of her in the common terms of praise which they award to the good and the lovely. She was not only handsome and amiable and agreeable, but there was a cordial frankness, an openhearted sincerity about her which made her seem like a sister to those who could help becoming her lovers. She stands quite apart in the memory of the friends who knew her best, even from the circle of young persons whose recollections they most cherish. Yet hardly could one of them have foreseen all that she was to be to him whose life she was to share. They were married on the 2d of March, 1837. His intimate friend, Mr. Joseph Lewis Stackpole, was married at about the same time to her sister, thus joining still more closely in friendship the two young men who were already like brothers in their mutual affection.

Two years after his marriage, in 1839, appeared his first work, a novel in two volumes, called "Morton's Hope." He had little reason to be gratified with its reception. The general verdict was not favorable to it, and the leading critical journal of America, not usually harsh or cynical in its treatment of native authorship, did not even give it a place among its "Critical Notices," but dropped a small-print extinguisher upon it in one of the pages of its "List of New Publications." Nothing could be more utterly disheartening than the unqualified condemnation passed upon the story. At the same time the critic says that "no one can read 'Morton's Hope' without perceiving it to have been written by a person of uncommon resources of mind and scholarship."

It must be confessed that, as a story, "Morton's Hope" cannot endure a searching or even a moderately careful criticism. It is wanting in cohesion, in character, even in a proper regard to circumstances of time and place; it is a map of dissected incidents which has been flung out of its box and has arranged itself without the least regard to chronology or geography. It is not difficult to trace in it many of the influences which had helped in forming or deforming the mind of the young man of twenty-five, not yet come into possession of his full inheritance of the slowly ripening qualities which were yet to assert their robust independence. How could he help admiring Byron and falling into more or less unconscious imitation of his moods if not of his special affectations? Passion showing itself off against a dark foil of cynicism; sentiment, ashamed of its own self-betrayal, and sneering at itself from time to time for fear of the laugh of the world at its sincerity,—how many young men were spoiled and how many more injured by becoming bad copies of a bad ideal! The blood of Don Juan ran in the veins of Vivian Grey and of Pelham. But if we read the fantastic dreams of Disraeli, the intellectual dandyisms of Bulwer, remembering the after careers of which these were the preludes, we can understand how there might well be something in those earlier efforts which would betray itself in the way of thought and in the style of the young men who read them during the plastic period of their minds and characters. Allow for all these influences, allow for whatever impressions his German residence and his familiarity with German literature had produced; accept the fact that the story is to the last degree disjointed, improbable, impossible; lay it aside as a complete failure in what it attempted to be, and read it, as "Vivian Grey" is now read, in the light of the career which it heralded.

"Morton's Hope" is not to be read as a novel: it is to be studied as an autobiography, a prophecy, a record of aspirations, disguised under a series of incidents which are flung together with no more regard to the unities than a pack of shuffled playing-cards. I can do nothing better than let him picture himself, for it is impossible not to recognize the portrait. It is of little consequence whether every trait is an exact copy from his own features, but it is so obvious that many of the lines are direct transcripts from nature that we may believe the same thing of many others. Let us compare his fictitious hero's story with what we have read of his own life.

In early boyhood Morton amused himself and astonished those about him by enacting plays for a puppet theatre. This was at six years old, and at twelve we find him acting in a play with other boys, just as Motley's playmates have already described him. The hero may now speak for himself, but we shall all perceive that we are listening to the writer's own story.

"I was always a huge reader; my mind was essentially craving and insatiable. Its appetite was enormous, and it devoured too greedily for health. I rejected all guidance in my studies. I already fancied myself a misanthrope. I had taken a step very common for boys of my age, and strove with all my might to be a cynic."

He goes on to describe, under the perfectly transparent mask of his hero, the course of his studies. "To poetry, like most infants, I devoted most of my time." From modern poetry he went back to the earlier sources, first with the idea of systematic reading and at last through Chaucer and Gower and early ballads, until he lost himself "in a dismal swamp of barbarous romances and lying Latin chronicles. I got hold of the Bibliotheca Monastica, containing a copious account of Anglo-Norman authors, with notices of their works,

and set seriously to reading every one of them." One profit of his antiquarianism, however, was, as he says, his attention to foreign languages,—French, Spanish, German, especially in their earliest and rudest forms of literature. From these he ascended to the ancient poets, and from Latin to Greek. He would have taken up the study of the Oriental languages, but for the advice of a relative, who begged him seriously to turn his attention to history. The paragraph which follows must speak for itself as a true record under a feigned heading.

"The groundwork of my early character was plasticity and fickleness. I was mortified by this exposure of my ignorance, and disgusted with my former course of reading. I now set myself violently to the study of history. With my turn of mind, and with the preposterous habits which I had been daily acquiring, I could not fail to make as gross mistakes in the pursuit of this as of other branches of knowledge. I imagined, on setting out, a system of strict and impartial investigation of the sources of history. I was inspired with the absurd ambition, not uncommon to youthful students, of knowing as much as their masters. I imagined it necessary for me, stripling as I was, to study the authorities; and, imbued with the strict necessity of judging for myself, I turned from the limpid pages of the modern historians to the notes and authorities at the bottom of the page. These, of course, sent me back to my monastic acquaintances, and I again found myself in such congenial company to a youthful and ardent mind as Florence of Worcester and Simeon of Durham, the Venerable Bede and Matthew Paris; and so on to Gregory and Fredegarius, down to the more modern and elegant pages of Froissart, Hollinshed, Hooker, and Stowe. Infant as I was, I presumed to grapple with masses of learning almost beyond the strength of the giants of history. A spendthrift of my time and labor, I went out of my way to collect materials, and to build for myself, when I should have known that older and abler architects had already appropriated all that was worth preserving; that the edifice was built, the quarry exhausted, and that I was, consequently, only delving amidst rubbish.

"This course of study was not absolutely without its advantages. The mind gained a certain proportion of vigor even by this exercise of its faculties, just as my bodily health would have been improved by transporting the refuse ore of a mine from one pit to another, instead of coining the ingots which lay heaped before my eyes. Still, however, my time was squandered. There was a constant want of fitness and concentration of my energies. My dreams of education were boundless, brilliant, indefinite; but alas! they were only dreams. There was nothing accurate and defined in my future course of life. I was ambitious and conceited, but my aspirations were vague and shapeless. I had crowded together the most gorgeous and even some of the most useful and durable materials for my woof, but I had no pattern, and consequently never began to weave.

"I had not made the discovery that an individual cannot learn, nor be, everything; that the world is a factory in which each individual must perform his portion of work:—happy enough if he can choose it according to his taste and talent, but must renounce the desire of observing or superintending the whole operation. . . .

"From studying and investigating the sources of history with my own eyes, I went a step further; I refused the guidance of modern writers; and proceeding from one point of presumption to another, I came to the magnanimous conviction that I could not know history as I ought to know it unless I wrote it for myself. . . .

"It would be tedious and useless to enlarge upon my various attempts and various failures. I forbear to comment upon mistakes which I was in time wise enough to retrieve. Pushing out as I did, without compass and without experience, on the boundless ocean of learning, what could I expect but an utter and a hopeless shipwreck?

"Thus I went on, becoming more learned, and therefore more ignorant, more confused in my brain, and more awkward in my habits, from day to day. I was ever at my studies, and could hardly be prevailed upon to allot a moment to exercise or recreation. I breakfasted with a pen behind my ear, and dined in company with a folio bigger than the table. I became solitary and morose, the necessary consequence of reckless study; talked impatiently of the value of my time, and the immensity of my labors; spoke contemptuously of the learning and acquirements of the whole world, and threw out mysterious hints of the magnitude and importance of my own project.

"In the midst of all this study and this infant authorship the perusal of such masses of poetry could not fail to produce their effect. Of a youth whose mind, like mine at that period, possessed some general capability, without perhaps a single prominent and marked talent, a proneness to imitation is sure to be the besetting sin. I consequently, for a large portion of my earlier life, never read a work which struck my fancy, without planning a better one upon its model; for my ambition, like my vanity, knew no bounds. It was a matter of course that I should be attacked by the poetic mania. I took the infection at the usual time, went through its various stages, and recovered as soon as could be expected. I discovered soon enough that emulation is not capability, and he is fortunate to whom is soonest revealed the relative extent of his ambition and his powers.

"My ambition was boundless; my dreams of glory were not confined to

authorship and literature alone; but every sphere in which the intellect of man exerts itself revolved in a blaze of light before me. And there I sat in my solitude and dreamed such wondrous dreams! Events were thickening around me which were soon to change the world, but they were unmarked by me. The country was changing to a mighty theatre, on whose stage those who were as great as I fancied myself to be were to enact a stupendous drama in which I had no part. I saw it not; I knew it not; and yet how infinitely beautiful were the imaginations of my solitude! Fancy shook her kaleidoscope each moment as chance directed, and lo! what new, fantastic, brilliant, but what unmeaning visions. My ambitious anticipations were as boundless as they were various and conflicting. There was not a path which leads to glory in which I was not destined to gather laurels. As a warrior I would conquer and overrun the world. As a statesman I would reorganize and govern it. As a historian I would consign it all to immortality; and in my leisure moments I would be a great poet and a man of the world.

"In short, I was already enrolled in that large category of what are called young men of genius,—men who are the pride of their sisters and the glory of their grandmothers,—men of whom unheard-of things are expected, till after long preparation comes a portentous failure, and then they are forgotten; subsiding into indifferent apprentices and attorneys' clerks.

"Alas for the golden imaginations of our youth! They are bright and beautiful, but they fade. They glitter brightly to deceive the wisest and most cautious, and we garner them up in the most secret caskets of our hearts; but are they not like the coins which the Dervise gave the merchant in the story? When we look for them the next morning, do we not find them withered leaves?"

The ideal picture just drawn is only a fuller portraiture of the youth whose outlines have been already sketched by the companions of his earlier years. If his hero says, "I breakfasted with a pen behind my ear and dined in company with a folio bigger than the table," one of his family says of the boy Motley that "if there were five minutes before dinner, when he came into the parlor he always took up some book near at hand and began to read until dinner was announced." The same unbounded thirst for knowledge, the same history of various attempts and various failures, the same ambition, not yet fixed in its aim, but showing itself in restless effort, belong to the hero of the story and its narrator.

Let no man despise the first efforts of immature genius. Nothing can be more crude as a novel, nothing more disappointing, than "Morton's Hope." But in no other of Motley's writings do we get such an inside view of his character with its varied impulses, its capricious appetites, its unregulated forces, its impatient grasp for all kinds of knowledge. With all his university experiences at home and abroad, it might be said with a large measure of truth that he was a self-educated man, as he had been a self-taught boy. His instincts were too powerful to let him work quietly in the common round of school and college training. Looking at him as his companions describe him, as he delineates himself 'mutato nomine,' the chances of success would have seemed to all but truly prophetic eyes very doubtful, if not decidedly against him. Too many brilliant young novel-readers and lovers of poetry, excused by their admirers for their shortcomings on the strength of their supposed birthright of "genius," have ended where they began; flattered into the vain belief that they were men at eighteen or twenty, and finding out at fifty that they were and always had been nothing more than boys. It was but a tangled skein of life that Motley's book showed us at twenty-five, and older men might well have doubted whether it would ever be wound off in any continuous thread. To repeat his own words, he had crowded together the materials for his work, but he had no pattern, and consequently never began to weave.

The more this first work of Motley's is examined, the more are its faults as a story and its interest as a self-revelation made manifest to the reader. The future historian, who spared no pains to be accurate, falls into the most extraordinary anachronisms in almost every chapter. Brutus in a bob-wig, Othello in a swallow-tail coat, could hardly be more incongruously equipped than some of his characters in the manner of thought, the phrases, the way of bearing themselves which belong to them in the tale, but never could have belonged to characters of our Revolutionary period. He goes so far in his carelessness as to mix up dates in such a way as almost to convince us that he never looked over his own manuscript or proofs. His hero is in Prague in June, 1777, reading a letter received from America in less than a fortnight from the date of its being written; in August of the same year he is in the American camp, where he is found in the company of a certain Colonel Waldron, an officer of some standing in the Revolutionary Army, with whom he is said to have been constantly associated for some three months, having arrived in America, as he says, on the 15th of May, that is to say, six weeks or more before he sailed, according to his previous account. Bohemia seems to have bewitched his chronology as it did Shakespeare's geography. To have made his story a consistent series of contradictions, Morton should have sailed from that Bohemian seashore which may be found in "A Winter's Tale," but not in the map of Europe.

And yet in the midst of all these marks of haste and negligence, here and there the philosophical student of history betrays himself, the ideal of noble achievement glows in an eloquent paragraph, or is embodied in a loving portrait like that of the professor and historian Harlem. The novel, taken in connection with the subsequent developments of the writer's mind, is a study of singular interest. It is a chaos before the creative epoch; the light has not been divided from the darkness; the firmament has not yet divided the waters from the waters. The forces at work in a human intelligence to bring harmony out of its discordant movements are as mysterious, as miraculous, we might truly say, as those which give shape and order to the confused materials out of which habitable worlds are evolved. It is too late now to be sensitive over this unsuccessful attempt as a story and unconscious success as a self-portraiture. The first sketches of Paul Veronese, the first patterns of the Gobelin tapestry, are not to be criticised for the sake of pointing out their inevitable and too manifest imperfections. They are to be carefully studied as the earliest efforts of the hand which painted the Marriage at Cana, of the art which taught the rude fabrics made to be trodden under foot to rival the glowing

canvas of the great painters. None of Motley's subsequent writings give such an insight into his character and mental history. It took many years to train the as yet undisciplined powers into orderly obedience, and to bring the unarranged materials into the organic connection which was needed in the construction of a work that should endure. There was a long interval between his early manhood and the middle term of life, during which the slow process of evolution was going on. There are plants which open their flowers with the first rays of the sun; there are others that wait until evening to spread their petals. It was already the high noon of life with him before his genius had truly shown itself; if he had not lived beyond this period, he would have left nothing to give him a lasting name.

V. 1841-1842. AEt. 27-28.

FIRST DIPLOMATIC APPOINTMENT, SECRETARY OF LEGATION TO THE RUSSIAN MISSION.—BRIEF RESIDENCE AT ST. PETERSBURG.—LETTER TO HIS MOTHER. —RETURN.

In the autumn of 1841, Mr. Motley received the appointment of Secretary of Legation to the Russian Mission, Mr. Todd being then the Minister. Arriving at St. Petersburg just at the beginning of winter, he found the climate acting very unfavorably upon his spirits if not upon his health, and was unwilling that his wife and his two young children should be exposed to its rigors. The expense of living, also, was out of proportion to his income, and his letters show that he had hardly established himself in St. Petersburg before he had made up his mind to leave a place where he found he had nothing to do and little to enjoy. He was homesick, too, as a young husband and father with an affectionate nature like his ought to have been under these circumstances. He did not regret having made the experiment, for he knew that he should not have been satisfied with himself if he had not made it. It was his first trial of a career in which he contemplated embarking, and in which afterwards he had an eventful experience. In his private letters to his family, many of which I have had the privilege of looking over, he mentions in detail all the reasons which influenced him in forming his own opinion about the expediency of a continued residence at St. Petersburg, and leaves the decision to her in whose judgment he always had the greatest confidence. No unpleasant circumstance attended his resignation of his secretaryship, and though it must have been a disappointment to find that the place did not suit him, as he and his family were then situated, it was only at the worst an experiment fairly tried and not proving satisfactory. He left St. Petersburg after a few months' residence, and returned to America. On reaching New York he was met by the sad tidings of the death of his first-born child, a boy of great promise, who had called out all the affections of his ardent nature. It was long before he recovered from the shock of this great affliction. The boy had shown a very quick and bright intelligence, and his father often betrayed a pride in his gifts and graces which he never for a moment made apparent in regard to his own.

Among the letters which he wrote from St. Petersburg are two miniature ones directed to this little boy. His affectionate disposition shows itself very sweetly in these touching mementos of a love of which his first great sorrow was so soon to be born. Not less charming are his letters to his mother, showing the tenderness with which he always regarded her, and full of all the details which he thought would entertain one to whom all that related to her children was always interesting. Of the letters to his wife it is needless to say more than that they always show the depth of the love he bore her and the absolute trust he placed in her, consulting her at all times as his nearest and wisest friend and adviser,—one in all respects fitted "To warn, to comfort, and command."

I extract a passage from one of his letters to his mother, as much for the sake of lending a character of reality to his brief residence at St. Petersburg as for that of the pleasant picture it gives us of an interior in that Northern capital.

"We entered through a small vestibule, with the usual arrangement of treble doors, padded with leather to exclude the cold and guarded by two 'proud young porters' in severe cocked hats and formidable batons, into a broad hall,—threw off our furred boots and cloaks, ascended a carpeted marble staircase, in every angle of which stood a statuesque footman in gaudy coat and unblemished unmentionables, and reached a broad landing upon the top thronged as usual with servants. Thence we passed through an antechamber into a long, high, brilliantly lighted, saffron-papered room, in which a dozen card-tables were arranged, and thence into the receiving room. This was a large room, with a splendidly inlaid and polished floor, the walls covered with crimson satin, the cornices heavily incrusting with gold, and the ceiling beautifully painted in arabesque. The massive fauteuils and sofas, as also the drapery, were of crimson satin with a profusion of gilding. The ubiquitous portrait of the Emperor was the only picture, and was the same you see everywhere. This crimson room had two doors upon the side facing the three windows: The innermost opened into a large supper-room, in which a table was spread covered with the usual refreshments of European parties,—tea, ices, lemonade, and et ceteras,—and the other opened into a ball-room which is a sort of miniature of the 'salle blanche' of the Winter Palace, being white and gold, and very brilliantly lighted with 'ormolu' chandeliers filled with myriads of candles. This room (at least forty feet long by perhaps twenty-five) opened into a carpeted conservatory of about the same size, filled with orange-trees and japonica plants covered with fruit and flowers, arranged very gracefully into arbors, with luxurious seats under the pendent boughs, and with here and there a pretty marble statue gleaming through the green and glossy leaves. One might almost have imagined one's self in the 'land of the cypress and myrtle' instead of our actual whereabouts upon the polar banks of the Neva. Wandering through these mimic groves, or reposing from the fatigues

of the dance, was many a fair and graceful form, while the brilliantly lighted ballroom, filled with hundreds of exquisitely dressed women (for the Russian ladies, if not very pretty, are graceful, and make admirable toilettes), formed a dazzling contrast with the tempered light of the 'Winter Garden.' The conservatory opened into a library, and from the library you reach the antechamber, thus completing the 'giro' of one of the prettiest houses in St. Petersburg. I waltzed one waltz and quadrilled one quadrille, but it was hard work; and as the sole occupation of these parties is dancing and card-playing—conversation apparently not being customary—they are to me not very attractive."

He could not be happy alone, and there were good reasons against his being joined by his wife and children.

"With my reserved habits," he says, "it would take a great deal longer to become intimate here than to thaw the Baltic. I have only to 'knock that it shall be opened to me,' but that is just what I hate to do. . . . 'Man delights not me, no, nor woman neither.'"

Disappointed in his expectations, but happy in the thought of meeting his wife and children, he came back to his household to find it clad in mourning for the loss of its first-born.

VI. 1844. AEt. 30.

LETTER TO PARK BENJAMIN.—POLITICAL VIEWS AND FEELINGS.

A letter to Mr. Park Benjamin, dated December 17, 1844, which has been kindly lent me by Mrs. Mary Lanman Douw of Poughkeepsie, gives a very complete and spirited account of himself at this period. He begins with a quiet, but tender reference to the death of his younger brother, Preble, one of the most beautiful youths seen or remembered among us, "a great favorite," as he says, "in the family and in deed with every one who knew him." He mentions the fact that his friends and near connections, the Stackpoles, are in Washington, which place he considers as exceptionally odious at the time when he is writing. The election of Mr. Polk as the opponent of Henry Clay gives him a discouraged feeling about our institutions. The question, he thinks, is now settled that a statesman can never again be called to administer the government of the country. He is almost if not quite in despair "because it is now proved that a man, take him for all in all, better qualified by intellectual power, energy and purity of character, knowledge of men, a great combination of personal qualities, a frank, high-spirited, manly bearing, keen sense of honor, the power of attracting and winning men, united with a vast experience in affairs, such as no man (but John Quincy Adams) now living has had and no man in this country can ever have again,—I say it is proved that a man better qualified by an extraordinary combination of advantages to administer the government than any man now living, or any man we can ever produce again, can be beaten by anybody. . . . It has taken forty years of public life to prepare such a man for the Presidency, and the result is that he can be beaten by anybody,—Mr. Polk is anybody,—he is Mr. Quelconque."

I do not venture to quote the most burning sentences of this impassioned letter. It shows that Motley had not only become interested most profoundly in the general movements of parties, but that he had followed the course of political events which resulted in the election of Mr. Polk with careful study, and that he was already looking forward to the revolt of the slave States which occurred sixteen years later. The letter is full of fiery eloquence, now and then extravagant and even violent in expression, but throbbing with a generous heat which shows the excitable spirit of a man who wishes to be proud of his country and does not wish to keep his temper when its acts make him ashamed of it. He is disgusted and indignant to the last degree at seeing "Mr. Quelconque" chosen over the illustrious statesman who was his favorite candidate. But all his indignation cannot repress a sense of humor which was one of his marked characteristics. After fatiguing his vocabulary with hard usage, after his unsparing denunciation of "the very dirty politics" which he finds mixed up with our popular institutions, he says,—it must be remembered that this was an offhand letter to one nearly connected with him,—

"All these things must in short, to use the energetic language of the Balm of Columbia advertisement, 'bring every generous thinking youth to that heavy sinking gloom which not even the loss of property can produce, but only the loss of hair, which brings on premature decay, causing many to shrink from being uncovered, and even to shun society, to avoid the jests and sneers of their acquaintances. The remainder of their lives is consequently spent in retirement.'"

He continues:—

"Before dropping the subject, and to show the perfect purity of my motives, I will add that I am not at all anxious about the legislation of the new government. I desired the election of Clay as a moral triumph, and because the administration of the country, at this moment of ten thousand times more importance than its legislation, would have been placed in pure, strong, and determined hands."

Then comes a dash of that satirical and somewhat cynical way of feeling which he had not as yet outgrown. He had been speaking about the general want of attachment to the Union and the absence of the sentiment of loyalty as bearing on the probable dissolution of the Union.

"I don't mean to express any opinions on these matters,—I haven't got any. It seems to me that the best way is to look at the hodge-podge, be good-natured if possible, and laugh,

*'As from the height of contemplation
We view the feeble joints men totter on.'*

"I began a tremendous political career during the election, having made two stump speeches of an hour and a half each,—after you went away,—one in Dedham town-hall and one in Jamaica Plain, with such eminent success that many invitations came to me from the surrounding villages, and if I had continued in active political life I might have risen to be vote-distributor, or fence-viewer, or selectman, or hog-reeve, or something of the kind."

The letter from which the above passages are quoted gives the same portrait of the writer, only seen in profile, as it were, which we have already seen drawn in full face in the story of "Morton's Hope." It is charged with that 'saeva indignatio' which at times verges on misanthropic contempt for its objects, not unnatural to a high-spirited young man who sees his lofty ideals confronted with the ignoble facts which strew the highways of political life. But we can recognize real conviction and the deepest feeling beneath his scornful rhetoric and his bitter laugh. He was no more a mere dilettante than Swift himself, but now and then in the midst of his most serious thought some absurd or grotesque image will obtrude itself, and one is reminded of the lines on the monument of Gay rather than of the fierce epitaph of the Dean of Saint Patrick's.

VII. 1845-1847. AEt. 31-33.

FIRST HISTORICAL AND CRITICAL ESSAYS.—PETER THE GREAT.—NOVELS OF BALZAC.—POLITY OF THE PURITANS.

Mr. Motley's first serious effort in historical composition was an article of fifty pages in "The North American Review" for October, 1845. This was nominally a notice of two works, one on Russia, the other "A Memoir of the Life of Peter the Great." It is, however, a narrative rather than a criticism, a rapid, continuous, brilliant, almost dramatic narrative. If there had been any question as to whether the young novelist who had missed his first mark had in him the elements which might give him success as an author, this essay would have settled the question. It shows throughout that the writer has made a thorough study of his subject, but it is written with an easy and abundant, yet scholarly freedom, not as if he were surrounded by his authorities and picking out his material piece by piece, but rather as if it were the overflow of long-pursued and well-remembered studies recalled without effort and poured forth almost as a recreation.

As he betrayed or revealed his personality in his first novel, so in this first effort in another department of literature he showed in epitome his qualities as a historian and a biographer. The hero of his narrative makes his entrance at once in his character as the shipwright of Saardam, on the occasion of a visit of the great Duke of Marlborough. The portrait instantly arrests attention. His ideal personages had been drawn in such a sketchy way, they presented so many imperfectly harmonized features, that they never became real, with the exception, of course, of the story-teller himself. But the vigor with which the presentment of the imperial ship-carpenter, the sturdy, savage, eager, fiery Peter, was given in the few opening sentences, showed the movement of the hand, the glow of the color, that were in due time to display on a broader canvas the full-length portraits of William the Silent and of John of Barneveld. The style of the whole article is rich, fluent, picturesque, with light touches of humor here and there, and perhaps a trace or two of youthful jauntiness, not quite as yet outgrown. His illustrative poetical quotations are mostly from Shakespeare,—from Milton and Byron also in a passage or two,—and now and then one is reminded that he is not unfamiliar with Carlyle's "Sartor Resartus" and the "French Revolution" of the same unmistakable writer, more perhaps by the way in which phrases borrowed from other authorities are set in the text than by any more important evidence of unconscious imitation.

The readers who had shaken their heads over the unsuccessful story of "Morton's Hope" were startled by the appearance of this manly and scholarly essay. This young man, it seemed, had been studying,—studying with careful accuracy, with broad purpose. He could paint a character with the ruddy life-blood coloring it as warmly as it glows in the cheeks of one of Van der Helst's burgomasters. He could sweep the horizon in a wide general outlook, and manage his perspective and his lights and shadows so as to place and accent his special subject with its due relief and just relations. It was a sketch, or rather a study for a larger picture, but it betrayed the hand of a master. The feeling of many was that expressed in the words of Mr. Longfellow in his review of the "Twice-Told Tales" of the unknown young writer, Nathaniel Hawthorne: "When a new star rises in the heavens, people gaze after it for a season with the naked eye, and with such telescopes as they may find. . . . This star is but newly risen; and ere long the observation of numerous star-gazers, perched up on arm-chairs and editor's tables, will inform the world of its magnitude and its place in the heaven of"—not poetry in this instance, but that serene and unclouded region of the firmament where shine unchanging the names of Herodotus and Thucydides. Those who had always believed in their brilliant schoolmate and friend at last felt themselves justified in their faith. The artist that sent this unframed picture to be hung in a corner of the literary gallery was equal to larger tasks. There was but one voice in the circle that surrounded the

young essayist. He must redeem his pledge, he can and will redeem it, if he will only follow the bent of his genius and grapple with the heroic labor of writing a great history.

And this was the achievement he was already meditating.

In the mean time he was studying history for its facts and principles, and fiction for its scenery and portraits. In "The North American Review" for July, 1847, is a long and characteristic article on Balzac, of whom he was an admirer, but with no blind worship. The readers of this great story-teller, who was so long in obtaining recognition, who "made twenty assaults upon fame and had forty books killed under him" before he achieved success, will find his genius fully appreciated and fairly weighed in this discriminating essay. A few brief extracts will show its quality.

"Balzac is an artist, and only an artist. In his tranquil, unimpassioned, remorseless diagnosis of morbid phenomena, in his cool method of treating the morbid anatomy of the heart, in his curiously accurate dissection of the passions, in the patient and painful attention with which, stethoscope in hand, finger on pulse, eye everywhere, you see him watching every symptom, alive to every sound and every breath, and in the scientific accuracy with which he portrays the phenomena which have been the subject of his investigation,—in all this calm and conscientious study of nature he often reminds us of Goethe. Balzac, however, is only an artist . . . He is neither moral nor immoral, but a calm and profound observer of human society and human passions, and a minute, patient, and powerful delineator of scenes and characters in the world before his eyes. His readers must moralize for themselves. . . . It is, perhaps, his defective style more than anything else which will prevent his becoming a classic, for style above all other qualities seems to embalm for posterity. As for his philosophy, his principles, moral, political, or social, we repeat that he seems to have none whatever. He looks for the picturesque and the striking. He studies sentiments and sensations from an artistic point of view. He is a physiognomist, a physiologist, a bit of an anatomist, a bit of a mesmerist, a bit of a geologist, a Flemish painter, an upholsterer, a micrological, misanthropical, sceptical philosopher; but he is no moralist, and certainly no reformer."

Another article contributed by Mr. Motley to "The North American Review" is to be found in the number for October, 1849. It is nominally a review of Talvi's (Mrs. Robinson's) "Geschichte der Colonisation von New England," but in reality an essay on the Polity of the Puritans,—an historical disquisition on the principles of self-government evolved in New England, broad in its views, eloquent in its language. Its spirit is thoroughly American, and its estimate of the Puritan character is not narrowed by the nearsighted liberalism which sees the past in the pitiless light of the present,—which looks around at high noon and finds fault with early dawn for its long and dark shadows. Here is a sentence or two from the article:—

"With all the faults of the system devised by the Puritans, it was a practical system. With all their foibles, with all their teasing, tyrannical, and arbitrary notions, the Pilgrims were lovers of liberty as well as sticklers for authority. . . . Nowhere can a better description of liberty be found than that given by Winthrop, in his defence of himself before the General Court on a charge of arbitrary conduct. 'Nor would I have you mistake your own liberty,' he says. 'There is a freedom of doing what we list, without regard to law or justice; this liberty is indeed inconsistent with authority; but civil, moral, and federal liberty consists in every man's enjoying his property and having the benefit of the laws of his country; which is very consistent with a due subjection to the civil magistrate.' . . ."

"We enjoy an inestimable advantage in America. One can be a republican, a democrat, without being a radical. A radical, one who would uproot, is a man whose trade is dangerous to society. Here is but little to uproot. The trade cannot flourish. All classes are conservative by necessity, for none can wish to change the structure of our polity. . . ."

"The country without a past cannot be intoxicated by visions of the past of other lands. Upon this absence of the past it seems to us that much of the security of our institutions depends. Nothing interferes with the development of what is now felt to be the true principle of government, the will of the people legitimately expressed. To establish that great truth, nothing was to be torn down, nothing to be uprooted. It grew up in New England out of the seed unconsciously planted by the first Pilgrims, was not crushed out by the weight of a thousand years of error spread over the whole continent, and the Revolution was proclaimed and recognized."

VIII. 1847-1849. AEt. 33-35.

JOSEPH LEWIS STACKPOLE, THE FRIEND OF MOTLEY. HIS SUDDEN DEATH.—MOTLEY IN THE MASSACHUSETTS HOUSE OF REPRESENTATIVES.—SECOND NOVEL, "MERRY-MOUNT, A ROMANCE OF THE MASSACHUSETTS COLONY."

The intimate friendships of early manhood are not very often kept up among our people. The eager pursuit of fortune, position, office, separates young friends, and the indoor home life imprisons them in the domestic circle so generally that it is quite exceptional to find two grown men who are like brothers,—or rather unlike most brothers, in being constantly found together. An exceptional instance of such a more than fraternal relation was seen in the friendship of Mr. Motley and Mr. Joseph Lewis Stackpole. Mr. William Amory, who knew them both well, has kindly furnished me with some recollections, which I cannot improve by changing his own language.

"Their intimacy began in Europe, and they returned to this country in 1835. In 1837 they married sisters, and this cemented their intimacy, which continued to Stackpole's death in 1847. The contrast in the temperament of the two friends—the one sensitive and irritable, and the other always cool and good-natured—only increased their mutual attachment to each other, and Motley's dependence upon Stackpole. Never were two friends more constantly together or more affectionately fond of each other. As Stackpole was about eight years older than Motley, and much less impulsive and more discreet, his death was to his friend irreparable, and at the time an overwhelming blow."

Mr. Stackpole was a man of great intelligence, of remarkable personal attractions, and amiable character. His death was a loss to Motley even greater than he knew, for he needed just such a friend, older, calmer, more experienced in the ways of the world, and above all capable of thoroughly understanding him and exercising a wholesome influence over his excitable nature without the seeming of a Mentor preaching to a Telemachus. Mr. Stackpole was killed by a railroad accident on the 20th of July, 1847.

In the same letter Mr. Amory refers to a very different experience in Mr. Motley's life,—his one year of service as a member of the Massachusetts House of Representatives, 1849.

"In respect to the one term during which he was a member of the Massachusetts House of Representatives, I can recall only one thing, to which he often and laughingly alluded. Motley, as the Chairman of the Committee on Education, made, as he thought, a most masterly report. It was very elaborate, and, as he supposed, unanswerable; but Boutwell, then a young man from some country town [Groton, Mass.], rose, and as Motley always said, demolished the report, so that he was unable to defend it against the attack. You can imagine his disgust, after the pains he had taken to render it unassailable, to find himself, as he expressed it, 'on his own dunghill,' ignominiously beaten. While the result exalted his opinion of the speech-making faculty of a Representative of a common school education, it at the same time cured him of any ambition for political promotion in Massachusetts."

To my letter of inquiry about this matter, Hon. George S. Boutwell courteously returned the following answer:—

BOSTON, October 14, 1878.

MY DEAR SIR,—As my memory serves me, Mr. Motley was a member of the Massachusetts House of Representatives in the year 1847 1849. It may be well to consult the manual for that year. I recollect the controversy over the report from the Committee on Education.

His failure was not due to his want of faculty or to the vigor of his opponents.

In truth he espoused the weak side of the question and the unpopular one also. His proposition was to endow the colleges at the expense of the fund for the support of the common schools. Failure was inevitable. Neither Webster nor Choate could have carried the bill.

*Very truly,
GEO. S. BOUTWELL.*

No one could be more ready and willing to recognize his own failures than Motley. He was as honest and manly, perhaps I may say as sympathetic with the feeling of those about him, on this occasion, as was Charles Lamb, who, sitting with his sister in the front of the pit, on the night when his farce was damned at its first representation, gave way to the common feeling, and hissed and hooted lustily with the others around him. It was what might be expected from his honest and truthful nature, sometimes too severe in judging itself.

The commendation bestowed upon Motley's historical essays in "The North American Review" must have gone far towards compensating him for the ill success of his earlier venture. It pointed clearly towards the field in which he was to gather his laurels. And it was in the year following the publication of the first essay, or about that time (1846), that he began collecting materials for a history of Holland. Whether to tell the story of men that have lived and of events that have happened, or to create the characters and invent the incidents of an imaginary tale be the higher task, we need not stop to discuss. But the young author was just now like the great actor in Sir Joshua's picture, between the allurements of Thalia and Melpomene, still doubtful whether he was to be a romancer or a historian.

The tale of which the title is given at the beginning of this section had been written several years before the date of its publication. It is a great advance in certain respects over the first novel, but wants the peculiar interest which belonged to that as a partially autobiographical memoir. The story is no longer disjointed and impossible. It is carefully studied in regard to its main facts. It has less to remind us of "Vivian Grey" and "Pelham," and more that recalls "Woodstock" and "Kenilworth." The personages were many of them historical, though idealized; the occurrences were many of them such as the record authenticated; the

localities were drawn largely from nature. The story betrays marks of haste or carelessness in some portions, though others are elaborately studied. His preface shows that the reception of his first book had made him timid and sensitive about the fate of the second, and explains and excuses what might be found fault with, to disarm the criticism he had some reason to fear.

That old watch-dog of our American literature, "The North American Review," always ready with lambent phrases in stately "Articles" for native talent of a certain pretension, and wagging its appendix of "Critical Notices" kindly at the advent of humbler merit, treated "Merry-Mount" with the distinction implied in a review of nearly twenty pages. This was a great contrast to the brief and slighting notice of "Morton's Hope." The reviewer thinks the author's descriptive power wholly exceeds his conception of character and invention of circumstances.

"He dwells, perhaps, too long and fondly upon his imagination of the landscape as it was before the stillness of the forest had been broken by the axe of the settler; but the picture is so finely drawn, with so much beauty of language and purity of sentiment, that we cannot blame him for lingering upon the scene. . . . The story is not managed with much skill, but it has variety enough of incident and character, and is told with so much liveliness that few will be inclined to lay it down before reaching the conclusion. . . . The writer certainly needs practice in elaborating the details of a consistent and interesting novel; but in many respects he is well qualified for the task, and we shall be glad to meet him again on the half-historical ground he has chosen. His present work, certainly, is not a fair specimen of what he is able to accomplish, and its failure, or partial success, ought only to inspire him for further effort."

The "half-historical ground" he had chosen had already led him to the entrance into the broader domain of history. The "further effort" for which he was to be inspired had already begun. He had been for some time, as was before mentioned, collecting materials for the work which was to cast all his former attempts into the kindly shadow of oblivion, save when from time to time the light of his brilliant after success is thrown upon them to illustrate the path by which it was at length attained.

IX. 1850. AEt. 36.

PLAN OF A HISTORY.—LETTERS.

The reputation of Mr. Prescott was now coextensive with the realm of scholarship. The histories of the reign of Ferdinand and Isabella and of the conquest of Mexico had met with a reception which might well tempt the ambition of a young writer to emulate it, but which was not likely to be awarded to any second candidate who should enter the field in rivalry with the great and universally popular historian. But this was the field on which Mr. Motley was to venture.

After he had chosen the subject of the history he contemplated, he found that Mr. Prescott was occupied with a kindred one, so that there might be too near a coincidence between them. I must borrow from Mr. Ticknor's beautiful life of Prescott the words which introduce a letter of Motley's to Mr. William Amory, who has kindly allowed me also to make use of it.

"The moment, therefore, that he [Mr. Motley] was aware of this condition of things, and the consequent possibility that there might be an untoward interference in their plans, he took the same frank and honorable course with Mr. Prescott that Mr. Prescott had taken in relation to Mr. Irving, when he found that they had both been contemplating a 'History of the Conquest of Mexico.' The result was the same. Mr. Prescott, instead of treating the matter as an interference, earnestly encouraged Mr. Motley to go on, and placed at his disposition such of the books in his library as could be most useful to him. How amply and promptly he did it, Mr. Motley's own account will best show. It is in a letter dated at Rome, 26th February, 1859, the day he heard of Mr. Prescott's death, and was addressed to his intimate friend, Mr. William Amory, of Boston, Mr. Prescott's much-loved brother-in-law."

"It seems to me but as yesterday," Mr. Motley writes, "though it must be now twelve years ago, that I was talking with our ever-lamented friend Stackpole about my intention of writing a history upon a subject to which I have since that time been devoting myself. I had then made already some general studies in reference to it, without being in the least aware that Prescott had the intention of writing the 'History of Philip the Second.' Stackpole had heard the fact, and that large preparations had already been made for the work, although 'Peru' had not yet been published. I felt naturally much disappointed. I was conscious of the immense disadvantage to myself of making my appearance, probably at the same time, before the public, with a work not at all similar in plan to 'Philip the Second,' but which must of necessity traverse a portion of the same ground."

"My first thought was inevitably, as it were, only of myself. It seemed to me that I had nothing to do but to abandon at once a cherished dream, and probably to renounce authorship. For I had not

first made up my mind to write a history, and then cast about to take up a subject. My subject had taken me up, drawn me on, and absorbed me into itself. It was necessary for me, it seemed, to write the book I had been thinking much of, even if it were destined to fall dead from the press, and I had no inclination or interest to write any other. When I had made up my mind accordingly, it then occurred to me that Prescott might not be pleased that I should come forward upon his ground. It is true that no announcement of his intentions had been made, and that he had not, I believe, even commenced his preliminary studies for Philip. At the same time I thought it would be disloyal on my part not to go to him at once, confer with him on the subject, and if I should find a shadow of dissatisfaction on his mind at my proposition, to abandon my plan altogether.

"I had only the slightest acquaintance with him at that time. I was comparatively a young man, and certainly not entitled on any ground to more than the common courtesy which Prescott never could refuse to any one. But he received me with such a frank and ready and liberal sympathy, and such an open-hearted, guileless expansiveness, that I felt a personal affection for him from that hour. I remember the interview as if it had taken place yesterday. It was in his father's house, in his own library, looking on the garden-house and garden,—honored father and illustrious son,—alas! all numbered with the things that were! He assured me that he had not the slightest objection whatever to my plan, that he wished me every success, and that, if there were any books in his library bearing on my subject that I liked to use, they were entirely at my service. After I had expressed my gratitude for his kindness and cordiality, by which I had been in a very few moments set completely at ease,—so far as my fears of his disapprobation went,—I also very naturally stated my opinion that the danger was entirely mine, and that it was rather wilful of me thus to risk such a collision at my first venture, the probable consequence of which was utter shipwreck. I recollect how kindly and warmly he combated this opinion, assuring me that no two books, as he said, ever injured each other, and encouraging me in the warmest and most earnest manner to proceed on the course I had marked out for myself.

"Had the result of that interview been different,—had he distinctly stated, or even vaguely hinted, that it would be as well if I should select some other topic, or had he only sprinkled me with the cold water of conventional and commonplace encouragement,—I should have gone from him with a chill upon my mind, and, no doubt, have laid down the pen at once; for, as I have already said, it was not that I cared about writing a history, but that I felt an inevitable impulse to write one particular history.

"You know how kindly he always spoke of and to me; and the generous manner in which, without the slightest hint from me, and entirely unexpected by me, he attracted the eyes of his hosts of readers to my forthcoming work, by so handsomely alluding to it in the Preface to his own, must be almost as fresh in your memory as it is in mine.

"And although it seems easy enough for a man of world-wide reputation thus to extend the right hand of fellowship to an unknown and struggling aspirant, yet I fear that the history of literature will show that such instances of disinterested kindness are as rare as they are noble."

It was not from any feeling that Mr. Motley was a young writer from whose rivalry he had nothing to apprehend. Mr. Amory says that Prescott expressed himself very decidedly to the effect that an author who had written such descriptive passages as were to be found in Mr. Motley's published writings was not to be undervalued as a competitor by any one. The reader who will turn to the description of Charles River in the eighth chapter of the second volume of "Merry-Mount," or of the autumnal woods in the sixteenth chapter of the same volume, will see good reason for Mr. Prescott's appreciation of the force of the rival whose advent he so heartily and generously welcomed.

X. 1851-1856. AEt. 37-42.

HISTORICAL STUDIES IN EUROPE.—LETTER FROM BRUSSELS.

After working for several years on his projected "History of the Dutch Republic," he found that, in order to do justice to his subject, he must have recourse to the authorities to be found only in the libraries and state archives of Europe. In the year 1851 he left America with his family, to begin his task over again, throwing aside all that he had already done, and following up his new course of investigations at Berlin, Dresden, the Hague, and Brussels during several succeeding years. I do not know that I can give a better idea of his mode of life during this busy period, his occupations, his state of mind, his objects of interest outside of his special work, than by making the following extracts from a long letter to myself, dated Brussels, 20th November, 1853.

After some personal matters he continued:—

"I don't really know what to say to you. I am in a town which, for aught I know, may be very gay. I don't know a living soul in it. We have not a single acquaintance in the place, and we glory in the fact. There is something rather sublime in thus floating on a single spar in the wide sea of a populous, busy, fuming, fussy world like this. At any rate it is consonant to both our tastes. You may suppose, however, that I find it rather difficult to amuse my friends out of the incidents of so isolated an existence. Our daily career is very regular and monotonous. Our life is as stagnant as a Dutch canal. Not that I complain of it,—on the contrary, the canal may be richly freighted with merchandise and be a short cut to the ocean of abundant and perpetual knowledge; but, at the same time, few points rise above the level of so regular a life, to be worthy of your notice. You must, therefore, allow me to meander along the meadows of commonplace. Don't expect anything of the impetuous and boiling style. We go it weak here. I don't know whether you were ever in Brussels. It is a striking, picturesque town, built up a steep promontory, the old part at the bottom, very dingy and mouldy, the new part at the top, very showy and elegant. Nothing can be more exquisite in its way than the grande place in the very heart of the city, surrounded with those toppling, zigzag, ten-storied buildings bedizened all over with ornaments and emblems so peculiar to the Netherlands, with the brocaded Hotel de Ville on one side, with its impossible spire rising some three hundred and seventy feet into the air and embroidered to the top with the delicacy of needle-work, sugarwork, spider-work, or what you will. I haunt this place because it is my scene, my theatre. Here were enacted so many deep tragedies, so many stately dramas, and even so many farces, which have been familiar to me so long that I have got to imagine myself invested with a kind of property in the place, and look at it as if it were merely the theatre with the coulisses, machinery, drapery, etc., for representing scenes which have long since vanished, and which no more enter the minds of the men and women who are actually moving across its pavements than if they had occurred in the moon. When I say that I knew no soul in Brussels I am perhaps wrong. With the present generation I am not familiar. 'En revanche,' the dead men of the place are my intimate friends. I am at home in any cemetery. With the fellows of the sixteenth century I am on the most familiar terms. Any ghost that ever flits by night across the moonlight square is at once hailed by me as a man and a brother. I call him by his Christian name at once. When you come out of this place, however, which, as I said, is in the heart of the town,—the antique gem in the modern setting,—you may go either up or down. If you go down, you will find yourself in the very nastiest complications of lanes and culs-de-sac possible, a dark entanglement of gin-shops, beer-houses, and hovels, through which charming valley dribbles the Senne (whence, I suppose, is derived Senna), the most nauseous little river in the world, which receives all the outpourings of all the drains and houses, and is then converted into beer for the inhabitants, all the many breweries being directly upon its edge. If you go up the hill instead of down, you come to an arrangement of squares, palaces, and gardens as trim and fashionable as you will find in Europe. Thus you see that our Cybele sits with her head crowned with very stately towers and her feet in a tub of very dirty water.

"My habits here for the present year are very regular. I came here, having, as I thought, finished my work, or rather the first Part (something like three or four volumes, 8vo), but I find so much original matter here, and so many emendations to make, that I am ready to despair. However, there is nothing for it but to penelopize, pull to pieces, and stitch away again. Whatever may be the result of my labor, nobody can say that I have not worked like a brute beast,—but I don't care for the result. The labor is in itself its own reward and all I want. I go day after day to the archives here (as I went all summer at the Hague), studying the old letters and documents of the fifteenth century. Here I remain among my fellow-worms, feeding on these musty mulberry-leaves, out of which we are afterwards to spin our silk. How can you expect anything interesting from such a human cocoon? It is, however, not without its amusement in a mouldy sort of way, this reading of dead letters. It is something to read the real, bona fide signs-manual of such fellows as William of Orange, Count Egmont, Alexander Farnese, Philip II., Cardinal Granvelle, and the rest of them. It gives a 'realizing sense,' as the Americans have it. . . . There are not many public resources of amusement in this place,—if we wanted them,—which we don't. I miss the Dresden Gallery very much, and it makes me sad to think that I shall never look at the face of the Sistine Madonna again,—that picture beyond all pictures in the world, in which the artist certainly did get to heaven and painted a face which was never seen on earth—so pathetic, so gentle, so passionless, so prophetic. . . . There are a few good Rubenses here,—but the great wealth of that master is in Antwerp. The great picture of the Descent from the Cross is free again, after having been ten years in the repairing room. It has come out in very good condition. What a picture? It seems to me as if I had really stood at the cross and seen Mary weeping on John's shoulder, and Magdalen receiving the dead body of the Saviour in her arms. Never was the grand tragedy represented in so profound and dramatic a manner. For it is not only in his color in which this man so easily surpasses all the world, but in his life-like, flesh-and-blood action,—the tragic power of his composition. And is it not appalling to think of the 'large constitution of this man,' when you reflect on the acres of canvas which he has covered? How inspiring to see with what muscular, masculine vigor this splendid Fleming rushed in and

plucked up drowning Art by the locks when it was sinking in the trashy sea of such creatures as the Luca Giordanos and Pietro Cortonas and the like. Well might Guido exclaim, 'The fellow mixes blood with his colors! . . . How providentially did the man come in and invoke living, breathing, moving men and women out of his canvas! Sometimes he is ranting and exaggerated, as are all men of great genius who wrestle with Nature so boldly. No doubt his heroines are more expansively endowed than would be thought genteel in our country, where cryptogams are so much in fashion, nevertheless there is always something very tremendous about him, and very often much that is sublime, pathetic, and moving. I defy any one of the average amount of imagination and sentiment to stand long before the Descent from the Cross without being moved more nearly to tears than he would care to acknowledge. As for color, his effects are as sure as those of the sun rising in a tropical landscape. There is something quite genial in the cheerful sense of his own omnipotence which always inspired him. There are a few fine pictures of his here, and I go in sometimes of a raw, foggy morning merely to warm myself in the blaze of their beauty.'

I have been more willing to give room to this description of Rubens's pictures and the effect they produced upon Motley, because there is a certain affinity between those sumptuous and glowing works of art and the prose pictures of the historian who so admired them. He was himself a colorist in language, and called up the image of a great personage or a splendid pageant of the past with the same affluence, the same rich vitality, that floods and warms the vast areas of canvas over which the full-fed genius of Rubens disported itself in the luxury of imaginative creation.

XI. 1856-1857. AEt. 42-43.

PUBLICATION OF HIS FIRST HISTORICAL WORK, "RISE OF THE DUTCH REPUBLIC."—ITS RECEPTION.—CRITICAL NOTICES.

The labor of ten years was at last finished. Carrying his formidable manuscript with him,—and how formidable the manuscript which melts down into three solid octavo volumes is, only writers and publishers know,—he knocked at the gate of that terrible fortress from which Lintot and Curll and Tonson looked down on the authors of an older generation. So large a work as the "History of the Rise of the Dutch Republic," offered for the press by an author as yet unknown to the British public, could hardly expect a warm welcome from the great dealers in literature as merchandise. Mr. Murray civilly declined the manuscript which was offered to him, and it was published at its author's expense by Mr. John Chapman. The time came when the positions of the first-named celebrated publisher and the unknown writer were reversed. Mr. Murray wrote to Mr. Motley asking to be allowed to publish his second great work, the "History of the United Netherlands," expressing at the same time his regret at what he candidly called his mistake in the first instance, and thus they were at length brought into business connection as well as the most agreeable and friendly relations. An American edition was published by the Harpers at the same time as the London one.

If the new work of the unknown author found it difficult to obtain a publisher, it was no sooner given to the public than it found an approving, an admiring, an enthusiastic world of readers, and a noble welcome at the colder hands of the critics.

"The Westminster Review" for April, 1856, had for its leading article a paper by Mr. Froude, in which the critic awarded the highest praise to the work of the new historian. As one of the earliest as well as one of the most important recognitions of the work, I quote some of its judgments.

"A history as complete as industry and genius can make it now lies before us of the first twenty years of the Revolt of the United Provinces; of the period in which those provinces finally conquered their independence and established the Republic of Holland. It has been the result of many years of silent, thoughtful, unobtrusive labor, and unless we are strangely mistaken, unless we are ourselves altogether unfit for this office of criticising which we have here undertaken, the book is one which will take its place among the finest histories in this or in any language. . . . All the essentials of a great writer Mr. Motley eminently possesses. His mind is broad, his industry unwearied. In power of dramatic description no modern historian, except perhaps Mr. Carlyle, surpasses him, and in analysis of character he is elaborate and distinct. His principles are those of honest love for all which is good and admirable in human character wherever he finds it, while he unaffectedly hates oppression, and despises selfishness with all his heart."

After giving a slight analytical sketch of the series of events related in the history, Mr. Froude objects to only one of the historian's estimates, that, namely, of the course of Queen Elizabeth.

"It is ungracious, however," he says, "even to find so slight a fault with these admirable volumes. Mr. Motley has written without haste, with the leisurely composure of a master. . . . We now take our leave of Mr. Motley, desiring him only to accept our hearty thanks for these volumes, which we trust will soon take their place in every English library. Our quotations will have sufficed to show the ability of the writer. Of the scope and general character of his work we have given but a languid conception. The true merit of

a great book must be learned from the book itself. Our part has been rather to select varied specimens of style and power. Of Mr. Motley's antecedents we know nothing. If he has previously appeared before the public, his reputation has not crossed the Atlantic. It will not be so now. We believe that we may promise him as warm a welcome among ourselves as he will receive even in America; that his place will be at once conceded to him among the first historians in our common language."

The faithful and unwearied Mr. Allibone has swept the whole field of contemporary criticism, and shown how wide and universal was the welcome accorded to the hitherto unknown author. An article headed "Prescott and Motley," attributed to M. Guizot, which must have been translated, I suppose, from his own language, judging by its freedom from French idioms, is to be found in "The Edinburgh Review" for January, 1857. The praise, not unmingled with criticisms, which that great historian bestowed upon Motley is less significant than the fact that he superintended a translation of the "Rise of the Dutch Republic," and himself wrote the Introduction to it.

A general chorus of approbation followed or accompanied these leading voices. The reception of the work in Great Britain was a triumph. On the Continent, in addition to the tribute paid to it by M. Guizot, it was translated into Dutch, into German, and into Russian. At home his reception was not less hearty. "The North American Review," which had set its foot on the semi-autobiographical medley which he called "Morton's Hope," which had granted a decent space and a tepid recognition to his "semi-historical" romance, in which he had already given the reading public a taste of his quality as a narrator of real events and a delineator of real personages,—this old and awe-inspiring New England and more than New England representative of the Fates, found room for a long and most laudatory article, in which the son of one of our most distinguished historians did the honors of the venerable literary periodical to the new-comer, for whom the folding-doors of all the critical headquarters were flying open as if of themselves. Mr. Allibone has recorded the opinions of some of our best scholars as expressed to him.

Dr. Lieber wrote a letter to Mr. Allibone in the strongest terms of praise. I quote one passage which in the light of after events borrows a cruel significance:—

"Congress and Parliament decree thanks for military exploits, rarely for diplomatic achievements. If they ever voted their thanks for books,—and what deeds have influenced the course of human events more than some books?—Motley ought to have the thanks of our Congress; but I doubt not that he has already the thanks of every American who has read the work. It will leave its distinct mark upon the American mind."

Mr. Everett writes:—

"Mr. Motley's 'History of the Dutch Republic' is in my judgment a work of the highest merit. Unwearying research for years in the libraries of Europe, patience and judgment in arranging and digesting his materials, a fine historical tact, much skill in characterization, the perspective of narration, as it may be called, and a vigorous style unite to make it a very capital work, and place the name of Motley by the side of those of our great historical trio,—Bancroft, Irving, and Prescott."

Mr. Irving, Mr. Bancroft, Mr. Sumner, Mr. Hillard, united their voices in the same strain of commendation. Mr. Prescott, whose estimate of the new history is of peculiar value for obvious reasons, writes to Mr. Allibone thus:—

"The opinion of any individual seems superfluous in respect to a work on the merits of which the public both at home and abroad have pronounced so unanimous a verdict. As Motley's path crosses my own historic field, I may be thought to possess some advantage over most critics in my familiarity with the ground."

"However this may be, I can honestly bear my testimony to the extent of his researches and to the accuracy with which he has given the results of them to the public. Far from making his book a mere register of events, he has penetrated deep below the surface and explored the cause of these events. He has carefully studied the physiognomy of the times and given finished portraits of the great men who conducted the march of the revolution. Every page is instinct with the love of freedom and with that personal knowledge of the working of free institutions which could alone enable him to do justice to his subject. We may congratulate ourselves that it was reserved for one of our countrymen to tell the story—better than it had yet been told—of this memorable revolution, which in so many of its features bears a striking resemblance to our own."

The public welcomed the work as cordially as the critics. Fifteen thousand copies had already been sold in London in 1857. In America it was equally popular. Its author saw his name enrolled by common consent among those of the great writers of his time. Europe accepted him, his country was proud to claim him, scholarship set its jealously guarded seal upon the result of his labors, the reading world, which had not cared greatly for his stories, hung in delight over a narrative more exciting than romances; and the lonely student, who had almost forgotten the look of living men in the solitude of archives haunted by dead memories, found himself suddenly in the full blaze of a great reputation.

XII. 1856-1857. AEt. 42-43.

VISIT TO AMERICA.—RESIDENCE IN BOYLSTON PLACE.

He visited this country in 1856, and spent the winter of 1856-57 in Boston, living with his family in a house in Boylston Place. At this time I had the pleasure of meeting him often, and of seeing the changes which maturity, success, the opening of a great literary and social career, had wrought in his character and bearing. He was in every way greatly improved; the interesting, impulsive youth had ripened into a noble manhood. Dealing with great themes, his own mind had gained their dignity. Accustomed to the company of dead statesmen and heroes, his own ideas had risen to a higher standard. The flattery of society had added a new grace to his natural modesty. He was now a citizen of the world by his reputation; the past was his province, in which he was recognized as a master; the idol's pedestal was ready for him, but he betrayed no desire to show himself upon it.

XIII. 1858-1860. AEt. 44-46.

RETURN TO ENGLAND.—SOCIAL RELATIONS.—LADY HARCOURT'S LETTER.

During the years spent in Europe in writing his first history, from 1851 to 1856, Mr. Motley had lived a life of great retirement and simplicity, devoting himself to his work and to the education of his children, to which last object he was always ready to give the most careful supervision. He was as yet unknown beyond the circle of his friends, and he did not seek society. In this quiet way he had passed the two years of residence in Dresden, the year divided between Brussels and the Hague, and a very tranquil year spent at Vevay on the Lake of Geneva. His health at this time was tolerably good, except for nervous headaches, which frequently recurred and were of great severity. His visit to England with his manuscript in search of a publisher has already been mentioned.

In 1858 he revisited England. His fame as a successful author was there before him, and he naturally became the object of many attentions. He now made many acquaintances who afterwards became his kind and valued friends. Among those mentioned by his daughter, Lady Harcourt, are Lord Lyndhurst, Lord Carlisle, Lady William Russell, Lord and Lady Palmerston, Dean Milman, with many others. The following winter was passed in Rome, among many English and American friends.

"In the course of the next summer," his daughter writes to me, "we all went to England, and for the next two years, marked chiefly by the success of the 'United Netherlands,' our social life was most agreeable and most interesting. He was in the fulness of his health and powers; his works had made him known in intellectual society, and I think his presence, on the other hand, increased their effects. As no one knows better than you do, his belief in his own country and in its institutions at their best was so passionate and intense that it was a part of his nature, yet his refined and fastidious tastes were deeply gratified by the influences of his life in England, and the spontaneous kindness which he received added much to his happiness. At that time Lord Palmerston was Prime Minister; the weekly receptions at Cambridge House were the centre of all that was brilliant in the political and social world, while Lansdowne House, Holland House, and others were open to the 'sommities' in all branches of literature, science, rank, and politics. . . . It was the last year of Lord Macaulay's life, and as a few out of many names which I recall come Dean Milman, Mr. Froude (whose review of the 'Dutch Republic' in the 'Westminster' was one of the first warm recognitions it ever received), the Duke and Duchess of Argyll, Sir William Stirling Maxwell, then Mr. Stirling of Keir, the Sheridan family in its different brilliant members, Lord Wensleydale, and many more."

There was no society to which Motley would not have added grace and attraction by his presence, and to say that he was a welcome guest in the best houses of England is only saying that these houses are always open to those whose abilities, characters, achievements, are commended to the circles that have the best choice by the personal gifts which are nature's passport everywhere.

LETTER TO MR. FRANCIS H. UNDERWOOD.—PLAN OF MR. MOTLEY'S HISTORICAL WORKS.—SECOND GREAT WORK, "HISTORY OF THE UNITED NETHERLANDS."

I am enabled by the kindness of Mr. Francis H. Underwood to avail myself of a letter addressed to him by Mr. Motley in the year before the publication of this second work, which gives us an insight into his mode of

working and the plan he proposed to follow. It begins with an allusion which recalls a literary event interesting to many of his American friends.

ROME, March 4, 1859.

F. H. UNDERWOOD, ESQ.

My dear Sir,— . . . I am delighted to hear of the great success of "The Atlantic Monthly." In this remote region I have not the chance of reading it as often as I should like, but from the specimens which I have seen I am quite sure it deserves its wide circulation. A serial publication, the contents of which are purely original and of such remarkable merit, is a novelty in our country, and I am delighted to find that it has already taken so prominent a position before the reading world. . .

The whole work [his history], of which the three volumes already published form a part, will be called "The Eighty Years' War for Liberty."

Epoch I. is the Rise of the Dutch Republic.

Epoch II. Independence Achieved. From the Death of William the Silent till the Twelve Years' Truce. 1584-1609.

Epoch III. Independence Recognized. From the Twelve Years' Truce to the Peace of Westphalia. 1609-1648.

My subject is a very vast one, for the struggle of the United Provinces with Spain was one in which all the leading states of Europe were more or less involved. After the death of William the Silent, the history assumes world-wide proportions. Thus the volume which I am just about terminating . . . is almost as much English history as Dutch. The Earl of Leicester, very soon after the death of Orange, was appointed governor of the provinces, and the alliance between the two countries almost amounted to a political union. I shall try to get the whole of the Leicester administration, terminating with the grand drama of the Invincible Armada, into one volume; but I doubt, my materials are so enormous. I have been personally very hard at work, nearly two years, ransacking the British State Paper Office, the British Museum, and the Holland archives, and I have had two copyists constantly engaged in London, and two others at the Hague. Besides this, I passed the whole of last winter at Brussels, where, by special favor of the Belgian Government, I was allowed to read what no one else has ever been permitted to see,—the great mass of copies taken by that government from the Simancas archives, a translated epitome of which has been published by Gachard. This correspondence reaches to the death of Philip II., and is of immense extent and importance. Had I not obtained leave to read the invaluable and, for my purpose, indispensable documents at Brussels, I should have gone to Spain, for they will not be published these twenty years, and then only in a translated and excessively abbreviated and unsatisfactory form. I have read the whole of this correspondence, and made very copious notes of it. In truth, I devoted three months of last winter to that purpose alone.

The materials I have collected from the English archives are also extremely important and curious. I have hundreds of interesting letters never published or to be published, by Queen Elizabeth, Burghley, Walsingham, Sidney, Drake, Willoughby, Leicester, and others. For the whole of that portion of my subject in which Holland and England were combined into one whole, to resist Spain in its attempt to obtain the universal empire, I have very abundant collections. For the history of the United Provinces is not at all a provincial history. It is the history of European liberty. Without the struggle of Holland and England against Spain, all Europe might have been Catholic and Spanish. It was Holland that saved England in the sixteenth century, and, by so doing, secured the triumph of the Reformation, and placed the independence of the various states of Europe upon a sure foundation. Of course, the materials collected by me at the Hague are of great importance. As a single specimen, I will state that I found in the archives there an immense and confused mass of papers, which turned out to be the autograph letters of Olden Barneveld during the last few years of his life; during, in short, the whole of that most important period which preceded his execution. These letters are in such an intolerable handwriting that no one has ever attempted to read them. I could read them only imperfectly myself, and it would have taken me a very long time to have acquired the power to do so; but my copyist and reader there is the most patient and indefatigable person alive, and he has quite mastered the handwriting, and he writes me that they are a mine of historical wealth for me. I shall have complete copies before I get to that period, one of signal interest, and which has never been described. I mention these matters that you may see that my work, whatever its other value may be, is built upon the only foundation fit for history,—original contemporary documents. These are all unpublished. Of course, I use the contemporary historians and pamphleteers,—Dutch, Spanish, French, Italian, German, and English,—but the most valuable of my sources are manuscript ones. I have said the little which I have said in order to vindicate the largeness of the subject. The kingdom of Holland is a small power now, but the Eighty Years' War, which secured the civil and religious independence of the Dutch

Commonwealth and of Europe, was the great event of that whole age.

The whole work will therefore cover a most remarkable epoch in human history, from the abdication of Charles Fifth to the Peace of Westphalia, at which last point the political and geographical arrangements of Europe were established on a permanent basis,—in the main undisturbed until the French Revolution. . . .

I will mention that I received yesterday a letter from the distinguished M. Guizot, informing me that the first volume of the French translation, edited by him, with an introduction, has just been published. The publication was hastened in consequence of the appearance of a rival translation at Brussels. The German translation is very elegantly and expensively printed in handsome octavos; and the Dutch translation, under the editorship of the archivist general of Holland, Bakhuyzen v. d. Brink, is enriched with copious notes and comments by that distinguished scholar.

There are also three different piratical reprints of the original work at Amsterdam, Leipzig, and London. I must add that I had nothing to do with the translation in any case. In fact, with the exception of M. Guizot, no one ever obtained permission of me to publish translations, and I never knew of the existence of them until I read of it in the journals. . . . I forgot to say that among the collections already thoroughly examined by me is that portion of the Simancas archives still retained in the Imperial archives of France. I spent a considerable time in Paris for the purpose of reading these documents. There are many letters of Philip II. there, with apostilles by his own hand. . . . I would add that I am going to pass this summer at Venice for the purpose of reading and procuring copies from the very rich archives of that Republic, of the correspondence of their envoys in Madrid, London, and Brussels during the epoch of which I am treating.

I am also not without hope of gaining access to the archives of the Vatican here, although there are some difficulties in the way.

*With kind regards . . .
I remain very truly yours,
J. L. MOTLEY.*

XV. 1860. AT. 46.

PUBLICATION OF THE FIRST TWO VOLUMES OF THE "HISTORY OF THE UNITED NETHERLANDS."—THEIR RECEPTION.

We know something of the manner in which Mr. Motley collected his materials. We know the labors, the difficulties, the cost of his toils among the dusty records of the past. What he gained by the years he spent in his researches is so well stated by himself that I shall borrow his own words:—

"Thanks to the liberality of many modern governments of Europe, the archives where the state secrets of the buried centuries have so long mouldered are now open to the student of history. To him who has patience and industry, many mysteries are thus revealed which no political sagacity or critical acumen could have divined. He leans over the shoulder of Philip the Second at his writing-table, as the King spells patiently out, with cipher-key in hand, the most concealed hieroglyphics of Parma, or Guise, or Mendoza. He reads the secret thoughts of 'Fabius' [Philip II.] as that cunctative Roman scrawls his marginal apostilles on each dispatch; he pries into all the stratagems of Camillus, Hortensius, Mucius, Julius, Tullius, and the rest of those ancient heroes who lent their names to the diplomatic masqueraders of the sixteenth century; he enters the cabinet of the deeply pondering Burghley, and takes from the most private drawer the memoranda which record that minister's unutterable doubts; he pulls from the dressing-gown folds of the stealthy, soft-gliding Walsingham the last secret which he has picked from the Emperor's pigeon-holes or the Pope's pocket, and which not Hatton, nor Buckhurst, nor Leicester, nor the Lord Treasurer is to see,—nobody but Elizabeth herself; he sits invisible at the most secret councils of the Nassaus and Barneveld and Buys, or pores with Farnese over coming victories and vast schemes of universal conquest; he reads the latest bit of scandal, the minutest characteristic of king or minister, chronicled by the gossiping Venetians for the edification of the Forty; and after all this prying and eavesdropping, having seen the cross-purposes, the bribings, the windings in the dark, he is not surprised if those who were systematically deceived did not always arrive at correct conclusions."

The fascination of such a quest is readily conceivable. A drama with real characters, and the spectator at liberty to go behind the scenes and look upon and talk with the kings and queens between the acts; to examine the scenery, to handle the properties, to study the "make up" of the imposing personages of full-dress histories; to deal with them all as Thackeray has done with the Grand Monarque in one of his caustic sketches,—this would be as exciting, one might suppose, as to sit through a play one knows by heart at Drury

Lane or the Theatre Francais, and might furnish occupation enough to the curious idler who was only in search of entertainment. The mechanical obstacles of half-illegible manuscript, of antiquated forms of speech, to say nothing of the intentional obscurities of diplomatic correspondence, stand, however, in the way of all but the resolute and unwearied scholar. These difficulties, in all their complex obstinacy, had been met and overcome by the heroic efforts, the concentrated devotion, of the new laborer in the unbroken fields of secret history.

Without stopping to take breath, as it were,—for his was a task 'de longue haleine,'—he proceeded to his second great undertaking.

The first portion—consisting of two volumes—of the “History of the United Netherlands” was published in the year 1860. It maintained and increased the reputation he had already gained by his first history.

“The London Quarterly Review” devoted a long article to it, beginning with this handsome tribute to his earlier and later volumes:—

“Mr. Motley's 'History of the Rise of the Dutch Republic' is already known and valued for the grasp of mind which it displays, for the earnest and manly spirit in which he has communicated the results of deep research and careful reflection. Again he appears before us, rich with the spoils of time, to tell the story of the United Netherlands from the time of William the Silent to the end of the eventful year of the Spanish Armada, and we still find him in every way worthy of this 'great argument.' Indeed, it seems to us that he proceeds with an increased facility of style, and with a more complete and easy command over his materials. These materials are indeed splendid, and of them most excellent use has been made. The English State Paper Office, the Spanish archives from Simancas, and the Dutch and Belgian repositories, have all yielded up their secrets; and Mr. Motley has enjoyed the advantage of dealing with a vast mass of unpublished documents, of which he has not failed to avail himself to an extent which places his work in the foremost rank as an authority for the period to which it relates. By means of his labor and his art we can sit at the council board of Philip and Elizabeth, we can read their most private dispatches. Guided by his demonstration, we are enabled to dissect out to their ultimate issues the minutest ramifications of intrigue. We join in the amusement of the popular lampoon; we visit the prison-house; we stand by the scaffold; we are present at the battle and the siege. We can scan the inmost characters of men and can view them in their habits as they lived.”

After a few criticisms upon lesser points of form and style, the writer says:—

“But the work itself must be read to appreciate the vast and conscientious industry bestowed upon it. His delineations are true and life-like, because they are not mere compositions written to please the ear, but are really taken from the facts and traits preserved in those authentic records to which he has devoted the labor of many years. Diligent and painstaking as the humblest chronicler, he has availed himself of many sources of information which have not been made use of by any previous historical writer. At the same time he is not oppressed by his materials, but has sagacity to estimate their real value, and he has combined with scholarly power the facts which they contain. He has rescued the story of the Netherlands from the domain of vague and general narrative, and has labored, with much judgment and ability, to unfold the 'Belli causas, et vitia, et modos,' and to assign to every man and every event their own share in the contest, and their own influence upon its fortunes. We do not wonder that his earlier publication has been received as a valuable addition, not only to English, but to European literature.”

One or two other contemporary criticisms may help us with their side lights. A critic in “The Edinburgh Review” for January, 1861, thinks that “Mr. Motley has not always been successful in keeping the graphic variety of his details subordinate to the main theme of his work.” Still, he excuses the fault, as he accounts it, in consideration of the new light thrown on various obscure points of history, and—

“it is atoned for by striking merits, by many narratives of great events faithfully, powerfully, and vividly executed, by the clearest and most life-like conceptions of character, and by a style which, if it sacrifices the severer principles of composition to a desire to be striking and picturesque, is always vigorous, full of animation, and glowing with the genuine enthusiasm of the writer. Mr. Motley combines as an historian two qualifications seldom found united,—to great capacity for historical research he adds much power of pictorial representation. In his pages we find characters and scenes minutely set forth in elaborate and characteristic detail, which is relieved and heightened in effect by the artistic breadth of light and shade thrown across the broader prospects of history. In an American author, too, we must commend the hearty English spirit in which the book is written; and fertile as the present age has been in historical works of the highest merit, none of them can be ranked above these volumes in the grand qualities of interest, accuracy, and truth.”

A writer in “Blackwood” (May, 1861) contrasts Motley with Froude somewhat in the way in which another critic had contrasted him with Prescott. Froude, he says, remembers that there are some golden threads in the black robe of the Dominican. Motley “finds it black and thrusts it farther into the darkness.”

Every writer carries more or less of his own character into his book, of course. A great professor has told me that there is a personal flavor in the mathematical work of a man of genius like Poisson. Those who have known Motley and Prescott would feel sure beforehand that the impulsive nature of the one and the judicial serenity of the other would as surely betray themselves in their writings as in their conversation and in their every movement. Another point which the critic of "Blackwood's Magazine" has noticed has not been so generally observed: it is what he calls "a dashing, offhand, rattling style,"—"fast" writing. It cannot be denied that here and there may be detected slight vestiges of the way of writing of an earlier period of Motley's literary life, with which I have no reason to think the writer just mentioned was acquainted. Now and then I can trace in the turn of a phrase, in the twinkle of an epithet, a faint reminiscence of a certain satirical levity, airiness, jauntiness, if I may hint such a word, which is just enough to remind me of those perilous shallows of his early time through which his richly freighted argosy had passed with such wonderful escape from their dangers and such very slight marks of injury. That which is pleasant gayety in conversation may be quite out of place in formal composition, and Motley's wit must have had a hard time of it struggling to show its spangles in the processions while his gorgeous tragedies went sweeping by.

Volume II.

XVI. 1860-1866. AEt. 46-52.

RESIDENCE IN ENGLAND.—OUTBREAK OF THE CIVIL WAR.—LETTERS TO THE LONDON "TIMES."—VISIT TO AMERICA.—APPOINTED MINISTER TO AUSTRIA.—LADY HARCOURT'S LETTER.—MISS MOTLEY'S MEMORANDUM.

The winter of 1859-60 was passed chiefly at Oatlands Hotel, Walton-on-Thames. In 1860 Mr. Motley hired the house No. 31 Hertford Street, May Fair, London. He had just published the first two volumes of his "History of the Netherlands," and was ready for the further labors of its continuation, when the threats, followed by the outbreak, of the great civil contention in his native land brought him back from the struggles of the sixteenth and seventeenth centuries to the conflict of the nineteenth.

His love of country, which had grown upon him so remarkably of late years, would not suffer him to be silent at such a moment. All around him he found ignorance and prejudice. The quarrel was like to be prejudged in default of a champion of the cause which to him was that of Liberty and Justice. He wrote two long letters to the London "Times," in which he attempted to make clear to Englishmen and to Europe the nature and conditions of our complex system of government, the real cause of the strife, and the mighty issues at stake. Nothing could have been more timely, nothing more needed. Mr. William Everett, who was then in England, bears strong testimony to the effect these letters produced. Had Mr. Motley done no other service to his country, this alone would entitle him to honorable remembrance as among the first defenders of the flag, which at that moment had more to fear from what was going on in the cabinet councils of Europe than from all the armed hosts that were gathering against it.

He returned to America in 1861, and soon afterwards was appointed by Mr. Lincoln Minister to Austria. Mr. Burlingame had been previously appointed to the office, but having been objected to by the Austrian Government for political reasons, the place unexpectedly left vacant was conferred upon Motley, who had no expectation of any diplomatic appointment when he left Europe. For some interesting particulars relating to his residence in Vienna I must refer to the communications addressed to me by his daughter, Lady Harcourt, and her youngest sister, and the letters I received from him while at the Austrian capital. Lady Harcourt writes:—

"He held the post for six years, seeing the civil war fought out and brought to a triumphant conclusion, and enjoying, as I have every reason to believe, the full confidence and esteem of Mr. Lincoln to the last hour of the President's life. In the first dark years the painful interest of the great national drama was so all-absorbing that literary work was entirely put aside, and with his countrymen at home he lived only in the varying fortunes of the day, his profound faith and enthusiasm sustaining him and lifting him above the natural influence of a by no means sanguine temperament. Later, when the tide was turning and success was nearing, he was more able to work. His social relations during the whole period of his mission were of the most agreeable character. The society of Vienna was at that time, and I believe is still, the absolute reverse of that of England, where all claims to distinction are recognized and welcomed. There the old feudal traditions were still in full force, and diplomatic representatives admitted to the court society by right of official position found it to consist exclusively of an aristocracy of birth, sixteen quarterings of nobility being necessary to a right of presentation to the Emperor and Empress. The society thus constituted was distinguished by great charm and grace of manner, the exclusion of all outer elements not only limiting the numbers, but giving the ease of a family party within the charmed circle. On the other hand, larger interests suffered under the rigid exclusion of all occupations except the army, diplomacy, and court place. The intimacy among the different members of the society was so close that, beyond a courtesy of

manner that never failed, the tendency was to resist the approach of any stranger as a 'gene'. A single new face was instantly remarked and commented on in a Vienna saloon to an extent unknown in any other large capital. This peculiarity, however, worked in favor of the old resident. Kindliness of feeling increased with familiarity and grew into something better than acquaintance, and the parting with most sincere and affectionately disposed friends in the end was deeply felt on both sides. Those years were passed in a pleasant house in the Weiden Faubourg, with a large garden at the back, and I do not think that during this time there was one disagreeable incident in his relations to his colleagues, while in several cases the relations, agreeable with all, became those of close friendship. We lived constantly, of course, in diplomatic and Austrian society, and during the latter part of the time particularly his house was as much frequented and the centre of as many dancing and other receptions as any in the place. His official relations with the Foreign Office were courteous and agreeable, the successive Foreign Ministers during his stay being Count Richberg, Count Mensdorff, and Baron Beust. Austria was so far removed from any real contact with our own country that, though the interest in our war may have been languid, they did not pretend to a knowledge which might have inclined them to controversy, while an instinct that we were acting as a constituted government against rebellion rather inclined them to sympathy. I think I may say that as he became known among them his keen patriotism and high sense of honor and truth were fully understood and appreciated, and that what he said always commanded a sympathetic hearing among men with totally different political ideas, but with chivalrous and loyal instincts to comprehend his own. I shall never forget his account of the terrible day when the news of Mr. Lincoln's death came. By some accident a rumor of it reached him first through a colleague. He went straight to the Foreign Office for news, hoping against hope, was received by Count Mensdorff, who merely came forward and laid his arm about his shoulder with an intense sympathy beyond words."

Miss Motley, the historian's youngest daughter, has added a note to her sister's communication:—

"During his residence in Vienna the most important negotiations which he had to carry on with the Austrian Government were those connected with the Mexican affair. Maximilian at one time applied to his brother the Emperor for assistance, and he promised to accede to his demand. Accordingly a large number of volunteers were equipped and had actually embarked at Trieste, when a dispatch from Seward arrived, instructing the American Minister to give notice to the Austrian Government that if the troops sailed for Mexico he was to leave Vienna at once. My father had to go at once to Count Mensdorff with these instructions, and in spite of the Foreign Minister being annoyed that the United States Government had not sooner intimated that this extreme course would be taken, the interview was quite amicable and the troops were not allowed to sail. We were in Vienna during the war in which Denmark fought alone against Austria and Prussia, and when it was over Bismarck came to Vienna to settle the terms of peace with the Emperor. He dined with us twice during his short stay, and was most delightful and agreeable. When he and my father were together they seemed to live over the youthful days they had spent together as students, and many were the anecdotes of their boyish frolics which Bismarck related."

XVII. 1861-1863. AEt. 47-49.

LETTERS FROM VIENNA.

Soon after Mr. Motley's arrival in Vienna I received a long letter from him, most of which relates to personal matters, but which contains a few sentences of interest to the general reader as showing his zealous labors, wherever he found himself, in behalf of the great cause then in bloody debate in his own country:

November 14, 1861.

. . . What can I say to you of cis-Atlantic things? I am almost ashamed to be away from home. You know that I had decided to remain, and had sent for my family to come to America, when my present appointment altered my plans. I do what good I can. I think I made some impression on Lord John Russell, with whom I spent two days soon after my arrival in England, and I talked very frankly and as strongly as I could to Palmerston, and I have had long conversations and correspondences with other leading men in England. I have also had an hour's [conversation] with Thouvenel in Paris. I hammered the Northern view into him as soundly as I could. For this year there will be no foreign interference with us. I don't anticipate it at any time, unless we bring it on ourselves by bad management, which I don't expect. Our fate is in our own hands, and Europe is looking on to see which side is strongest,—when it has made the discovery it will back it as also the best and the most moral. Yesterday I had my audience with the Emperor. He received

me with much cordiality, and seemed interested in a long account which I gave him of our affairs. You may suppose I inculcated the Northern views. We spoke in his vernacular, and he asked me afterwards if I was a German. I mention this not from vanity, but because he asked it with earnestness, and as if it had a political significance. Of course I undeceived him. His appearance interested me, and his manner is very pleasing.

I continued to receive long and interesting letters from him at intervals during his residence as Minister at Vienna. Relating as they often did to public matters, about which he had private sources of information, his anxiety that they should not get into print was perfectly natural. As, however, I was at liberty to read his letters to others at my discretion, and as many parts of these letters have an interest as showing how American affairs looked to one who was behind the scenes in Europe, I may venture to give some extracts without fear of violating the spirit of his injunctions, or of giving offence to individuals. The time may come when his extended correspondence can be printed in full with propriety, but it must be in a future year and after it has passed into the hands of a younger generation. Meanwhile these few glimpses at his life and records of his feelings and opinions will help to make the portrait of the man we are studying present itself somewhat more clearly.

LEGATION of THE U. S. A., VIENNA, January 14, 1862.

MY DEAR HOLMES,—I have two letters of yours, November 29 and December 17, to express my thanks for. It is quite true that it is difficult for me to write with the same feeling that inspires you, —that everything around the inkstand within a radius of a thousand miles is full of deepest interest to writer and reader. I don't even intend to try to amuse you with Vienna matters. What is it to you that we had a very pleasant dinner-party last week at Prince Esterhazy's, and another this week at Prince Liechtenstein's, and that to-morrow I am to put on my cocked hat and laced coat to make a visit to her Imperial Majesty, the Empress Mother, and that to-night there is to be the first of the assembly balls, the Vienna Almack's, at which—I shall be allowed to absent myself altogether?

It strikes me that there is likely to be left a fair field for us a few months longer, say till midsummer. The Trent affair I shall not say much about, except to state that I have always been for giving up the prisoners. I was awfully afraid, knowing that the demand had gone forth,—

"Send us your prisoners or you'll hear of it,"

that the answer would have come back in the Hotspur vein—

*'And if the Devil come and roar for them,
We will not send them.'*

The result would have been most disastrous, for in order to secure a most trifling advantage,—that of keeping Mason and Slidell at Fort Warren a little longer,—we should have turned our backs on all the principles maintained by us when neutral, and should have been obliged to accept a war at an enormous disadvantage. . . .

But I hardly dared to hope that we should have obtained such a victory as we have done. To have disavowed the illegal transaction at once,—before any demand came from England,—to have placed that disavowal on the broad ground of principle which we have always cherished, and thus with a clear conscience, and to our entire honor, to have kept ourselves clear from a war which must have given the Confederacy the invincible alliance of England,—was exactly what our enemies in Europe did not suppose us capable of doing. But we have done it in the handsomest manner, and there is not one liberal heart in this hemisphere that is not rejoiced, nor one hater of us and of our institutions that is not gnashing his teeth with rage.

The letter of ten close pages from which I have quoted these passages is full of confidential information, and contains extracts from letters of leading statesmen. If its date had been 1762, I might feel authorized in disobeying its injunctions of privacy. I must quote one other sentence, as it shows his animus at that time towards a distinguished statesman of whom he was afterwards accused of speaking in very hard terms by an obscure writer whose intent was to harm him. In speaking of the Trent affair, Mr. Motley says: "The English premier has been foiled by our much maligned Secretary of State, of whom, on this occasion at least, one has the right to say, with Sir Henry Wotton,—

*'His armor was his honest thought,
And simple truth his utmost skill.'*

"He says at the close of this long letter:

'I wish I could bore you about something else but American politics. But there is nothing else worth thinking of in the world. All else is leather and prunella. We are living over again the days of the Dutchmen or the seventeenth-century Englishmen.'

My next letter, of fourteen closely written pages, was of similar character to the last. Motley could think of nothing but the great conflict. He was alive to every report from America, listening too with passionate fears or hopes, as the case might be, to the whispers not yet audible to the world which passed from lip to lip of the statesmen who were watching the course of events from the other side of the Atlantic with the sweet

complacency of the looker-on of Lucretius; too often rejoicing in the storm that threatened wreck to institutions and an organization which they felt to be a standing menace to the established order of things in their older communities.

A few extracts from this very long letter will be found to have a special interest from the time at which they were written.

LEGATION OF U. S. A., VIENNA, February 26, 1862.

MY DEAR HOLMES,— . . . I take great pleasure in reading your prophecies, and intend to be just as free in hazarding my own, for, as you say, our mortal life is but a string of guesses at the future, and no one but an idiot would be discouraged at finding himself sometimes far out in his calculations. If I find you signally right in any of your predictions, be sure that I will congratulate and applaud. If you make mistakes, you shall never hear of them again, and I promise to forget them. Let me ask the same indulgence from you in return. This is what makes letter-writing a comfort and journalizing dangerous. . . . The ides of March will be upon us before this letter reaches you. We have got to squash the rebellion soon, or be squashed forever as a nation. I don't pretend to judge military plans or the capacities of generals. But, as you suggest, perhaps I can take a more just view of the whole picture of the eventful struggle at this great distance than do those absolutely acting and suffering on the scene. Nor can I resist the desire to prophesy any more than you can do, knowing that I may prove utterly mistaken. I say, then, that one great danger comes from the chance of foreign interference. What will prevent that?

Our utterly defeating the Confederates in some great and conclusive battle; or,

Our possession of the cotton ports and opening them to European trade; or,

A most unequivocal policy of slave emancipation.

Any one of these three conditions would stave off recognition by foreign powers, until we had ourselves abandoned the attempt to reduce the South to obedience.

The last measure is to my mind the most important. The South has, by going to war with the United States government, thrust into our hands against our will the invincible weapon which constitutional reasons had hitherto forbidden us to employ. At the same time it has given us the power to remedy a great wrong to four millions of the human race, in which we had hitherto been obliged to acquiesce. We are threatened with national annihilation, and defied to use the only means of national preservation. The question is distinctly proposed to us, Shall Slavery die, or the great Republic? It is most astounding to me that there can be two opinions in the free States as to the answer.

If we do fall, we deserve our fate. At the beginning of the contest, constitutional scruples might be respectable. But now we are fighting to subjugate the South; that is, Slavery. We are fighting for nothing else that I know of. We are fighting for the Union. Who wishes to destroy the Union? The slaveholder, nobody else. Are we to spend twelve hundred millions, and raise six hundred thousand soldiers, in order to protect slavery? It really does seem to me too simple for argument. I am anxiously waiting for the coming Columbus who will set this egg of ours on end by smashing in the slavery end. We shall be rolling about in the every direction until that is done. I don't know that it is to be done by proclamation. Rather perhaps by facts. . . . Well, I console myself with thinking that the people—the American people, at least—is about as wise collectively as less numerous collections of individuals, and that the people has really declared emancipation, and is only puzzling how to carry it into effect. After all, it seems to be a law of Providence, that progress should be by a spiral movement; so that when it seems most tortuous, we may perhaps be going ahead. I am firm in the faith that slavery is now wriggling itself to death. With slavery in its pristine vigor, I should think the restored Union neither possible nor desirable. Don't understand me as not taking into account all the strategical considerations against premature governmental utterances on this great subject. But are there any trustworthy friends to the Union among the slaveholders? Should we lose many Kentuckians and Virginians who are now with us, if we boldly confiscated the slaves of all rebels?—and a confiscation of property which has legs and so confiscates itself, at command, is not only a legal, but would prove a very practical measure in time of war. In brief, the time is fast approaching, I think, when 'Thorough' should be written on all our banners. Slavery will never accept a subordinate position. The great Republic and Slavery cannot both survive. We have been defied to mortal combat, and yet we hesitate to strike. These are my poor thoughts on this great subject. Perhaps you will think them crude. I was much struck with what you quote from Mr. Conway, that if emancipation was proclaimed on the Upper Mississippi it would be known to the negroes of Louisiana in advance of the telegraph. And if once the blacks had leave to run, how many whites would have to stay at home to guard their dissolving property?

You have had enough of my maunderings. But before I conclude them, may I ask you to give all our kindest regards to Lowell, and to express our admiration for the Yankee Idyl. I am afraid of using too extravagant language if I say all I think about it. Was there ever anything more stinging, more concentrated, more vigorous, more just? He has condensed into those few pages the essence of a hundred diplomatic papers and historical disquisitions and Fourth of July orations. I was dining a day or two since with his friend Lytton (Bulwer's son, attache here) and Julian Fane (secretary of the embassy), both great admirers of him,—and especially of the "Biglow Papers;" they begged me to send them the Mason and Slidell Idyl, but I wouldn't,—I don't think it is in English nature (although theirs is very cosmopolitan and liberal) to take such punishment and come up smiling. I would rather they got it in some other way, and then told me what they thought voluntarily.

I have very pleasant relations with all the J. B.'s here. They are all friendly and well disposed to the North,—I speak of the embassy, which, with the ambassador and—dress, numbers eight or ten souls, some of them very intellectual ones. There are no other J. B.'s here. I have no fear at present of foreign interference. We have got three or four months to do our work in,—a fair field and no favor. There is no question whatever that the Southern commissioners have been thoroughly snubbed in London and Paris. There is to be a blockade debate in Parliament next week, but no bad consequences are to be apprehended. The Duke de Gramont (French ambassador, and an intimate friend of the Emperor) told my wife last night that it was entirely false that the Emperor had ever urged the English government to break the blockade. "Don't believe it,—don't believe a word of it," he said. He has always held that language to me. He added that Prince Napoleon had just come out with a strong speech about us,—you will see it, doubtless, before you get this letter,—but it has not yet reached us.

Shall I say anything of Austria,—what can I say that would interest you? That's the reason why I hate to write. All my thoughts are in America. Do you care to know about the Archduke Ferdinand Maximilian, that shall be King hereafter of Mexico (if L. N. has his way)? He is next brother to the Emperor, but although I have had the honor of private audiences of many archdukes here, this one is a resident of Trieste.

He is about thirty,—has an adventurous disposition,—some imagination,—a turn for poetry,—has voyaged a good deal about the world in the Austrian ship-of-war,—for in one respect he much resembles that unfortunate but anonymous ancestor of his, the King of Bohemia with the seven castles, who, according to Corporal Trim, had such a passion for navigation and sea-affairs, "with never a seaport in all his dominions." But now the present King of Bohemia has got the sway of Trieste, and is Lord High Admiral and Chief of the Marine Department. He has been much in Spain, also in South America; I have read some travels, "Reise Skizzen," of his—printed, not published. They are not without talent, and he ever and anon relieves his prose jog-trot by breaking into a canter of poetry. He adores bull-fights, and rather regrets the Inquisition, and considers the Duke of Alva everything noble and chivalrous, and the most abused of men. It would do your heart good to hear his invocations to that deeply injured shade, and his denunciations of the ignorant and vulgar protestants who have defamed him. (N.B. Let me observe that the R. of the D. R. was not published until long after the "Reise Skizzen" were written.) 'Du armer Alva! weil du dem Willen deines Herrn unerschütterlich treu vast, weil die festbestimmten Grundsätze der Regierung,' etc., etc., etc. You can imagine the rest. Dear me! I wish I could get back to the sixteenth and seventeenth century. . . . But alas! the events of the nineteenth are too engrossing.

If Lowell cares to read this letter, will you allow me to "make it over to him jointly," as Captain Cuttle says. I wished to write to him, but I am afraid only you would tolerate my writing so much when I have nothing to say. If he would ever send me a line I should be infinitely obliged, and would quickly respond. We read the "Washers of the Shroud" with fervid admiration.

Always remember me most sincerely to the Club, one and all. It touches me nearly when you assure me that I am not forgotten by them. To-morrow is Saturday and the last of the month.—[See Appendix A.]—We are going to dine with our Spanish colleague. But the first bumper of the Don's champagne I shall drain to the health of my Parker House friends.

From another long letter dated August 31, 1862, I extract the following passages:—

"I quite agree in all that you said in your last letter. 'The imp of secession can't reenter its mother's womb.' It is merely childish to talk of the Union 'as it was.' You might as well bring back the Saxon Heptarchy. But the great Republic is destined to live and flourish, I can't doubt. . . . Do you remember that wonderful scene in Faust in which Mephistopheles draws wine for the rabble with a gimlet out of the wooden table; and how it changes to fire as they drink it, and how they all go mad, draw their knives, grasp each other by the nose, and think they are cutting off bunches of grapes at every blow, and how foolish they all look when they awake from the spell and see how the Devil has been mocking them? It always seems to me a parable of the great Secession.

"I repeat, I can't doubt as to the ultimate result. But I dare say we have all been much mistaken in our calculations as to time. Days, months, years, are nothing in history. Men die, man is immortal, practically, even on this earth. We are so impatient, —and we are always watching for the last scene of the tragedy. Now I humbly opine that the drop is only about falling on the first act, or perhaps only the prologue. This act or prologue will be called, in after days, War for the status quo. Such enthusiasm, heroism, and manslaughter as status quo could inspire, has, I trust, been not entirely in vain, but it has been proved insufficient.

"I firmly believe that when the slaveholders declared war on the United States government they began a series of events that, in the logical chain of history, cannot come to a conclusion until the last vestige of slavery is gone. Looking at the whole field for a moment dispassionately, objectively, as the dear Teutonic philosophers say, and merely as an exhibition of phenomena, I cannot imagine any other issue. Everything else may happen. This alone must happen.

"But after all this isn't a war. It is a revolution. It is n't strategists that are wanted so much as believers. In revolutions the men who win are those who are in earnest. Jeff and Stonewall and the other Devil-worshippers are in earnest, but it was not written in the book of fate that the slaveholders' rebellion should be vanquished by a pro-slavery general. History is never so illogical. No, the coming 'man on horseback' on our side must be a great strategist, with the soul of that insane lion, mad old John Brown, in his belly. That is your only Promethean recipe:—

*'et insani leonis
Vim stomacho apposuisse nostro.'*

"I don't know why Horace runs so in my head this morning. . . .

"There will be work enough for all; but I feel awfully fidgety just now about Port Royal and Hilton Head, and about affairs generally for the next three months. After that iron-clads and the new levies must make us invincible."

In another letter, dated November 2, 1862, he expresses himself very warmly about his disappointment in the attitude of many of his old English friends with reference to our civil conflict. He had recently heard the details of the death of "the noble Wilder Dwight."

"It is unnecessary," he says, "to say how deeply we were moved. I had the pleasure of knowing him well, and I always appreciated his energy, his manliness, and his intelligent cheerful heroism. I look back upon him now as a kind of heroic type of what a young New Englander ought to be and was. I tell you that one of these days —after a generation of mankind has passed away—these youths will take their places in our history, and be regarded by the young men and women now unborn with the admiration which the Philip Sidneys and the Max Piccolominis now inspire. After all, what was your Chevy Chace to stir blood with like a trumpet? What noble principle, what deathless interest, was there at stake? Nothing but a bloody fight between a lot of noble gamekeepers on one side and of noble poachers on the other. And because they fought well and hacked each other to pieces like devils, they have been heroes for centuries."

The letter was written in a very excited state of feeling, and runs over with passionate love of country and indignation at the want of sympathy with the cause of freedom which he had found in quarters where he had not expected such coldness or hostile tendencies.

From a letter dated Vienna, September 22, 1863.

. . . "When you wrote me last you said on general matters this: 'In a few days we shall get the news of the success or failure of the attacks on Port Hudson and Vicksburg. If both are successful, many will say that the whole matter is about settled.' You may suppose that when I got the great news I shook hands warmly with you in the spirit across the Atlantic. Day by day for so long we had been hoping to hear the fall of Vicksburg. At last when that little concentrated telegram came, announcing Vicksburg and Gettysburg on the same day and in two lines, I found myself almost alone. . . . There was nobody in the house to join in my huzzahs but my youngest infant. And my conduct very much resembled that of the excellent Philip II. when he heard the fall of Antwerp,—for I went to her door, screeching through the key-hole 'Vicksburg is ours!' just as that other 'pere de famille,' more potent, but I trust not more respectable than I, conveyed the news to his Infanta. (Fide, for the incident, an American work on the Netherlands, i. p. 263, and the authorities there cited.) It is contemptible on my part to speak thus frivolously of events which will stand out in such golden letters so long as America has a history, but I wanted to illustrate the yearning for sympathy which I felt. You who were among people grim and self-contained usually, who, I trust, were falling on each other's necks in the public streets, shouting, with tears in their eyes and triumph in their hearts, can picture my isolation.

"I have never faltered in my faith, and in the darkest hours, when misfortunes seemed thronging most thickly upon us, I have never felt

the want of anything to lean against; but I own I did feel like shaking hands with a few hundred people when I heard of our Fourth of July, 1863, work, and should like to have heard and joined in an American cheer or two.

"I have not much to say of matters here to interest you. We have had an intensely hot, historically hot, and very long and very dry summer. I never knew before what a drought meant. In Hungary the suffering is great, and the people are killing the sheep to feed the pigs with the mutton. Here about Vienna the trees have been almost stripped of foliage ever since the end of August. There is no glory in the grass nor verdure in anything.

"In fact, we have nothing green here but the Archduke Max, who firmly believes that he is going forth to Mexico to establish an American empire, and that it is his divine mission to destroy the dragon of democracy and reestablish the true Church, the Right Divine, and all sorts of games. Poor young man! . . .

"Our information from home is to the 12th. Charleston seems to be in 'articulo mortis,' but how forts nowadays seem to fly in the face of Scripture. Those founded on a rock, and built of it, fall easily enough under the rain of Parrotts and Dahlgrens, while the house built of sand seems to bid defiance to the storm."

In quoting from these confidential letters I have been restrained from doing full justice to their writer by the fact that he spoke with such entire freedom of persons as well as events. But if they could be read from beginning to end, no one could help feeling that his love for his own country, and passionate absorption of every thought in the strife upon which its existence as a nation depended, were his very life during all this agonizing period. He can think and talk of nothing else, or, if he turns for a moment to other subjects, he reverts to the one great central interest of "American politics," of which he says in one of the letters from which I have quoted, "There is nothing else worth thinking of in the world."

But in spite of his public record as the historian of the struggle for liberty and the champion of its defenders, and while every letter he wrote betrayed in every word the intensity of his patriotic feeling, he was not safe against the attacks of malevolence. A train laid by unseen hands was waiting for the spark to kindle it, and this came at last in the shape of a letter from an unknown individual,—a letter the existence of which ought never to have been a matter of official recognition.

XVIII. 1866-1867. AEt. 52-43.

RESIGNATION OF HIS OFFICE.—CAUSES OF HIS RESIGNATION.

It is a relief to me that just here, where I come to the first of two painful episodes in this brilliant and fortunate career, I can preface my statement with the generous words of one who speaks with authority of his predecessor in office.

The Hon. John Jay, Ex-Minister to Austria, in the tribute to the memory of Motley read at a meeting of the New York Historical Society, wrote as follows:—

"In singular contrast to Mr. Motley's brilliant career as an historian stands the fact recorded in our diplomatic annals that he was twice forced from the service as one who had forfeited the confidence of the American government. This society, while he was living, recognized his fame as a statesman, diplomatist, and patriot, as belonging to America, and now that death has closed the career of Seward, Sumner, and Motley, it will be remembered that the great historian, twice humiliated, by orders from Washington, before the diplomacy and culture of Europe, appealed from the passions of the hour to the verdict of history.

"Having succeeded Mr. Motley at Vienna some two years after his departure, I had occasion to read most of his dispatches, which exhibited a mastery of the subjects of which they treated, with much of the clear perception, the scholarly and philosophic tone and decided judgment, which, supplemented by his picturesque description, full of life and color, have given character to his histories. They are features which might well have served to extend the remark of Madame de Stael that a great historian is almost a statesman. I can speak also from my own observation of the reputation which Motley left in the Austrian capital. Notwithstanding the decision with which, under the direction of Mr. Seward, he had addressed the minister of foreign affairs, Count Mensdorff, afterwards the Prince Diedrickstein, protesting against the departure of an Austrian force of one thousand volunteers, who were about to embark for Mexico in aid of the ill-fated Maximilian,—a protest which at the last moment arrested the project,—Mr. Motley and his amiable family were always spoken of in terms of cordial regard and respect by members of the imperial family and those eminent statesmen, Count de Beust and Count Andrassy. His death, I am sure, is mourned to-day by the representatives of the historic names of Austria and Hungary, and by the surviving diplomats then residing near the Court of Vienna, wherever they may

The story of Mr. Motley's resignation of his office and its acceptance by the government is this.

The President of the United States, Andrew Johnson, received a letter professing to be written from the Hotel Meurice, Paris, dated October 23, 1866, and signed "George W. M'Crackin, of New York." This letter was filled with accusations directed against various public agents, ministers, and consuls, representing the United States in different countries. Its language was coarse, its assertions were improbable, its spirit that of the lowest of party scribblers. It was bitter against New England, especially so against Massachusetts, and it singled out Motley for the most particular abuse. I think it is still questioned whether there was any such person as the one named,—at any rate, it bore the characteristic marks of those vulgar anonymous communications which rarely receive any attention unless they are important enough to have the police set on the track of the writer to find his rathole, if possible. A paragraph in the "Daily Advertiser" of June 7, 1869, quotes from a Western paper a story to the effect that one William R. M'Crackin, who had recently died at — confessed to having written the M' Crackin letter. Motley, he said, had snubbed him and refused to lend him money. "He appears to have been a Bohemian of the lowest order." Between such authorship and the anonymous there does not seem to be much to choose. But the dying confession sounds in my ears as decidedly apocryphal. As for the letter, I had rather characterize it than reproduce it. It is an offence to decency and a disgrace to the national record on which it is found. This letter of "George W. M'Crackin" passed into the hands of Mr. Seward, the Secretary of State. Most gentlemen, I think, would have destroyed it on the spot, as it was not fit for the waste-basket. Some, more cautious, might have smothered it among the piles of their private communications. If any notice was taken of it, one would say that a private note to each of the gentlemen attacked might have warned him that there were malicious eavesdroppers about, ready to catch up any careless expression he might let fall and make a scandalous report of it to his detriment.

The secretary, acquiescing without resistance in a suggestion of the President, saw fit to address a formal note to several of the gentlemen mentioned in the M'Crackin letter, repeating some of its offensive expressions, and requesting those officials to deny or confirm the report that they had uttered them.

A gentleman who is asked whether he has spoken in a "malignant" or "offensive" manner, whether he has "railed violently and shamefully" against the President of the United States, or against anybody else, might well wonder who would address such a question to the humblest citizen not supposed to be wanting in a common measure of self-respect. A gentleman holding an important official station in a foreign country, receiving a letter containing such questions, signed by the prime minister of his government, if he did not think himself imposed upon by a forgery, might well consider himself outraged. It was a letter of this kind which was sent by the Secretary of State to the Minister Plenipotentiary to the Empire of Austria. Not quite all the vulgar insolence of the M'Crackin letter was repeated. Mr. Seward did not ask Mr. Motley to deny or confirm the assertion of the letter that he was a "thorough flunky" and "un-American functionary." But he did insult him with various questions suggested by the anonymous letter,—questions that must have been felt as an indignity by the most thick-skinned of battered politicians.

Mr. Motley was very sensitive, very high-spirited, very impulsive, very patriotic, and singularly truthful. The letter of Mr. Seward to such a man was like a buffet on the cheek of an unarmed officer. It stung like the thrust of a stiletto. It roused a resentment that could not find any words to give it expression. He could not wait to turn the insult over in his mind, to weigh the exact amount of affront in each question, to take counsel, to sleep over it, and reply to it with diplomatic measure and suavity. One hour had scarcely elapsed before his answer was written. As to his feelings as an American, he appeals to his record. This might have shown that if he erred it was on the side of enthusiasm and extravagant expressions of reverence for the American people during the heroic years just passed. He denounces the accusations as pitiful fabrications and vile calumny. He blushes that such charges could have been uttered; he is deeply wounded that Mr. Seward could have listened to such falsehood. He does not hesitate to say what his opinions are with reference to home questions, and especially to that of reconstruction.

"These opinions," he says, "in the privacy of my own household, and to occasional American visitors, I have not concealed. The great question now presenting itself for solution demands the conscientious scrutiny of every American who loves his country and believes in the human progress of which that country is one of the foremost representatives. I have never thought, during my residence at Vienna, that because I have the honor of being a public servant of the American people I am deprived of the right of discussing within my own walls the gravest subjects that can interest freemen. A minister of the United States does not cease to be a citizen of the United States, as deeply interested as others in all that relates to the welfare of his country."

Among the "occasional American visitors" spoken of above must have been some of those self-appointed or hired agents called "interviewers," who do for the American public what the Venetian spies did for the Council of Ten, what the familiars of the Inquisition did for the priesthood, who invade every public man's privacy, who listen at every key-hole, who tamper with every guardian of secrets; purveyors to the insatiable appetite of a public which must have a slain reputation to devour with its breakfast, as the monster of antiquity called regularly for his tribute of a spotless virgin.

The "interviewer" has his use, undoubtedly, and often instructs and amuses his public with gossip they could not otherwise listen to. He serves the politician by repeating the artless and unstudied remarks which fall from his lips in a conversation which the reporter has been invited to take notes of. He tickles the author's vanity by showing him off as he sits in his library unconsciously uttering the engaging items of self-portraiture which, as he well knows, are to be given to the public in next week's illustrated paper. The feathered end of his shaft titillates harmlessly enough, but too often the arrowhead is crusted with a poison worse than the Indian gets by mingling the wolf's gall with the rattlesnake's venom. No man is safe whose

unguarded threshold the mischief-making questioner has crossed. The more unsuspecting, the more frank, the more courageous, the more social is the subject of his vivisection, the more easily does he get at his vital secrets, if he has any to be extracted. No man is safe if the hearsay reports of his conversation are to be given to the public without his own careful revision. When we remember that a proof-text bearing on the mighty question of the future life, words of supreme significance, uttered as they were in the last hour, and by the lips to which we listen as to none other,—that this text depends for its interpretation on the position of a single comma, we can readily see what wrong may be done by the unintentional blunder of the most conscientious reporter. But too frequently it happens that the careless talk of an honest and high-minded man only reaches the public after filtering through the drain of some reckless hireling's memory,—one who has played so long with other men's characters and good name that he forgets they have any value except to fill out his morning paragraphs.

Whether the author of the scandalous letter which it was disgraceful to the government to recognize was a professional interviewer or only a malicious amateur, or whether he was a paid "spotter," sent by some jealous official to report on the foreign ministers as is sometimes done in the case of conductors of city horsecars, or whether the dying miscreant before mentioned told the truth, cannot be certainly known. But those who remember Mr. Hawthorne's account of his consular experiences at Liverpool are fully aware to what intrusions and impertinences and impositions our national representatives in other countries are subjected. Those fellow-citizens who "often came to the consulate in parties of half a dozen or more, on no business whatever, but merely to subject their public servant to a rigid examination, and see how he was getting on with his duties," may very possibly have included among them some such mischief-maker as the author of the odious letter which received official recognition. Mr. Motley had spoken in one of his histories of "a set of venomous familiars who glided through every chamber and coiled themselves at every fireside." He little thought that under his own roof he himself was to be the victim of an equally base espionage.

It was an insult on the part of the government to have sent Mr. Motley such a letter with such questions as were annexed to it. No very exact rule can be laid down as to the manner in which an insult shall be dealt with. Something depends on temperament, and his was of the warmer complexion. His first impulse, he says, was to content himself with a flat denial of the truth of the accusations. But his scrupulous honesty compelled him to make a plain statement of his opinions, and to avow the fact that he had made no secret of them in conversation under conditions where he had a right to speak freely of matters quite apart from his official duties. His answer to the accusation was denial of its charges; his reply to the insult was his resignation.

It may be questioned whether this was the wisest course, but wisdom is often disconcerted by an indignity, and even a meek Christian may forget to turn the other cheek after receiving the first blow until the natural man has asserted himself by a retort in kind. But the wrong was committed; his resignation was accepted; the vulgar letter, not fit to be spread out on these pages, is enrolled in the records of the nation, and the first deep wound was inflicted on the proud spirit of one whose renown had shed lustre on the whole country.

That the burden of this wrong may rest where it belongs, I quote the following statement from Mr. Jay's paper, already referred to.

"It is due to the memory of Mr. Seward to say, and there would seem now no further motive for concealing the truth, that I was told in Europe, on what I regarded as reliable authority, that there was reason to believe that on the receipt of Mr. Motley's resignation Mr. Seward had written to him declining to accept it, and that this letter, by a telegraphic order of President Johnson, had been arrested in the hands of a dispatch agent before its delivery to Mr. Motley, and that the curt letter of the 18th of April had been substituted in its stead."

The Hon. John Bigelow, late Minister to France, has published an article in "The International Review" for July-August, 1878, in which he defends his late friend Mr. Seward's action in this matter at the expense of the President, Mr. Andrew Johnson, and not without inferences unfavorable to the discretion of Mr. Motley. Many readers will think that the simple record of Mr. Seward's unresisting acquiescence in the action of the President is far from being to his advantage. I quote from his own conversation as carefully reported by his friend Mr. Bigelow. "Mr. Johnson was in a state of intense irritation, and more or less suspicious of everybody about him."—"Instead of throwing the letter into the fire," the President handed it to him, the secretary, and suggested answering it, and without a word, so far as appears, he simply answered, "Certainly, sir." Again, the secretary having already written to Mr. Motley that "his answer was satisfactory," the President, on reaching the last paragraph of Mr. Motley's letter, in which he begged respectfully to resign his post, "without waiting to learn what Mr. Seward had done or proposed to do, exclaimed, with a not unnatural asperity, 'Well, let him go,' and 'on hearing this,' said Mr. Seward, laughing, 'I did not read my dispatch.'" Many persons will think that the counsel for the defence has stated the plaintiff's case so strongly that there is nothing left for him but to show his ingenuity and his friendship for the late secretary in a hopeless argument. At any rate, Mr. Seward appears not to have made the slightest effort to protect Mr. Motley against his coarse and jealous chief at two critical moments, and though his own continuance in office may have been more important to the State than that of the Vicar of Bray was to the Church, he ought to have risked something, as it seems to me, to shield such a patriot, such a gentleman, such a scholar, from ignoble treatment; he ought to have been as ready to guard Mr. Motley from wrong as Mr. Bigelow has shown himself to shield Mr. Seward from reproach, and his task, if more delicate, was not more difficult. I am willing to accept Mr. Bigelow's loyal and honorable defence of his friend's memory as the best that could be said for Mr. Seward, but the best defence in this case is little better than an impeachment. As for Mr. Johnson, he had held the weapon of the most relentless of the 'Parcae' so long that his suddenly clipping the thread of a foreign minister's tenure of office in a fit of jealous anger is not at all surprising.

Thus finished Mr. Motley's long and successful diplomatic service at the Court of Austria. He may have been judged hasty in resigning his place; he may have committed himself in expressing his opinions too strongly before strangers, whose true character as spies and eavesdroppers he was too high-minded to

suspect. But no caution could have protected him against a slanderer who hated the place he came from, the company he kept, the name he had made famous, to whom his very look and bearing —such as belong to a gentleman of natural refinement and good breeding —must have been a personal grievance and an unpardonable offence.

I will add, in illustration of what has been said, and as showing his feeling with reference to the matter, an extract from a letter to me from Vienna, dated the 12th of March, 1867.

. . . *"As so many friends and so many strangers have said so much that is gratifying to me in public and private on this very painful subject, it would be like affectation, in writing to so old a friend as you, not to touch upon it. I shall confine myself, however, to one fact, which, so far as I know, may be new to you.*

"Geo. W. M'Cracken is a man and a name utterly unknown to me.

"With the necessary qualification which every man who values truth must make when asserting such a negation,—viz., to the very best of my memory and belief,—I never set eyes on him nor heard of him until now, in the whole course of my life. Not a member of my family or of the legation has the faintest recollection of any such person. I am quite convinced that he never saw me nor heard the sound of my voice. That his letter was a tissue of vile calumnies, shameless fabrications, and unblushing and contemptible falsehoods,—by whomsoever uttered,—I have stated in a reply to what ought never to have been an official letter. No man can regret more than I do that such a correspondence is enrolled in the capital among American state papers. I shall not trust myself to speak of the matter. It has been a sufficiently public scandal."

LAST TWO VOLUMES OF THE "HISTORY OF THE UNITED NETHERLANDS."—GENERAL CRITICISMS OF DUTCH SCHOLARS ON MOTLEY'S HISTORICAL WORKS.

In his letter to me of March 12, 1867, just cited, Mr. Motley writes:—

"My two concluding volumes of the United Netherlands are passing rapidly through the press. Indeed, Volume III. is entirely printed and a third of Volume IV.

"If I live ten years longer I shall have probably written the natural sequel to the first two works,—viz., the Thirty Years' War. After that I shall cease to scourge the public.

"I don't know whether my last two volumes are good or bad; I only know that they are true—but that need n't make them amusing.

"Alas! one never knows when one becomes a bore."

In 1868 the two concluding volumes of the "History of the Netherlands" were published at the same time in London and in New York. The events described and the characters delineated in these two volumes had, perhaps, less peculiar interest for English and American readers than some of those which had lent attraction to the preceding ones. There was no scene like the siege of Antwerp, no story like that of the Spanish Armada. There were no names that sounded to our ears like those of Sir Philip Sidney and Leicester and Amy Robsart. But the main course of his narrative flowed on with the same breadth and depth of learning and the same brilliancy of expression. The monumental work continued as nobly as it had begun. The facts had been slowly, quietly gathered, one by one, like pebbles from the empty channel of a brook. The style was fluent, impetuous, abundant, impatient, as it were, at times, and leaping the sober boundaries prescribed to it, like the torrent which rushes through the same channel when the rains have filled it. Thus there was matter for criticism in his use of language. He was not always careful in the construction of his sentences. He introduced expressions now and then into his vocabulary which reminded one of his earlier literary efforts. He used stronger language at times than was necessary, coloring too highly, shading too deeply in his pictorial delineations. To come to the matter of his narrative, it must be granted that not every reader will care to follow him through all the details of diplomatic intrigues which he has with such industry and sagacity extricated from the old manuscripts in which they had long lain hidden. But we turn a few pages and we come to one of those descriptions which arrest us at once and show him in his power and brilliancy as a literary artist. His characters move before us with the features of life; we can see Elizabeth, or Philip, or Maurice, not as a name connected with events, but as a breathing and acting human being, to be loved or hated, admired or despised, as if he or she were our contemporary. That all his judgments would not be accepted as final we might easily anticipate; he could not help writing more or less as a partisan, but he was a partisan on the side of freedom in politics and religion, of human nature as against every form of tyranny, secular or priestly, of noble manhood wherever he saw it as against meanness and violence and imposture, whether clad in the soldier's mail or the emperor's purple. His sternest critics, and even these admiring ones, were yet to be found among those who with fundamental beliefs at variance with his own followed him in his long researches among the dusty annals of the past.

The work of the learned M. Groen van Prinsterer,—[Maurice et Barnevelt, Etude Historique. Utrecht, 1875.]—devoted expressly to the revision and correction of what the author considers the erroneous views of

Mr. Motley on certain important points, bears, notwithstanding, such sincere and hearty tribute to his industry, his acquisitions, his brilliant qualities as a historian, that some extracts from it will be read, I think, with interest.

"My first interview, more than twenty years ago, with Mr. Lothrop Motley, has left an indelible impression on my memory.

"It was the 8th of August, 1853. A note is handed me from our eminent archivist Bakhuyzen van den Brink. It informs me that I am to receive a visit from an American, who, having been struck by the analogies between the United Provinces and the United States, between Washington and the founder of our independence, has interrupted his diplomatic career to write the life of William the First; that he has already given proof of ardor and perseverance, having worked in libraries and among collections of manuscripts, and that he is coming to pursue his studies at the Hague.

"While I am surprised and delighted with this intelligence, I am informed that Mr. Motley himself is waiting for my answer. My eagerness to make the acquaintance of such an associate in my sympathies and my labors may be well imagined. But how shall I picture my surprise, in presently discovering that this unknown and indefatigable fellow-worker has really read, I say read and reread, our Quartos, our Folios, the enormous volumes of Bor, of van Meteren, besides a multitude of books, of pamphlets, and even of unedited documents. Already he is familiar with the events, the changes of condition, the characteristic details of the life of his and my hero. Not only is he acquainted with my Archives, but it seems as if there was nothing in this voluminous collection of which he was ignorant. . . .

"In sending me the last volume of his 'History of the Foundation of the Republic of the Netherlands,' Mr. Motley wrote to me: 'Without the help of the Archives I could never have undertaken the difficult task I had set myself, and you will have seen at least from my numerous citations that I have made a sincere and conscientious study of them.' Certainly in reading such a testimonial I congratulated myself on the excellent fruit of my labors, but the gratitude expressed to me by Mr. Motley was sincerely reciprocated. The Archives are a scientific collection, and my 'Manual of National History,' written in Dutch, hardly gets beyond the limits of my own country. And here is a stranger, become our compatriot in virtue of the warmth of his sympathies, who has accomplished what was not in my power. By the detail and the charm of his narrative, by the matter and form of a work which the universality of the English language and numerous translations were to render cosmopolitan, Mr. Motley, like that other illustrious historian, Prescott, lost to science by too early death, has popularized in both hemispheres the sublime devotion of the Prince of Orange, the exceptional and providential destinies of my country, and the benedictions of the Eternal for all those who trust in Him and tremble only at his Word."

The old Dutch scholar differs in many important points from Mr. Motley, as might be expected from his creed and his life-long pursuits. This I shall refer to in connection with Motley's last work, "John of Barneveld." An historian among archivists and annalists reminds one of Sir John Lubbock in the midst of his ant-hills. Undoubtedly he disturbs the ants in their praiseworthy industry, much as his attentions may flatter them. Unquestionably the ants (if their means of expressing themselves were equal to their apparent intellectual ability) could teach him many things that he has overlooked and correct him in many mistakes. But the ants will labor ingloriously without an observer to chronicle their doings, and the archivists and annalists will pile up facts forever like so many articulates or mollusks or radiates, until the vertebrate historian comes with his generalizing ideas, his beliefs, his prejudices, his idiosyncrasies of all kinds, and brings the facts into a more or less imperfect, but still organic series of relations. The history which is not open to adverse criticism is worth little, except as material, for it is written without taking cognizance of those higher facts about which men must differ; of which Guizot writes as follows, as quoted in the work of M. Groen van Prinsterer himself.

"It is with facts that our minds are exercised, it has nothing but facts as its materials, and when it discovers general laws these laws are themselves facts which it determines. . . . In the study of facts the intelligence may allow itself to be crushed; it may lower, narrow, materialize itself; it may come to believe that there are no facts except those which strike us at the first glance, which come close to us, which fall, as we say, under our senses; a great and gross error; there are remote facts, immense, obscure, sublime, very difficult to reach, to observe, to describe, and which are not any less facts for these reasons, and which man is not less obliged to study and to know; and if he fails to recognize them or forgets them, his thought will be prodigiously abashed, and all his ideas carry the stamp of this deterioration."

In that higher region of facts which belongs to the historian, whose task it is to interpret as well as to transcribe, Mr. Motley showed, of course, the political and religious school in which he had been brought up. Every man has a right to his "personal equation" of prejudice, and Mr. Motley, whose ardent temperament gave life to his writings, betrayed his sympathies in the disputes of which he told the story, in a way to insure sharp criticism from those of a different way of thinking. Thus it is that in the work of M. Groen van Prinsterer, from which I have quoted, he is considered as having been betrayed into error, while his critic

recognizes "his manifest desire to be scrupulously impartial and truth-telling." And M. Fruin, another of his Dutch critics, says, "His sincerity, his perspicacity, the accuracy of his laborious researches, are incontestable."

Some of the criticisms of Dutch scholars will be considered in the pages which deal with his last work, "The Life of John of Barneveld."

VISIT TO AMERICA.—RESIDENCE AT NO. 2 PARK STREET, BOSTON.—ADDRESS ON THE COMING PRESIDENTIAL ELECTION.—ADDRESS ON HISTORIC PROGRESS AND AMERICAN DEMOCRACY.—APPOINTED MINISTER TO ENGLAND.

In June, 1868, Mr. Motley returned with his family to Boston, and established himself in the house No. 2 Park Street. During his residence here he entered a good deal into society, and entertained many visitors in a most hospitable and agreeable way.

On the 20th of October, 1868, he delivered an address before the Parker Fraternity, in the Music Hall, by special invitation. Its title was "Four Questions for the People, at the Presidential Election." This was of course what is commonly called an electioneering speech, but a speech full of noble sentiments and eloquent expression. Here are two of its paragraphs:—

"Certainly there have been bitterly contested elections in this country before. Party spirit is always rife, and in such vivid, excitable, disputatious communities as ours are, and I trust always will be, it is the very soul of freedom. To those who reflect upon the means and end of popular government, nothing seems more stupid than in grand generalities to deprecate party spirit. Why, government by parties and through party machinery is the only possible method by which a free government can accomplish the purpose of its existence. The old republics of the past may be said to have fallen, not because of party spirit, but because there was no adequate machinery by which party spirit could develop itself with facility and regularity.

"And if our Republic be true to herself, the future of the human race is assured by our example. No sweep of overwhelming armies, no ponderous treatises on the rights of man, no hymns to liberty, though set to martial music and resounding with the full diapason of a million human throats, can exert so persuasive an influence as does the spectacle of a great republic, occupying a quarter of the civilized globe, and governed quietly and sagely by the people itself."

A large portion of this address is devoted to the proposition that it is just and reasonable to pay our debts rather than to repudiate them, and that the nation is as much bound to be honest as is the individual. "It is an awful thing," he says, "that this should be a question at all," but it was one of the points on which the election turned, for all that.

In his advocacy of the candidate with whom, and the government of which he became the head, his relations became afterwards so full of personal antagonism, he spoke as a man of his ardent nature might be expected to speak on such an occasion. No one doubts that his admiration of General Grant's career was perfectly sincere, and no one at the present day can deny that the great captain stood before the historian with such a record as one familiar with the deeds of heroes and patriots might well consider as entitling him to the honors too often grudged to the living to be wasted on the dead. The speaker only gave voice to the widely prevailing feelings which had led to his receiving the invitation to speak. The time was one which called for outspoken utterance, and there was not a listener whose heart did not warm as he heard the glowing words in which the speaker recorded the noble achievements of the soldier who must in so many ways have reminded him of his favorite character, William the Silent.

On the 16th of December of this same year, 1868, Mr. Motley delivered an address before the New York Historical Society, on the occasion of the sixty-fourth anniversary of its foundation. The president of the society, Mr. Hamilton Fish, introduced the speaker as one "whose name belongs to no single country, and to no single age. As a statesman and diplomatist and patriot, he belongs to America; as a scholar, to the world of letters; as a historian, all ages will claim him in the future."

His subject was "Historic Progress and American Democracy." The discourse is, to use his own words, "a rapid sweep through the eons and the centuries," illustrating the great truth of the development of the race from its origin to the time in which we are living. It is a long distance from the planetary fact of the obliquity of the equator, which gave the earth its alternation of seasons, and rendered the history, if not the existence of man and of civilization a possibility, to the surrender of General Lee under the apple-tree at Appomattox Court-House. No one but a scholar familiar with the course of history could have marshalled such a procession of events into a connected and intelligible sequence. It is indeed a flight rather than a march; the reader is borne along as on the wings of a soaring poem, and sees the rising and decaying empires of history beneath him as a bird of passage marks the succession of cities and wilds and deserts as he keeps pace with the sun in his journey.

Its eloquence, its patriotism, its crowded illustrations, drawn from vast resources of knowledge, its epigrammatic axioms, its occasional pleasantries, are all characteristic of the writer.

Mr. Gulian C. Verplanck, the venerable senior member of the society, proposed the vote of thanks to Mr.

Motley with words of warm commendation.

Mr. William Cullen Bryant rose and said:—

"I take great pleasure in seconding the resolution which has just been read. The eminent historian of the Dutch Republic, who has made the story of its earlier days as interesting as that of Athens and Sparta, and who has infused into the narrative the generous glow of his own genius, has the highest of titles to be heard with respectful attention by the citizens of a community which, in its origin, was an offshoot of that renowned republic. And cheerfully has that title been recognized, as the vast audience assembled here to-night, in spite of the storm, fully testifies; and well has our illustrious friend spoken of the growth of civilization and of the improvement in the condition of mankind, both in the Old World—the institutions of which he has so lately observed—and in the country which is proud to claim him as one of her children."

Soon after the election of General Grant, Mr. Motley received the appointment of Minister to England. That the position was one which was in many respects most agreeable to him cannot be doubted. Yet it was not without unmingled feelings of satisfaction, not without misgivings which warned him but too truly of the dangers about to encompass him, that he accepted the place. He writes to me on April 16, 1869:—

"I feel anything but exultation at present,—rather the opposite sensation. I feel that I am placed higher than I deserve, and at the same time that I am taking greater responsibilities than ever were assumed by me before. You will be indulgent to my mistakes and shortcomings,—and who can expect to avoid them? But the world will be cruel, and the times are threatening. I shall do my best,—but the best may be poor enough,—and keep 'a heart for any fate.'"

XXI. 1869-1870. AEt. 55-56.

RECALL FROM THE ENGLISH MISSION.—ITS ALLEGED AND ITS PROBABLE REASONS.

The misgivings thus expressed to me in confidence, natural enough in one who had already known what it is to fall on evil days and evil tongues, were but too well justified by after events. I could have wished to leave untold the story of the English mission, an episode in Motley's life full of heart-burnings, and long to be regretted as a passage of American history. But his living appeal to my indulgence comes to me from his grave as a call for his defence, however little needed, at least as a part of my tribute to his memory. It is little needed, because the case is clear enough to all intelligent readers of our diplomatic history, and because his cause has been amply sustained by others in many ways better qualified than myself to do it justice. The task is painful, for if a wrong was done him it must be laid at the doors of those whom the nation has delighted to honor, and whose services no error of judgment or feeling or conduct can ever induce us to forget. If he confessed him, self-liable, like the rest of us, to mistakes and shortcomings, we must remember that the great officers of the government who decreed his downfall were not less the subjects of human infirmity.

The outline to be filled up is this: A new administration had just been elected. The "Alabama Treaty," negotiated by Motley's predecessor, Mr. Reverdy Johnson, had been rejected by the Senate. The minister was recalled, and Motley, nominated without opposition and unanimously confirmed by the Senate, was sent to England in his place. He was welcomed most cordially on his arrival at Liverpool, and replied in a similar strain of good feeling, expressing the same kindly sentiments which may be found in his instructions. Soon after arriving in London he had a conversation with Lord Clarendon, the British Foreign Secretary, of which he sent a full report to his own government. While the reported conversation was generally approved of in the government's dispatch acknowledging it, it was hinted that some of its expressions were stronger than were required by the instructions, and that one of its points was not conveyed in precise conformity with the President's view. The criticism was very gently worded, and the dispatch closed with a somewhat guarded paragraph repeating the government's approbation.

This was the first offence alleged against Mr. Motley. The second ground of complaint was that he had shown written minutes of this conversation to Lord Clarendon to obtain his confirmation of its exactness, and that he had—as he said, inadvertently,—omitted to make mention to the government of this circumstance until some weeks after the time of the interview.

He was requested to explain to Lord Clarendon that a portion of his presentation and treatment of the subject discussed at the interview immediately after his arrival was disapproved by the Secretary of State, and he did so in a written communication, in which he used the very words employed by Mr. Fish in his criticism of the conversation with Lord Clarendon. An alleged mistake; a temperate criticism, coupled with a general approval; a rectification of the mistake criticised. All this within the first two months of Mr. Motley's official residence in London.

No further fault was found with him, so far as appears, in the discharge of his duties, to which he must have devoted himself faithfully, for he writes to me, under the date of December 27, 1870: "I have worked harder in the discharge of this mission than I ever did in my life." This from a man whose working powers astonished the old Dutch archivist, Groen van Prinsterer, means a good deal.

More than a year had elapsed since the interview with Lord Clarendon, which had been the subject of

criticism. In the mean time a paper of instructions was sent to Motley, dated September 25, 1869, in which the points in the report of his interview which had been found fault with are so nearly covered by similar expressions, that there seemed no real ground left for difference between the government and the minister. Whatever over-statement there had been, these new instructions would imply that the government was now ready to go quite as far as the minister had gone, and in some points to put the case still more strongly. Everything was going on quietly. Important business had been transacted, with no sign of distrust or discontent on the part of the government as regarded Motley. Whatever mistake he was thought to have committed was condoned by amicable treatment, neutralized by the virtual indorsement of the government in the instructions of the 25th of September, and obsolete as a ground of quarrel by lapse of time. The question about which the misunderstanding, if such it deserves to be called, had taken place, was no longer a possible source of disagreement, as it had long been settled that the Alabama case should only be opened again at the suggestion of the British government, and that it should be transferred to Washington whenever that suggestion should again bring it up for consideration.

Such was the aspect of affairs at the American Legation in London. No foreign minister felt more secure in his place than Mr. Motley. "I thought myself," he says in the letter of December 27, "entirely in the confidence of my own government, and I know that I had the thorough confidence and the friendship of the leading personages in England." All at once, on the first of July, 1870, a letter was written by the Secretary of State, requesting him to resign. This gentle form of violence is well understood in the diplomatic service. Horace Walpole says, speaking of Lady Archibald Hamilton: "They have civilly asked her and grossly forced her to ask civilly to go away, which she has done, with a pension of twelve hundred a year." Such a request is like the embrace of the "virgin" in old torture-chambers. She is robed in soft raiment, but beneath it are the knife-blades which are ready to lacerate and kill the victim, if he awaits the pressure of the machinery already in motion.

Mr. Motley knew well what was the logical order in an official execution, and saw fit to let the government work its will upon him as its servant. In November he was recalled.

The recall of a minister under such circumstances is an unusual if not an unprecedented occurrence. The government which appoints a citizen to represent the country at a foreign court assumes a very serious obligation to him. The next administration may turn him out and nothing will be thought of it. He may be obliged to ask for his passports and leave all at once if war is threatened between his own country and that which he represents. He may, of course, be recalled for gross misconduct. But his dismissal is very serious matter to him personally, and not to be thought of on the ground of passion or caprice. Marriage is a simple business, but divorce is a very different thing. The world wants to know the reason of it; the law demands its justification. It was a great blow to Mr. Motley, a cause of indignation to those who were interested in him, a surprise and a mystery to the world in general.

When he, his friends, and the public, all startled by this unexpected treatment, looked to find an explanation of it, one was found which seemed to many quite sufficient. Mr. Sumner had been prominent among those who had favored his appointment. A very serious breach had taken place between the President and Mr. Sumner on the important San Domingo question. It was a quarrel, in short, neither more nor less, at least so far as the President was concerned. The proposed San Domingo treaty had just been rejected by the Senate, on the thirtieth day of June, and immediately thereupon,—the very next day,—the letter requesting Mr. Motley's resignation was issued by the executive. This fact was interpreted as implying something more than a mere coincidence. It was thought that Sumner's friend, who had been supported by him as a candidate for high office, who shared many of his political ideas and feelings, who was his intimate associate, his fellow-townsmen, his companion in scholarship and cultivation, his sympathetic co-laborer in many ways, had been accounted and dealt with as the ally of an enemy, and that the shaft which struck to the heart of the sensitive envoy had glanced from the 'aes triplex' of the obdurate Senator.

Mr. Motley wrote a letter to the Secretary of State immediately after his recall, in which he reviewed his relations with the government from the time of his taking office, and showed that no sufficient reason could be assigned for the treatment to which he had been subjected. He referred finally to the public rumor which assigned the President's hostility to his friend Sumner, growing out of the San Domingo treaty question, as the cause of his own removal, and to the coincidence between the dates of the rejection of the treaty and his dismissal, with an evident belief that these two occurrences were connected by something more than accident.

To this, a reply was received from the Secretary of State's office, signed by Mr. Fish, but so objectionable in its tone and expressions that it has been generally doubted whether the paper could claim anything more of the secretary's hand than his signature. It travelled back to the old record of the conversation with Lord Clarendon, more than a year and a half before, took up the old exceptions, warmed them over into grievances, and joined with them whatever the 'captatores verborum,' not extinct since Daniel Webster's time, could add to their number. This was the letter which was rendered so peculiarly offensive by a most undignified comparison which startled every well-bred reader. No answer was possible to such a letter, and the matter rested until the death of Mr. Motley caused it to be brought up once more for judgment.

The Honorable John Jay, in his tribute to the memory of Mr. Motley, read at a meeting of the New York Historical Society, vindicated his character against the attacks of the late executive in such a way as to leave an unfavorable impression as to the course of the government. Objection was made on this account to placing the tribute upon the minutes of the society. This led to a publication by Mr. Jay, entitled "Motley's Appeal to History," in which the propriety of the society's action is questioned, and the wrong done to him insisted upon and further illustrated.

The defence could not have fallen into better hands. Bearing a name which is, in itself, a title to the confidence of the American people, a diplomatist familiar with the rights, the customs, the traditions, the courtesies, which belong to the diplomatic service, the successor of Mr. Motley at Vienna, and therefore familiar with his official record, not self-made, which too commonly means half-made, but with careful training added to the instincts to which he had a right by inheritance, he could not allow the memory of such a scholar, of such a high-minded lover of his country, of so true a gentleman as Mr. Motley, to remain without

challenge under the stigma of official condemnation. I must refer to Mr. Jay's memorial tribute as printed in the newspapers of the day, and to his "Appeal" published in "The International Review," for his convincing presentation of the case, and content myself with a condensed statement of the general and special causes of complaint against Mr. Motley, and the explanations which suggest themselves, as abundantly competent to show the insufficiency of the reasons alleged by the government as an excuse for the manner in which he was treated.

The grounds of complaint against Mr. Motley are to be looked for:—

1. In the letter of Mr. Fish to Mr. Moran, of December 30, 1870.
2. In Mr. Bancroft Davis's letter to the New York "Herald" of January 4, 1878, entitled, "Mr. Sumner, the Alabama Claims and their Settlement."
3. The reported conversations of General Grant.
4. The reported conversations of Mr. Fish.

In considering Mr. Fish's letter, we must first notice its animus. The manner in which Dickens's two old women are brought in is not only indecorous, but it shows a state of feeling from which nothing but harsh interpretation of every questionable expression of Mr. Motley's was to be expected.

There is not the least need of maintaining the perfect fitness and rhetorical felicity of every phrase and every word used by him in his interview with Lord Clarendon. It is not to be expected that a minister, when about to hold a conversation with a representative of the government to which he is accredited, will commit his instructions to memory and recite them, like a school-boy "speaking his piece." He will give them more or less in his own language, amplifying, it may be, explaining, illustrating, at any rate paraphrasing in some degree, but endeavoring to convey an idea of their essential meaning. In fact, as any one can see, a conversation between two persons must necessarily imply a certain amount of extemporization on the part of both. I do not believe any long and important conference was ever had between two able men without each of them feeling that he had not spoken exactly in all respects as he would if he could say all over again.

Doubtless, therefore, Mr. Motley's report of his conversation shows that some of his expressions might have been improved, and others might as well have been omitted. A man does not change his temperament on taking office. General Jackson still swore "by the Eternal," and his illustrious military successor of a more recent period seems, by his own showing, to have been able to sudden impulses of excitement. It might be said of Motley, as it was said of Shakespeare by Ben Jonson, "aliquando sufflaminandus erat." Yet not too much must be made of this concession. Only a determination to make out a case could, as it seems to me, have framed such an indictment as that which the secretary constructed by stringing together a slender list of pretended peccadillos. One instance will show the extreme slightness which characterizes many of the grounds of inculpation:—

The instructions say, "The government, in rejecting the recent convention, abandons neither its own claims nor those of its citizens," etc.

Mr. Motley said, in the course of his conversation, "At present, the United States government, while withdrawing neither its national claims nor the claims of its individual citizens against the British government," etc.

Mr. Fish says, "The determination of this government not to abandon its claims nor those of its citizens was stated parenthetically, and in such a subordinate way as not necessarily to attract the attention of Lord Clarendon."

What reported conversation can stand a captious criticism like this? Are there not two versions of the ten commandments which were given out in the thunder and smoke of Sinai, and would the secretary hold that this would have been a sufficient reason to recall Moses from his "Divine Legation" at the court of the Almighty?

There are certain expressions which, as Mr. Fish shows them apart from their connection, do very certainly seem in bad taste, if not actually indiscreet and unjustifiable. Let me give an example:—

"Instead of expressing the hope entertained by this government that there would be an early, satisfactory, and friendly settlement of the questions at issue, he volunteered the unnecessary, and from the manner in which it was thrust in, the highly objectionable statement that the United States government had no insidious purposes," etc.

This sounds very badly as Mr. Fish puts it; let us see how it stands in its proper connection:—

"He [Lord Clarendon] added with some feeling, that in his opinion it would be highly objectionable that the question should be hung up on a peg, to be taken down at some convenient moment for us, when it might be difficult for the British government to enter upon its solution, and when they might go into the debate at a disadvantage. These were, as nearly as I can remember, his words, and I replied very earnestly that I had already answered that question when I said that my instructions were to propose as brief a delay as would probably be requisite for the cooling of passions and for producing the calm necessary for discussing the defects of the old treaty and a basis for a new one. The United States government had no insidious purposes," etc.

Is it not evident that Lord Clarendon suggested the idea which Mr. Motley repelled as implying an insidious mode of action? Is it not just as clear that Mr. Fish's way of reproducing the expression without the insinuation which called it forth is a practical misstatement which does Mr. Motley great wrong?

One more example of the method of wringing a dry cloth for drops of evidence ought to be enough to show the whole spirit of the paper.

Mr. Fish, in his instructions:—

"It might, indeed, well have occurred in the event of the selection

by lot of the arbitrator or umpire in different cases, involving however precisely the same principles, that different awards, resting upon antagonistic principles, might have been made."

Mr. Motley, in the conversation with Lord Clarendon:—

"I called his lordship's attention to your very judicious suggestion that the throwing of the dice for umpires might bring about opposite decisions in cases arising out of identical principles. He agreed entirely that no principle was established by the treaty, but that the throwing of dice or drawing of lots was not a new invention on that occasion, but a not uncommon method in arbitrations. I only expressed the opinion that such an aleatory process seemed an unworthy method in arbitrations," etc.

Mr. Fish, in his letter to Mr. Moran:—

"That he had in his mind at that interview something else than his letter of instructions from this department would appear to be evident, when he says that 'he called his lordship's attention to your [my] very judicious suggestion that the throwing of dice for umpire might bring about opposite decisions.' The instructions which Mr. Motley received from me contained no suggestion about throwing of dice.' That idea is embraced in the suggestive words 'aleatory process' (adopted by Mr. Motley), but previously applied in a speech made in the Senate on the question of ratifying the treaty."

Charles Sumner's Speech on the Johnson-Clarendon Treaty, April 13, 1869:

"In the event of failure to agree, the arbitrator is determined 'by lot' out of two persons named by each side. Even if this aleatory proceeding were a proper device in the umpirage of private claims, it is strongly inconsistent with the solemnity which belongs to the present question."

It is "suggestive" that the critical secretary, so keen in detecting conversational inaccuracies, having but two words to quote from a printed document, got one of them wrong. But this trivial comment must not lead the careful reader to neglect to note how much is made of what is really nothing at all. The word aleatory, whether used in its original and limited sense, or in its derived extension as a technical term of the civil law, was appropriate and convenient; one especially likely to be remembered by any person who had read Mr. Sumner's speech,—and everybody had read it; the secretary himself doubtless got the suggestion of determining the question "by lot" from it. What more natural than that it should be used again when the subject of appealing to chance came up in conversation? It "was an excellent good word before it was ill-sorted," and we were fortunate in having a minister who was scholar enough to know what it meant. The language used by Mr. Motley conveyed the idea of his instructions plainly enough, and threw in a compliment to their author which should have saved this passage at least from the wringing process. The example just given is, like the concession of belligerency to the insurgents by Great Britain, chiefly important as "showing animus."

It is hardly necessary to bring forward other instances of virtual misrepresentation. If Mr. Motley could have talked his conversation over again, he would very probably have changed some expressions. But he felt bound to repeat the interview exactly as it occurred, with all the errors to which its extemporaneous character exposed it. When a case was to be made out against him, the secretary wrote, December 30, 1870:

"Well might he say, as he did in a subsequent dispatch on the 15th of July, 1869, that he had gone beyond the strict letter of his instructions. He might have added, in direct opposition to their temper and spirit."

Of the same report the secretary had said, June 28, 1869: "Your general presentation and treatment of the several subjects discussed in that interview meet the approval of this department." This general approval is qualified by mild criticism of a single statement as not having been conveyed in "precise conformity" to the President's view. The minister was told he might be well content to rest the question on the very forcible presentation he had made of the American side of the question, and that if there were expressions used stronger than were required by his instructions, they were in the right direction. The mere fact that a minute of this conversation was confidentially submitted to Lord Clarendon in order that our own government might have his authority for the accuracy of the record, which was intended exclusively for its own use, and that this circumstance was overlooked and not reported to the government until some weeks afterward, are the additional charges against Mr. Motley. The submission of the dispatch containing an account of the interview, the secretary says, is not inconsistent with diplomatic usage, but it is inconsistent with the duty of a minister not to inform his government of that submission. "Mr. Motley submitted the draft of his No. 8 to Lord Clarendon, and failed to communicate that fact to his government." He did inform Mr. Fish, at any rate, on the 30th of July, and alleged "inadvertence" as the reason for his omission to do it before.

Inasmuch as submitting the dispatch was not inconsistent with diplomatic usage, nothing seems left to find fault with but the not very long delay in mentioning the fact, or in his making the note "private and confidential," as is so frequently done in diplomatic correspondence.

Such were the grounds of complaint. On the strength of the conversation which had met with the general approval of the government, tempered by certain qualifications, and of the omission to report immediately to the government the fact of its verification by Lord Clarendon, the secretary rests the case against Mr. Motley. On these grounds it was that, according to him, the President withdrew all right to discuss the Alabama question from the minister whose dismissal was now only a question of time. But other evidence comes in

here.

Mr. Motley says:—

"It was, as I supposed, understood before my departure for England, although not publicly announced, that the so-called Alabama negotiations, whenever renewed, should be conducted at Washington, in case of the consent of the British government."

Mr. Sumner says, in his "Explanation in Reply to an Assault:"—

"The secretary in a letter to me at Boston, dated at Washington, October 9, 1869, informs me that the discussion of the question was withdrawn from London 'because (the italics are the secretary's) we think that when renewed it can be carried on here with a better prospect of settlement, than where the late attempt at a convention which resulted so disastrously and was conducted so strangely was had;' and what the secretary thus wrote he repeated in conversation when we met, carefully making the transfer to Washington depend upon our advantage here, from the presence of the Senate,—thus showing that the pretext put forth to wound Mr. Motley was an afterthought."

Again we may fairly ask how the government came to send a dispatch like that of September 25, 1869, in which the views and expressions for which Mr. Motley's conversation had been criticised were so nearly reproduced, and with such emphasis that Mr. Motley says, in a letter to me, dated April 8, 1871, "It not only covers all the ground which I ever took, but goes far beyond it. No one has ever used stronger language to the British government than is contained in that dispatch. . . . It is very able and well worth your reading. Lord Clarendon called it to me 'Sumner's speech over again.' It was thought by the English cabinet to have 'out-Sumnered Sumner,' and now our government, thinking that every one in the United States had forgotten the dispatch, makes believe that I was removed because my sayings and doings in England were too much influenced by Sumner!" Mr. Motley goes on to speak of the report that an offer of his place in England was made to Sumner "to get him out of the way of San Domingo." The facts concerning this offer are now sufficiently known to the public.

Here I must dismiss Mr. Fish's letter to Mr. Moran, having, as I trust, sufficiently shown the spirit in which it was written and the strained interpretations and manifest overstatements by which it attempts to make out its case against Mr. Motley. I will not parade the two old women, whose untimely and unseemly introduction into the dress-circle of diplomacy was hardly to have been expected of the high official whose name is at the bottom of this paper. They prove nothing, they disprove nothing, they illustrate nothing—except that a statesman may forget himself. Neither will I do more than barely allude to the unfortunate reference to the death of Lord Clarendon as connected with Mr. Motley's removal, so placidly disposed of by a sentence or two in the London "Times" of January 24, 1871. I think we may consider ourselves ready for the next witness.

Mr. J. C. Bancroft Davis, Assistant Secretary of State under President Grant and Secretary Fish, wrote a letter to the New York "Herald," under the date of January 4, 1878, since reprinted as a pamphlet and entitled "Mr. Sumner, the Alabama Claims and their Settlement." Mr. Sumner was never successfully attacked when living,—except with a bludgeon,—and his friends have more than sufficiently vindicated him since his death. But Mr. Motley comes in for his share of animadversion in Mr. Davis's letter. He has nothing of importance to add to Mr. Fish's criticisms on the interview with Lord Clarendon. Only he brings out the head and front of Mr. Motley's offending by italicizing three very brief passages from his conversation at this interview; not discreetly, as it seems to me, for they will not bear the strain that is put upon them. These are the passages:—

1. "but that such, measures must always be taken with a full view of the grave responsibilities assumed." 2. "and as being the fountain head of the disasters which had been caused to the American people." 3. "as the fruits of the proclamation."

1. It is true that nothing was said of responsibility in Mr. Motley's instructions. But the idea was necessarily involved in their statements. For if, as Mr. Motley's instructions say, the right of a power "to define its own relations," etc., when a civil conflict has arisen in another state depends on its (the conflict's) having "attained a sufficient complexity, magnitude, and completeness," inasmuch as that Power has to judge whether it has or has not fulfilled these conditions, and is of course liable to judge wrong, every such act of judgment must be attended with grave responsibilities. The instructions say that "the necessity and propriety of the original concession of belligerency by Great Britain at the time it was made have been contested and are not admitted." It follows beyond dispute that Great Britain may in this particular case have incurred grave responsibilities; in fact, the whole negotiations implied as much. Perhaps Mr. Motley need not have used the word "responsibilities." But considering that the government itself said in dispatch No. 70, September 25, 1869, "The President does not deny, on the contrary he maintains, that every sovereign power decides for itself on its responsibility whether or not it will, at a given time, accord the status of belligerency," etc., it was hardly worth while to use italics about Mr. Motley's employment of the same language as constituting a grave cause of offence.

2. Mr. Motley's expression, "as being the fountain head of the disasters," is a conversational paraphrase of the words of his instructions, "as it shows the beginning and the animus of that course of conduct which resulted so disastrously," which is not "in precise conformity" with his instructions, but is just such a variation as is to be expected when one is talking with another and using the words that suggest themselves at the moment, just as the familiar expression, "hung up on a peg," probably suggested itself to Lord Clarendon.

3. "The fruits of the proclamation" is so inconsiderable a variation on the text of the instructions, "supplemented by acts causing direct damage," that the secretary's hint about want of precise conformity seems hardly to have been called for.

It is important to notice this point in the instructions: With other powers Mr. Motley was to take the

position that the "recognition of the insurgents' state of war" was made "no ground of complaint;" with Great Britain that the cause of grievance was "not so much" placed upon the issuance of this recognition as upon her conduct under, and subsequent to, such recognition.

There is no need of maintaining the exact fitness of every expression used by Mr. Motley. But any candid person who will carefully read the government's dispatch No. 70, dated September 25, 1869, will see that a government holding such language could find nothing in Mr. Motley's expressions in a conversation held at his first official interview to visit with official capital punishment more than a year afterwards. If Mr. Motley had, as it was pretended, followed Sumner, Mr. Fish had "out-Sumnered" the Senator himself.

Mr. Davis's pamphlet would hardly be complete without a mysterious letter from an unnamed writer, whether a faithless friend, a disguised enemy, a secret emissary, or an injudicious alarmist, we have no means of judging for ourselves. The minister appears to have been watched by somebody in London, as he was in Vienna. This somebody wrote a private letter in which he expressed "fear and regret that Mr. Motley's bearing in his social intercourse was throwing obstacles in the way of a future settlement." The charge as mentioned in Mr. Davis's letter is hardly entitled to our attention. Mr. Sumner considered it the work of an enemy, and the recollection of the M'Crackin letter might well have made the government cautious of listening to complaints of such a character. This Somebody may have been one whom we should call Nobody. We cannot help remembering how well 'Outis' served 'Odusseus' of old, when he was puzzled to extricate himself from an embarrassing position. 'Stat nominis umbra' is a poor showing for authority to support an attack on a public servant exposed to every form of open and insidious abuse from those who are prejudiced against his person or his birthplace, who are jealous of his success, envious of his position, hostile to his politics, dwarfed by his reputation, or hate him by the divine right of idiosyncrasy, always liable, too, to questioning comment from well-meaning friends who happen to be suspicious or sensitive in their political or social relations.

The reported sayings of General Grant and of Mr. Fish to the correspondents who talked with them may be taken for what they are worth. They sound naturally enough to have come from the speakers who are said to have uttered them. I quote the most important part of the Edinburgh letter, September 11, 1877, to the New York "Herald." These are the words attributed to General Grant:—

"Mr. Motley was certainly a very able, very honest gentleman, fit to hold any official position. But he knew long before he went out that he would have to go. When I was making these appointments, Mr. Sumner came to me and asked me to appoint Mr. Motley as minister to the court of St. James. I told him I would, and did. Soon after Mr. Sumner made that violent speech about the Alabama claims, and the British government was greatly offended. Mr. Sumner was at the time chairman of the committee on foreign affairs. Mr. Motley had to be instructed. The instructions were prepared very carefully, and after Governor Fish and I had gone over them for the last time I wrote an addendum charging him that above all things he should handle the subject of the Alabama claims with the greatest delicacy. Mr. Motley instead of obeying his explicit instructions, deliberately fell in line with Sumner, and thus added insult to the previous injury. As soon as I heard of it I went over to the State Department and told Governor Fish to dismiss Motley at once. I was very angry indeed, and I have been sorry many a time since that I did not stick to my first determination. Mr. Fish advised delay because of Sumner's position in the Senate and attitude on the treaty question. We did not want to stir him up just then. We dispatched a note of severe censure to Motley at once and ordered him to abstain from any further connection with that question. We thereupon commenced negotiations with the British minister at Washington, and the result was the joint high commission and the Geneva award. I supposed Mr. Motley would be manly enough to resign after that snub, but he kept on till he was removed. Mr. Sumner promised me that he would vote for the treaty. But when it was before the Senate he did all he could to beat it."

General Grant talked again at Cairo, in Egypt.

"Grant then referred to the statement published at an interview with him in Scotland, and said the publication had some omissions and errors. He had no ill-will towards Mr. Motley, who, like other estimable men, made mistakes, and Motley made a mistake which made him an improper person to hold office under me."

"It is proper to say of me that I killed Motley, or that I made war upon Sumner for not supporting the annexation of San Domingo. But if I dare to answer that I removed Motley from the highest considerations of duty as an executive; if I presume to say that he made a mistake in his office which made him no longer useful to the country; if Fish has the temerity to hint that Sumner's temper was so unfortunate that business relations with him became impossible, we are slandering the dead."

"Nothing but Mortimer." Those who knew both men—the Ex-President and the late Senator—would agree, I do not doubt, that they would not be the most promising pair of human beings to make harmonious members of a political happy family. "Cedant arma togae," the life-long sentiment of Sumner, in conflict with "Stand fast and stand sure," the well-known device of the clan of Grant, reminds one of the problem of an irresistible force in collision with an insuperable resistance. But the President says,—or is reported as saying,—"I may be blamed for my opposition to Mr. Sumner's tactics, but I was not guided so much by reason of his personal hatred of myself, as I was by a desire to protect our national interests in diplomatic affairs."

"It would be useless," says Mr. Davis in his letter to the "Herald," "to enter into a controversy whether the President may or may not have been influenced in the final determination of the moment for requesting

Motley's resignation by the feeling caused by Sumner's personal hostility and abuse of himself." Unfortunately, this controversy had been entered into, and the idleness of suggesting any relation of cause and effect between Mr. Motley's dismissal and the irritation produced in the President's mind by the rejection of the San Domingo treaty—which rejection was mainly due to Motley's friend Sumner's opposition—strongly insisted upon in a letter signed by the Secretary of State. Too strongly, for here it was that he failed to remember what was due to his office, to himself, and to the gentleman of whom he was writing; if indeed it was the secretary's own hand which held the pen, and not another's.

We might as well leave out the wrath of Achilles from the Iliad, as the anger of the President with Sumner from the story of Motley's dismissal. The sad recital must always begin with M———-. He was, he is reported as saying, "very angry indeed" with Motley because he had, fallen in line with Sumner. He couples them together in his conversation as closely as Chang and Eng were coupled. The death of Lord Clarendon would have covered up the coincidence between the rejection of the San Domingo treaty and Mr. Motley's dismissal very neatly, but for the inexorable facts about its date, as revealed by the London "Times." It betrays itself as an afterthought, and its failure as a defence reminds us too nearly of the trial in which Mr. Webster said suicide is confession.

It is not strange that the spurs of the man who had so lately got out of the saddle should catch in the scholastic robe of the man on the floor of the Senate. But we should not have looked for any such antagonism between the Secretary of State and the envoy to Great Britain. On the contrary, they must have had many sympathies, and it must have cost the secretary pain, as he said it did, to be forced to communicate with Mr. Moran instead of with Mr. Motley.

He, too, was inquired of by one of the emissaries of the American Unholy Inquisition. His evidence is thus reported:

"The reason for Mr. Motley's removal was found in considerations of state. He misrepresented the government on the Alabama question, especially in the two speeches made by him before his arrival at his post."

These must be the two speeches made to the American and the Liverpool chambers of commerce. If there is anything in these short addresses beyond those civil generalities which the occasion called out, I have failed to find it. If it was in these that the reason of Mr. Motley's removal was to be looked for, it is singular that they are not mentioned in the secretary's letter to Mr. Moran, or by Mr. Davis in his letter to the New York "Herald." They must have been as unsuccessful as myself in the search after anything in these speeches which could be construed into misinterpretation of the government on the Alabama question.

We may much more readily accept "considerations of state" as a reason for Mr. Motley's removal. Considerations of state have never yet failed the axe or the bowstring when a reason for the use of those convenient implements was wanted, and they are quite equal to every emergency which can arise in a republican autocracy. But for the very reason that a minister is absolutely in the power of his government, the manner in which that power is used is always open to the scrutiny, and, if it has been misused, to the condemnation, of a tribunal higher than itself; a court that never goes out of office, and which no personal feelings, no lapse of time, can silence.

The ostensible grounds on which Mr. Motley was recalled are plainly insufficient to account for the action of the government. If it was in great measure a manifestation of personal feeling on the part of the high officials by whom and through whom the act was accomplished, it was a wrong which can never be repaired and never sufficiently regretted.

Stung by the slanderous report of an anonymous eavesdropper to whom the government of the day was not ashamed to listen, he had quitted Vienna, too hastily, it may be, but wounded, indignant, feeling that he had been unworthily treated. The sudden recall from London, on no pretext whatever but an obsolete and overstated incident which had ceased to have any importance, was under these circumstances a deadly blow. It fell upon "the new-healed wound of malice," and though he would not own it, and bore up against it, it was a shock from which he never fully recovered.

"I hope I am one of those," he writes to me from the Hague, in 1872, "who 'fortune's buffets and rewards can take with equal thanks.' I am quite aware that I have had far more than I deserve of political honors, and they might have had my post as a voluntary gift on my part had they remembered that I was an honorable man, and not treated me as a detected criminal deserves to be dealt with."

Mr. Sumner naturally felt very deeply what he considered the great wrong done to his friend. He says:—

"How little Mr. Motley merited anything but respect and courtesy from the secretary is attested by all who know his eminent position in London, and the service he rendered to his country. Already the London press, usually slow to praise Americans when strenuous for their country, has furnished its voluntary testimony. The 'Daily News' of August 16, 1870, spoke of the insulted minister in these terms:—

"We are violating no confidence in saying that all the hopes of Mr. Motley's official residence in England have been amply fulfilled, and that the announcement of his unexpected and unexplained recall was received with extreme astonishment and unfeigned regret. The vacancy he leaves cannot possibly be filled by a minister more sensitive to the honor of his government, more attentive to the interests of his country, and more capable of uniting the most vigorous performance of his public duties with the high-bred courtesy and conciliatory tact and temper that make those duties easy and successful. Mr. Motley's successor will find his mission wonderfully facilitated by the firmness and discretion that have presided over the conduct of American affairs in this country during too brief a term, too suddenly and unaccountably concluded."

No man can escape being found fault with when it is necessary to make out a case against him. A diplomatist is watched by the sharpest eyes and commented on by the most merciless tongues. The best and wisest has his defects, and sometimes they would seem to be very grave ones if brought up against him in the form of accusation. Take these two portraits, for instance, as drawn by John Quincy Adams. The first is that of Stratford Canning, afterwards Lord Stratford de Redcliffe:—

"He is to depart to-morrow. I shall probably see him no more. He is a proud, high-tempered Englishman, of good but not extraordinary parts; stubborn and punctilious, with a disposition to be overbearing, which I have often been compelled to check in its own way. He is, of all the foreign ministers with whom I have had occasion to treat, the man who has most severely tried my temper. Yet he has been long in the diplomatic career, and treated with governments of the most opposite characters. He has, however, a great respect for his word, and there is nothing false about him. This is an excellent quality for a negotiator. Mr. Canning is a man of forms, studious of courtesy, and tenacious of private morals. As a diplomatic man, his great want is suppleness, and his great virtue is sincerity."

The second portrait is that of the French minister, Hyde de Neuville:—

"No foreign minister who ever resided here has been so universally esteemed and beloved, nor have I ever been in political relations with any foreign statesman of whose moral qualities I have formed so good an opinion, with the exception of Count Romanzoff. He has not sufficient command of his temper, is quick, irritable, sometimes punctilious, occasionally indiscreet in his discourse, and tainted with Royalist and Bourbon prejudices. But he has strong sentiments of honor, justice, truth, and even liberty. His flurries of temper pass off as quickly as they rise. He is neither profound nor sublime nor brilliant; but a man of strong and good feelings, with the experience of many vicissitudes of fortune, a good but common understanding, and good intentions biassed by party feelings, occasional interests, and personal affections."

It means very little to say that a man has some human imperfections, or that a public servant might have done some things better. But when a questionable cause is to be justified, the victim's excellences are looked at with the eyes of Liliput and his failings with those of Brobdingnag.

The recall of a foreign minister for alleged misconduct in office is a kind of capital punishment. It is the nearest approach to the Sultan's bowstring which is permitted to the chief magistrate of our Republic. A general can do nothing under martial law more peremptory than a President can do with regard to the public functionary whom he has appointed with the advice and consent of the Senate, but whom he can officially degrade and disgrace at his own pleasure for insufficient cause or for none at all. Like the centurion of Scripture, he says Go, and he goeth. The nation's representative is less secure in his tenure of office than his own servant, to whom he must give warning of his impending dismissal.

"A breath unmakes him as a breath has made."

The chief magistrate's responsibility to duty, to the fellow-citizen at his mercy, to his countrymen, to mankind, is in proportion to his power. His prime minister, the agent of his edicts, should feel bound to withstand him if he seeks to gratify a personal feeling under the plea of public policy, unless the minister, like the slaves of the harem, is to find his qualification for office in leaving his manhood behind him.

The two successive administrations, which treated Mr. Motley in a manner unworthy of their position and cruel, if not fatal to him, have been heard, directly or through their advocates. I have attempted to show that the defence set up for their action is anything but satisfactory. A later generation will sit in judgment upon the evidence more calmly than our own. It is not for a friend, like the writer, to anticipate its decision, but unless the reasons alleged to justify his treatment, and which have so much the air of afterthoughts, shall seem stronger to that future tribunal than they do to him, the verdict will be that Mr. Motley was twice sacrificed to personal feelings which should never have been cherished by the heads of the government, and should never have been countenanced by their chief advisers.

Volume III.

XXII. 1874. AEt. 60.

"LIFE OF JOHN OF BARNEVELD."—CRITICISMS.—GROEN VAN PRINSTERER.

The full title of Mr. Motley's next and last work is "The Life and Death of John of Barneveld, Advocate of Holland; with a View of the Primary Causes and Movements of the Thirty Years' War."

In point of fact this work is a history rather than a biography. It is an interlude, a pause between the acts which were to fill out the complete plan of the "Eighty Years' Tragedy," and of which the last act, the Thirty Years' War, remains unwritten. The "Life of Barneveld" was received as a fitting and worthy continuation of the series of intellectual labor in which he was engaged. I will quote but two general expressions of approval from the two best known British critical reviews. In connection with his previous works, it forms, says "The London Quarterly," "a fine and continuous story, of which the writer and the nation celebrated by him have equal reason to be proud; a narrative which will remain a prominent ornament of American genius, while it has permanently enriched English literature on this as well as on the other side of the Atlantic."

"The Edinburgh Review" speaks no less warmly: "We can hardly give too much appreciation to that subtle alchemy of the brain which has enabled him to produce out of dull, crabbed, and often illegible state papers, the vivid, graphic, and sparkling narrative which he has given to the world."

In a literary point of view, M. Groen van Prinsterer, whose elaborate work has been already referred to, speaks of it as perhaps the most classical of Motley's productions, but it is upon this work that the force of his own and other Dutch criticisms has been chiefly expended.

The key to this biographical history or historical biography may be found in a few sentences from its opening chapter.

"There have been few men at any period whose lives have been more closely identical than his [Barneveld's] with a national history. There have been few great men in any history whose names have become less familiar to the world, and lived less in the mouths of posterity. Yet there can be no doubt that if William the Silent was the founder of the independence of the United Provinces, Barneveld was the founder of the Commonwealth itself. . . .

"Had that country of which he was so long the first citizen maintained until our own day the same proportional position among the empires of Christendom as it held in the seventeenth century, the name of John of Barneveld would have perhaps been as familiar to all men as it is at this moment to nearly every inhabitant of the Netherlands. Even now political passion is almost as ready to flame forth, either in ardent affection or enthusiastic hatred, as if two centuries and a half had not elapsed since his death. His name is so typical of a party, a polity, and a faith, so indelibly associated with a great historical cataclysm, as to render it difficult even for the grave, the conscientious, the learned, the patriotic, of his own compatriots to speak of him with absolute impartiality.

"A foreigner who loves and admires all that is great and noble in the history of that famous republic, and can have no hereditary bias as to its ecclesiastical or political theories, may at least attempt the task with comparative coldness, although conscious of inability to do thorough justice to a most complex subject."

With all Mr. Motley's efforts to be impartial, to which even his sternest critics bear witness, he could not help becoming a partisan of the cause which for him was that of religious liberty and progress, as against the accepted formula of an old ecclesiastical organization. For the quarrel which came near being a civil war, which convulsed the state, and cost Barneveld his head, had its origin in a difference on certain points, and more especially on a single point, of religious doctrine.

As a great river may be traced back until its fountainhead is found in a thread of water streaming from a cleft in the rocks, so a great national movement may sometimes be followed until its starting-point is found in the cell of a monk or the studies of a pair of wrangling professors.

The religious quarrel of the Dutchmen in the seventeenth century reminds us in some points of the strife between two parties in our own New England, sometimes arraying the "church" on one side against the "parish," or the general body of worshippers, on the other. The portraits of Gomarus, the great orthodox champion, and Arminius, the head and front of the "liberal theology" of his day, as given in the little old quarto of Meursius, recall two ministerial types of countenance familiar to those who remember the earlier years of our century.

Under the name of "Remonstrants" and "Contra-Remonstrants,"—Arminians and old-fashioned Calvinists, as we should say,—the adherents of the two Leyden professors disputed the right to the possession of the churches, and the claim to be considered as representing the national religion. Of the seven United Provinces, two, Holland and Utrecht, were prevailingly Arminian, and the other five Calvinistic. Barneveld, who, under the title of Advocate, represented the province of Holland, the most important of them all, claimed for each province a right to determine its own state religion. Maurice the Stadholder, son of William the Silent, the military chief of the republic, claimed the right for the States-General. 'Cujus regio ejus religio' was then the accepted public doctrine of Protestant nations. Thus the provincial and the general governments were brought into conflict by their creeds, and the question whether the republic was a confederation or a nation, the same question which has been practically raised, and for the time at least settled, in our own republic, was in some way to be decided. After various disturbances and acts of violence by both parties, Maurice, representing the States-General, pronounced for the Calvinists or Contra-Remonstrants, and took possession of one of the great churches, as an assertion of his authority. Barneveld, representing the Arminian or Remonstrant provinces, levied a body of mercenary soldiers in several of the cities. These were disbanded by Maurice, and afterwards by an act of the States-General. Barneveld was apprehended, imprisoned, and executed, after an examination which was in no proper sense a trial. Grotius, who was on the Arminian side and involved in the inculpatated proceedings, was also arrested and imprisoned. His escape, by a stratagem successfully repeated by a slave in our own times, may challenge comparison for its romantic interest with any chapter of fiction. How his wife packed him into the chest supposed to contain the folios of the great oriental scholar Erpenius, how the soldiers wondered at its weight and questioned whether it did

not hold an Arminian, how the servant-maid, Elsje van Houwening, quick-witted as Morgiana of the "Forty Thieves," parried their questions and convoyed her master safely to the friendly place of refuge,—all this must be read in the vivid narrative of the author.

The questions involved were political, local, personal, and above all religious. Here is the picture which Motley draws of the religious quarrel as it divided the people:—

"In burghers' mansions, peasants' cottages, mechanics' back-parlors; on board herring-smacks, canal-boats, and East Indiemen; in shops, counting-rooms, farm-yards, guard-rooms, alehouses; on the exchange, in the tennis court, on the mall; at banquets, at burials, christenings, or bridals; wherever and whenever human creatures met each other, there was ever to be found the fierce wrangle of Remonstrant and Contra-Remonstrant, the hissing of red-hot theological rhetoric, the pelting of hostile texts. The blacksmith's iron cooled on the anvil, the tinker dropped a kettle half mended, the broker left a bargain unclinched, the Scheveningen fisherman in his wooden shoes forgot the cracks in his pinkie, while each paused to hold high converse with friend or foe on fate, free-will, or absolute foreknowledge; losing himself in wandering mazes whence there was no issue. Province against province, city against city, family against family; it was one vast scene of bickering, denunciation, heart-burnings, mutual excommunication and hatred."

The religious grounds of the quarrel which set these seventeenth-century Dutchmen to cutting each other's throats were to be looked for in the "Five Points" of the Arminians as arrayed against the "Seven Points" of the Gomarites, or Contra-Remonstrants. The most important of the differences which were to be settled by fratricide seem to have been these:—

According to the Five Points, "God has from eternity resolved to choose to eternal life those who through his grace believe in Jesus Christ," etc. According to the Seven Points, "God in his election has not looked at the belief and the repentance of the elect," etc. According to the Five Points, all good deeds must be ascribed to God's grace in Christ, but it does not work irresistibly. The language of the Seven Points implies that the elect cannot resist God's eternal and unchangeable design to give them faith and steadfastness, and that they can never wholly and for always lose the true faith. The language of the Five Points is unsettled as to the last proposition, but it was afterwards maintained by the Remonstrant party that a true believer could, through his own fault, fall away from God and lose faith.

It must be remembered that these religious questions had an immediate connection with politics. Independently of the conflict of jurisdiction, in which they involved the parties to the two different creeds, it was believed or pretended that the new doctrines of the Remonstrants led towards Romanism, and were allied with designs which threatened the independence of the country. "There are two factions in the land," said Maurice, "that of Orange and that of Spain, and the two chiefs of the Spanish faction are those political and priestly Arminians, Uytenbogaert and Oldenbarneveld."

The heads of the two religious and political parties were in such hereditary, long-continued, and intimate relations up to the time when one signed the other's death-warrant, that it was impossible to write the life of one without also writing that of the other. For his biographer John of Barneveld is the true patriot, the martyr, whose cause was that of religious and political freedom. For him Maurice is the ambitious soldier who hated his political rival, and never rested until this rival was brought to the scaffold.

The questions which agitated men's minds two centuries and a half ago are not dead yet in the country where they produced such estrangement, violence, and wrong. No stranger could take them up without encountering hostile criticism from one party or the other. It may be and has been conceded that Mr. Motley writes as a partisan,—a partisan of freedom in politics and religion, as he understands freedom. This secures him the antagonism of one class of critics. But these critics are themselves partisans, and themselves open to the cross-fire of their antagonists. M. Groen van Prinsterer, "the learned and distinguished" editor of the "Archives et Correspondance" of the Orange and Nassau family, published a considerable volume, before referred to, in which many of Motley's views are strongly controverted. But he himself is far from being in accord with "that eminent scholar," M. Bakhuyzen van den Brink, whose name, he says, is celebrated enough to need no comment, or with M. Fruin, of whose impartiality and erudition he himself speaks in the strongest terms. The ground upon which he is attacked is thus stated in his own words:—

"People have often pretended to find in my writings the deplorable influence of an extreme Calvinism. The Puritans of the seventeenth century are my fellow-religionists. I am a sectarian and not an historian."

It is plain enough to any impartial reader that there are at least plausible grounds for this accusation against Mr. Motley's critic. And on a careful examination of the formidable volume, it becomes obvious that Mr. Motley has presented a view of the events and the personages of the stormy epoch with which he is dealing, which leaves a battle-ground yet to be fought over by those who come after him. The dispute is not and cannot be settled.

The end of all religious discussion has come when one of the parties claims that it is thinking or acting under immediate Divine guidance. "It is God's affair, and his honor is touched," says William Lewis to Prince Maurice. Mr. Motley's critic is not less confident in claiming the Almighty as on the side of his own views. Let him state his own ground of departure:—

"To show the difference, let me rather say the contrast, between the point of view of Mr. Motley and my own, between the Unitarian and the Evangelical belief. I am issue of CALVIN, child of the Awakening (revel). Faithful to the device of the Reformers: Justification by faith alone, and the Word of God endures eternally. I consider history from the point of view of Merle d'Aubigne, Chalmers, Guizot. I desire to be disciple and witness of our Lord and Saviour, Jesus Christ."

He is therefore of necessity antagonistic to a writer whom he describes in such words as these:—

"Mr. Motley is liberal and rationalist.

"He becomes, in attacking the principle of the Reformation, the passionate opponent of the Puritans and of Maurice, the ardent apologist of Barnevelt and the Arminians.

"It is understood, and he makes no mystery of it, that he inclines towards the vague and undecided doctrine of the Unitarians."

What M. Groen's idea of Unitarians is may be gathered from the statement about them which he gets from a letter of De Tocqueville.

"They are pure deists; they talk about the Bible, because they do not wish to shock too severely public opinion, which is prevailingly Christian. They have a service on Sundays; I have been there. At it they read verses from Dryden or other English poets on the existence of God and the immortality of the soul. They deliver a discourse on some point of morality, and all is said."

In point of fact the wave of protest which stormed the dikes of Dutch orthodoxy in the seventeenth century stole gently through the bars of New England Puritanism in the eighteenth.

"Though the large number," says Mr. Bancroft, "still acknowledged the fixedness of the divine decrees, and the resistless certainty from all eternity of election and of reprobation, there were not wanting, even among the clergy, some who had modified the sternness of the ancient doctrine by making the self-direction of the active powers of man with freedom of inquiry and private judgment the central idea of a protest against Calvinism."

Protestantism, cut loose from an infallible church, and drifting with currents it cannot resist, wakes up once or oftener in every century, to find itself in a new locality. Then it rubs its eyes and wonders whether it has found its harbor or only lost its anchor. There is no end to its disputes, for it has nothing but a fallible vote as authority for its oracles, and these appeal only to fallible interpreters.

It is as hard to contend in argument against "the oligarchy of heaven," as Motley calls the Calvinistic party, as it was formerly to strive with them in arms.

To this "aristocracy of God's elect" belonged the party which framed the declaration of the Synod of Dort; the party which under the forms of justice shed the blood of the great statesman who had served his country so long and so well. To this chosen body belonged the late venerable and truly excellent as well as learned M. Groen van Prinsterer, and he exercised the usual right of examining in the light of his privileged position the views of a "liberal" and "rationalist" writer who goes to meeting on Sunday to hear verses from Dryden. This does not diminish his claim for a fair reading of the "intimate correspondence," which he considers Mr. Motley has not duly taken into account, and of the other letters to be found printed in his somewhat disjointed and fragmentary volume.

This "intimate correspondence" shows Maurice the Stadholder indifferent and lax in internal administration and as being constantly advised and urged by his relative Count William of Nassau. This need of constant urging extends to religious as well as other matters, and is inconsistent with M. Groen van Prinsterer's assertion that the question was for Maurice above all religious, and for Barnevelt above all political. Whether its negative evidence can be considered as neutralizing that which is adduced by Mr. Motley to show the Stadholder's hatred of the Advocate may be left to the reader who has just risen from the account of the mock trial and the swift execution of the great and venerable statesman. The formal entry on the record upon the day of his "judicial murder" is singularly solemn and impressive:—

"Monday, 13th May, 1619. To-day was executed with the sword here in the Hague, on a scaffold thereto erected in the Binnenhof before the steps of the great hall, Mr. John of Barnevelt, in his life Knight, Lord of Berkel, Rodenrys, etc., Advocate of Holland and West Friesland, for reasons expressed in the sentence and otherwise, with confiscation of his property, after he had served the state thirty-three years two months and five days, since 8th March, 1586; a man of great activity, business, memory, and wisdom,—yea, extraordinary in every respect. He that stands let him see that he does not fall."

Maurice gave an account of the execution of Barnevelt to Count William Lewis on the same day in a note "painfully brief and dry."

Most authors write their own biography consciously or unconsciously. We have seen Mr. Motley portraying much of himself, his course of life and his future, as he would have had it, in his first story. In this, his last work, it is impossible not to read much of his own external and internal personal history told under other names and with different accessories. The parallelism often accidentally or intentionally passes into divergence. He would not have had it too close if he could, but there are various passages in which it is plain enough that he is telling his own story.

Mr. Motley was a diplomatist, and he writes of other diplomatists, and one in particular, with most significant detail. It need not be supposed that he intends the "arch intriguer" Aerssens to stand for himself, or that he would have endured being thought to identify himself with the man of whose "almost devilish acts" he speaks so freely. But the sagacious reader—and he need not be very sharp-sighted—will very certainly see something more than a mere historical significance in some of the passages which I shall cite for him to reflect upon. Mr. Motley's standard of an ambassador's accomplishments may be judged from the following passage:—

"That those ministers [those of the Republic] were second to the

representatives of no other European state in capacity and accomplishment was a fact well known to all who had dealings with them, for the states required in their diplomatic representatives knowledge of history and international law, modern languages, and the classics, as well as familiarity with political customs and social courtesies; the breeding of gentlemen, in short, and the accomplishments of scholars."

The story of the troubles of Aerssens, the ambassador of the United Provinces at Paris, must be given at some length, and will repay careful reading.

"Francis Aerssens . . . continued to be the Dutch ambassador after the murder of Henry IV. . . . He was beyond doubt one of the ablest diplomatists in Europe. Versed in many languages, a classical student, familiar with history and international law, a man of the world and familiar with its usages, accustomed to associate with dignity and tact on friendliest terms with sovereigns, eminent statesmen, and men of letters; endowed with a facile tongue, a fluent pen, and an eye and ear of singular acuteness and delicacy; distinguished for unflagging industry and singular aptitude for secret and intricate affairs;—he had by the exercise of these various qualities during a period of nearly twenty years at the court of Henry the Great been able to render inestimable services to the Republic which he represented.

"He had enjoyed the intimacy and even the confidence of Henry IV., so far as any man could be said to possess that monarch's confidence, and his friendly relations and familiar access to the king gave him political advantages superior to those of any of his colleagues at the same court.

"Acting entirely and faithfully according to the instructions of the Advocate of Holland, he always gratefully and copiously acknowledged the privilege of being guided and sustained in the difficult paths he had to traverse by so powerful and active an intellect. I have seldom alluded in terms to the instructions and dispatches of the chief, but every position, negotiation, and opinion of the envoy—and the reader has seen many of them is pervaded by their spirit.

"It had become a question whether he was to remain at his post or return. It was doubtful whether he wished to be relieved of his embassy or not. The States of Holland voted 'to leave it to his candid opinion if in his free conscience he thinks he can serve the public any longer. If yes, he may keep his office one year more. If no, he may take leave and come home.'

"Surely the States, under the guidance of the Advocate, had thus acted with consummate courtesy towards a diplomatist whose position, from no apparent fault of his own, but by the force of circumstances,—and rather to his credit than otherwise,—was gravely compromised."

The Queen, Mary de' Medici, had a talk with him, got angry, "became very red in the face," and wanted to be rid of him.

"Nor was the envoy at first desirous of remaining. . . . Nevertheless, he yielded reluctantly to Barneveld's request that he should, for the time at least, remain at his post. Later on, as the intrigues against him began to unfold themselves, and his faithful services were made use of at home to blacken his character and procure his removal, he refused to resign, as to do so would be to play into the hands of his enemies, and, by inference at least, to accuse himself of infidelity to his trust. . . .

"It is no wonder that the ambassador was galled to the quick by the outrage which those concerned in the government were seeking to put upon him. How could an honest man fail to be overwhelmed with rage and anguish at being dishonored before the world by his masters for scrupulously doing his duty, and for maintaining the rights and dignity of his own country? He knew that the charges were but pretexts, that the motives of his enemies were as base as the intrigues themselves, but he also knew that the world usually sides with the government against the individual, and that a man's reputation is rarely strong enough to maintain itself unsullied in a foreign land when his own government stretches forth its hand, not to shield, but to stab him. . . .

"'I know,' he said, that this plot has been woven partly here in Holland and partly here by good correspondence in order to drive me from my post.

"'But as I have discovered this accurately, I have resolved to offer to my masters the continuance of my very humble service for such time and under such conditions as they may think good to prescribe. I prefer forcing my natural and private inclinations to giving an opportunity for the ministers of this kingdom to discredit us, and to my enemies to succeed in injuring me, and by fraud and malice to force me from my post. . . . I am truly sorry, being ready to retire, wishing to have an honorable testimony in recompense of my labors, that one is in such hurry to take advantage of my fall. . . . What envoy will ever dare to speak with vigor if he is not sustained by the government at home? . . . My enemies have

misrepresented my actions, and my language as passionate, exaggerated, mischievous, but I have no passion except for the service of my superiors.'

"Barneveld, from well-considered motives of public policy, was favoring his honorable recall. But he allowed a decorous interval of more than three years to elapse in which to terminate his affairs, and to take a deliberate departure from that French embassy to which the Advocate had originally promoted him, and in which there had been so many years of mutual benefit and confidence between the two statesmen. He used no underhand means. He did not abuse the power of the States-General which he wielded to cast him suddenly and brutally from the distinguished post which he occupied, and so to attempt to dishonor him before the world. Nothing could be more respectful and conciliatory than the attitude of the government from first to last towards this distinguished functionary. The Republic respected itself too much to deal with honorable agents whose services it felt obliged to dispense with as with vulgar malefactors who had been detected in crime. . . ."

"This work aims at being a political study. I would attempt to exemplify the influence of individual humors and passions—some of them among the highest, and others certainly the basest that agitate humanity—upon the march of great events, upon general historical results at certain epochs, and upon the destiny of eminent personages."

Here are two suggestive portraits:—

"The Advocate, while acting only in the name of a slender confederacy, was in truth, so long as he held his place, the prime minister of European Protestantism. There was none other to rival him, few to comprehend him, fewer still to sustain him. As Prince Maurice was at that time the great soldier of Protestantism, without clearly scanning the grandeur of the field in which he was a chief actor, or foreseeing the vastness of its future, so the Advocate was its statesman and its prophet. Could the two have worked together as harmoniously as they had done at an earlier day, it would have been a blessing for the common weal of Europe. But, alas! the evil genius of jealousy, which so often forbids cordial relations between soldier and statesman, already stood shrouded in the distance, darkly menacing the strenuous patriot, who was wearing his life out in exertions for what he deemed the true cause of progress and humanity. . . ."

"All history shows that the brilliant soldier of a republic is apt to have the advantage, in a struggle for popular affection and popular applause, over the statesman, however consummate. . . . The great battles and sieges of the prince had been on a world's theatre, had enchaind the attention of Christendom, and on their issue had frequently depended, or seemed to depend, the very existence of the nation. The labors of the statesman, on the contrary, had been comparatively secret. His noble orations and arguments had been spoken with closed doors to assemblies of colleagues, rather envoys than senators, . . . while his vast labors in directing both the internal administration and especially the foreign affairs of the commonwealth had been by their very nature as secret as they were perpetual and enormous."

The reader of the "Life of Barneveld" must judge for himself whether in these and similar passages the historian was thinking solely of Maurice, the great military leader, of Barneveld, the great statesman, and of Aerssens, the recalled ambassador. He will certainly find that there were "burning questions" for ministers to handle then as now, and recognize in "that visible atmosphere of power the poison of which it is so difficult to resist" a respiratory medium as well known to the nineteenth as to the seventeenth century.

XXIII. 1874-1877. AEt. 60-63.

DEATH OF MRS. MOTLEY.—LAST VISIT TO AMERICA.—ILLNESS AND DEATH.—LADY HARCOURT'S COMMUNICATION.

On the last day of 1874, the beloved wife, whose health had for some years been failing, was taken from him by death. She had been the pride of his happier years, the stay and solace of those which had so tried his sensitive spirit. The blow found him already weakened by mental suffering and bodily infirmity, and he never recovered from it. Mr. Motley's last visit to America was in the summer and autumn of 1875. During several weeks which he passed at Nahant, a seaside resort near Boston, I saw him almost daily. He walked feebly and with some little difficulty, and complained of a feeling of great weight in the right arm, which made writing laborious. His handwriting had not betrayed any very obvious change, so far as I had noticed in his letters. His features and speech were without any paralytic character. His mind was clear except when, as on one or two occasions, he complained of some confused feeling, and walked a few minutes in the open air to compose himself. His thoughts were always tending to revert to the almost worshipped companion from whom death had parted him a few months before. Yet he could often be led away to other topics, and in talking of them could be betrayed into momentary cheerfulness of manner. His long-enduring and all-pervading grief was not

more a tribute to the virtues and graces of her whom he mourned than an evidence of the deeply affectionate nature which in other relations endeared him to so many whose friendship was a title to love and honor.

I have now the privilege of once more recurring to the narrative of Mr. Motley's daughter, Lady Harcourt.

"The harassing work and mental distress of this time [after the recall from England], acting on an acutely nervous organization, began the process of undermining his constitution, of which we were so soon to see the results. It was not the least courageous act of his life, that, smarting under a fresh wound, tired and unhappy, he set his face immediately towards the accomplishment of fresh literary labor. After my sister's marriage in January he went to the Hague to begin his researches in the archives for John of Barneveld. The Queen of the Netherlands had made ready a house for us, and personally superintended every preparation for his reception. We remained there until the spring, and then removed to a house more immediately in the town, a charming old-fashioned mansion, once lived in by John de Witt, where he had a large library and every domestic comfort during the year of his sojourn. The incessant literary labor in an enervating climate with enfeebled health may have prepared the way for the first break in his constitution, which was to show itself soon after. There were many compensations in the life about him. He enjoyed the privilege of constant companionship with one of the warmest hearts and finest intellects which I have ever known in a woman,—the 'ame d'elite' which has passed beyond this earth. The gracious sentiment with which the Queen sought to express her sense of what Holland owed him would have been deeply felt even had her personal friendship been less dear to us all. From the King, the society of the Hague, and the diplomatic circle we had many marks of kindness. Once or twice I made short journeys with him for change of air to Amsterdam, to look for the portraits of John of Barneveld and his wife; to Bohemia, where, with the lingering hope of occupying himself with the Thirty Years' War, he looked carefully at the scene of Wallenstein's death near Prague, and later to Varzin in Pomerania for a week with Prince Bismarck, after the great events of the Franco-German war. In the autumn of 1872 we moved to England, partly because it was evident that his health and my mother's required a change; partly for private reasons to be near my sister and her children. The day after our arrival at Bournemouth occurred the rupture of a vessel on the lungs, without any apparently sufficient cause. He recovered enough to revise and complete his manuscript, and we thought him better, when at the end of July, in London, he was struck down by the first attack of the head, which robbed him of all after power of work, although the intellect remained untouched. Sir William Gull sent him to Cannes for the winter, where he was seized with a violent internal inflammation, in which I suppose there was again the indication of the lesion of blood-vessels. I am nearing the shadow now,—the time of which I can hardly bear to write. You know the terrible sorrow which crushed him on the last day of 1874,—the grief which broke his heart and from which he never rallied. From that day it seems to me that his life may be summed up in the two words,—patient waiting. Never for one hour did her spirit leave him, and he strove to follow its leading for the short and evil days left and the hope of the life beyond. I think I have never watched quietly and reverently the traces of one personal character remaining so strongly impressed on another nature. With herself—depreciation and unselfishness she would have been the last to believe how much of him was in her very existence; nor could we have realized it until the parting came. Henceforward, with the mind still there, but with the machinery necessary to set it in motion disturbed and shattered, he could but try to create small occupations with which to fill the hours of a life which was only valued for his children's sake. Kind and loving friends in England and America soothed the passage, and our gratitude for so many gracious acts is deep and true. His love for children, always a strong feeling, was gratified by the constant presence of my sister's babies, the eldest, a little girl who bore my mother's name, and had been her idol, being the companion of many hours and his best comforter. At the end the blow came swiftly and suddenly, as he would have wished it. It was a terrible shock to us who had vainly hoped to keep him a few years longer, but at least he was spared what he had dreaded with a great dread, a gradual failure of mental or bodily power. The mind was never clouded, the affections never weakened, and after a few hours of unconscious physical struggle he lay at rest, his face beautiful and calm, without a trace of suffering or illness. Once or twice he said, 'It has come, it has come,' and there were a few broken words before consciousness fled, but there was little time for messages or leave-taking. By a strange coincidence his life ended near the town of Dorchester, in the mother country, as if the last hour brought with it a reminiscence of his birthplace, and of his own dearly loved mother. By his own wish only the dates of his birth and death appear upon his gravestone, with the text chosen by himself, 'In God is light, and in him is no darkness at all.'"

XXIV. CONCLUSION.

HIS CHARACTER.—HIS LABORS.—HIS REWARD.

In closing this restricted and imperfect record of a life which merits, and in due time will, I trust, receive an ampler tribute, I cannot refrain from adding a few thoughts which naturally suggest themselves, and some of which may seem quite unnecessary to the reader who has followed the story of the historian and diplomatist's brilliant and eventful career.

Mr. Motley came of a parentage which promised the gifts of mind and body very generally to be accounted for, in a measure at least, wherever we find them, by the blood of one or both of the parents. They gave him special attractions and laid him open to not a few temptations. Too many young men born to shine in social life, to sparkle, it may be, in conversation, perhaps in the lighter walks of literature, become agreeable idlers, self-indulgent, frivolous, incapable of large designs or sustained effort, lose every aspiration and forget every ideal. Our gilded youth want such examples as this of Motley, not a solitary, but a conspicuous one, to teach them how much better is the restlessness of a noble ambition than the narcotized stupor of club-life or the vapid amusement of a dressed-up intercourse which too often requires a questionable flavor of forbidden license to render it endurable to persons of vivacious character and temperament.

It would seem difficult for a man so flattered from his earliest days to be modest in his self-estimate; but Motley was never satisfied with himself. He was impulsive, and was occasionally, I have heard it said, over excited, when his prejudices were roughly handled. In all that related to the questions involved in our civil war, he was, no doubt, very sensitive. He had heard so much that exasperated him in the foreign society which he had expected to be in full sympathy with the cause of liberty as against slavery, that he might be excused if he showed impatience when he met with similar sentiments among his own countrymen. He felt that he had been cruelly treated by his own government, and no one who conceives himself to have been wronged and insulted must be expected to reason in naked syllogisms on the propriety of the liberties which have been taken with his name and standing. But with all his quickness of feeling, his manners were easy and courteous, simply because his nature was warm and kindly, and with all his natural fastidiousness there was nothing of the coxcomb about him.

He must have had enemies, as all men of striking individuality are sure to have; his presence cast more uncouth patriots into the shade; his learning was a reproach to the ignorant, his fame was too bright a distinction; his high-bred air and refinement, which he could not help, would hardly commend him to the average citizen in an order of things in which mediocrity is at a premium, and the natural nobility of presence, which rarely comes without family antecedents to account for it, is not always agreeable to the many whose two ideals are the man on horseback and the man in his shirt-sleeves. It may well be questioned whether Washington, with his grand manner, would be nearly as popular with what are called "the masses" as Lincoln, with his homely ways and broad stories. The experiment of universal suffrage must render the waters of political and social life more or less turbid even if they remain innocuous. The Cloaca Maxima can hardly mingle its contents with the stream of the Aqua Claudia, without taking something from its crystal clearness. We need not go so far as one of our well-known politicians has recently gone in saying that no great man can reach the highest position in our government, but we can safely say that, apart from military fame, the loftiest and purest and finest personal qualities are not those which can be most depended upon at the ballot-box. Strange stories are told of avowed opposition to Mr. Motley on the ground of the most trivial differences in point of taste in personal matters,—so told that it is hard to disbelieve them, and they show that the caprices which we might have thought belonged exclusively to absolute rulers among their mistresses or their minions may be felt in the councils of a great people which calls itself self-governing. It is perfectly true that Mr. Motley did not illustrate the popular type of politician. He was too high-minded, too scholarly, too generously industrious, too polished, too much at home in the highest European circles, too much courted for his personal fascinations, too remote from the trading world of caucus managers. To degrade him, so far as official capital punishment could do it, was not merely to wrong one whom the nation should have delighted to honor as showing it to the world in the fairest flower of its young civilization, but it was an indignity to a representative of the highest scholarship of native growth, which every student in the land felt as a discouragement to all sound learning and noble ambition.

If he was disappointed in his diplomatic career, he had enough, and more than enough, to console him in his brilliant literary triumphs. He had earned them all by the most faithful and patient labor. If he had not the "frame of adamant" of the Swedish hero, he had his "soul of fire." No labors could tire him, no difficulties affright him. What most surprised those who knew him as a young man was, not his ambition, not his brilliancy, but his dogged, continuous capacity for work. We have seen with what astonishment the old Dutch scholar, Groen van Prinsterer, looked upon a man who had wrestled with authors like Bor and Van Meteren, who had grappled with the mightiest folios and toiled undiscouraged among half-illegible manuscript records. Having spared no pains in collecting his materials, he told his story, as we all know, with flowing ease and stirring vitality. His views may have been more or less partial; Philip the Second may have deserved the pitying benevolence of poor Maximilian; Maurice may have wept as sincerely over the errors of Arminius as any one of "the crocodile crew that believe in election;" Barneveld and Grotius may have been on the road to Rome; none of these things seem probable, but if they were all proved true in opposition to his views, we should still have the long roll of glowing tapestry he has woven for us, with all its life-like portraits, its almost moving pageants, its sieges where we can see the artillery flashing, its battle-fields with their smoke and fire,—pictures which cannot fade, and which will preserve his name interwoven with their own enduring colors.

Republics are said to be ungrateful; it might be truer to say that they are forgetful. They forgive those who have wronged them as easily as they forget those who have done them good service. But History never forgets and never forgives. To her decision we may trust the question, whether the warm-hearted patriot who had stood up for his country nobly and manfully in the hour of trial, the great scholar and writer who had reflected honor upon her throughout the world of letters, the high-minded public servant, whose shortcomings it taxed the ingenuity of experts to make conspicuous enough to be presentable, was treated as such a citizen should have been dealt with. His record is safe in her hands, and his memory will be precious always in the hearts of all who enjoyed his friendship.

APPENDIX.

A.

THE SATURDAY CLUB.

This club, of which we were both members, and which is still flourishing, came into existence in a very quiet sort of way at about the same time as "The Atlantic Monthly," and, although entirely unconnected with that magazine, included as members some of its chief contributors. Of those who might have been met at some of the monthly gatherings in its earlier days I may mention Emerson, Hawthorne, Longfellow, Lowell, Motley, Whipple, Whittier; Professors Agassiz and Peirce; John S. Dwight; Governor Andrew, Richard H. Dana, Junior, Charles Sumner. It offered a wide gamut of intelligences, and the meetings were noteworthy occasions. If there was not a certain amount of "mutual admiration" among some of those I have mentioned it was a great pity, and implied a defect in the nature of men who were otherwise largely endowed. The vitality of this club has depended in a great measure on its utter poverty in statutes and by-laws, its entire absence of formality, and its blessed freedom from speech-making.

That holy man, Richard Baxter, says in his Preface to Alleine's "Alarm:"—

"I have done, when I have sought to remove a little scandal, which I foresaw, that I should myself write the Preface to his Life where himself and two of his friends make such a mention of my name, which I cannot own; which will seem a praising him for praising me. I confess it looketh ill-favoredly in me. But I had not the power of other men's writings, and durst not forbear that which was his due."

I do not know that I have any occasion for a similar apology in printing the following lines read at a meeting of members of the Saturday Club and other friends who came together to bid farewell to Motley before his return to Europe in 1857.

A PARTING HEALTH

*Yes, we knew we must lose him,—though friendship may claim
To blend her green leaves with the laurels of fame,
Though fondly, at parting, we call him our own,
'T is the whisper of love when the bugle has blown.*

*As the rider that rests with the spur on his heel,
As the guardsman that sleeps in his corselet of steel,
As the archer that stands with his shaft on the string,
He stoops from his toil to the garland we bring.*

*What pictures yet slumber unborn in his loom
Till their warriors shall breathe and their beauties shall bloom,
While the tapestry lengthens the life-glowing dyes
That caught from our sunsets the stain of their skies!*

*In the alcoves of death, in the charnels of time,
Where flit the dark spectres of passion and crime,
There are triumphs untold, there are martyrs unsung,
There are heroes yet silent to speak with his tongue!*

*Let us hear the proud story that time has bequeathed
From lips that are warm with the freedom they breathed!
Let him summon its tyrants, and tell us their doom,
Though he sweep the black past like Van Tromp with his broom!*

*The dream flashes by, for the west-winds awake
On pampas, on prairie, o'er mountain and lake,
To bathe the swift bark, like a sea-girdled shrine
With incense they stole from the rose and the pine.*

*So fill a bright cup with the sunlight that gushed
When the dead summer's jewels were trampled and crushed;
THE TRUE KNIGHT OF LEARNING,—the world holds him dear,—*

Love bless him, joy crown him, God speed his career!

B. HABITS AND METHODS OF STUDY.

Mr. Motley's daughter, Lady Harcourt, has favored me with many interesting particulars which I could not have learned except from a member of his own family. Her description of his way of living and of working will be best given in her own words:—

"He generally rose early, the hour varying somewhat at different parts of his life, according to his work and health. Sometimes when much absorbed by literary labor he would rise before seven, often lighting his own fire, and with a cup of tea or coffee writing until the family breakfast hour, after which his work was immediately resumed, and he usually sat over his writing-table until late in the afternoon, when he would take a short walk. His dinner hour was late, and he rarely worked at night. During the early years of his literary studies he led a life of great retirement. Later, after the publication of the 'Dutch Republic' and during the years of

official place, he was much in society in England, Austria, and Holland. He enjoyed social life, and particularly dining out, keenly, but was very moderate and simple in all his personal habits, and for many years before his death had entirely given up smoking. His work, when not in his own library, was in the Archives of the Netherlands, Brussels, Paris, the English State Paper Office, and the British Museum, where he made his own researches, patiently and laboriously consulting original manuscripts and reading masses of correspondence, from which he afterwards sometimes caused copies to be made, and where he worked for many consecutive hours a day. After his material had been thus painfully and toilsomely amassed, the writing of his own story was always done at home, and his mind, having digested the necessary matter, always poured itself forth in writing so copiously that his revision was chiefly devoted to reducing the over-abundance. He never shrank from any of the drudgery of preparation, but I think his own part of the work was sheer pleasure to him."

I should have mentioned that his residence in London while minister was at the house No. 17 Arlington Street, belonging to Lord Yarborough.

C.
SIR WILLIAM GULL'S ACCOUNT OF HIS ILLNESS.

I have availed myself of the permission implied in the subjoined letter of Sir William Gull to make large extracts from his account of Mr. Motley's condition while under his medical care. In his earlier years he had often complained to me of those "nervous feelings connected with the respiration" referred to by this very distinguished physician. I do not remember any other habitual trouble to which he was subject.

74 BROOK STREET, GROSVENOR SQUARE, W.
February 13, 1878.

MY DEAR SIR,—I send the notes of Mr. Motley's last illness, as I promised. They are too technical for general readers, but you will make such exception as you require. The medical details may interest your professional friends. Mr. Motley's case was a striking illustration that the renal disease of so-called Bright's disease may supervene as part and parcel of a larger and antecedent change in the blood-vessels in other parts than the kidney. . . . I am, my dear sir,

Yours very truly,
WILLIAM W. GULL.

To OLIVER WENDELL HOLMES, ESQ.

I first saw Mr. Motley, I believe, about the year 1870, on account of some nervous feelings connected with the respiration. At that time his general health was good, and all he complained of was occasionally a feeling of oppression about the chest. There were no physical signs of anything abnormal, and the symptoms quite passed away in the course of time, and with the use of simple antispasmodic remedies, such as camphor and the like. This was my first interview with Mr. Motley, and I was naturally glad to have the opportunity of making his acquaintance. I remember that in our conversation I jokingly said that my wife could hardly forgive him for not making her hero, Henri IV., a perfect character, and the earnestness with which he replied 'au sérieux,' I assure you I have fairly recorded the facts. After this date I did not see Mr. Motley for some time. He had three slight attacks of hæmoptysis in the autumn of 1872, but no physical signs of change in the lung tissue resulted. So early as this I noticed that there were signs of commencing thickening in the heart, as shown by the degree and extent of its impulse. The condition of his health, though at that time not very obviously failing, a good deal arrested my attention, as I thought I could perceive in the occurrence of the hæmoptysis, and in the cardiac hypertrophy, the early beginnings of vascular degeneration.

In August, 1873, occurred the remarkable seizure, from the effects of which Mr. Motley never recovered. I did not see him in the attack, but was informed, as far as I can remember, that he was on a casual visit at a friend's house at luncheon (or it might have been dinner), when he suddenly became strangely excited, but not quite unconscious. . . . I believed at the time, and do so still, that there was some capillary apoplexy of the convolutions. The attack was attended with some hemiplegic weakness on the right side, and altered sensation, and ever after there was a want of freedom and ease both in the gait and in the use of the arm of that side. To my inquiries from time to time how the arm was, the patient would always flex and extend it freely, but nearly always used the expression, "There is a bedevilment in it;" though the handwriting was not much, if at all, altered.

In December, 1873, Mr. Motley went by my advice to Cannes. I wrote the following letter at the time to my friend Dr. Frank, who was practising there:—

[This letter, every word of which was of value to the practitioner who was to have charge of the patient, relates many of the facts given above, and I shall therefore only give extracts from it.]

December 29, 1873.

MY DEAR DR. FRANK,—My friend Mr. Motley, the historian and late American Minister, whose name and fame no doubt you know very well,

has by my advice come to Cannes for the winter and spring, and I have promised him to give you some account of his case. To me it is one of special interest, and personally, as respects the subject of it, of painful interest. I have known Mr. Motley for some time, but he consulted me for the present condition about midsummer.

. . . If I have formed a correct opinion of the pathology of the case, I believe the smaller vessels are degenerating in several parts of the vascular area, lung, brain, and kidneys. With this view I have suggested a change of climate, a nourishing diet, etc.; and it is to be hoped, and I trust expected, that by great attention to the conditions of hygiene, internal and external, the progress of degeneration may be retarded. I have no doubt you will find, as time goes on, increasing evidence of renal change, but this is rather a coincidence and consequence than a cause, though no doubt when the renal change has reached a certain point, it becomes in its own way a factor of other lesions. I have troubled you at this length because my mind is much occupied with the pathology of these cases, and because no case can, on personal grounds, more strongly challenge our attention.

Yours very truly,
WILLIAM W. GULL.

During the spring of 1874, whilst at Cannes, Mr. Motley had a sharp attack of nephritis, attended with fever; but on returning to England in July there was no important change in the health. The weakness of the side continued, and the inability to undertake any mental work. The signs of cardiac hypertrophy were more distinct. In the beginning of the year 1875 I wrote as follows:—

February 20, 1875.

MY DEAR Mr. MOTLEY,— . . . The examination I have just made appears to indicate that the main conditions of your health are more stable than they were some months ago, and would therefore be so far in favor of your going to America in the summer, as we talked of. The ground of my doubt has lain in the possibility of such a trip further disordering the circulation. Of this, I hope, there is now less risk.

On the 4th of June, 1875, I received the following letter:—

CALVERLY PARK HOTEL, TUNBRIDGE WELLS,
June 4, 1875.

MY DEAR SIR WILLIAM,—I have been absent from town for a long time, but am to be there on the 9th and 10th. Could I make an appointment with you for either of those days? I am anxious to have a full consultation with you before leaving for America. Our departure is fixed for the 19th of this month. I have not been worse than usual of late. I think myself, on the contrary, rather stronger, and it is almost impossible for me not to make my visit to America this summer, unless you should absolutely prohibit it. If neither of those days should suit you, could you kindly suggest another day? I hope, however, you can spare me half an hour on one of those days, as I like to get as much of this bracing air as I can. Will you kindly name the hour when I may call on you, and address me at this hotel. Excuse this slovenly note in pencil, but it fatigues my head and arm much more to sit at a writing-table with pen and ink.

Always most sincerely yours,
My dear Sir William,
J. L. MOTLEY.

On Mr. Motley's return from America I saw him, and found him, I thought, rather better in general health than when he left England.

In December, 1875, Mr. Motley consulted me for trouble of vision in reading or walking, from sensations like those produced by flakes of falling snow coming between him and the objects he was looking at. Mr. Bowman, one of our most excellent oculists, was then consulted. Mr. Bowman wrote to me as follows: "Such symptoms as exist point rather to disturbed retinal function than to any brain-mischief. It is, however, quite likely that what you fear for the brain may have had its counterpart in the nerve-structures of the eye, and as he is short-sighted, this tendency may be further intensified."

Mr. Bowman suggested no more than such an arrangement of glasses as might put the eyes, when in use, under better optic conditions.

The year 1876 was passed over without any special change worth notice. The walking powers were much impeded by the want of control over the right leg. The mind was entirely clear, though Mr. Motley did not feel equal, and indeed had been advised not to apply himself, to any literary work. Occasional conversations, when I had interviews with him on the subject of his health, proved that the attack which had weakened the movements of the right side had not impaired the mental power. The most noticeable change which had come over Mr. Motley since I first knew him was due to the death of Mrs. Motley in December, 1874. It had in fact not only profoundly depressed him, but, if I may so express it, had removed the centre of his thought to a new world. In long conversations with me of a speculative kind, after that painful event, it was plain how much his point of view of the whole course and relation of things had

changed. His mind was the last to dogmatize on any subject. There was a candid and childlike desire to know, with an equal confession of the incapacity of the human intellect. I wish I could recall the actual expressions he used, but the sense was that which has been so well stated by Hooker in concluding an exhortation against the pride of the human intellect, where he remarks:—

"Dangerous it were for the feeble brain of man to wade far into the doings of the Most High; whom although to know be life, and joy to make mention of His Name, yet our soundest knowledge is to know that we know Him, not indeed as He is, neither can we know Him; and our safest eloquence concerning Him is our silence, when we confess without confession that His glory is inexplicable, His greatness above our capacity and reach. He is above and we upon earth; therefore it behoveth our words to be wary and few."

Mrs. Motley's illness was not a long one, and the nature of it was such that its course could with certainty be predicted. Mr. Motley and her children passed the remaining days of her life, extending over about a month, with her, in the mutual understanding that she was soon to part from them. The character of the illness, and the natural exhaustion of her strength by suffering, lessened the shock of her death, though not the loss, to those who survived her.

The last time I saw Mr. Motley was, I believe, about two months before his death, March 28, 1877. There was no great change in his health, but he complained of indescribable sensations in his nervous system, and felt as if losing the whole power of walking, but this was not obvious in his gait, although he walked shorter distances than before. I heard no more of him until I was suddenly summoned on the 29th of May into Devonshire to see him. The telegram I received was so urgent, that I suspected some rupture of a blood-vessel in the brain, and that I should hardly reach him alive; and this was the case. About two o'clock in the day he complained of a feeling of faintness, said he felt ill and should not recover; and in a few minutes was insensible with symptoms of ingravescent apoplexy. There was extensive hæmorrhage into the brain, as shown by post-mortem examination, the cerebral vessels being atheromatous. The fatal hæmorrhage had occurred into the lateral ventricles, from rupture of one of the middle cerebral arteries.

I am, my dear Sir,
Yours very truly,
WILLIAM W. GULL.

E. FROM THE PROCEEDINGS OF THE MASSACHUSETTS SOCIETY.

At a meeting of the Massachusetts Historical Society, held on Thursday, the 14th of June, 1877, after the reading of the records of the preceding meeting, the president, the Hon. Robert C. Winthrop, spoke as follows:

"Our first thoughts to-day, gentlemen, are of those whom we may not again welcome to these halls. We shall be in no mood, certainly, for entering on other subjects this morning until we have given some expression to our deep sense of the loss—the double loss—which our Society has sustained since our last monthly meeting."—[Edmund Quincy died May 17. John Lothrop Motley died May 29.]

After a most interesting and cordial tribute to his friend, Mr. Quincy, Mr. Winthrop continued:

"The death of our distinguished associate, Motley, can hardly have taken many of us by surprise. Sudden at the moment of its occurrence, we had long been more or less prepared for it by his failing health. It must, indeed, have been quite too evident to those who had seen him, during the last two or three years, that his life-work was finished. I think he so regarded it himself.

"Hopes may have been occasionally revived in the hearts of his friends, and even in his own heart, that his long-cherished purpose of completing a History of the Thirty Years' War, as the grand consummation of his historical labors,—for which all his other volumes seemed to him to have been but the preludes and overtures,—might still be accomplished. But such hopes, faint and flickering from his first attack, had well-nigh died away. They were like Prescott's hopes of completing his 'Philip the Second,' or like Macaulay's hopes of finishing his brilliant 'History of England.'

"But great as may be the loss to literature of such a crowning work from Motley's pen, it was by no means necessary to the completeness of his own fame. His 'Rise of the Dutch Republic,' his 'History of the United Netherlands,' and his 'Life of John of Barneveld,' had abundantly established his reputation, and given him a fixed place among the most eminent historians of our country and of our age.

"No American writer, certainly, has secured a wider recognition or a higher appreciation from the scholars of the Old World. The universities of England and the learned societies of Europe have bestowed upon him their largest honors. It happened to me to be in Paris when he was first chosen a corresponding member of the Institute, and when his claims were canvassed with the freedom and earnestness which peculiarly characterize such a candidacy in France. There was no mistaking the profound impression which his first work had made on the minds of such men as Guizot and Mignet. Within a year or two past, a still higher honor has been awarded him from the same source. The journals not long ago announced his

election as one of the six foreign associates of the French Academy of Moral and Political Sciences,—a distinction which Prescott would probably have attained had he lived a few years longer, until there was a vacancy, but which, as a matter of fact, I believe, Motley was the only American writer, except the late Edward Livingston, of Louisiana, who has actually enjoyed.

“Residing much abroad, for the purpose of pursuing his historical researches, he had become the associate and friend of the most eminent literary men in almost all parts of the world, and the singular charms of his conversation and manners had made him a favorite guest in the most refined and exalted circles.

“Of his relations to political and public life, this is hardly the occasion or the moment for speaking in detail. Misconstructions and injustices are the proverbial lot of those who occupy eminent position. It was a duke of Vienna, if I remember rightly, whom Shakespeare, in his 'Measure for Measure,' introduces as exclaiming,—

*'O place and greatness, millions of false eyes
Are stuck upon thee! Volumes of report
Run with these false and most contrarious quests
Upon thy doings! Thousand 'stapes of wit
Make thee the father of their idle dream,
And rack thee in their fancies!'*

“I forbear from all application of the lines. It is enough for me, certainly, to say here, to-day, that our country was proud to be represented at the courts of Vienna and London successively by a gentleman of so much culture and accomplishment as Mr. Motley, and that the circumstances of his recall were deeply regretted by us all.

“His fame, however, was quite beyond the reach of any such accidents, and could neither be enhanced nor impaired by appointments or removals. As a powerful and brilliant historian we pay him our unanimous tribute of admiration and regret, and give him a place in our memories by the side of Prescott and Irving. I do not forget how many of us lament him, also, as a cherished friend.

“He died on the 29th ultimo, at the house of his daughter, Mrs. Sheridan, in Dorsetshire, England, and an impressive tribute to his memory was paid, in Westminster Abbey, on the following Sunday, by our Honorary Member, Dean Stanley. Such a tribute, from such lips, and with such surroundings, leaves nothing to be desired in the way of eulogy. He was buried in Kensal Green Cemetery, by the side of his beloved wife.

“One might well say of Motley precisely what he said of Prescott, in a letter from Rome to our associate, Mr. William Amory, immediately on hearing of Prescott's death: 'I feel inexpressibly disappointed—speaking now for an instant purely from a literary point of view—that the noble and crowning monument of his life, for which he had laid such massive foundations, and the structure of which had been carried forward in such a grand and masterly manner, must remain uncompleted, like the unfinished peristyle of some stately and beautiful temple on which the night of time has suddenly descended. But, still, the works which his great and untiring hand had already thoroughly finished will remain to attest his learning and genius,—a precious and perpetual possession for his country.’”

.....

The President now called on Dr. Oliver Wendell Holmes, who said:—

“The thoughts which suggest themselves upon this occasion are such as belong to the personal memories of the dear friends whom we have lost, rather than to their literary labors, the just tribute to which must wait for a calmer hour than the present, following so closely as it does on our bereavement.”

.....

“His first literary venture of any note was the story called 'Morton's Hope; or, The Memoirs of a Provincial.' This first effort failed to satisfy the critics, the public, or himself. His personality pervaded the characters and times which he portrayed, so that there was a discord between the actor and his costume. Brilliant passages could not save it; and it was plain enough that he must ripen into something better before the world would give him the reception which surely awaited him if he should find his true destination.

“The early failures of a great writer are like the first sketches of a great artist, and well reward patient study. More than this, the first efforts of poets and story-tellers are very commonly palimpsests: beneath the rhymes or the fiction one can almost always spell out the characters which betray the writer's self. Take these passages from the story just referred to:

“'Ah! flattery is a sweet and intoxicating potion, whether we drink it from an earthen ewer or a golden chalice. . . . Flattery from man to woman is expected: it is a part of the courtesy of society; but when the divinity descends from the altar to burn incense to the

priest, what wonder if the idolater should feel himself transformed into a god!'

"He had run the risk of being spoiled, but he had a safeguard in his aspirations.

"My ambitious anticipations,' says Morton, in the story, were as boundless as they were various and conflicting. There was not a path which leads to glory in which I was not destined to gather laurels. As a warrior, I would conquer and overrun the world; as a statesman, I would reorganize and govern it; as a historian, I would consign it all to immortality; and, in my leisure moments, I would be a great poet and a man of the world.'

"Who can doubt that in this passage of his story he is picturing his own visions, one of the fairest of which was destined to become reality?

"But there was another element in his character, which those who knew him best recognized as one with which he had to struggle hard,—that is, a modesty which sometimes tended to collapse into self-distrust. This, too, betrays itself in the sentences which follow those just quoted:—

"'In short,' says Morton, 'I was already enrolled in that large category of what are called young men of genius, . . . men of whom unheard-of things are expected; till after long preparation comes a portentous failure, and then they are forgotten. . . . Alas! for the golden imaginations of our youth. . . . They are all disappointments. They are bright and beautiful, but they fade.'"

.....

The President appointed Professor Lowell to write the Memoir of Mr. Quincy, and Dr. Holmes that of Mr. Motley, for the Society's "Proceedings."

Professor William Everett then spoke as follows:

"There is one incident, sir, in Mr. Motley's career that has not been mentioned to-day, which is, perhaps, most vividly remembered by those of us who were in Europe at the outbreak of our civil war in 1861. At that time, the ignorance of Englishmen, friendly or otherwise, about America, was infinite: they knew very little of us, and that little wrong. Americans were overwhelmed with questions, taunts, threats, misrepresentations, the outgrowth of ignorance, and ignoring worse than ignorance, from every class of Englishmen. Never was an authoritative exposition of our hopes and policy worse needed; and there was no one to do it. The outgoing diplomatic agents represented a bygone order of things; the representatives of Mr. Lincoln's administration had not come. At that time of anxiety, Mr. Motley, living in England as a private person, came forward with two letters in the 'Times,' which set forth the cause of the United States once and for all. No unofficial, and few official, men could have spoken with such authority, and been so certain of obtaining a hearing from Englishmen. Thereafter, amid all the clouds of falsehood and ridicule which we had to encounter, there was one lighthouse fixed on a rock to which we could go for foothold, from which we could not be driven, and against which all assaults were impotent.

"There can be no question that the effect produced by these letters helped, if help had been needed, to point out Mr. Motley as a candidate for high diplomatic place who could not be overlooked. Their value was recognized alike by his fellow-citizens in America and his admirers in England; but none valued them more than the little band of exiles, who were struggling against terrible odds, and who rejoiced with a great joy to see the stars and stripes, whose centennial anniversary those guns are now celebrating, planted by a hand so truly worthy to rally every American to its support."

G. POEM BY WILLIAM CULLEN BRYANT.

I cannot close this Memoir more appropriately than by appending the following poetical tribute:—

IN MEMORY OF JOHN LOTHROP MOTLEY.

BY WILLIAM CULLEN BRYANT.

Sleep, Motley, with the great of ancient days,
Who wrote for all the years that yet shall be.
Sleep with Herodotus, whose name and praise
Have reached the isles of earth's remotest sea.
Sleep, while, defiant of the slow delays
Of Time, thy glorious writings speak for thee
And in the answering heart of millions raise
The generous zeal for Right and Liberty.
And should the days o'ertake us, when, at last,
The silence that—ere yet a human pen
Had traced the slenderest record of the past
Hushed the primeval languages of men
Upon our English tongue its spell shall cast,
Thy memory shall perish only then.

The dead men of the place are my intimate friends
They knew very little of us, and that little wrong
This Somebody may have been one whom we should call Nobody
Twenty assaults upon fame and had forty books killed under him
Unequivocal policy of slave emancipation
Vain belief that they were men at eighteen or twenty
Visible atmosphere of power the poison of which
Weight of a thousand years of error
Wonders whether it has found its harbor or only lost its anchor
Wringing a dry cloth for drops of evidence

*** END OF THE PROJECT GUTENBERG EBOOK THE WORKS OF OLIVER WENDELL HOLMES: AN INDEX
OF THE PROJECT GUTENBERG EDITIONS ***

Updated editions will replace the previous one—the old editions will be renamed.

Creating the works from print editions not protected by U.S. copyright law means that no one owns a United States copyright in these works, so the Foundation (and you!) can copy and distribute it in the United States without permission and without paying copyright royalties. Special rules, set forth in the General Terms of Use part of this license, apply to copying and distributing Project Gutenberg™ electronic works to protect the PROJECT GUTENBERG™ concept and trademark. Project Gutenberg is a registered trademark, and may not be used if you charge for an eBook, except by following the terms of the trademark license, including paying royalties for use of the Project Gutenberg trademark. If you do not charge anything for copies of this eBook, complying with the trademark license is very easy. You may use this eBook for nearly any purpose such as creation of derivative works, reports, performances and research. Project Gutenberg eBooks may be modified and printed and given away—you may do practically ANYTHING in the United States with eBooks not protected by U.S. copyright law. Redistribution is subject to the trademark license, especially commercial redistribution.

START: FULL LICENSE
THE FULL PROJECT GUTENBERG LICENSE
PLEASE READ THIS BEFORE YOU DISTRIBUTE OR USE THIS WORK

To protect the Project Gutenberg™ mission of promoting the free distribution of electronic works, by using or distributing this work (or any other work associated in any way with the phrase “Project Gutenberg”), you agree to comply with all the terms of the Full Project Gutenberg™ License available with this file or online at www.gutenberg.org/license.

Section 1. General Terms of Use and Redistributing Project Gutenberg™ electronic works

1.A. By reading or using any part of this Project Gutenberg™ electronic work, you indicate that you have read, understand, agree to and accept all the terms of this license and intellectual property (trademark/copyright) agreement. If you do not agree to abide by all the terms of this agreement, you must cease using and return or destroy all copies of Project Gutenberg™ electronic works in your possession. If you paid a fee for obtaining a copy of or access to a Project Gutenberg™ electronic work and you do not agree to be bound by the terms of this agreement, you may obtain a refund from the person or entity to whom you paid the fee as set forth in paragraph 1.E.8.

1.B. “Project Gutenberg” is a registered trademark. It may only be used on or associated in any way with an electronic work by people who agree to be bound by the terms of this agreement. There are a few things that you can do with most Project Gutenberg™ electronic works even without complying with the full terms of this agreement. See paragraph 1.C below. There are a lot of things you can do with Project Gutenberg™ electronic works if you follow the terms of this agreement and help preserve free future access to Project Gutenberg™ electronic works. See paragraph 1.E below.

1.C. The Project Gutenberg Literary Archive Foundation (“the Foundation” or PGLAF), owns a compilation copyright in the collection of Project Gutenberg™ electronic works. Nearly all the individual works in the collection are in the public domain in the United States. If an individual work is unprotected by copyright law in the United States and you are located in the United States, we do not claim a right to prevent you from copying, distributing, performing, displaying or creating derivative works based on the work as long as all references to Project Gutenberg are removed. Of course, we hope that you will support the Project Gutenberg™ mission of promoting free access to electronic works by freely sharing Project Gutenberg™ works in compliance with the terms of this agreement for keeping the Project Gutenberg™ name associated with the work. You can easily comply with the terms of this agreement by keeping this work in the same format with its attached full Project Gutenberg™ License when you share it without charge with others.

1.D. The copyright laws of the place where you are located also govern what you can do with this work. Copyright laws in most countries are in a constant state of change. If you are outside the United States,

check the laws of your country in addition to the terms of this agreement before downloading, copying, displaying, performing, distributing or creating derivative works based on this work or any other Project Gutenberg™ work. The Foundation makes no representations concerning the copyright status of any work in any country other than the United States.

1.E. Unless you have removed all references to Project Gutenberg:

1.E.1. The following sentence, with active links to, or other immediate access to, the full Project Gutenberg™ License must appear prominently whenever any copy of a Project Gutenberg™ work (any work on which the phrase “Project Gutenberg” appears, or with which the phrase “Project Gutenberg” is associated) is accessed, displayed, performed, viewed, copied or distributed:

This eBook is for the use of anyone anywhere in the United States and most other parts of the world at no cost and with almost no restrictions whatsoever. You may copy it, give it away or re-use it under the terms of the Project Gutenberg License included with this eBook or online at www.gutenberg.org. If you are not located in the United States, you will have to check the laws of the country where you are located before using this eBook.

1.E.2. If an individual Project Gutenberg™ electronic work is derived from texts not protected by U.S. copyright law (does not contain a notice indicating that it is posted with permission of the copyright holder), the work can be copied and distributed to anyone in the United States without paying any fees or charges. If you are redistributing or providing access to a work with the phrase “Project Gutenberg” associated with or appearing on the work, you must comply either with the requirements of paragraphs 1.E.1 through 1.E.7 or obtain permission for the use of the work and the Project Gutenberg™ trademark as set forth in paragraphs 1.E.8 or 1.E.9.

1.E.3. If an individual Project Gutenberg™ electronic work is posted with the permission of the copyright holder, your use and distribution must comply with both paragraphs 1.E.1 through 1.E.7 and any additional terms imposed by the copyright holder. Additional terms will be linked to the Project Gutenberg™ License for all works posted with the permission of the copyright holder found at the beginning of this work.

1.E.4. Do not unlink or detach or remove the full Project Gutenberg™ License terms from this work, or any files containing a part of this work or any other work associated with Project Gutenberg™.

1.E.5. Do not copy, display, perform, distribute or redistribute this electronic work, or any part of this electronic work, without prominently displaying the sentence set forth in paragraph 1.E.1 with active links or immediate access to the full terms of the Project Gutenberg™ License.

1.E.6. You may convert to and distribute this work in any binary, compressed, marked up, nonproprietary or proprietary form, including any word processing or hypertext form. However, if you provide access to or distribute copies of a Project Gutenberg™ work in a format other than “Plain Vanilla ASCII” or other format used in the official version posted on the official Project Gutenberg™ website (www.gutenberg.org), you must, at no additional cost, fee or expense to the user, provide a copy, a means of exporting a copy, or a means of obtaining a copy upon request, of the work in its original “Plain Vanilla ASCII” or other form. Any alternate format must include the full Project Gutenberg™ License as specified in paragraph 1.E.1.

1.E.7. Do not charge a fee for access to, viewing, displaying, performing, copying or distributing any Project Gutenberg™ works unless you comply with paragraph 1.E.8 or 1.E.9.

1.E.8. You may charge a reasonable fee for copies of or providing access to or distributing Project Gutenberg™ electronic works provided that:

- You pay a royalty fee of 20% of the gross profits you derive from the use of Project Gutenberg™ works calculated using the method you already use to calculate your applicable taxes. The fee is owed to the owner of the Project Gutenberg™ trademark, but he has agreed to donate royalties under this paragraph to the Project Gutenberg Literary Archive Foundation. Royalty payments must be paid within 60 days following each date on which you prepare (or are legally required to prepare) your periodic tax returns. Royalty payments should be clearly marked as such and sent to the Project Gutenberg Literary Archive Foundation at the address specified in Section 4, “Information about donations to the Project Gutenberg Literary Archive Foundation.”
- You provide a full refund of any money paid by a user who notifies you in writing (or by e-mail) within 30 days of receipt that s/he does not agree to the terms of the full Project Gutenberg™ License. You must require such a user to return or destroy all copies of the works possessed in a physical medium and discontinue all use of and all access to other copies of Project Gutenberg™ works.
- You provide, in accordance with paragraph 1.F.3, a full refund of any money paid for a work or a replacement copy, if a defect in the electronic work is discovered and reported to you within 90 days of receipt of the work.
- You comply with all other terms of this agreement for free distribution of Project Gutenberg™ works.

1.E.9. If you wish to charge a fee or distribute a Project Gutenberg™ electronic work or group of works on different terms than are set forth in this agreement, you must obtain permission in writing from the

Project Gutenberg Literary Archive Foundation, the manager of the Project Gutenberg™ trademark. Contact the Foundation as set forth in Section 3 below.

1.F.

1.F.1. Project Gutenberg volunteers and employees expend considerable effort to identify, do copyright research on, transcribe and proofread works not protected by U.S. copyright law in creating the Project Gutenberg™ collection. Despite these efforts, Project Gutenberg™ electronic works, and the medium on which they may be stored, may contain “Defects,” such as, but not limited to, incomplete, inaccurate or corrupt data, transcription errors, a copyright or other intellectual property infringement, a defective or damaged disk or other medium, a computer virus, or computer codes that damage or cannot be read by your equipment.

1.F.2. LIMITED WARRANTY, DISCLAIMER OF DAMAGES - Except for the “Right of Replacement or Refund” described in paragraph 1.F.3, the Project Gutenberg Literary Archive Foundation, the owner of the Project Gutenberg™ trademark, and any other party distributing a Project Gutenberg™ electronic work under this agreement, disclaim all liability to you for damages, costs and expenses, including legal fees. YOU AGREE THAT YOU HAVE NO REMEDIES FOR NEGLIGENCE, STRICT LIABILITY, BREACH OF WARRANTY OR BREACH OF CONTRACT EXCEPT THOSE PROVIDED IN PARAGRAPH 1.F.3. YOU AGREE THAT THE FOUNDATION, THE TRADEMARK OWNER, AND ANY DISTRIBUTOR UNDER THIS AGREEMENT WILL NOT BE LIABLE TO YOU FOR ACTUAL, DIRECT, INDIRECT, CONSEQUENTIAL, PUNITIVE OR INCIDENTAL DAMAGES EVEN IF YOU GIVE NOTICE OF THE POSSIBILITY OF SUCH DAMAGE.

1.F.3. LIMITED RIGHT OF REPLACEMENT OR REFUND - If you discover a defect in this electronic work within 90 days of receiving it, you can receive a refund of the money (if any) you paid for it by sending a written explanation to the person you received the work from. If you received the work on a physical medium, you must return the medium with your written explanation. The person or entity that provided you with the defective work may elect to provide a replacement copy in lieu of a refund. If you received the work electronically, the person or entity providing it to you may choose to give you a second opportunity to receive the work electronically in lieu of a refund. If the second copy is also defective, you may demand a refund in writing without further opportunities to fix the problem.

1.F.4. Except for the limited right of replacement or refund set forth in paragraph 1.F.3, this work is provided to you ‘AS-IS’, WITH NO OTHER WARRANTIES OF ANY KIND, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO WARRANTIES OF MERCHANTABILITY OR FITNESS FOR ANY PURPOSE.

1.F.5. Some states do not allow disclaimers of certain implied warranties or the exclusion or limitation of certain types of damages. If any disclaimer or limitation set forth in this agreement violates the law of the state applicable to this agreement, the agreement shall be interpreted to make the maximum disclaimer or limitation permitted by the applicable state law. The invalidity or unenforceability of any provision of this agreement shall not void the remaining provisions.

1.F.6. INDEMNITY - You agree to indemnify and hold the Foundation, the trademark owner, any agent or employee of the Foundation, anyone providing copies of Project Gutenberg™ electronic works in accordance with this agreement, and any volunteers associated with the production, promotion and distribution of Project Gutenberg™ electronic works, harmless from all liability, costs and expenses, including legal fees, that arise directly or indirectly from any of the following which you do or cause to occur: (a) distribution of this or any Project Gutenberg™ work, (b) alteration, modification, or additions or deletions to any Project Gutenberg™ work, and (c) any Defect you cause.

Section 2. Information about the Mission of Project Gutenberg™

Project Gutenberg™ is synonymous with the free distribution of electronic works in formats readable by the widest variety of computers including obsolete, old, middle-aged and new computers. It exists because of the efforts of hundreds of volunteers and donations from people in all walks of life.

Volunteers and financial support to provide volunteers with the assistance they need are critical to reaching Project Gutenberg™’s goals and ensuring that the Project Gutenberg™ collection will remain freely available for generations to come. In 2001, the Project Gutenberg Literary Archive Foundation was created to provide a secure and permanent future for Project Gutenberg™ and future generations. To learn more about the Project Gutenberg Literary Archive Foundation and how your efforts and donations can help, see Sections 3 and 4 and the Foundation information page at www.gutenberg.org.

Section 3. Information about the Project Gutenberg Literary Archive Foundation

The Project Gutenberg Literary Archive Foundation is a non-profit 501(c)(3) educational corporation organized under the laws of the state of Mississippi and granted tax exempt status by the Internal Revenue Service. The Foundation’s EIN or federal tax identification number is 64-6221541. Contributions to the Project Gutenberg Literary Archive Foundation are tax deductible to the full extent permitted by U.S. federal laws and your state’s laws.

The Foundation’s business office is located at 809 North 1500 West, Salt Lake City, UT 84116, (801) 596-1887. Email contact links and up to date contact information can be found at the Foundation’s website and official page at www.gutenberg.org/contact

Section 4. Information about Donations to the Project Gutenberg Literary Archive Foundation

Project Gutenberg™ depends upon and cannot survive without widespread public support and donations to carry out its mission of increasing the number of public domain and licensed works that can be freely distributed in machine-readable form accessible by the widest array of equipment including outdated equipment. Many small donations (\$1 to \$5,000) are particularly important to maintaining tax exempt status with the IRS.

The Foundation is committed to complying with the laws regulating charities and charitable donations in all 50 states of the United States. Compliance requirements are not uniform and it takes a considerable effort, much paperwork and many fees to meet and keep up with these requirements. We do not solicit donations in locations where we have not received written confirmation of compliance. To SEND DONATIONS or determine the status of compliance for any particular state visit www.gutenberg.org/donate.

While we cannot and do not solicit contributions from states where we have not met the solicitation requirements, we know of no prohibition against accepting unsolicited donations from donors in such states who approach us with offers to donate.

International donations are gratefully accepted, but we cannot make any statements concerning tax treatment of donations received from outside the United States. U.S. laws alone swamp our small staff.

Please check the Project Gutenberg web pages for current donation methods and addresses. Donations are accepted in a number of other ways including checks, online payments and credit card donations. To donate, please visit: www.gutenberg.org/donate

Section 5. General Information About Project Gutenberg™ electronic works

Professor Michael S. Hart was the originator of the Project Gutenberg™ concept of a library of electronic works that could be freely shared with anyone. For forty years, he produced and distributed Project Gutenberg™ eBooks with only a loose network of volunteer support.

Project Gutenberg™ eBooks are often created from several printed editions, all of which are confirmed as not protected by copyright in the U.S. unless a copyright notice is included. Thus, we do not necessarily keep eBooks in compliance with any particular paper edition.

Most people start at our website which has the main PG search facility: www.gutenberg.org.

This website includes information about Project Gutenberg™, including how to make donations to the Project Gutenberg Literary Archive Foundation, how to help produce our new eBooks, and how to subscribe to our email newsletter to hear about new eBooks.
