THE
CIRCLE OF KNOWLEDGE

ESSENTIAL FACTS OF EVERYDAY INTEREST IN
NATURE, GEOGRAPHY, HISTORY, TRAVEL,
GOVERNMENT, SCIENCE, INVENTION,
EDUCATION, LANGUAGE, LITERATURE, FINE
ARTS, PHILOSOPHY, RELIGION, INDUSTRY,
BIOGRAPHY, HUMAN CULTURE, AND UNIVERSAL
PROGRESS

Easy to Read; Easy to Understand; Easy to Retain

EDITOR-IN-CHIEF
HENRY W. RUOFF, M.A., Litt.D., D.C.L.
EDITOR OF "THE CENTURY BOOK OF FACTS," "THE CAPITALS OF THE WORLD,"
"LEADERS OF MEN," "THE STANDARD DICTIONARY OF FACTS,"
"MASTERS OF ACHIEVEMENT," "THE VOLUME LIBRARY,"
"THE HUMAN INTEREST LIBRARY," ETC.

*NUMEROUS TEXT ILLUSTRATIONS, MAPS
TABLES, DUOTONE AND COLOR PLATES*

THE PUBLISHER'S PREFATORY

All books that are really worth while may be divided into four classes: first, books of *information*; second, books of *inspiration*; third, books of *entertainment*; fourth, books of *excitement*. By far the most important and practical of these classes is the first. The next in importance is the second; while rather trivial importance attaches to the third and fourth.

THE CIRCLE OF KNOWLEDGE preëminently belongs to the first; but it is also designed to be both inspiring and entertaining. In its methods of presentation and in its editorship it typifies the modern, progressive spirit. Behind it lies a quarter of a century of successful editorial experience in selecting, adapting, and translating from highly technical treatises into simple, clear, understandable language the essentials as well as important sidelights of human knowledge. Its purpose is to answer the why, who, what, when, where, how, of the vast majority of inquiring minds, both young and mature, and to stimulate them to still further questionings. For it is only through this self-questioning process of the active mind that individual progress is possible.

It is a fact of singular interest that every human being born into the world must independently go through practically the same educative processes from childhood to maturity. No matter how great the storehouse of the world's past knowledge, or how marvelous the multitude and wonder of new discoveries in every department of human endeavor, each individual must acquire and learn for himself the selfsame facts of nature, history, science, literature, human culture, and everyday needs.

In the present work special effort has been made to separate essentials from non-essentials; to distinguish human interest subjects of universal importance from those of minor concern; to present living facts instead of dead verbiage; and to bring the whole within the understanding of the average reader, without regard to age, in an acceptable and interesting form. The use of graphic outlines and tables; maps, drawings, and diagrams; the pictured works of great painters, sculptors, and architects—all combine in visualizing and vitalizing both the useful and cultural knowledge of past and present. Indeed it is difficult to conceive how the purely pictorial interest of the work could be surpassed, with its veritable picture galleries illustrating the pageant of man's progress; while the entire field of knowledge, from the measureless universe of space down to the simple fancy of a child, is sketched in its practical and essential outlines.

Never has there been greater demand for books of knowledge of the present type. The busy reader or consulter soon tires of the diffuse book or set of books of interminable words. He wants conciseness, directness, reasonable compass, reliability, with up-to-date treatment of topics of permanent usefulness. Above all he wants something that appeals to the eye, and, through the interest of its form and subject matter, stimulates thought and the imagination. While simplicity and clearness are undoubted virtues, great care has been exercised to prevent them from degenerating into those childish forms, all too frequent in certain books, that rob real knowledge of almost its entire value.

The best sources in the world of books have been laid under tribute in the preparation of this work, wisely supplemented by the wide experience of many eminent, practical, and progressive men and women—masters in their respective fields. It is earnestly hoped that this joint product will create for it a large sphere of usefulness and numerous satisfied readers.

EDITOR'S ACKNOWLEDGMENTS

The Editor desires to acknowledge his indebtedness to the following distinguished educators, scientists, writers and publicists for helpful suggestions, counsel, contributions, or revisions connected with the various departments of THE CIRCLE OF KNOWLEDGE.

- EDWIN A. ALDERMAN, LL.D., D.C.L.
President University of Virginia; Editor-in-Chief *Library of Southern Literature*; author of *Obligations and Opportunities of Citizenship*, etc.
- E. BENJAMIN ANDREWS, D.D., LL.D.
Educator and Historian; author of *Institutes of General History, History of the United States*, etc.
- JAMES B. ANGELL, LL.D.
Late President University of Michigan; author of *The Higher Education, Progress in International Law*, etc.
- LIBERTY H. BAILEY, D.Sc., LL.D.
Cornell University; author of *Plant Breeding, Manual of Gardening, Cyclopaedia of American Horticulture*, etc.
- GEORGE F. BARKER, Sc.D., LL.D.
University of Pennsylvania; author of *Text-book of Chemistry, Text-book of Physics*, etc.
- JOHN HENRY BARROWS, LL.D.
Late President Oberlin College; author of *Christian Evidences, Lectures*, etc.
- CHARLES E. BESSEY, Ph.D., LL.D.
University of Nebraska; author of *Essentials of Botany, Botany for High Schools and Colleges, Elementary Botany*, etc.
- FRANK W. BLACKMAR, Ph.D.
University of Kansas; author of *The Story of Human Progress, Outlines of Sociology*, etc.
- DAVID J. BREWER, LL.D.
Jurist, Publicist; Associate Justice U. S. Supreme Court; author of *American Citizenship, The Twentieth Century*, etc.
- ELMER ELLSWORTH BROWN, Ph.D., LL.D.
President N. Y. University; former U. S. Commissioner of Education; author of *The Making of our Middle Schools, Origin of American State Universities*, etc.
- JAMES M. BUCKLEY, LL.D.
Late editor New York *Christian Advocate*; author of *Travels in Three Continents, The Land of the Czar*, etc.
- JOHN W. BURGESS, Ph.D., LL.D.
Columbia University; author of *The Civil War and the Constitution, Political Science and Comparative Constitutional Law*, etc.
- G. MONTAGUE BUTLER, M.E.
Colorado School of Mines; Geologist for Colorado Geological Survey; author of *A Pocket Handbook of Minerals*, etc.
- JAMES McKEAN CATTELL, Ph.D.
Editor *Popular Science Monthly*; author of *School and Society, American Men of Science*, etc.
- JOHN W. CAVANAUGH, C.S.C., LL.D.
President Notre Dame University; author of *Priests of Holy Cross*, etc.
- EDWARD CHANNING, Ph.D., LL.D.
Harvard University; author of *History of United States, English History for American Readers*, etc.
- SUSAN FRANCES CHASE, M.A., Ph.D.
Department of Psychology and Literature, Buffalo State Normal School; author of *Talks to Teachers, Outlines of Literature*, etc.
- FOSTER D. COBURN, LL.D.
Former Secretary Kansas Department of Agriculture; author of *Swine Husbandry, Alfalfa, The Farmer's Encyclopedia*, etc.
- MAURICE F. EGAN, Litt.D., LL.D.
U. S. Minister to Denmark; author of *Lectures on English Literature, Modern Novelists*, etc.
- CHARLES W. ELIOT, LL.D.
President Emeritus Harvard University; author of *Educational Reform, The Durable Satisfactions of Life*, etc.
- EPHRAIM EMERTON, Ph.D.
Harvard University; author of *Synopsis of the History of Continental Europe, Mediaeval Europe*, etc.
- WILLIAM H. EMMONS, Ph.D.
University of Minnesota; Geologist of Minnesota; author of numerous Reports and Technical Papers on Geology.
- ALCEE FORTIER, Litt.D., LL.D.
Tulane University; author of *History of French Literature, Louisiana Folk Tales, History of France*, etc.
- ARTHUR L. FROTHINGHAM, Ph.D.
Author of *History of Sculpture, Mediaeval Art Inventions of the Vatican*, etc.; co-author Sturgis, *History of Architecture*, etc.
- HORACE HOWARD FURNESS, Litt.D., LL.D.
Shakespearean Scholar, Critic; author of *The Variorum Shakespeare*, etc.
- MERRILL E. GATES, LL.D., L.H.D.
Ex-President Amherst College; author of *Land and Law as Agents in Educating the Indian, International Arbitration*, etc.
- JOHN F. GENUNG, D.D., Ph.D., Litt.D.
Amherst College; author of *Practical Elements of Rhetoric, Working Principles of Rhetoric, The Idylls of the Ages*, etc.
- NICHOLAS PAINE GILMAN, L.H.D.
Meadville Theological School; author of *Profit Sharing, A Dividend to Labor, Methods of Industrial Peace*, etc.
- WILLIAM W. GOODWIN, D.C.L., LL.D.
Harvard University; author of *Greek Grammar, Syntax of the Moods and Tenses of the Greek Verb*, etc.
- EDWARD HOWARD GRIGGS, L.H.D.
Lecturer, Educator; author of *Moral Education, Self-Culture through the Vocation*, etc.
- FRANK W. GUNSAULUS, D.D., LL.D.
President Armour Institute; author of *Paths to Power, Higher Ministries of Recent English Poetry*, etc.
- G. STANLEY HALL, Ph.D., LL.D.
President Clark University; author of *Adolescence, Youth—Its Education, Regimen and Hygiene*, etc.; editor of the *American Journal of Psychology, The Pedagogical Seminary*, etc.
- JOHN HAY, LL.D.
Diplomat, Historian; co-author of *Life of Abraham Lincoln, Castilian Days*, etc.
- EMIL G. HIRSCH, L.H.D., LL.D., D.C.L.
University of Chicago; minister of Sinai Congregation, Chicago; associate editor *Jewish Encyclopedia*; author of many articles on religion, etc.
- GEORGE HODGES, D.D., D.C.L.
Dean Episcopal Theological School, Cambridge, Mass.; author of *The Episcopal Church, The Pursuit of Happiness*, etc.
- ARTHUR HOEBER, A.N.A.
Art Critic *New York Globe*; Art Editor *New Encyclopedia Britannica*; author of *Painting in the Nineteenth Century*, etc.
- GEORGE S. HOLMESTED, K.C., Esq.
Registrar of the High Court of Justice of Ontario; editor of the *Ontario Mechanics Lien Act*, etc.
- JAMES M. HOPPIN, D.D.
Yale University; author of *Great Epochs in Art History, Old England: Its Art, Scenery and People*, etc.
- WILLIAM WIRT HOWE, LL.D.
Jurist, Lecturer; Justice Supreme Court of La.; author of *Studies in Civil Law*, etc.
- GEORGE HOLMES HOWISON, LL.D.
University of California; author of *Limits of Evolution, Philosophy: Its Fundamental Concepts and Methods*, etc.
- THOMAS WELBURN HUGHES, LL.D.
Dean Washburn College of Law; author of *Hughes' Cases on Evidence, Outline of Criminal Law, Commercial Law*, etc.
- JOHN F. HURST, D.D., LL.D.
Late Chancellor American University; author of *History of the Christian Church*, etc.
- WILLIAM DeWITT HYDE, D.D., LL.D.
President Bowdoin College; author of *The Teacher's Philosophy In and Out of School, The Quest of the Best*, etc.
- MORRIS JASTROW, Ph.D.

- University of Pennsylvania; author of *Civilization of Babylonia and Assyria, The Study of Religion*, etc.
- JEREMIAH W. JENKS, PH.D., LL.D.
New York University; author of *The Trust Problem, Citizenship and the Schools, Government Action for Social Welfare*, etc.
- DAVID STARR JORDAN, PH.D., LL.D.
Leland Stanford Jr. University; author of *Science Sketches, Footnotes to Evolution, Animal Life, Food and Game Fishes of North America*, etc.
- ARTHUR B. LAMB, PH.D.
Director Chemical Laboratory, Harvard University; translator of Haber's *Thermodynamics of Technical Gas Reaction*; author of many papers on chemical subjects.
- JOSEPHUS N. LARNED, LL.D.
Librarian and Historian; author of *History for Ready Reference, Literature of American History*, etc.
- HENRY C. LEA, LL.D.
Historian; author of *Studies in Church History, Superstition and Force*, etc.
- SIMON LITMAN, JUR.D., PH.D.
University of Illinois; author of *Trade and Commerce*, and of many articles on commerce and industry.
- THOMAS H. MACBRIDE, PH.D., LL.D.
Ex-President Iowa State University; author of *Textbook of Botany*, etc.
- OTIS T. MASON, PH.D., LL.D.
Ethnologist, Scientist; author of *Origin of Inventions, Woman's Share in Primitive Culture*, etc.
- HUGO MÜNSTERBERG, M.D., PH.D., LL.D.,
Harvard University; author of *Psychology and the Teacher, The Eternal Values, American Problems*, etc.
- CHARLES W. NEEDHAM, LL.D.
Educator, Lawyer; Ex-President George Washington University; associate counsel Interstate Commerce Commission; etc.
- THOMAS NELSON PAGE, LITT.D., LL.D.
Lawyer, Diplomat, Novelist; U. S. Ambassador to Italy; author of *Social Life in Old Virginia, Robert E. Lee: Man and Soldier*, etc.
- JOHN K. PAINE, MUS.D.
Harvard University; Musician, Composer; author of *Realm of Fancy, Song of Promise*, etc.
- GEORGE H. PALMER, LITT.D., LL.D.
Harvard University; author of *Self-Cultivation in English, The Teacher, Trades and Professions*, etc.
- HORATIO W. PARKER, MUS.D.
Yale University; Composer; author of the operas *Mona, Fairyland*, and much other music.
- HARRY THURSTON PECK, PH.D., L.H.D.
Co-editor *New International Encyclopedia*, editor of *Harper's Classical Dictionary*, etc.
- JOHN W. POWELL, PH.D., LL.D.
Late Chief of Bureau of American Ethnology; author of *Studies in Sociology, The Cañons of the Colorado*, etc.
- IRA REMSEN, PH.D., LL.D.
Ex-President Johns Hopkins University; author of *The Elements of Chemistry, Classical Experiments*, etc.
- HENRY A. ROWLAND, PH.D., LL.D.
Late Professor Johns Hopkins University; author of *Mechanical Equivalents of Heat, The Solar Spectrum*, etc.
- BOHUMIL SHIMEK, C.E., M.Sc.
Iowa State University; Botanist; author of numerous scientific papers.
- AINSWORTH R. SPOFFORD, LL.D.
Late Librarian of Congress, Critic; editor of *Library of Choice Literature, Book for All Readers*, etc.
- ROBERT H. THURSTON, LL.D., D.ENG.
Late Professor Cornell University; author of *History of the Steam Engine, Materials of Construction*, etc.
- CRAWFORD H. TOY, M.A., LL.D.
Harvard University; author of *The Religion of Israel, Judaism and Christianity, Quotations in the New Testament*, etc.
- JOHN C. VAN DYKE, L.H.D.
Rutgers College; author of *New Guides to Old Masters, Studies in Pictures*, etc.
- LESTER F. WARD, PH.D., LL.D.
Brown University; Scientist; author of *Sociology and Economics, Pure Sociology*, etc.
- ROBERT M. WENLEY, PH.D., LITT.D., D.SC., LL.D.
University of Michigan; co-editor of *The Dictionary of Philosophy, Dictionary of Theology, Religion and Ethics*; author of *Introduction to Kant, Contemporary Theology and Theism*, etc.
- BENJAMIN I. WHEELER, PH.D., LL.D.
President University of California; author of *Introduction to the History of Language, Life of Alexander the Great*, etc.
- JOHN SHARP WILLIAMS, LL.D.
Publicist, U. S. Senator; author of *Permanent Influence of Thomas Jefferson on American Institutions*, etc.
- OWEN WISTER, LITT.D., LL.D.
Lawyer, Novelist, Critic; author of *The Virginians, Biography of U. S. Grant*, etc.
- ROBERT S. WOODWARD, D.Sc., LL.D.
Director Carnegie Institute; Scientist; author of *Higher Mathematics*, etc.
- CARROLL D. WRIGHT, PH.D., LL.D.
Educator, Economist, Statistician; author of *The Industrial Evolution of the United States*, etc.
- G. FREDERICK WRIGHT, D.D., LL.D.
Oberlin College; author of *Man and the Glacial Period, Science and Religion*, etc.
-

GENERAL OUTLINE OF CONTENTS

FIRST DIVISION: THE KINGDOMS OF NATURE

BOOK OF THE HEAVENS

THE UNIVERSE—THE SOLAR SYSTEM—SUN—PLANETS—MOON—CONSTELLATIONS—STARS—COMETS—METEORS—NEBULÆ—NEBULAR HYPOTHESIS—ECLIPSES—MYTHOLOGY OF THE CONSTELLATIONS—DICTIONARY OF SCIENTIFIC TERMS USED IN ASTRONOMY—STAR CHARTS AND MAPS.

♣**Books of Reference about the Heavens.**—Campbell: *Handbook of Practical Astronomy*. Young: *Elementary Astronomy, Manual of Astronomy, and General Astronomy*. Ball: *Story of the Heavens*. Turner: *Modern Astronomy*. Newcomb: *Popular Astronomy*. Todd: *A New Astronomy*. Gregory: *Vault of Heaven*.

BOOK OF THE EARTH

OUR EARTH: ITS STRUCTURE AND SURFACE—GEOLOGICAL VIEW OF THE GROWTH OF THE EARTH—LAND FORMS OF THE WORLD—DISTRIBUTION OF LAND AND WATER—THE CONTINENTS—ISLANDS—MOUNTAINS—WATERS OF THE EARTH—FORMS OF WATER—RIVERS—WATERFALLS AND RAPIDS—LAKES—OCEANS—VOLCANOES—GEYSERS—ATMOSPHERE, CLIMATE, AND WEATHER—WINDS—CLOUDS—ATMOSPHERIC VAPOR, (DEW, MIST, FOG, RAIN, HAIL, SNOW)—GLACIERS—ICEBERGS—DESERTS—NATURAL FORCES—MINERAL PRODUCTS—PRONOUNCING DICTIONARY OF SCIENTIFIC TERMS—MAPS AND CHARTS.

♣**Books of Reference about the Earth.**—Dawson: *Story of the Earth*. Lyell: *Principles of Geology*. Geikie: *Primer of Geology*. Shaler: *Sea and Land*. Scott: *Geology*. Geikie: *Text-Book of Geology*. Chamberlin and Salisbury: *Geology*. Le Conte: *Elements of Geology*. Dana: *Manual of Geology*. Miers: *Mineralogy*. Dana: *Text-Book of Mineralogy and System of Mineralogy* (most comprehensive work in English). Brush and Penfield: *Determinative Mineralogy*. Rosenbusch-Iddings: *Rock-Making Minerals*. Hatch: *Petrology*. Butler: *Pocket Handbook of Minerals*. Mill: *Realm of Nature*. W. M. Davis: *Physical Geography*. Tarr: *Physical Geography*.

BOOK OF THE VEGETABLE KINGDOM

REALMS OF LIFE UPON THE EARTH—CHIEF DIVISIONS OF THE PLANT KINGDOM: (1) CEREALS, GRASSES AND FORAGE PLANTS; (2) KITCHEN VEGETABLES; (3) THE FRUIT TREES; (4) FRUIT-BEARING SHRUBS AND PLANTS; (5) FLOWERS AND OTHER ORNAMENTAL PLANTS; (6) WILD FLOWERS AND FLOWERLESS PLANTS; (7) TREES OF THE FOREST; (8) FIBER AND COMMERCIAL PLANTS; (9) POISONOUS PLANTS; (10) SOME WONDERS OF PLANT LIFE—BOTANICAL CLASSIFICATION OF PLANTS—SCIENTIFIC TERMS USED IN BOTANY, CLASSIFIED AND ILLUSTRATED—MAP OF THE PLANT KINGDOM.

♣**Books of Reference about the Vegetable Kingdom.**—Gray: *New Manual of Botany*. Bessey: *Synopsis of Plant Phyla*. Small: *Flora of the Southeastern United States*. Coulter and Nelson: *New Manual of the Botany of the Central Rocky Mountains*. Gray: *Synoptical Flora of North America*. Britton: *Manual of the Flora of the Northern States and Canada*. Strasburger, Noll, Schenck and Karsten: *Text-Book of Botany*. Pfeffer: *Physiology of Plants*. Ward: *Disease in Plants*. Schimper: *Plant Geography*. Campbell: *Evolution of Plants*. Green: *Landmarks of Botanical History*. Sach: *History of Botany, 1530-1860*. Green: *History of Botany, 1860-1900*. Baker: *Elementary Lessons in Botanical Geography*.

BOOK OF THE ANIMAL KINGDOM

SCIENTIFIC CLASSIFICATION OF ANIMALS—TABULAR VIEW OF REPRESENTATIVE ANIMAL TYPES—ANIMALS IN CLASSIFIED GROUPS:

I. Wild Animals:

1. THE MAMMALS: (a) THE MONKEY TRIBE; (b) ANIMALS OF PREY; (c) GNAWING ANIMALS; (d) HOOFED ANIMALS; (e) TOOTHLESS ANIMALS; (f) THICK-SKINNED ANIMALS; (g) POUCHED ANIMALS; (h) FLYING ANIMALS; (i) THE SEALS; (j) THE WHALES.
2. THE BIRDS: (a) BIRDS OF PREY; (b) CLIMBING BIRDS; (c) SINGING BIRDS; (d) WADING BIRDS; (e) SWIMMING BIRDS; (f) RUNNING BIRDS; (g) GAME BIRDS.
3. THE REPTILES: LIZARDS—CHAMELEONS—SNAKES—CROCODILES—TORTOISES—TURTLES.
4. AMPHIBIANS: FROGS—TOADS—SALAMANDERS.
5. THE FISHES: (a) BONY FISHES; (b) CARTILAGINOUS FISHES; (c) ARMORED FISHES; (d) LUNGFISHES.
6. THE MOLLUSCS: SNAILS—CUTTLEFISH—SQUIDS—OCTOPUS—TUSK SHELLS—BIVALVES—OYSTERS.
7. JOINTED-LIMBED ANIMALS: CRABS—LOBSTERS—SCORPIONS—SPIDERS—INSECTS—GRASSHOPPERS.
8. BUTTERFLIES AND MOTHS: STRAIGHT-WINGED INSECTS—ANTS AND BEES—FLIES.
9. STARFISHES AND SEA-URCHINS.
10. SIMPLEST FORMS OF LIFE.

[vii]

II. Domesticated Animals:

1. DOMESTICATED MAMMALS: ALPACA—ASS—CAMEL—CAT—CATTLE—DOG—ELEPHANT—GAYAL—GOAT—GUINEA PIG—HORSE—LLAMA—RABBIT—REINDEER—SHEEP—SWINE—YAK—ZEBU.
2. DOMESTICATED BIRDS: CANARY—CHICKENS OR FOWLS—GUINEA—GOOSE—OSTRICH—PARROT—PEACOCK—PIGEON—SWAN—TURKEY.
3. DOMESTICATED INSECTS: BEE—COCHINEAL—SILKWORM MOTH.

III. Pronouncing Dictionary of Scientific Terms concerning Animals.

♣**Books of Reference about Animals.**—Rolleston: *Forms of Animal Life*. Huxley: *Anatomy of Invertebrated Animals and Anatomy of Vertebrated Animals*. Lankester: *Treatise on Zoölogy*. Parker and Haswell: *Text-Book of Zoölogy*. Kingsley: *The Standard Natural History and Elements of Comparative Zoölogy*. Newton: *A Dictionary of Birds*. Headley: *The Structure and Life of Birds*. Wilson: *American Ornithology*. Audubon: *Ornithological Biography*. Coues: *Key to North American Birds*. Chapman: *Handbook of Birds of East North America*. Bendire: *Life Histories of North American Birds*. Comstock: *Insect Life*. Packard: *Text-Book of Entomology and Guide to Study of Insects*. Howard: *The Insect Book*. Beddard: *Text-Book of Zoögeography*. A. Heilprin: *The Geographical and Geological Distribution of Animals*.

SECOND DIVISION: THE KINGDOMS OF MAN

BOOK OF RACES AND PEOPLES

I. MAN AND THE HUMAN FAMILY—HOW MAN DIFFERS FROM OTHER ANIMALS—QUESTIONS OF MAN'S ORIGIN—HIS PRIMEVAL HOME—OLDEST EXTANT REMAINS OF THE HUMAN RACE—MAN'S ADVANCEMENT IN THE PRE-HISTORIC AGES—CHART SHOWING DEVELOPMENT OF THE RACE THROUGH THE AGES: (1) DAWN; STONE AGE; (2) OLD STONE AGE; (3) NEW STONE AGE; (4) BRONZE AGE; (5) EARLY IRON AGE; (6) LATE IRON AGE; (7) AGE OF LETTERS.

II. HOW THE RACES ARE CLASSIFIED—CHART OF PHYSICAL AND MENTAL RACE CHARACTERISTICS—GEOGRAPHICAL DISTRIBUTION OF THE RACES OF MANKIND—DICTIONARY OF THE HISTORICAL RACE GROUPS—COMPARATIVE CLASSIFICATION OF RACES AND PEOPLES.

♣**Books of Reference about Man.**—Prichard: *Researches into the Physical History of Mankind*. Latham: *Natural History of the Varieties of Man*. Waitz: *Anthropology*. Darwin: *The Descent of Man*. Huxley: *Essays and Man's Place in Nature*. Quatrefages: *Classification des Races Humaines*. Peschel: *The Races of Man*. Tylor: *Anthropology*. Lubbock: *Prehistoric Times*. Ratzel: *History of Mankind*. Keane: *Ethnology and Man. Past and Present*. Deniker: *The Races of Man*. Hutchinson: *The Living Races of Mankind*.

BOOK OF NATIONS: Geographical, Historical, Descriptive

I. Extinct Nations of the Past.

CHIEF HISTORICAL PEOPLES: EGYPTIANS—BABYLONIANS—ASSYRIANS—HEBREWS—PHENICIANS—MEDES AND PERSIANS—HINDUS—GREEKS—ROMANS—PROGRESS OF HISTORICAL GEOGRAPHY AND DISCOVERY, B.C. 3800 TO THE PRESENT, WITH 16 MAPS—THE WORLD'S GREATEST EXPLORERS, B.C. 1400 TO 1917 A.D.—COMPARATIVE OUTLINE HISTORY OF ANCIENT NATIONS, B.C. 5000 TO 843 A.D.—DESCRIPTIVE GEOGRAPHY, HISTORY AND GOVERNMENT: THE SPELL OF EGYPT: ANCIENT AND MODERN—THE BABYLONIAN-ASSYRIAN EMPIRES—THE HEBREWS AND THE HOLY LAND—THE PHENICIANS: FIRST NATION OF COLONIZERS—THE MEDO-PERSIAN EMPIRE—THE GREEKS: GLORY OF THE ANCIENT WORLD—ROME: MISTRESS OF THE WORLD—THE SARACEN EMPIRE: ITS FANATICISM, ART, AND LEARNING—THE GERMANIC EMPIRE OF CHARLEMAGNE.

II. Living Nations of To-day.

COMPARATIVE OUTLINE HISTORY OF MODERN NATIONS—TRANSITION PERIOD FROM THE ANCIENT TO THE MODERN—GEOGRAPHICAL AND HISTORICAL DEVELOPMENT OF THE GREAT POWERS: GREAT BRITAIN—FRANCE—GERMANY—ITALY—AUSTRIA—HUNGARY—RUSSIA—UNITED STATES—JAPAN—THE LESSER MODERN NATIONS: IN EUROPE, Spain and Portugal—Scandinavia (Norway, Sweden, Denmark)—The Netherlands—Switzerland—The Balkan States (Bulgaria, Roumania, Turkey, Greece, Servia); IN ASIA, China—Persia—Turkey; IN AMERICA, Brazil—Argentina—Chile—Mexico—Canada.

[viii]

III. Tables and Charts.

INCLUDING GREAT WARS, GREAT BATTLES, DYNASTIES, RULERS, COMPARATIVE GOVERNMENT, BIOGRAPHICAL FACTS RELATING TO THE PRESIDENTS OF THE UNITED STATES, IMPORTANT FACTS CONCERNING THE STATES, ETC.

IV. Historical Charts and Tables, Maps and Plans.

♣**Books of Reference about the Nations.**—HISTORY—Freeman: *General Sketch*. Haydn: *Dictionary Dates*. Rawlinson: *Manual of Ancient History*. Peck: *Harper's Classical Dictionary*. Duncker: *History of Antiquity*. Brugsch-Bey: *Egypt under the Pharaohs*. Ewald: *History of Israel*. Allen: *Hebrew Men and Times*. Ranke: *Universal History*. Fisher: *Outlines of Universal History*. Mommsen: *History of Rome*. Gibbon: *History of the Decline and Fall of the Roman Empire*. Grote: *History of Greece*. Duruy: *History of Rome*. Merivale: *General History of Rome*. Lecky: *History of European Morals*. Hallam: *Middle Ages*. Guizot: *History of*

Civilization. Sybel: *History of the Crusades*. Cox: *The Crusades*. Emerton: *Mediaeval Europe; Introduction to the Study of the Middle Ages*. Harding: *Essentials in Mediaeval and Modern History*. Gieseler: *Church History*. Alzog: *Manual of Universal Church History*. Clarke: *Events and Epochs of Religious History*. Fisher: *History of the Reformation*. Ranke: *History of the Popes*. Dyer: *History of Modern Europe*. Fyffe: *History of Europe*. Sybel: *History of the French Revolution*. Acton: *Cambridge Modern History*. Larned: *Topical Outlines of Universal History*.

ATLASES.—Bartholomew: *Atlas*. Rand-McNally: *Atlas; Century Dictionary and Atlas*. Johnson: *Historical Atlas*. McClure: *Historical Church Atlas*.
GAZETTEERS.—Blackie: *Imperial Gazetteer*. Longman: *Gazetteer of the World*. Lippincott: *Gazetteer*. Baedeker: *Guides*.
GOVERNMENT AND LAW.—Aristotle: *Politics*. Bluntschli: *Theory of the State*. Burgess: *Political Science and Comparative Constitutional Law*. Freeman: *Comparative Politics*. Goodnow: *Comparative Administrative Law*. Lalor: *Cyclopedia of Political Science*. Locke: *Treatises of Government*. Maine: *Popular Government*. Montesquieu: *Spirit of Laws*. Morley: *Ideal Commonwealths*. Plato: *Republic*. Rousseau: *The Social Contract*. Sidgwick: *Elements of Politics*. Spencer: *Man vs. the State*. Wilson: *The State*. Bryce: *The American Commonwealth*. Hart: *Actual Government*. Robinson: *Elements of American Jurisprudence*. Thompson: *English and American Encyclopedia of Law*. Burdick: *The Essentials of Business Law*. Lowell: *Governments and Parties in Continental Europe*. Goodnow: *Comparative Administrative Law*. Dicey: *The Law of the Constitution*.

BOOK OF LANGUAGE AND LITERATURE

I. CLASSIFICATION OF LANGUAGES—WRITTEN AND SPOKEN ENGLISH—THE PROPER USE OF WORDS, SENTENCES AND PARAGRAPHS—FIGURES OF SPEECH—POETICS—USE OF CAPITAL LETTERS—PUNCTUATION—FORMS OF PRACTICAL ENGLISH COMPOSITION: LETTERS, ARGUMENT AND DEBATE, NEWS, SHORT STORY, FICTION, ESSAY, EDITORIALS, REVIEWS, CRITICISM, ADDRESSES AND OTHER FORMS OF PUBLIC SPEECH—ABBREVIATIONS—PRONOUNCING DICTIONARY OF CLASSIC WORDS AND PHRASES—PRONOUNCING DICTIONARY OF WORDS AND PHRASES FROM THE MODERN LANGUAGES.

II. ENGLISH AND AMERICAN LITERATURE—OUTLINE CHARTS OF ENGLISH AND AMERICAN AUTHORS—DICTIONARY OF LITERARY ALLUSIONS: FAMOUS BOOKS, POEMS, DRAMAS, LITERARY CHARACTERS, PLOTS, PEN NAMES, LITERARY SHRINES AND GEOGRAPHY, AND OTHER MISCELLANY—PRONOUNCING DICTIONARY OF MYTHOLOGY: GODS, HEROES, AND MYTHICAL WONDER TALES—CHART OF GREEK AND ROMAN MYTHS, THEIR ORIGIN, RELATIONSHIP AND DESCENT.

♣**Books of Reference.**—LANGUAGE.—Sayce: *Introduction to the Science of Language*. Whitney: *Language and the Study of Language*. Paul: *Principles of the History of Language*. Muller: *Science of Language*. Skeat: *Philosophy*. Jespersen: *Progress in Language, with Special Reference to English*. Giles: *Manual of Comparative Philosophy for Classical Students*. Oertel: *Lectures on the Study of Language*. Sweet: *Primer of Spoken English*. Skeat: *Etymological Dictionary of the English Language*. Sweet: *Grammar, Logical and Historical*. Lewis: *Applied English Grammar*. Genung: *Practical Elements of Rhetoric*. Gummere: *Poetics*. Wendell: *English Composition*. Palmer: *Self-Cultivation in English*. Kittredge: *Words and their Ways in English Speech*. Trench: *Study of Words*. Fernald: *Synonyms and Antonyms*.

LITERATURE.—Jevons: *History of Greek Literature*. Mahaffy: *Greek Literature*. Crutwell: *History of Roman Literature*. Fortier: *History of French Literature*. Robertson: *History of German Literature*. Garnett: *Short History of Italian Literature*. Symonds: *Italian Renaissance*. Horn: *History of Scandinavian Literature and Jewish Encyclopedia*. Morley: *Library of English Literature*. Brooke: *History of English Literature*. Ward: *English Poets*. Gosse: *Short History of English Literature*. Tyler: *History of American Literature*. Matthews: *History of American Literature*. Stedman: *An American Anthology*. Johnson: *Elements of Literary Criticism*. Warner: *Library of Universal Literature*.

DICTIONARIES.—Webster: *New International Dictionary*. Worcester: *Dictionary of the English Language*. Funk and Wagnalls: *Standard Dictionary*. Whitney: *The Century Dictionary*. Murray: *Oxford English Dictionary*. Wright: *Dialect Dictionary*.

BOOK OF THE SCIENCES AND INVENTION

HOW THE PLANETS WOULD APPEAR IF GROUPED IN SPACE

In the above picture we have represented the planets of the Solar System as we should see them from the earth if the human eye could grasp a space of such immensity. The spectator is supposed to be standing on the earth, and the moon is in the foreground, 240,000 miles away. The planets are in their order outward from the sun, and vary in distance from 40,000,000 miles, in the case of Mars, to 2,700,000,000 miles in the case of Neptune. From the bottom upward, the planets are Mercury, Venus, Mars, Jupiter, Saturn and its rings, Uranus and Neptune.

THE WORLDS IN THE SKIES

The earth upon which we live is only one of many worlds that whirl through space. If we are to understand our own world, we must first learn something about the worlds in the skies. These bodies are arranged in groups, or systems, sweeping through circuits that baffle measurement; and such is the magnitude of the boundless space they occupy that our entire solar system is only a point in comparison. To this vast expanse of worlds, and systems and space we give the general name *Universe*.

THE SOLAR SYSTEM AND ITS MEMBERS

First in importance to us in this immense space filled with stars is what astronomers call the Solar System, so-called because the sun is its center. It contains the planets, eight in number, of which our earth is one. They have been named after the ancient deities; the two interior ones, Mercury and Venus, and the exterior ones, Mars, Jupiter, Saturn, Uranus, and Neptune; the first three being smaller than our earth, and the remainder a great deal larger.

Mercury and Venus are known to be *interior* planets, that is, planets between us and the sun, because they appear to swing on either side of the sun. Mercury very seldom leaves the sun sufficiently to rise so early before the sun, or set so late after him, as to be visible. Venus, however, gets so far away as to be seen long after sunset or before sunrise, and is called the Evening or Morning star, accordingly.

Besides the planets there are other members of the system, namely, *comets* and *falling stars*, which will be mentioned again more fully hereafter. All these bodies form a sort of family, having the sun for their head. The illustrations and drawings on separate pages give a view of the entire system.

COMPARATIVE SIZE. The size of the planets, in general, increases with their distance from the sun. The four composing the first group are all comparatively small, the earth being the largest. Those of the second group are all of great size. Jupiter, the largest, is not less than 1,390 times as large as the earth; but as it is much less dense, the amount of matter it contains is only a trifle more than 337 times that of the earth. All the planets together equal but one seven-hundredth part of the mass of the sun.

The **SATELLITES**, except our moon, and the two satellites of Mars, belong wholly to the second group of planets. Jupiter has eight; Saturn eight and several revolving rings; Uranus has four, and possibly more; while Neptune, so far as known with certainty, has but one.

MOVEMENTS WITHIN THE SOLAR SYSTEM

ROTARY MOTION. The sun, all the primary planets, and their satellites, as far as known, rotate from west to east. Each rotation constitutes a day for the rotating body. The central line of rotary motion is called the axis of rotation, and the extremities of the axis are called the Poles.

REVOLUTION AROUND THE SUN. All the primary planets and asteroids revolve around the sun in the direction of their rotation, that is from west to east; and the planes of the orbits in which they revolve coincide very nearly with the plane of the sun's equator. One revolution around the sun constitutes the year of a planet.

All the satellites, except those of Uranus and perhaps Neptune, also revolve from west to east.

Most of the comets revolve around the sun in very irregular and elongated orbits, only a few having their entire orbit within the planetary system. Some so move that after having entered our system and made their circuit around the sun, they seem to leave it, never to return.

Since the orbits of the planets are in most cases not far removed from the plane of the ecliptic, they are to be seen in a comparatively narrow belt of the heavens called,

THE ZODIAC. The belt of the sky which occupies 8° on each side of the ecliptic is called the Zodiac, and it is within this belt that the moon and the chief planets confine their movements, as none of their orbits is inclined to that of the earth by more than 8° . The Zodiac, which circles the celestial sphere, is divided into twelve signs each of which occupies 30° , and roughly coincides with a constellation. The following lists give the signs of the Zodiac, with the seasons in which the sun passes through each of them:

Spring: Aries the Ram; Taurus the Bull; Gemini the Twins.

Summer: Cancer the Crab; Leo the Lion; Virgo the Virgin.

Autumn: Libra the Balance; Scorpio the Scorpion; Sagittarius the Archer.

Winter: Capricornus the Goat; Aquarius the Water-bearer; Pisces the Fishes.

Owing to the precession of the equinoxes, the signs of the Zodiac do not now correspond with the constellations of which they bear the names. Thus the sign Aries, in which the sun is seen on March 21st as it passes the vernal equinox, with which the solar year begins, is now in the constellation of Pisces, and in the course of the next 23,000 years it will move steadily backward through the constellations until it returns to the Ram, where it stood when its name was first given to it.

KEPLER'S CELEBRATED LAWS OF PLANETARY MOVEMENTS

The laws under which the planets move were discovered through the genius of John Kepler, and are known as Kepler's Laws of Planetary Motion. Kepler derived these laws from observation only, but Newton first explained them by showing that they were the necessary consequences of the laws of motion and the law of universal gravitation.

KEPLER'S FIRST LAW states: "The earth and the other planets revolve in ellipses with the sun in one focus."

KEPLER'S SECOND LAW states: "The radius vector of each planet moves over equal areas in equal times."

KEPLER'S THIRD LAW states: "The squares of the periodic times of the planets are in proportion to the cubes of their mean distances from the sun."

DIAGRAMS ILLUSTRATING KEPLER'S FIRST TWO LAWS OF PLANETARY MOTION

The diagram on the top illustrates the ellipse, and explains the first and second laws. The picture-diagram on the bottom illustrates the second law, which is that, as the planet moves round the sun, its radius vector describes equal areas in equal times. That is to say, a planet moves from A to B in the same time as it takes to move from C to D.

These laws cannot be fully understood without some acquaintance with mathematics. They may, however, be briefly explained for the comprehension of the non-mathematical reader. The figure in the diagram is an ellipse—what is known in popular language as an oval—which is symmetrical about the line AB, known as its major axis. It has two foci, S and S₁. The fundamental law of the ellipse is that if we take any point P on it, and join this point by a straight line to the two foci, then the sum of these two lines SP and S₁P is always the same—SP + S₁P = C.

The second law is rather less easy to understand. The *radius vector* is the line joining the sun to the planet at any moment; if we suppose the sun to be at the focus S, and P to be the planet, the radius vector at various positions of the planet will be represented by the lines SP, SP₁, SP₂, and so on. If the positions P, P₁, P₂, and so on, represent those which the planet occupies after equal periods of time—say, once a month—then the sectors of the ellipse bounded by each pair of lines, SP and SP₁, SP₁ and SP₂, will be equal. If a planet were to move in a circle round the sun, it is obvious that this law would imply that it moved with a uniform speed; but since the curvature of the ellipse varies in every part of its course, so must the speed of the planet, in order that its radius vector may describe equal areas in equal times. The planet will, in fact, be moving faster when it is near the sun, as at P, than when it is far off from the sun, as at P₂.

The third law shows that there is a definite numerical relation between the motions of all the planets, and that the time which each of them takes to complete its orbit depends upon its distance from the sun.

On his discovery of his third law Kepler had written: "The book is written to be read either now or by posterity—I care not which; it may well wait a century for a reader, as God has waited six thousand years for an observer." Twelve years after his death, on Christmas Day, 1642, near Grantham, England, the predestined "reader" was born. The inner meaning of Kepler's three laws was brought to light by Isaac Newton.

THE GIGANTIC SUN AND HIS FUNCTION IN THE SOLAR SYSTEM

The great luminary which warms, lights, and rules the solar system is, like the majority of its fellow stars, a gigantic bubble. In other words, it is a globe of glowing gas, which is nowhere solid, though the immense pressure which must exist in its interior probably causes this gas to assume there a density greater than that of any solid which we know.

A PHOTOGRAPH OF THE SUN, SHOWING THE CLOUDS OF FIERY VAPOR WHICH SURROUND IT

DIMENSIONS OF THE SUN. The sun appears to human vision as a brilliant globe of a little more than half a degree in diameter. It is about the same apparent size as the moon, since the size of the sun is to that of the moon very nearly in the same proportion as their relative distances from the earth. In reality, however, the sun is a gigantic orb, so huge that if the earth were at its center the whole orbit of the moon would lie well within its circumference. The diameter of the sun is about 866,500 miles.

The mass of the sun is about 332,000 times that of the earth, but its specific gravity is only about a quarter that of the earth, 1.41, if that of water be taken as unity. The mean distance of the sun from the earth is about 92,800,000 miles; but, as the earth's orbit is not circular but elliptic, this distance varies by about 3,000,000 miles, being smallest in January and greatest in July.

THE PHYSICAL CONDITION of the sun is very different from that of the earth, though we know it is composed of very similar materials. The white-hot surface that we see, called the *photosphere*, is believed to be largely a shell of highly heated metallic vapors surrounding the unseen mass beneath. Dark spaces seen in the photosphere are known as *sun-spots*, and these are often surrounded by brighter patches, termed *faculae*. Above the photosphere a shallow envelope of gases, rising here and there into huge prominences, and known as the *chromosphere*, is seen in red tints when the sun is totally eclipsed. Beyond the chromosphere, there is also seen, at the same time, a faint but far more extensive envelope called the *corona*.

This diagram illustrates the theory that sun-spots are formed by fragments struck from Saturn's rings (which are in themselves nothing more than a great meteoric swarm) by the swarm of meteors known as the Leonids, which fragments fall into the solar furnace at a speed of four hundred miles a second.

The sun's rays supply light and heat not only to the earth, but also to the other planets which revolve round it. Its attraction confines these planets in their orbits and controls their motions.

[18]

THE MOON—THE EARTH'S ONLY SATELLITE

THE MOON, the satellite of the earth, is the nearest to us of all the heavenly bodies, being at a mean distance of 240,000 miles. Its diameter is 2,153 miles and, its density being little more than half that of the earth, the force of gravity at its surface is very much less than that at the surface of the earth. A body which weighs a pound here would only weigh about two and one-half ounces if taken to the moon.

THE SYSTEM OF MARS AND ITS MOONS CONTRASTED WITH THAT OF THE EARTH AND MOON

In this diagram the markings on the earth and Mars are to scale, the orbits of the planets are seen in perspective and the measurements are according to Prof. Percival Lowell.

THE MOON'S ORBIT. Her path is approximately an ellipse with the earth in one focus. Its apparent motion in the sky is from west to east, but she moves much faster than the sun, taking about twenty-seven days eight hours to travel all round the earth. The time between two successive new moons (synodic period or lunation) is twenty-nine and one-half days. The reason of the difference is that the sun moves slowly in his annual course through the stars in the same direction as the moon, which therefore in its revolution round the earth has to overtake him when it returns. The moon rotates on its axis in the same time as it performs a revolution in its orbit; hence the same half is always turned toward us.

When the moon in her orbit lies between the sun and the earth, she is said to be in *conjunction* with the sun; when the earth is between the moon and the sun, the moon is said to be in *opposition* to the sun. At either of the two points midway from conjunction and opposition, i. e. 90° from conjunction or opposition, the moon is said to be in *quadrature*.

THE PHASES OF THE MOON. Except at opposition—i. e. when the earth is between the moon and sun—the whole of the moon's disc does not appear bright to us, and the amount of the bright surface seen by us is found to depend on the relative positions of moon and sun. Half of the moon is always illuminated by the sun; but when it is in conjunction between the earth and sun the whole of the bright surface is on the side away from us; so that the moon is invisible. As it moves farther from the line joining earth and sun, a small portion of the bright side comes into view as a narrow crescent. This increases till half the disc is illuminated, when the lines joining earth and moon and earth and sun are at right angles. From this time the moon loses its crescent shape and becomes convex on both sides, or gibbous (Lat. *gibbus*, a hump)—the maximum brightness, or full moon, occurring when sun and moon are on opposite sides of the earth. After this the moon becomes gibbous, then crescent, and vanishes before the time of new moon.

[19]

It is worthy of note that the moon is higher in the heavens and longer above the horizon in the winter than in summer. This is owing to the plane of its orbit being at night high towards the south in winter and low in summer, as is the ecliptic. The moon's orbit, like that of other planets, is elliptical, but irregular. When nearest to the earth, she is said to be in *perigee*; when at the greatest distance, in *apogee*.

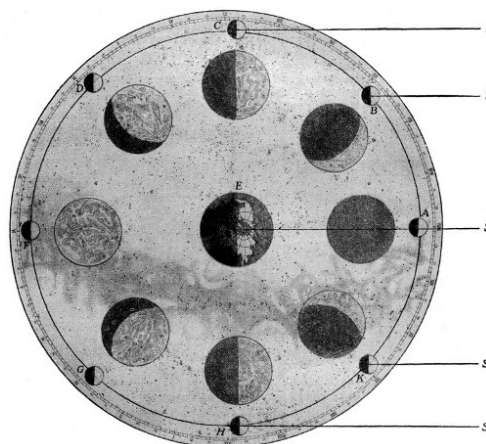

DIAGRAM SHOWING HOW THE MOON'S PHASES ARE CAUSED

In the above diagram, the earth is in the center, and the circle ACFH the orbit of the moon. Since the inclination of the plane of the moon's orbit to the plane of the ecliptic is only a few degrees, we may neglect it in this case, and suppose the two planes to coincide. Let the sun lie in the direction ES. Since the distance of the sun from the earth is about three hundred and eighty-seven times the distance of the moon from the earth, the lines ES, HS, BS, etc., drawn to the sun from different points of the moon's orbit, may be considered to be sensibly parallel. Let us first suppose the moon to be in conjunction with the sun at the point A. Here only the dark portion of the moon is turned towards the earth, and the moon is therefore invisible. This is called new moon. As the moon moves on towards B, the enlightened part begins to be visible, and when it reaches C, half the enlightened

part is visible, and the moon is at its first quarter. When the moon is at F, in opposition to the sun, all the illuminated part is turned towards the earth, and the moon is full. The moon wanes after leaving F, passes through its last quarter at H, and finally becomes again invisible at A.

SURFACE OF THE MOON. The moon is an opaque, cold globe, covered with mountains, extinct volcanoes, and plains. She has neither water nor atmosphere, and always presents the same surface to the earth in consequence of rotating on her axis in the same time as she revolves round the earth. Moonlight is only reflected sunlight, the illuminated hemisphere being always turned towards the sun.

The face of the moon has been studied and mapped on a large scale. Its chief features are three in number: (1) the numerous *volcanic craters*, such as Tycho and Copernicus, which are mostly named after distinguished men of science; (2) the wide, dark plains which are known as *seas*, because they were formerly thought to consist of water; (3) the curious systems of *bright streaks*, which radiate from many of these craters, of which the most remarkable extend in all directions from the great crater Tycho, near the moon's south pole, and are conspicuous even to the naked eye at the time of full moon.

THE MOON AND THE TIDES. The moon has long been known to have an effect upon the tides, and may perhaps influence the winds. It is of enormous importance to navigators for the determination of longitude, and hence its movements have been investigated with the greatest care and precision.

HOW THE MOON FORMS "TIDES" IN THE CRUST OF THE EARTH

By reason of its power of attraction, it is well recognized that the Moon exercises a greater influence on the side of the earth which is nearest to it. In consequence the earth is subject to a stress or pull that tends to lengthen it out toward the moon, and then to recede as the earth turns away on its axis.

THE PLANET MARS. Nearest to the earth, with the single exception of Venus, resembles the earth more closely than any other of the planets, and is most favorably situated for our observation of all the heavenly bodies, except the moon. It is a globe rather more than half the size of the earth. When Mars comes nearest to the earth its distance from us is about 35,000,000 miles. At these favorable moments its brightness is about equal to Jupiter, and only surpassed by that of Venus. Mars has a very pronounced red color, which is supposed to be due to the prevalence of a rock like our red sandstone on its surface, or possibly to the color of its vegetation.

Its density is much less—about three-quarters that of the earth; so a pound weight placed on its surface would not weigh much more than six ounces, and a ponderous elephant would, if there, be able to jump about with the agility of a fawn.

The heat and light which Mars receives from the sun, therefore, vary enormously, and so cause a difference in the lengths of winter and summer in his north and south hemispheres, the seasons in the north hemisphere being far more temperate than those in the south. Viewed with the telescope, large dark green spots are seen, the rest of the surface being of a ruddy tint, except at the two poles, where two white spots are observed and considered to be due to large masses of snow and ice. It has been supposed that the greenish spots are oceans, and the ruddy parts land. The spectroscope has shown that watery vapor is present in Mars' atmosphere, and appearances like huge rain-clouds sometimes obscure a part of the planet for a considerable period. Physical processes seem to go on there much the same as on our planet; hence many believe that Mars is inhabited and forms, in fact, a miniature picture of the earth.

JUPITER. By far the largest of the planets is second in brilliancy to Venus, unlike which, however, it is a "superior" planet, having its orbit outside that of the earth. It is about five times as brilliant as Sirius, the brightest of the fixed stars.

The planet is a beautiful object when viewed with a telescope; it is probable that the markings are entirely due to its atmosphere, and that the actual surface of the planet is rarely visible. Jupiter has hardly yet cooled from the condition of incandescence, and it is only slightly solidified. It possesses eight satellites, four of which were discovered by Galileo when he applied the telescope first to the investigation of the heavens. By means of these satellites the first observations of the velocity of light were made. A fifth was discovered in 1892 at the Lick Observatory.

SATURN was recognized as a planet by the ancients, and was the outside member of the solar system as known by them. His diameters at the equator and poles differ considerably, the protuberance at the equator giving him there a diameter of 74,000 miles, while at the poles it is only 68,000. In size Saturn is the largest of the planets except Jupiter, being in fact seven hundred times larger than our earth, but his density is so small that he would be able to float on water far more easily than an iceberg. From this it follows that he cannot consist of solid or liquid matter, and in fact we can only view a mass of clouds intensely heated within, the whole being probably a planet in the early stage of development—younger even than Jupiter.

The most remarkable characteristic of Saturn, which makes him an object of such interest in the sky, is his possession of a luminous ring. The ring is only luminous on account of its reflection of the sun's light; hence is invisible to us when, for instance, we are endeavoring to look at the ring from below while the sun is shining above. It also sometimes happens that the plane of the rings passes through the sun or through the center of the earth, in which case only the thin edge of the rings can be seen. The ring is divided into two parts, the inner being the wider, while another faint division appears to divide the outer part into two smaller rings. In 1850 another ring was discovered; this is quite different from the outer rings, being dark, and generally known as the dusky ring of Saturn. The outer ones, though far from solid, can receive a shadow of Saturn, and themselves cast one on his disc. The rings are not continuous masses of matter, but consist of countless myriads of tiny satellites, so close together that to the observer they appear as one body. The planet has eight satellites which seldom pass behind or in front of the planet's disc, and therefore are not objects of great interest.

URANUS is the next planet beyond Saturn. His mass is about fifteen times as much as that of the earth, an amount which makes him more than outweigh Mercury, Venus, the Earth, and Mars combined. All astronomers do not agree in their estimation of these numbers, Uranus being too far away for measurements to be more than approximate. Gravity on his surface is only three-quarters of what it is here. Uranus has four satellites, and possibly faint rings like those which encircle Saturn.

NEPTUNE is farthest from the sun, the distance between the two bodies being about 2,750,000,000 miles. At this immense distance it will, according to Kepler's laws, take a long time to travel once around its orbit, and this time has been found to be one hundred and sixty-five of our years. Although it is ninety-seven times as large as the earth, yet, on account of its enormous distance from us it can only just be seen, even with a powerful telescope. Neptune possesses one satellite, which moves around the planet in rather less than six days.

MERCURY is the smallest planet, except the planetoids, in the solar system, and the one nearest the sun. It is never seen for more than two hours before sunrise or after sunset, and is not always visible then; but when it does appear, it is extremely brilliant. Even when it is most distant the sun appears four and a half times as big to it as it does to us, and when the two are at their nearest, this small planet gets ten times as much light and heat as we do. It is, however, so small and difficult to observe, that comparatively little is known of it.

VENUS appears to us as the most brilliant of all the planets, sometimes heralding the sun's approach in the morning and sometimes following him at night. Hence she has been called the "morning" and the "evening" star; and the ancient Greeks, believing her to be two bodies, and not one, called her Hesperus (Vesper) when she appeared at night, but Phosphorus when she preceded the dawn, this last name having been translated in the Latin, Lucifer. We know very little of the actual surface of Venus, for her envelope of clouds remains constantly in front of us to baffle curiosity, and never lifts to give us a glimpse of the planet beneath. These clouds send on to us the light they borrow from the sun, and shine to us with a brilliant silvery lustre interrupted here and there with shadowy markings of short duration. But when Venus shines to us in crescent-form, certain spots near the ends of the horns can be seen more definitely, and the effects of light and shadow round these points suggest that they are lofty peaks, reaching above the clouds.

THE MINOR PLANETS OR ASTEROIDS. The space between Mars and Jupiter is occupied by a strange and numerous swarm of *minor planets* or *asteroids*. The first of these singular bodies was discovered by an Italian astronomer, Piazzi, on the first night of the nineteenth century. Three others were discovered within the course of the next seven years, and the number now known is upward of 600, most of which have been recognized by the record of their motion on photographs of the sky. The four asteroids first discovered, Ceres, Pallas, Juno, and Vesta, are naturally the largest, ranging in diameter from four hundred to one hundred and eighteen miles.

Vesta, though not the largest, is considerably the brightest of the minor planets, and is occasionally visible to the naked eye. None of the other asteroids has a diameter so great as one hundred miles, and probably the majority of them are only ten or twenty miles in diameter.

COMETS, METEORS AND SKY DUST

In addition to the planets and their satellites, the sun is attended by numerous other bodies, moving with far less regularity, and generally much less conspicuous in the heavens. These are known as *comets* and *meteorites* or *shooting stars*. One of the most interesting of recent astronomical discoveries is that an intimate physical connection exists between these two classes of bodies.

COMETS. Comets have been known from the earliest times, because every now and then a very large and conspicuous one hastens up to the sun from the remote regions of space, and perplexes monarchs with the fear of change. They are called *comets*, from the Latin *coma*, meaning hair, because when they are bright enough to be seen with the naked eye they look like stars attended by a long stream of hazy light, which was thought to resemble a woman's hair flowing down her back. This train of light is known as the comet's *tail*. Such bright comets are sometimes as brilliant as Venus; their tails have been known to stretch halfway across the visible sky.

These comets are very beautiful and conspicuous objects, which usually appear in the sky without any warning from astronomers, and invariably create a great popular sensation. By far the greater number of comets, however, are only visible through a telescope, and it is rare that a year passes without at least half a dozen of these being reported. Up to the present time nearly a thousand comets of all sizes have been recorded. Not more than one in five of these visitors is visible to the naked eye.

COMETARY ORBITS. In all cases in which a comet has been observed sufficiently often for its orbit to be calculated, it is found that it moves in one of the curves which are known to the geometer as conic sections. Less than a hundred of the known comets move like the planets in *elliptical* orbits, and consequently their periodical return to visibility can be predicted. As a rule the eccentricity of these cometary orbits is very much greater than that of any planetary orbit, which means that the comet approaches fairly close to the sun at one end of its orbit, but at the other flies away far beyond the outermost planet, and for a long period disappears from the view of our most powerful telescopes.

The great majority of comets have only been seen once, and their orbits appear to be either *parabolic* or *hyperbolic*. Neither of these is a closed curve, and what seems to happen in such cases is that a comet travelling in such an orbit dashes up to the sun from the remote parts of space, swings round it, often at very close quarters, and flies away again forever. Only those comets which have elliptical orbits can be said to belong to the solar system. The

[20]

[21]

[22]

[23]

others are visitors from space, which in the course of their motion come near the sun and are deflected by it, but then fly away until after a lapse of ages they perhaps come within the sphere of another star's attraction. Of the comets which move in elliptical orbits, about twenty have been observed at more than one return to the sun. Some of these complete their orbits in quite a short period, like Encke's comet, which has the shortest period of all, less than three and a half years; the longest periodical comet is known as Halley's, which returns to the sun after seventy-six years, and last appeared in 1910; it is a bright and conspicuous object.

THE CONSTITUTION OF COMETS. The nature of comets was long in doubt, and even today their physical characteristics are not fully understood. They are certainly formed of gravitational matter, because they move in orbits which are subject to the same laws as those of the planets. But they also appear to be acted upon by powerful *repulsive forces* emanating from the sun, to which is due the remarkable phenomenon of cometary tails. Perhaps there is not much exaggeration in the statement once made by a well-known astronomer that the whole material of a comet stretching halfway across the visible heavens, if properly compressed, could be placed in a hatbox. The old fear that the earth might suddenly be annihilated by a comet striking it is thoroughly dispelled by modern investigation, which leads us to believe that the worst results of such an encounter would be an extremely beautiful display of shooting stars.

METEORS, OR FIREBALLS, are bodies which do not belong to the earth, but come from other parts of space into our atmosphere, and are seen as bright balls of fire crossing the sky, with a train of light behind. Suddenly they are seen to go out, and very often a fall of stones occurs. Sometimes they are observed to break in two, and loud explosions like thunder are heard. They move very fast—ten or twelve miles per second, and are visible when between forty and eighty miles above the earth.

Other meteors dart across the sky and disappear, all in a very short time. These are known as shooting stars, and are sometimes big and bright, like planets. It is estimated that about six or eight meteors which drop stones come into our atmosphere every year; but some 20,000,000 of small bodies pass through the air every day—these would all appear as shooting stars if they occurred at night.

At some periods of the year there are so many shooting stars that they appear like a shower of fire. On November 14th this happens, the shower being greatest every thirty-three years. A stream of meteors is travelling round the sun, and every thirty-three years the earth just comes through them. Meteoric showers also occur about August 9th to 11th, and smaller ones in April.

The luminosity of meteors is due to the intense heat caused by the resistance of the air to their passage, and in support of this theory it is found that meteoric stones are always covered, either wholly or in part, with a crust of cement that has recently been melted.

THE FIXED STARS IN THE HEAVENS

We shall now study the so-called fixed stars, those stars, namely, which preserve the same relative position and configuration from night to night, only varying, and that with perfect regularity, in the times at which they reach the meridian. For this reason they have been known from the dawn of astronomy as fixed stars, in contrast with the planets or wandering stars.

The observer who watches the nightly changes in the sky with close attention will soon perceive that all these fixed stars appear to move in circles or parts of circles. Some of them describe larger circles than others, and the further south a star is when it passes the meridian, the larger circle will it describe.

It cannot be too often repeated that this motion of the stars is only apparent, being due to the real rotation of the earth, along with the observer on its surface, in the contrary direction. It is estimated that there are about three thousand stars visible to the naked eye in our latitude, though not all these are visible at the same time, many of them being below the horizon, while others are elevated in the sky at different times and seasons.

[24]

THE MAGNITUDES AND GROUPING OF THE STARS

In beginning our study of the stars, let us put ourselves in the position of the earliest observers. Let us first, like them, watch the stars, and see how they appear from night to night.

We see, at the first glance, that the stars vary much in brightness. The brightest ones—like Sirius, Capella, Arcturus, and Vega—are called stars of the *first magnitude*. Those less brilliant, like the six brightest of "the Dipper," are said to be of the *second* magnitude. All the stars which can be seen with the unaided eye are thus divided into six classes or *magnitudes*, according to their brightness.

CONSTELLATIONS. We also see that the stars are not uniformly distributed over the sky. They seem to be arranged in groups, some of which take the form of familiar objects. Every one knows the seven bright stars which are called "the Dipper." Another group resembles a *sickle*, another a *cross*, and so on. All the stars in the heavens have been divided into groups called constellations. Many of these were recognized and named at a very early period.

We should become familiar with these constellations in order to study the stars with any profit.

It is necessary, in the first place, to have some way of designating the stars in each constellation. Many of the brighter stars have proper names as Sirius, Arcturus, and Vega; but the great majority of them are marked by the letters of the Greek alphabet. The brightest star in each constellation is called α (alpha); the next brightest, β (beta); the next, γ (gamma); and so on. The characters and names of the Greek alphabet are as follows:

- α , Alpha.
- β , Beta.
- γ , Gamma.
- δ , Delta.
- ϵ , Epsilon.
- ζ , Zeta.
- η , Eta.
- θ , Theta.
- ι , Iota.
- κ , Kappa.
- λ , Lambda.
- μ , Mu.
- ν , Nu.
- ξ , Xi.
- \omicron , Omicron.
- π , Pi.
- ρ , Rho.
- σ , Sigma.
- τ , Tau.
- υ , Upsilon.
- ϕ , Phi.
- χ , Chi.
- ψ , Psi.
- ω , Omega.

These letters are followed by the Latin name of the constellation. Thus Aldebaran is called α Tauri; Rigel, β Orionis; Sirius, α Canis Majoris.

If there are more stars in a constellation than can be named from the Greek alphabet, the Roman alphabet is used in the same way; and when both alphabets are exhausted, numbers are used.

CIRCUMPOLAR CONSTELLATIONS. One of the most important constellations, and one easily recognized, is the Great Bear, or Ursa Major. It is represented in [Plate 1](#) on the Star Chart. It may be known by the seven stars forming "the Dipper." The Bear's feet are marked by three pairs of stars. These and the star in the nose can be readily found by means of the lines drawn on the chart. It may be remarked here, that in all cases the stars thus connected by lines are the leading stars of the constellation. The stars α and β are called the Pointers. If a line be drawn from β to α , and prolonged about five times the distance between them, it will pass near an isolated star of the second magnitude known as the Pole Star, or Polaris. This is the brightest star in the Little Bear, or Ursa Minor ([Plate 2](#)). It is in the end of the handle of a second "dipper," smaller than the one in the Great Bear.

On the opposite side of the Pole Star from the Great Bear, and at about the same distance, is another conspicuous constellation, called Cassiopeia. Its five brightest stars form an irregular W, opening towards the Pole Star ([Plate 2](#)).

About half-way between the two Dippers three stars of the third magnitude will be seen, the only stars at all prominent in that neighborhood. These belong to Draco, or the Dragon. The chart will show that the other stars in the body of the monster form an irregular curve around the Little Bear, while the head is marked by four stars arranged in a trapezium. Two of these stars, β and γ , are quite bright. A little less than half-way from Cassiopeia to the head of the Dragon is a constellation known as Cepheus, five stars of which form an irregular K.

These five constellations never set in our latitude, and are called circumpolar constellations.

CONSTELLATIONS VISIBLE IN SEPTEMBER. At this time the Great Bear will be low down in the northwest, and the Dragon's head nearly in the zenith. If we draw a line from ζ to η of the Great Bear and prolong it, we shall find that it will pass near a reddish star of the first magnitude. This star is called Arcturus, or α Boötis, since it is the brightest star in the constellation Boötes. Of its other conspicuous stars, four form a cross. These and the remaining stars of the constellation can be readily traced with the aid of [Plate 3](#).

Near the Dragon's head ([Plate 4](#)) may be seen a very bright star of the first magnitude, shining with a pure white light. This star is Vega, or α Lyrae.

If we draw a line from Arcturus to Vega ([Plate 3](#)), it will pass through two constellations, the Crown, or Corona Borealis and Hercules. The former is about one-third of the way from Arcturus to Vega, and consists of a semicircle of six stars, the brightest of which is called Alphecca or Gemma Coronæ,—"the gem of the crown."

Hercules is about half-way between the Crown and Vega. This constellation is marked by a trapezoid of stars of the third magnitude. A star in one foot is near the Dragon's head; there is also a star in each shoulder, and one in the face.

Just across the Milky Way from Vega ([Plate 5](#)) is a star of the first magnitude, called Altair, or α Aquilæ. This star marks the constellation Aquila, or the Eagle, and may be recognized by a small star on each side of it. These are the only important stars in this constellation.

In the Milky Way, between Altair and Cassiopeia ([Plate 4](#)), there is a large constellation called Cygnus, or the Swan. Six of its stars form a large cross, by which it will be readily known. α Cygni is often called Deneb. It forms a large isosceles triangle with Altair and Vega.

Low down in the south, on the edge of the Milky Way ([Plate 6](#)), is a constellation called Sagittarius, or the Archer. It may be known by five stars forming an inverted dipper, often called "the Milk-dipper." The head is marked by a small triangle. The other stars, as seen by the map, may be grouped so as to represent a bow and an arrow.

[25]

I. STAR CHART OF THE PRINCIPAL CONSTELLATIONS

Large illustrations (all less than 100 kB):
[Plate 1](#), [Plate 2](#), [Plate 3](#), [Plate 4](#),
[Plate 5](#), [Plate 6](#), [Plate 7](#), [Plate 8](#)

Low in the southwest is a bright red star called Antares, or α Scorpionis.

The space between Sagittarius and Hercules and Scorpio is occupied by the Serpent (Serpens) and the Serpent-bearer, or Ophiuchus (Plates 6 and 7). The head of the Serpent is near the Crown, and marked by a small triangle. The head of Ophiuchus is close to the head of Hercules, and may be known by a star of the second magnitude. Each shoulder is marked by a pair of stars. His feet are near the Scorpion.

Nearly on a line with Arcturus and γ Ursæ Majoris (Plate 1), and rather nearer the latter, is an isolated star of the third magnitude, called Cor Caroli, or Charles' Heart. This star may be readily recognized from the fact, together with β and γ Andromeda and the four stars in the Square of Pegasus, it forms a figure similar in outline to the Dipper in Ursa Major, but much larger. If the handle of this great Dipper is made straight instead of being bent, the star in the end of it is α Persei, of the second magnitude. This star has one of the third magnitude on each side of it. The other stars in Perseus may be found by the chart.

Cassiopeia is almost due east of the Pole Star. A line drawn from the latter through β Cassiopeia and prolonged, passes through two stars of the second and third magnitude. These, with two others farther to the south, form a large square, called the Square of Pegasus. Three of these, as seen by the chart (Plate 5), belong to the constellation Pegasus, or the Winged Horse. α Pegasi is called Markab, and β is called Algenib. The bright stars in the neck and nose can be found by the chart.

[26]

II. STAR CHART OF THE PRINCIPAL CONSTELLATIONS

Large illustrations (all less than 100 kB):
[Plate 9](#), [Plate 10](#), [Plate 11](#), [Plate 12](#),
[Plate 13](#), [Plate 14](#), [Plate 15](#), [Plate 16](#)

The fourth star in the Square of Pegasus belongs (Plate 8) to the constellation Andromeda. Nearly in a line with α Pegasi and this star are two other bright stars belonging to Andromeda. The stars in her belt may be found by the chart.

Following the direction of the line of stars in Andromeda just mentioned, and bending a little towards the east, we come to Algol, or β Persei, a remarkable variable star. This star may be readily recognized from the fact, together with β and γ Andromeda and the four stars in the Square of Pegasus, it forms a figure similar in outline to the Dipper in Ursa Major, but much larger. If the handle of this great Dipper is made straight instead of being bent, the star in the end of it is α Persei, of the second magnitude. This star has one of the third magnitude on each side of it. The other stars in Perseus may be found by the chart.

[27]

Just below θ in the head of Pegasus (Plate 9) are three stars of the third and fourth magnitudes, forming a small arc. These mark the urn of Aquarius, the Water-bearer. His body consists of a trapezium of four stars of the third and fourth magnitudes. Small clusters of stars show the course of the water flowing from his urn.

This stream enters the mouth of the Southern Fish, or Piscis Australis. The only bright star in this constellation is Fomalhaut, which is of the first magnitude, and at this time will be low down in the southeast.

To the south of Aquarius is Capricornus, or the Goat. He is marked by three pairs of stars arranged in a triangle. One pair is in his head, another in his tail, and the third in his knees.

Near Altair (Plate 5), and a little higher up, is a small diamond of stars forming the Dolphin, or Delphinus.

A little to the west of the Dolphin, in the Milky Way, are four stars of the fourth magnitude, which form the constellation Sagitta, or the Arrow.

CONSTELLATIONS VISIBLE IN OCTOBER. If we look at the heavens at eight o'clock on the 15th of October, we shall see that all the constellations described above have shifted somewhat towards the west. Arcturus and Antares have set. In the east, below Andromeda (Plate 10), we see a pair of bright stars, which are the only conspicuous ones in the constellation Aries, or the Ram.

About half-way between Aries and γ Andromedæ are three stars which form a small triangle. This constellation is called Triangulum, or the Triangle.

Between Aries and Pegasus is the constellation Pisces, or the Fishes. The southernmost Fish may be recognized by a pentagon of small stars lying below the back of Pegasus. There are no conspicuous stars in the other Fish, which is directly below Andromeda.

CONSTELLATIONS VISIBLE IN NOVEMBER. At eight o'clock in the evening on the 15th of November, we see at a glance that the constellations with which we have become acquainted have moved yet farther to the westward. Boötes, the Crown, Ophiuchus, and the Archer have set; Pegasus, Cassiopeia, and Andromeda are overhead; while new constellations appear in the east.

We notice at once (Plate 11) a very bright star in the northeast, directly below Perseus. This is Capella, or α Aurigæ. There are five other conspicuous stars in Auriga, or the Charioteer; and with Capella they form an irregular pentagon.

Somewhat to the eastward (Plate 12), and a little lower down, is a very bright red star. This is Aldebaran, or α Tauri. It is familiarly known as the Bull's eye. It will be noticed by the map that it is at one end of a V which forms the face of the Bull. This group is known as the Hyades. Somewhat above the Hyades is a smaller group, called the Pleiades, —more commonly known as the Seven Stars, though few persons can distinguish more than six. The bright star on the northern horn, or β Tauri, is also in the foot of Auriga, and counts as γ of that constellation.

All the space between Taurus and the Southern Fish, and below Aries and Pisces (Plate 13), is occupied by Cetus, the Whale. The head is marked by a triangle of rather conspicuous stars below Aries; the tail, by a bright star of the second magnitude, which is now just about as far above the horizon as Fomalhaut. On the body there are five stars, forming a sort of sickle. About halfway between this sickle and the triangle, in the head, is σ Ceti, which is also called Mira, or the wonderful star.

CONSTELLATIONS VISIBLE IN DECEMBER. At eight o'clock in the middle of December, we shall find that Hercules, Aquila, and Capricornus have sunk below the horizon; while Vega and the Swan are on the point of setting. The Great Bear is climbing up in the northeast. In the east we behold by far the most brilliant group of constellations we have yet seen. Capella and Aldebaran are now high up; and below the former (Plate 12) is the splendid constellation of Orion. His belt, made up of three stars in a straight line, will be recognized at once. Above this, on one shoulder, is a star of the first magnitude, called Betelgeuse, or α Orionis. About as far from the belt, on the other side, is another star of the first magnitude, called Rigel. There are two other fainter stars which form a large trapezium with Betelgeuse and Rigel. The three small stars below the belt are upon the sword.

Below Orion (Plate 14) is a small trapezium of stars which are in the constellation of Lepus, or the Hare. The head is marked by a small triangle, as seen on the map.

To the north of Orion, and a little lower down (Plate 12), are two bright stars near together, one of the first and the other of the second magnitude. The latter is called Castor,

and the former Pollux. These stars are in the constellation of Gemini, or the Twins. A line of three smaller stars just in the edge of the Milky Way marks the feet, and another line of three the knees. Pollux forms a large triangle with Capella and Betelgeuse.

CONSTELLATIONS VISIBLE IN JANUARY. At eight in the evening on the 15th of January, Vega, Altair, the Dolphin, Aquarius, and Fomalhaut have disappeared in the west; Deneb and the Square of Pegasus are near the horizon; while Capella and Aldebaran are nearly overhead. Two stars of exceeding brilliancy have come up in the west. The one farthest to the south (Plate 14) is the brightest star in the whole heavens. It is called Sirius, or the Dogstar; and is in the constellation of Canis Major, or the Great Dog, which can be readily traced by the lines on the map.

The other bright star is between Sirius and Pollux (Plate 12), and is called Procyon. It is in Canis Minor, or the Little Dog. The only other prominent star in this constellation is one of the third magnitude near Procyon.

Procyon, Sirius, and Betelgeuse form a large equilateral triangle.

Orion and the group of constellations about it constitute by far the most brilliant portion of the heavens, as seen in our latitude. There are, in all, only about twenty stars of the first magnitude, and seven of these are in this immediate vicinity.

CONSTELLATIONS VISIBLE IN FEBRUARY. If we look at the heavens at the same time in the evening about the middle of February, we shall miss Cygnus and Pegasus from the west. Auriga and Orion are nearly overhead.

Southeast of the Great Bear (Plate 15) is a red star of the first magnitude, called Regulus, in the constellation of Leo, or the Lion. There are five stars near Regulus, which together with it form a group often called the Sickle. The star in the tail is Denebola, which makes a right-angled triangle with two others near it.

[28]

MAP SHOWING THE LOCATIONS OF NORTHERN CONSTELLATIONS

Large illustration (363 kB)

Between Leo and Gemini is the constellation Cancer, or the Crab. It contains no bright stars, but a remarkable cluster of small stars called Præsepe, or the Beehive.

Below Regulus (Plate 14) is a bright red star of the second magnitude, called Cor Hydræ, or the Hydra's Heart. The head of Hydra is marked by five small stars. The coils of the monster can be traced by the map. A portion of the constellation is on Plate 16.

CONSTELLATIONS VISIBLE IN MARCH. At the middle of March, the heavens will have shifted round somewhat towards the west; but all the conspicuous constellations of the preceding month are still visible, while no new ones at all brilliant have come into view.

If we draw a line from the end of the Great Bear's tail to Denebola, it will pass through two constellations,—Canes Venatici, described above; and Coma Berenices, or Berenice's Hair, a large cluster of faint stars. (Plate 15).

[29]

MAP SHOWING THE LOCATIONS OF THE SOUTHERN CONSTELLATIONS AND ALSO MANY REMARKABLE NEBULAR FORMS

1. Double nebula in Gemini. 2. Double nebula of great brilliancy in Coma Berenicensis. 3. Small double nebula. 4. Curiously shaped nebula in Ophiuchus. 5. Two nebulous spots in Canes Venatici. 6. Remarkable veil-like nebula in Lyra. 7. Elliptical nebula in Perseus. 8. Nebulous spot in Sagittarius, split into three pieces; a double star in center. 9. Large curiously-shaped nebula in Rober Caroli, filled with minute stars. 10. Great nebula in Andromeda, visible to the eye. 11. Nebula in Cetus. 12. Elongated nebula in Cygnus. 13. Brilliant round spots in Sagittarius. 14. Round spots in Andromeda. 15-16. Spots in Orion and Ursa Major. 17. Most remarkable of all nebula, in Orion. 18. Great oval nebula in Vulpes, containing two darker nebulae. 19. Nebulous figure in Canis Venaticus. 20. Nebular clouds in the Southern hemisphere.

Large illustration (497 kB)

CONSTELLATIONS VISIBLE IN APRIL. At the middle of April, Aries and Andromeda have set; Taurus, Orion and Canis Major are sinking towards the west; the Great Bear and the Lion are overhead; Arcturus has risen in the northeast (Plate 16); and some way to the south of this is seen a star of the first magnitude, which forms a large triangle with Arcturus and Denebola. It is called Spica Virginis, and is the chief star in the constellation Virgo, or the Virgin. The stars on the breast and wings can be found with the aid of the map.

South of Virgo is a trapezium of four stars, which are in the constellation of Corvus, or the Crow.

CONSTELLATIONS VISIBLE IN MAY. At the middle of May, Taurus, Orion, and Canis Major have set; Vega has just come up in the northeast; and between Vega and Arcturus we again see Hercules and Corona. Below Spica are two stars of the second magnitude, belonging to the constellation Libra, or the Balance. Another star of the fourth magnitude forms a triangle with these, and marks one pan of the balance. (Plate 7).

CONSTELLATIONS VISIBLE IN JUNE. In June we shall find that Canis Minor, Perseus, Auriga, and Gemini have either set, or are on the point of setting; Arcturus is overhead; Cygnus and Aquila are just rising. Ophiuchus is well up; and low in the southeast we see again the red star Antares, in the constellation Scorpio, or the Scorpion (Plate 6). There is a star of the third magnitude on each side of Antares, and several stars of the third and fourth magnitudes in the head and claws. The configuration of these stars is much like a boy's kite with a long tail. Scorpio is a very brilliant constellation, and is seen to better advantage in July and August.

CONSTELLATIONS VISIBLE IN JULY AND AUGUST. We have now described all the important constellations visible in our latitude. Those which are seen in July and August are mainly those described under the last two or three months, and under September.

SOUTHERN CIRCUMPOLAR CONSTELLATIONS. There are a number of constellations near the South Pole of the heavens which never rise in our latitude, just as there are certain ones near the North Pole which never set. These are called the southern circumpolar constellations.

CONSTELLATIONS VISIBLE EACH MONTH

The following table gives the constellations visible at eight o'clock in the evening about the middle of each month. The stars opposite the names of the constellations indicate those visible in the month designated at the top.

NAME OF CONSTELLATION	Sept.	Oct.	Nov.	Dec.	Jan.	Feb.	Mar.	April	May	June	July	Aug.

[30]

Ursa Major (er'sa mā'jor). The Greater Bear.	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★
Ursa Minor (er'sa mī'nor). The Lesser Bear.	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★
Draco (drak'ō). Dragon.	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★
Cassiopeia (kas-si-o-pē'a). Lady's Chair.	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★
Cepheus (sē'fē-us).	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★
Bootes (bo-ō'tēz). The Oxdriver or Plowman.	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★
Corona Borealis (kō-rō'na bō-rē-ā'lis). The Northern Crown.	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★
Ophiuchus (ōf-i-u'kus). The Serpent Bearer.	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★
Sagittarius (saj-i-tā'ri-us). The Archer.	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★
Hercules (her'ku-lēz).	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★
Lyra (lī'ra). The Lyre.	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★
Aquila (ak'wil-a).	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★
Delphinus (del'fin-us). Dolphin.	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★
Capricornus (kap-ri-kor'nus). The Goat.	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★
Cygnus (sig'nus). The Swan.	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★
Sagitta (saj'it-ta). The Arrow.	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★
Aquarius (a-kwā'ri-us). The Water-bearer.	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★
Piscis Australis (pis'sis aw-strā'lis). The Southern Fish.	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★
Pegasus (peg'a-sus). The Winged Horse.	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★
Andromeda (an-drom'e-da).	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★	★

THE WONDERFUL MILKY WAY

[31]

Everyone knows the Milky Way. It is one of the most striking sights of a clear night, for only on clear, moonless nights can we see its cloudy track of light across the heavens. More than any other celestial object it affects us with a sense of mystery and of unknown destiny as, indeed, it has affected men at all times and in all countries. To the American Indian it was the "path of souls." In ancient mythology it had various meanings: thus, it was the highway of the gods to Olympus; or it sprang from the ears of corn dropped by Isis as she fled from her pursuer; or it marked the original course of the sun, which he later abandoned. In mediæval times it became associated by pilgrims with their own journeys.

It stretches like a vast ragged semicircle over the sky. Indeed, it traces a rough circle, for this line is continued over the southern hemisphere also. The circle is, however, very far from being smooth or even; the path is full of irregularities. It varies in width to an extent of about thirty degrees, and varies also considerably in brightness. Its total area has been estimated to cover rather less than one-fourth of the whole northern hemisphere of the sky, and to cover about one-third of the southern hemisphere. Its track lies through the constellations Cassiopeia and Auriga; it passes between the feet of Gemini and the horns of Taurus, through Orion just above the giant's club, and through the neck and shoulder of Monoceros. It passes above Sirius into Argo, here entering the southern hemisphere, and through Argo and the Southern Cross into the Centaur. In the Centaur the Milky Way divides into two streams, in a manner which suggests the divided course of a river around an island, a dark rift between the two luminous streams representing the island.

It is a very long island, however, for the double conformation of the Milky Way extends over one-third of its entire course—that is to say, one hundred and twenty degrees of the circle. The divergent branches reunite in the northern hemisphere in the constellation Cygnus. The brighter stream passes through Norma, Ara, Scorpio and Sagittarius; along the bow of Sagittarius into Antinous, here entering the northern hemisphere again; then through Aquila, Sagitta, and Vulpecula it arrives at Cygnus and reunion with the branch which left it in Centaur. From Cygnus the stream, now single, passes through Lacerta and the head of Cepheus to the point whence we started, in Cassiopeia.

As we follow the Milky Way throughout its course, we find it continually sending out streaming appendages of nebulous appearance towards clusters, nebulæ, or groups of stars. In Norma it sends out a complicated series of nebulous streaks and patches, covering the Scorpion's tail, spreading faintly over the leg of Ophiuchus, and extending beyond, as if to meet a corresponding branch sent off from the region of Cygnus in the northern hemisphere. The latter is a very bright and remarkable streak, running south through Cygnus and Aquila, to become lost in a dim and sparsely starred region. From Cassiopeia a vivid branch proceeds to the chief star of Perseus, and faint streaks appear to continue the "feeler" towards the Hyades and the Pleiades. There are many other "feelers" of the same kind, and they are all of great interest, because they seem to show some sort of influence exercised by the Milky Way upon the whole starry universe.

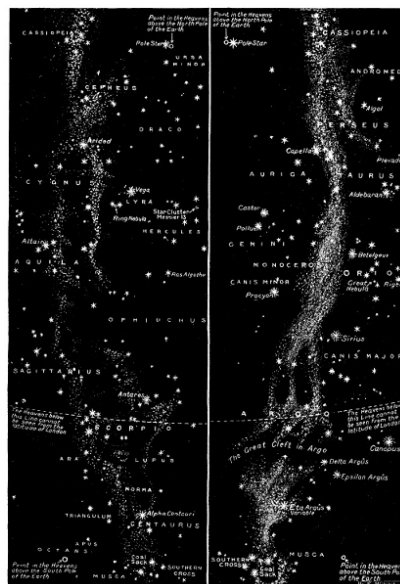

ANCIENT AND MODERN CONCEPTIONS OF THE NATURE OF THE MILKY WAY. Strange theories as to the nature of the Milky Way have been put forward at various times. Anaxagoras thought it might be due to the shadow of our globe; Aristotle, that it was some kind of mist due to the exhalation of vapors from the earth.

But a grander and truer conception of its nature and situation, removed far from the earth and independent of any terrestrial cause, had early come to several minds. Pythagoras and Democritus both formed the conjecture that its shimmer might be due to innumerable stars, and Galileo's telescope confirmed their theory.

As we have seen, the Milky Way is by no means a simple stream of stars; with careful observation, even the naked eye can perceive something of its irregular detail, when the atmosphere is unusually clear, and there is no moon. Viewed under these conditions through a good telescope, the effect of the Milky Way, when made to pass progressively before the vision, is one of unexampled grandeur and sublimity.

[32]

THE STARRY GRANDEUR OF THE MILKY WAY

COURSE OF THE MILKY WAY THROUGH THE TWO HEMISPHERES OF THE HEAVENS

These two drawings show the two semi-circles of the Milky Way as they extend from the regions of the Polar Star to the region of the Southern Cross on each side of the apparent sphere of the heavens. It will be noticed that the bright stars congregate near its region, and that there is a

characteristic harmony in the way in which the wisps appear to project into space, suggesting some common cause for this appearance throughout the whole galaxy.

Large illustration (235 kB)

The general effect has been well likened to that of an old, gnarled tree-trunk, marked with knots and curving lines, and riddled with dark holes and passages, linked together by shimmering wisps or arches. This general effect is practically lost as the detail becomes clear in a telescopic view. The detail is extremely various. At one point it may consist of separate stars scattered irregularly upon a background of darkness; at another, of star-clusters, sometimes following one upon another in long, processional line; at another, the stars seem to collect in small, soft clouds, presenting the appearance, as the telescope sweeps over them, of drifting foam.

[33]

THE STRANGE, DARK RIFTS IN THE SKYSCAPE WHERE NO STARS APPEAR. At yet another point the track may be involved in nebulosity in which many stars appear to be imbedded. Perhaps the most characteristic features are several which have already been remarked as conspicuous in star-clusters or nebulae, such as lines of stars, dark lanes or rifts, and dark holes. The lines of stars, which are evidently connected by some actual physical relation, are either straight, curved, radiated, or in parallels. In Sagittarius is a very striking collection of about thirty stars resembling in form a forked twig with a curved hook at the unforked end. The dark rifts in the Milky Way show the same features as those in star-clusters. Sometimes they are parallel; sometimes they radiate like branches from a common center; sometimes they are lines with bright stars; sometimes they are quite black, as if utterly void; sometimes slightly luminous, as if powdered with small stars.

It can be by no accident or chance that in the vast edifice of the heavens objects of certain classes should crowd into the belt of the Milky Way, and other classes avoid it; it points to the whole forming a single growth, an essential unity. For there is but one belt in the heavens, like the Milky Way, a belt in which small stars, new stars, and planetary nebulae find their favorite home; and that belt encircles the entire heavens; and similarly that belt is the only region from which the white nebulae appear to be repelled. The Milky Way forms the foundation, the strong and buttressed wall of the celestial building; the white nebulae close in the roof of its dome.

NEBULAE AND THE THEORY OF THE UNIVERSE

It has already been observed that a number of stars are arranged in clusters of groups, while others, like our own sun, are at vast distances from their nearest neighbors. Some of these clusters, of which the Pleiades afford the best example to the naked eye, can be resolved by a keen eye into separate stars; some, like Præsepe in Cancer, which only show to the naked eye as a hazy spot of light, break up in a good field-glass into clusters of stars; but the majority of stellar clusters require a powerful telescope for their resolution.

It was long ago noticed that, the more powerful a telescope was, the greater was the number of these hazy spots of light which it would resolve into clusters of stars. Consequently the opinion was formed that all the hazy little clouds or nebulae which are so prevalent throughout a large part of the sky were simply clusters of stars, so far away that their light merged into a single impression on the eye. A great number of these nebulae were only resolved by large telescopes; many were found to be irresolvable by any telescope. It was simply concluded from this that they were still more distant than the clusters which had yielded to the resolving powers of the telescope; and it was further supposed that each of these clusters of stars might be a separate universe or galaxy, comparable in extent and importance with our own universe, bounded by the vast girdle of the Milky Way.

THE NEBULAR HYPOTHESIS. This grand conception of innumerable universes scattered throughout space was speedily destroyed by the spectroscope, which distinguishes with entire certainty between the light sent to us from a solid star and that emitted by a gas. When it was turned upon the nebulae which had been supposed in reality to be star-clusters so distant that no telescope could resolve them, it showed unmistakably that these nebulae were not star-groups, but simply masses of incandescent gas.

[34]

Besides, nebulae vary greatly in form and appearance; some are clearly clusters of stars, others are perfectly hazy. A round or oval form is sometimes exhibited, with a gradual condensation towards the center, and a number of stars standing in the center of a nebulous haze can be observed. Such observations on nebulae caused Kant and Laplace to suggest a theory—now known as the nebular theory—as to the formation of worlds. They considered that the solar system, for example, originally existed as uncondensed nebulous matter. This gradually condensed towards the center, forming the nucleus of the sun, and later the outer parts separated into distinct parts, each part condensing into a planet. The different forms of nebulae observed in the heavens are then supposed to be systems in different stages of development.

THE VARIED COLOR OF THE STARS

Many of the stars shine with colored light, as red, blue, green, or yellow.

These colors are exhibited in striking contrast in many of the double stars. Combinations of blue and yellow, or green and yellow, are not uncommon; while in fewer cases we find one star white and the other purple, or one white and the other red. In several instances each star has a rosy light.

The following are a few of the most interesting colored double stars:

Name of Star	Color of Larger One	Color of Smaller One
γ Andromedæ	Orange	Sea-Green.
α Piscium	Pale Green	Blue.
β Cygni	Yellow	Sapphire Blue.
η Cassiopeiæ	Yellow	Purple.
σ Cassiopeiæ	Greenish	Bright Blue.
ζ Coronæ	White	Light Purple.
ι Cancri	Orange	Blue.
α Herculis	Orange	Emerald Green.

Single stars of a fiery red or deep orange color are common enough. Of the first color may be mentioned Aldebaran, Antares and Betelgeuse. Arcturus is a good example of an orange star. Isolated stars of a deep blue or green color are very rarely found; among the conspicuous stars, β Libræ appears to be the only instance.

It is now a well-established fact that the stars change their color. Sirius was described as a fiery red star by the ancients, is now decided green color.

NAMES OF IMPORTANT STARS INCLUDING THOSE OF FIRST MAGNITUDE

Individual Name	Meaning	Constellation in Which Found
Achernar	The End of The River	α Eridani.
Alcor	The Near One	80 Ursæ Majoris.
Alcyone	Daughter of Atlas and Pleione	η Tauri.
Aldebaran	The Follower	α Tauri.
Algenib	The Side	γ Pegasi.
Algol	The Demon Star	β Persei.
Alioth	The Tail (of the Sheep)	ε Ursæ Majoris.
Altair	The Soaring Eagle	α Aquilæ.
Antares	The Rival of Mars	α Scorpii.
Arcturus	The Watcher of the Bear	α Boötis.
Bellatrix	The Woman Warrior	γ Orionis.
Betelgeuse	The Shoulder of the Giant	α Orionis.
Canopus	The Pilot of Menelaus	α Argûs.
Capella	The Goat	α Aurigæ.
Caph	The Hand	β Cassiopeiæ.
Castor	Son of Zeus and Leda	α Geminorum.
Cor Caroli	Charles' Heart	α Canum Ven.
Deneb	The Tail	α Cygni.
Denebola	The Lion's Tail	β Leonis.
Dubhe	The Bear	α Ursæ Majoris.
Fomalhaut	The Fish's Mouth	α Piscis Australis.
Markab	The Saddle	α Pegasi.
Mira Ceti	The Wonderful Star of Cetus	ο Ceti.
Mizar	The Girdle	ζ Ursæ Majoris.
Polaris	The Pole Star	α Ursæ Minoris.
Pollux	Son of Zeus and Leda	β Geminorum.
Procyon	Before the Dog	α Canis Minoris.
Regulus	The Little King	α Leonis.
Rigel	The Foot	β Orionis.
Sirius	Chief	α Canis Majoris.
Spica	The Ear of Corn	α Virginis.
Vega	The Swooping Eagle	α Lyræ.

WHAT CAUSES THE ECLIPSES

When the earth is between the moon and the sun in a line, the moon lies in the shadow of the earth, and so suffers temporary obscuration; a *lunar eclipse* then takes place. When the moon passes between the earth and the sun, the latter is at certain places on the earth obscured by the dark body of the moon, and a *solar eclipse* takes place.

LUNAR ECLIPSES. The shadow cast by the earth is conical, and may be shown to extend about one million miles from its surface. At a distance of a quarter of a million miles away the width of this shadow is about six thousand miles; and if the moon passes into it at that approximate distance from the earth, its disc of two thousand miles diameter may be partially or totally obscured. The moon and sun may be on opposite sides of the earth, and yet the former not in shadow. This is due to the fact that the moon's orbit round the earth is not exactly in the same plane as that of the earth's orbit round the sun. If it were so, we should have total eclipses at every full moon; but since the two planes are inclined to each other at an angle of 5° 9', eclipses will occur when the moon is at or near its *nodes* or positions of coincidence with the plane of the ecliptic. Partial eclipses are produced when only a portion of the moon passes into shadow; annular eclipses such as are sometimes observed in the case of the sun cannot occur with the moon.

[35]

GIANT SHADOWS CAST BY THE EARTH AND MOON

HOW THE MOON THROWS ITS SHADOW ON THE EARTH, SHUTTING OFF THE LIGHT OF THE SUN

HOW THE MOON COMES BETWEEN THE EARTH AND SUN, CAUSING THE SHADOW SHOWN ABOVE

HOW THE EARTH THROWS ITS SHADOW ACROSS THE MOON

On its way through space the moon passes sometimes between the sun and the earth, shutting off the sunlight from the earth, as shown in the top picture. The drawing in the middle shows us that the moon does not hide the sunlight from the whole of the earth, but only from a part of it. But in the part from which the sun is hid the moon's shadow makes day so dark that we can see the stars. We call this an eclipse of the sun. Sometimes, too, the earth passes between the moon and the sun so as to cut off all sunlight from the moon, as shown in the bottom picture. We call this an eclipse of the moon.

SOLAR ECLIPSES. The shadow cast by the moon is also conical, and extends over a slightly varying distance of about a quarter of a million miles from the moon's surface. This being the approximate distance of the moon from the earth, it is seen that when the moon is between the earth and the sun the shadow may reach the earth. The extreme limit of the shadow may range from twenty-three thousand miles short of the earth, in which case an entire eclipse of the sun is impossible, to fifteen thousand miles beyond the earth. In the latter case a circular shadow will be projected on the surface of the globe, travelling onwards slowly in the direction of the motion of the moon. Within this shadow or *umbra* the body of the sun cannot be observed, and a total eclipse prevails. A circular region exists round this shadow, in which only part of the sun is visible; this region is therefore partly in shadow, and is called the *penumbra*. Outside the penumbra the whole sun may be viewed; the moon's shadow is not nearly large enough to render a solar eclipse co-existent over all parts of the earth's face towards the sun.

[36]

THE MYTHOLOGY OF THE CONSTELLATIONS

To the Greeks the starry heavens were an illustrated mythological poem. Every constellation was a picture, connected with some old fable of gods or heroes.

The two Bears have one story. Callisto was a nymph beloved by Jupiter, who changed her into a she-bear to save her from the jealous wrath of Juno. But Juno learned the truth, and induced Diana to kill the bear in the chase. Jupiter then placed her among the stars as *Ursa Major*, and her son Arcas afterwards became *Ursa Minor*. Juno, indignant at the honor thus shown the objects of her hatred, persuaded *Tethys* and *Oceanus* to forbid the Bears to descend, like the other stars, into the sea.

According to *Ovid*, Juno changed *Callisto* into a bear; and when *Arcas*, in hunting, was about to kill his mother, Jupiter placed both among the stars.

Ursa Minor was also called *Phœnice*, because the *Phœnicians* made it their guide in navigation, while the Greeks preferred the *Great Bear* for that purpose. It was also known as *Cynosura* (dog's tail) from its resemblance to the upturned curl of a dog's tail. The *Great Bear* was sometimes called *Helice* (winding), either from its shape or its curved path.

Boötes (the Herdsman) was also called *Arctophylax* and *Arcturus*, both of which names mean the guard or keeper of the bear. According to some of the stories, *Boötes* was *Arcas*; according to others, he was *Icarus*, the unfortunate son of *Dædalus*. The name *Arcturus* was afterwards given to the chief star of the constellation.

Cepheus, *Cassiopeia*, *Andromeda*, *Perseus*, and *Pegasus* are a group of star-pictures illustrating a single story.

Cepheus and *Cassiopeia* were the king and queen of *Ethiopia*, and had a very beautiful daughter, *Andromeda*. Her mother boasted that the maiden was fairer than the *Nereids*, who in their anger persuaded *Neptune* to send a sea-monster to ravage the shores of *Ethiopia*. To appease the offended deities *Andromeda*, by the command of an oracle, was exposed to this monster. The hero *Perseus* rescued her and married her.

Pegasus, the winged horse, sprang from the blood of the frightful *Gorgon*, *Medusa*, whom *Perseus* had slain not long before he rescued *Andromeda* from the sea-monster. According to the most ancient account, *Pegasus* became the horse of *Jupiter*, for whom he carried the thunder and lightning; but he afterward came to be considered the horse of *Aurora*, and finally of the *Muses*. Modern poets rarely speak of him except as connected with the *Muses*.

The *Dragon*, according to some of the poets, was the one that guarded the golden apples of the *Hesperides*; according to others, the monster sacred to *Mars* which *Cadmus* killed in *Boëotia*.

The *Lyre* is said to be the one which *Apollo* gave to *Orpheus*. After the death of *Orpheus*, *Jupiter* placed it among the stars at the intercession of *Apollo* and the *Muses*.

The *Crown* was the bridal gift of *Bacchus* to *Ariadne*, transferred to the heavens after her death.

Aquila is probably the eagle into which *Merops* was changed. It was placed among the stars by *Juno*. Some, however, make it the *Eagle* of *Jupiter*.

Cygnus or *Cycnus*, according to *Ovid*, was a relative of *Phaëthon*. While lamenting the unhappy fate of his kinsman on the banks of the *Eridanus*, he was changed by *Apollo* into a swan, and placed among the stars.

Sagittarius was said by the Greeks to be the *Centaur* *Cheiron*, the instructor of *Peleus*, *Achilles* and *Diomed*. It is pretty certain, however, that all the zodiacal constellations are of Egyptian origin, and represent twelve Egyptian deities who presided over the months of the year. Thus *Aries* was *Jupiter Ammon*; *Taurus*, the bull *Apis*; *Gemini*, the inseparable gods *Horus* and *Harpocrates*; and so on. The Greeks adopted the figures, and invented stories of their own to explain them.

Scorpio, in the Egyptian zodiac, represented the monster *Typhon*. Originally this constellation extended also over the space now filled by *Libra*.

Ophiuchus represents *Æsculapius*, the god of medicine. Serpents were sacred to him, probably because they were a symbol of prudence and renovation, and were believed to have the power of discovering herbs of wondrous powers.

Aquarius, in Greek fable, was *Ganymede*, the *Phrygian* boy who became the cup-bearer of the gods in place of *Hebe*.

Taurus, as has been stated above, was the Egyptian *Apis*. The Greeks made it the bull which carried off *Europa*. The *Pleiades* are usually called the daughters of *Atlas*, whence their name *Atlantides*. *Milton* speaks of them as "the seven *Atlantic Sisters*."

According to one legend the seventh was *Sterope*, who became invisible because she had loved a mortal; according to another, her name was *Electra*, and she left her place that she might not witness the downfall of *Troy*, which was founded by her son, *Dardanus*.

The *Hyades*, according to one of several stories, were sisters of the *Pleiades*. The name probably means "the *Rainy*," since their rising announced wet weather.

Cetus is said by most writers to be the sea-monster from which *Perseus* rescued *Andromeda*.

Orion was a famous giant and hunter, who loved the daughter of *Oinopion*, King of *Chios*. As her father was slow to consent to her marriage, *Orion* attempted to carry off the maiden; whereupon *Oinopion*, with the help of *Bacchus*, put out his eyes. But the hero, in obedience to an oracle, exposed his eye-balls to the rays of the rising sun, and thus regained his sight. The accounts of his subsequent life, and of his death, are various and conflicting. According to some, *Aurora* loved him and carried him off; but, as the gods were angry at this, *Diana* killed him with an arrow. Others say that *Diana* loved him, and that *Apollo*, indignant at his sister's affection for the hero, once pointed out a distant object on the surface of the sea, and challenged her to hit it. It was the head of *Orion* swimming, and the unerring shot of the goddess pierced it with a fatal wound. Another fable asserts that *Orion* boasted that he would conquer every animal; but the earth sent forth a scorpion which destroyed him.

Canis Major and *Minor* are the dogs of *Orion*, and are pursuing the *Hare*.

The *Twins*, *Castor* and *Pollux*, the sons of *Jupiter* and *Leda*, are the theme of many a fable. They were especially worshipped as the protectors of those who sailed the seas, for *Neptune* had rewarded their brotherly love by giving them power over winds and waves, that they might assist the shipwrecked.

Leo, according to the Greek story, was the famous *Nemean* lion slain by *Hercules*. *Jupiter* placed it in the heavens in honor of the exploit.

The *Hydra* also commemorates one of the twelve labors of *Hercules*—the destruction of the hundred-headed monster of the *Lernæan* lake.

Virgo represents *Astræa*, the goddess of innocence and purity, or, as some say, of justice. She was the last of the gods to withdraw from earth at the close of "the golden age."

Libra, or the *Balance*, is the emblem of justice, and is usually associated with the fable of *Astræa*.

Argo Navis is the famous ship in which *Jason* and his companions sailed to find the *Golden Fleece*.

This slight sketch of the leading fables connected with the constellations will serve to show how completely the Greeks "nationalized the heavens."

[37]

Astronomy (*as-tron'om-i*). The science which treats of the heavenly bodies, explaining the motions, times and causes of the motions, distances, magnitudes, gravities, light, etc., of the sun, moon, and stars, the nature and causes of the eclipses of the sun and moon, the conjunction and apposition of the planets, and any other of their mutual aspects, with the times when they did or will happen.

Aberration (*ab-er-ā'shun*). A small apparent motion of the fixed stars, occasioned by the progressive motion of light and the earth's annual motion in its orbit. By this they sometimes appear twenty seconds distant from their true situation.

Amplitude (*am'pli-tud*). An arc of the horizon intercepted between the true east and west points and the center of the sun, or a star at its rising or setting.

Anomaly (*an-om'al-i*). The angular distance of a planet from its perihelion, as seen from the sun; either true, mean, or eccentric.

Aphelion (*af-ēl'yūn*). That point of a planet's orbit which is most distant from the sun.

Apogee (*ap'o-jē*). That point in the orbit of the moon which is at the greatest distance from the earth.

Apparition (*ap-par-ish'un*). The first appearance of a star or other luminary after having been obscured.

Ap' pulse. The approach of a planet towards a conjunction with the sun or any of the fixed stars.

Apsis (*ap'sis*). The two points of a planet's orbit in which it is at its greatest and least distance from the sun.

Aquarius (*a-kwā'ri-us*). The eleventh sign of the zodiac, which the sun enters about the 21st of January.

Asteroids (*as'ter-oids*). The small planets that circulate between the orbits of Mars and Jupiter.

Ax'is (*ax'is*). The imaginary line passing through the center and poles of the earth, on which it performs its diurnal revolutions from west to east.

Azimuth (*az'im-uth*). An arc of the horizon intercepted between the meridian of the place and the vertical circle passing through the center of a celestial object.

Can'cer. The fourth sign of the zodiac, being that of the summer solstice, which the sun enters about the 21st of June.

Capricorn (*kap'ri-korn*). The tenth sign of the zodiac, which the sun enters about the 21st of December, at the winter solstice.

Colure (*kol'ūr*). Two great circles, supposed to intersect each other at right angles in the poles of the world, one of them passing through the solstitial and the other through the equinoctial points of the ecliptic, viz., Cancer and Capricorn, Aries and Libra, dividing the ecliptic into four equal parts.

[38]

Coma (*kō'ma*). A dense, nebulous covering, which surround the nucleus or body of a comet.

Com'et. A member of the solar system, commonly consisting of three parts: the nucleus, the envelope or coma, and the tail; but one or more of these parts is frequently wanting.

Conjunc'tion. The meeting of two heavenly bodies in the same point or place in the heavens.

Constella'tion. A number of stars which appear as if situated near each other in the heavens, and are considered as forming a particular division.

Cynosure (*sin'o-shōōr or sī'*). A name of the constellation Ursa Minor, or the Lesser Bear, which contains, in the tail, the pole star by which mariners are guided.

Declination (*dek-lin-a'shun*). Distance of any object from the celestial equator, either northward or southward.

Disk. The face or visible projection of a celestial body, usually predicated of the sun, moon, or planets; but the stars have also apparent disks.

Eclipse'. An obscuration or interception of the light of the sun, moon, or other luminous body.

Eclip'tic. The great circle of the heavens which the sun appears to describe in his annual revolution.

Equa'tor. The great circle of the sphere, equally distant from the two poles of the world, or having the same poles as the world.

Equinox (*ē'kwī-noks*). The precise time when the sun enters one of the equinoctial points, making the day and night of equal length.

Faculae (*fā'ku-lē*). Certain spots sometimes seen on the sun's disk, which appear brighter than the rest of his surface.

Fixed Stars. Those which retain the same or very nearly the same position with respect to each other.

Gal'axy. The Milky-Way.

Gemini (*jem'i-ni*). The third sign or constellation in the zodiac, which the sun enters about the 21st of May.

Geocentric (*jē-o-sen'trik*) **Par'allax**. The apparent change of a body's place that would arise from a change of the spectator's station from the surface to the center of the earth.

Ha'lo. A luminous circle, usually prismatically colored round the sun or moon, and supposed to be caused by the refraction of light through crystals of ice in the atmosphere.

Heliocentric (*hē-li-o-sen'trik*) **Par'allax**. The arc of the great circle of the celestial sphere, drawn from the heliocentric to the geocentric place of a body.

Heliometer (*hē-li-om'e-ter*). An instrument for measuring with exactness the apparent diameter of the sun, moon, planets, etc.

Hori'zon. A circle touching the earth at the place of the spectator, and bounded by the line in which the earth and skies seem to meet.

Le'o (Lat., the Lion). The fifth sign of the zodiac which the sun enters about the 22d of July.

Libra (*lī'bra*), the Balance. The seventh sign of the zodiac, which the sun enters at the autumnal equinox, in September.

Luna'tion. The period of a revolution of the moon round the earth, or the time from one new moon to the next.

Maculae (*mak'ū-lē*). Dark spots on the surfaces of sun and moon, and on some of the planets.

Moon. A secondary planet or satellite of the earth, whose light, borrowed from the sun, serves to dispel the darkness of night.

Nadir (*nā'dīr*). The point of the heavens or lower hemisphere directly opposite the zenith.

Neb'ulae (*neb'ū-lē*). Misty appearances among the stars, usually, but not always, resolved by telescope into myriads of small stars.

Nodes (*nōdes*). The two points in which the orbit of a planet intersects the ecliptic.

Nuta'tion. A vibratory motion of the earth's axis, arising from periodical fluctuations in the obliquity of the ecliptic.

Oculta'tion. The hiding of a heavenly body from our sight by the intervention of some other of the heavenly bodies.

Or'bit. The path described by a heavenly body in its periodical revolution.

Par'allax. The change of place in a heavenly body in consequence of being viewed from different points.

Penum'bra. A partial shadow or obscurity on the margin of the perfect shadow in an eclipse, or between the perfect shadow, where the light is entirely intercepted, and the full light.

Perigee (*per'i-jē*). That point in the orbit of the sun or moon in which it is at the least distance from the earth.

Perihelion (*per-i-hē'li-on*). That part of the orbit of a planet or comet in which it is at its least distance from the sun.

Plan'et. The name given to a few bright and conspicuous stars which are constantly changing their apparent situations in the celestial sphere.

Precession (*pre-sesh'un*) **of the Equinoxes**. A continual shifting of the equinoctial points from east to west.

Radius Vector. An imaginary line joining the center of the sun and the center of a body revolving about it.

Retrocession (*rē-tro-sesh'un*) **of the Equinoxes**. The going backward of the equinoctial points.

Sagittarius (*saj-i-tā'ri-us*). One of the twelve signs of the zodiac, which the sun enters about November 22.

Sat'ellite. A small planet revolving round another planet.

Scor'pio. The eighth sign of the zodiac, which the sun enters about October 23.

Selenography (*sel-en-og'raf-i*). The description of the surface of the moon.

Sign. The twelfth part of the ecliptic.

Solstice (*sol'stis*). The time when the sun, in its annual revolution, arrives at that point in the ecliptic farthest north or south of the equator, or reaches its greatest northern or southern declination.

Star. An apparently small, luminous body in the heavens, that shines in the night, or when its light is not obscured by clouds or lost in the brighter effulgence of the sun.

Sun. The central body of our system, about which all the planets and comets revolve, and by which their motions are regulated and controlled.

Taurus (*taw'rus*). The second sign of the zodiac, which the sun enters about the 20th of April.

Virgo (*ver'go*). The sixth sign of the zodiac, which the sun enters in August.

Ze'nith. The point in the heavens directly overhead.

BOOK OF THE EARTH

[41]

Science tells us that the Earth was once a shining star, a globe of liquid fire. As it cooled down, a crust formed over its surface, composed chiefly of rocks and metals. This crust was rent by the force of the gases shut up within, and thus the mountains, valleys, gorges, and volcanoes were formed. The Earth, indeed, is still upheaving and subsiding, but so slowly that we rarely feel it. Through these agencies the distribution of land and water on the surface of the earth has undergone great changes. The shape of the Earth is that of a sphere somewhat flattened at the poles, and it has a diameter of about 8,000 miles. The solid crust is called the *lithosphere*—which is surrounded by an envelope of air—the *atmosphere*—and in part by an envelope of water—the *hydrosphere*.

HOW THE EARTH WOULD APPEAR IF CUT THROUGH THE CENTER
Beneath the rocky crust of the earth, thirty-five miles in thickness, there is a broad belt of heavier material to a depth of nine hundred miles. Within this shell lies the great metallic core.

OUR EARTH: ITS STRUCTURE AND SURFACE

Our first glimpse of the earth as a planet shows it as a nebulous star, still intensely hot, and with no solid nucleus, rotating on its own axis, and at the same time revolving around the sun in a nearly circular orbit.

WHAT THE HEAT OF THE EARTH SHOWS

At first it seems hardly possible that the earth could have been a star. But, if we go down beneath the surface of the earth, we find that at a depth of forty or fifty feet there is very slight variation in temperature. When we go yet deeper, as in mines, we find that the earth grows hotter as we descend. The temperature increases on an average about one degree Fahrenheit for every sixty-four feet descent. But this amount is variable according to the locality, geological formation, and dip of strata. In the Calumet and Hecla Mine, observations show an increase of one degree in about every one hundred and twenty-five feet. At Paris, the water from a depth of 1794 feet has a temperature of eighty-two degrees; at Salzwerth, in Germany, from a depth of 2144 feet, a temperature of ninety-one degrees. Natural hot springs, rising from unknown depths, are sometimes scalding hot. One in Arkansas has a temperature of one hundred and eighty degrees.

At a depth of twenty miles, with this continual increase of temperature, the ground must be fully red-hot; and not very much farther down the heat must be sufficient to melt every known substance. The solid earth, then, is merely a thin crust, covering a sea of liquid fire below. The streams of lava poured forth from volcanoes are a proof of the existence of this molten mass beneath our feet.

WHAT CAUSES THE INTERNAL HEAT OF THE EARTH

If we examine the solid crust of the earth we shall not long be at a loss in regard to the origin of this internal heat. We are all familiar with the burning of coal. Now coal is mainly a substance called *carbon*, and when it burns it unites with *oxygen*, one of the gases in the air. Many rarer substances, such as silicon, and the metals magnesium, calcium, and sodium, are even more inflammable than carbon, and in burning give rise to solid products. Now the rocks in the earth are found to be made up almost wholly of these very inflammable substances combined with oxygen. The solid portions of the earth, then, are nothing but the ashes and cinders of a great conflagration. Even the waters are made up of hydrogen, one of the most inflammable substances, united with this same oxygen, and, strange as it may seem, they too, are the products of combustion. When, therefore, the materials of which the earth is formed were burning, our planet must have been a fiery star, and the great heat must have reduced all the products of the conflagration to a liquid state.

HOW THE EARTH'S CRUST WAS FORMED

When the fire went out for lack of fuel the mass began to cool at the surface, and a solid crust was finally formed, which with the lapse of time became thicker and thicker. This crust shut in the steam and gases generated in the fiery ocean underneath; and these, acting upon the crust with enormous pressure, heaved it into ridges. At times the strain caused the crust to crack, and forced the melted mass up through it, and in this way hills and mountains were formed. The thicker the crust the greater the strain it would bear before it gave way, and the greater the amount of molten matter driven out through the rent. The highest mountains, then, are the last that were uplifted. In some cases the openings thus made in the crust were never completely closed, and thus volcanoes were formed. These act like safety-valves, and prevent the forces within from accumulating sufficiently to cause fresh rents. But notwithstanding the relief thus given to the pent-up forces, they still manifest themselves in earthquakes.

SHAPE OF THE EARTH A SPHEROID

Like all other planets, the earth is a solid sphere that has undergone a slight flattening at the opposite extremities or poles of the axis of revolution. More accurately, it is an oblate spheroid generated by the rotation of an ellipse about its minor axis. Such a figure would be assumed by a sphere of liquid rotating about a diameter, centrifugal force acting most vigorously at the equator, and tending to overcome the internal forces that keep the molecules together.

SIZE AND DENSITY OF THE EARTH

The smallest diameter of the earth is that measured from pole to pole along the axis of rotation; this is 7,899.6 miles, or about 500,000,000 inches. The greatest diameters are those measured between opposite points on the equator; these are 7,926.6 miles, and, therefore, show that the eccentricity of the earth, or the extent of its departure from the perfect sphere, is very slight.

The circumference of the earth, measured along the equator, is 24,899 miles; the area is 197,000,000 square miles; and the volume is 260,000,000,000 cubic miles. Experiments on the comparative attraction of the earth show that its density is about five and one-half times that of pure water. Its mass is, therefore, approximately six thousand trillion tons.

HOW WE KNOW THE EARTH IS A SPHERE

The ordinary proofs of the sphericity of the earth are: (1) It can be circumnavigated; (2) the appearance of a vessel at sea always indicates a nearer convexity of the earth's surface; (3) the sea-horizon is always depressed equally in all directions when viewed from an elevation; (4) the elevation of the pole star increases as we travel northwards from the equator; (5) the shadow of the earth on the moon during a lunar eclipse is spherical.

THE ROTATION OF THE EARTH

The earth rotates uniformly about its axis. The time taken to make a complete revolution of three hundred and sixty degrees is called a sidereal day, for it is the interval of time between consecutive transits of any distant star across any meridian of the earth. The time between consecutive transits of the sun across any meridian is called a solar day; the average of these throughout the whole year is called a mean solar day, and is the practical standard of time adopted by civilized nations. The ordinary proofs that the earth rotates are: (1) Bodies falling from a great height have an easterly deviation; (2) Foucault's pendulum experiment; (3) a gyroscope delicately balanced so as to be free to change the direction of its axis in any way will, if rotated, exhibit an apparent deviation; (4) in northern hemispheres a projectile deviates to the right, in southern hemispheres to the left; (5) the trade winds; (6) Dove's law of wind-change.

The speed of a body on the equator, due to the diurnal rotation, is about 1,000 miles an hour. The centrifugal force due to this speed diminishes the weight of bodies; if the earth rotated in an hour, they would be thrown off from the surface at the equator.

The axis of the earth is not perpendicular to the ecliptic, but at angle of 66° 32' to it; the equator is, therefore, inclined to it at an angle of 23° 28'. This unsymmetrical placing of the bulging portions of the earth causes a slow wobbling, or precession of its axis, in the same sort of way as a spinning top will wobble when pushed over on one side. There is also a slight vibration or "nodding" motion of the earth's axis, known as nutation. The period of each precession is about twenty-one thousand years; if the earth's orbit occupied a constant position in its plane, the periods would be twenty-six thousand years each. These motions have considerable influence on climate, the modern theories of the Ice Age being connected with the known facts of precessional motion.

THE EARTH A SERIES OF SHELLS OF MATTER

The great bulk of the earth consists of the *lithosphere*, or solid globe of rocks, with which geology properly deals. It is on the part of this lithosphere, composing a little more than a quarter of the earth's whole area—55,500,000 square miles—which rises above the seas and is called land, that mankind lives.

The central core is a globe of about 7600 miles in diameter, which is composed of iron and other elements, probably not forming compounds, in the gaseous state, but exposed to such tremendous pressure that it behaves as a solid and extremely rigid body. Outside this core is a shell of liquid matter which consists of all the rocks which we know at the surface in a state of fusion, perhaps one hundred miles in thickness. Upon this magma floats the solid crust, thirty or forty miles thick, which is composed of various rocks, breaking down at the surface into soil. Three-fourths of the surface of this crust are covered by the water of the oceans, the hydrosphere, the rest being dry land. Outside all comes the atmospheric mantle, chiefly composed of air, which supports life, acts as a blanket to keep the earth warm, and as a shield against the blows of meteorites.

[42]

[43]

HOW THE EARTH'S CRUST IS CONSTRUCTED

An examination of the Earth's crust shows us that it is constructed of numerous strata of rocks, some of limestone, some of sandstone, and some of clay; and some are very hard, others soft and crumbling, and readily worn away by the action of running streams or the waves of the ocean. To these several substances which form the materials of the earth's crust we give the name *rock*. Hence we see that while in ordinary language the word rock denotes a great mass of hard stone, in geology a rock is any mass of natural substance forming part of the earth's crust. In this sense, loose sand, gravel, and soft clay are as much rocks as hard limestone and granite. [44]

MATERIALS OF WHICH ROCKS ARE COMPOSED

Rocks are formed of various materials called minerals. If we take a piece of sandstone rock, or a piece of granite, we shall probably be able to notice that the rock is made up of different substances.

On looking at a piece of *sandstone*, for example, especially if we use a magnifying glass, we see that it is composed of little rounded grains of a glassy-looking substance cemented together. In some specimens these grains are larger than in others. This cementing material is not the same in all sandstones, but in our specimen it is formed of *calcium carbonate*, for when we drop a little diluted hydrochloric acid on the rock there is an effervescence. The cementing material is dissolved, but the little rounded grains, which consist of *quartz*, are not affected by the acid. The sandstone, then, consists of quartz grains cemented together by calcium carbonate. It is called a calcareous sandstone. [45]

Now take a piece of granite, and break it with a hammer to get a clean-cut face. On looking at this face we see that the rock is made up of *three* different substances.

One of these has a glassy appearance like the grains in the sandstone, and is so hard that we cannot scratch it with a knife. This is *quartz*. Another of the substances is of a dull white or pinkish color. It lies in long, smooth-faced crystalline patches, which easily break along a number of smooth parallel surfaces having a pearly lustre. It can be scratched with difficulty by the point of a knife. This substance is called *felspar*. The third substance consists of bright glistening plates, sometimes of a dark color, which can be easily scratched, and which readily split into transparent leaves. This is *mica*. Notice that these substances do not occur in any definite order, but are scattered about through the stone irregularly, the felspar occurring in some specimens in larger crystals than in others.

WHAT A MINERAL IS

Hence we see that granite consists of a mixture of three substances, called quartz, felspar, and mica, the felspar being in greatest quantity. Each of these substances possesses properties more or less peculiar to itself, such as hardness, solubility in acids, specific gravity, crystalline form, way of splitting, etc. Hence, each of these substances has a *definite chemical composition and constant physical properties* which define them as *minerals*.

This definition may be understood to include such substances as coal and chalk, which are the mineralized remains of plants and animals respectively. Even water and gases of the atmosphere may be said to belong to the mineral kingdom of nature, as plants and their parts are said to belong to the vegetable kingdom, and animals and their parts to the animal kingdom.

CHIEF ROCK-FORMING MINERALS

The total number of rock-forming minerals is very large, but many of them are very rare, and form but a very small part of the earth's crust.

The most abundant materials or earths of which rocks are composed are *silica*, *lime* and *aluminum*. Silica or flint is very universally diffused. It is found almost pure in quartz, opal, chalcedony, rock crystal, and the flinty sand of the sea-shore. Lime is also a very generally distributed earth, and is usually found in the form of carbonate. Under the several names of marl, limestone, oolite, and chalk it constitutes mountains, and even ranges of mountains. Aluminum is likewise very abundant, and of great importance to mankind. It enters largely into the clayey or argillaceous earths, and forms part of various kinds of rock which possess the property of not permitting water to pass through its substance—a property which renders it of inestimable value both for natural and artificial reservoirs of water.

CHIEF CHEMICAL ELEMENTS WHICH FORM MINERALS

The larger number of elements play so small a part in the constitution of the earth that they may be neglected by the geologist. The following list includes the elements of which ninety-nine per cent of the earth's crust, as known to us, is composed, with their relative proportions, as indicated by Clarke's laborious analyses of a very large number of typical rocks:

ELEMENT	CHEMICAL SYMBOL	PERCENTAGE OF EARTH'S CRUST WHICH IT FORMS
Oxygen	O	47.02
Silicon	Si	28.06
Aluminum	Al	8.16
Iron	Fe	4.64
Calcium	Ca	3.50
Magnesium	Mg	2.62
Sodium	Na	2.63
Potassium	K	2.32
Hydrogen	H	0.17
Carbon	C	0.12
		99.24

The ten elements given above form 99.24 of the earth's solid crust.

HOW ROCKS ARE CLASSIFIED

The beds or layers which form the crust of the earth are divided into three classes: (1) *Sedimentary*, or stratified; (2) *Igneous*, or unstratified; (3) *Metamorphic*, or transformed.

SEDIMENTARY OR STRATIFIED ROCKS

Sedimentary rocks are such as give evidence of having been formed by successive deposits of sediment in water. They include sandstones or freestones, limestones, clays, etc. The material for these must have been derived from some original source, and in many instances this may be traced to the disintegration of older rocks. Thus gneiss appears to be formed by the disintegration of granite. The great class of sedimentary rocks may be divided into three smaller divisions. These divisions, with the chief rocks of each division, may be tabulated as follows: [46]

- Mechanically formed rocks from detrital sediments: Conglomerates, sandstones, clay, and shale.
- Organically formed rocks from animal and plant remains: Limestones, chalk, coral, peat, and coal.
- Chemically formed rocks from material once in solution: Limestones, stalactites, gypsum, rock-salt and sinter.

Most of the stratified rocks contain fossils; and since each group contains certain kinds peculiar to itself, it is by means of these organic remains that their relative ages have been determined.

Although the lowest stratified rocks are more ancient than those which have been deposited above them, the layers or beds do not always retain a

horizontal position. Were such the case, it could only be by deep cuttings that we should arrive at the older strata. We however find that, owing to some convulsion of nature, stratified rocks have been thrown out of their original position, and thus crop out to the surface. Not only is facility thus afforded us to become acquainted with the nature of the lower rocks, but many of the most valuable products of the earth are by this means rendered accessible to man.

HOW THE HISTORY OF THE EARTH IS EMBEDDED IN THE ROCKS

A million years ago, a little stream trickled down a mountain-side, carrying with it grains of sand and stones which fell to the bottom of the sea. In the sea swam a great and wonderful creature called an ichthyosaurus. One day the great creature died, or probably it was killed in battle with another strange monster, and its body fell to the bottom of the sea among the shells and seaweed. Meanwhile, the stones and sand brought down by the stream continued to fall upon the bed of the sea until at last the great reptile's body was buried, and the lower layers became pressed into hard rock by the weight on top. One day an elephant going to the river to drink broke off his tusk, and this was carried down by the river and sank in the sea. Another day a bird was drowned, and this, too, fell upon the ocean-bed. Dead fishes and shells also sank, and all were buried by the never-ceasing shower of mud and earth and sand and stones. Ages after the ichthyosaurus died, men began to live on the earth, and one day a man who had made a boat went out to fish. Trying to spear a big fish, the head of his harpoon broke off and fell to the bottom of the sea. In course of time this also was buried in the mud. The bottom of the sea crept higher and higher, till at last it became dry land. Then one day men began to dig, and the world's wonderful story was revealed as we read it here. First the spear-head was found, then the tusk, the bird's skeleton, the shells, the fish, and at last the skeleton of the great sea reptile, all turned to stone and become *fossils*, a word that means "something dug up."

The greater number of these beds contain organic remains, i. e., the remains of animals and plants, which are termed fossils. Among these the most numerous are the remains of marine animals, and in some instances shells and corals occur in such abundance as to form the principal part of extensive beds. Every part of the earth exhibits similar, or nearly similar formations; and not only are marine fossils met with in the interior of continents, and at great elevations above the sea, but a vast variety of plants, corals, shells, fish, reptiles, etc., are found, of species dissimilar to any at present on the land or in the waters. Besides rocks, we meet with earthy formations on the surface. These include such loose materials as are disintegrated or worn away from rocks, and form, when combined with decayed animal and vegetable matter, the soil of meadows and arable lands.

[47]

IGNEOUS, OR UNSTRATIFIED ROCKS are such as appear to be of igneous origin, or to have been formed by the action of fire or intense heat. They are called unstratified, because instead of having been deposited in successive layers, like the stratified rocks, they seem to have been formed by the fusion or melting of the materials of which they are composed, and the subsequent cooling and hardening of the melted matter into one great mass. Granite, basalt, lava, etc., are examples of this class of rocks, and represent respectively the sub-classes of plutonic, trap, and volcanic rocks. Plutonic rocks are those which have cooled under the pressure of overlying rocks; trap rocks, those which have cooled under that of deep water; and volcanic rocks, such as have cooled in the air.

Though granite is the most useful of the igneous rocks, basalt is probably the most interesting because of the wonderful formations it discloses. It is a dense basic lava of a dark color, that breaks with a conchoidal or shell-like fracture, and shows a finely grained or hemi-crystalline texture in a glassy base. The basalt rocks are found both as intrusive masses and as sheets that have been poured out on the surface. Many of these lava sheets of basalt in slowly cooling and solidifying acquired a columnar structure, the columns often having a more or less hexagonal shape, though the number of sides varies. Fine examples of these columnar basalts occur at Fingal's cave in the island of Staffa, at the Giant's Causeway in the north of Ireland, and on the shores of Lake Superior.

METAMORPHIC, OR Transformed rocks, include altered rocks of either sedimentary or igneous origin, in which the acquired are more prominent than the original characteristics. Igneous rocks have, in many cases, forced their way up through stratified rocks. These igneous formations, while still in a molten state, in coming in contact with the aqueous or stratified rocks, have usually changed the character of those portions immediately near them. The chief changes of structure effected by metamorphic action are crystallization and foliation. Examples of metamorphic rocks are marble, quartzite, slate, gneiss, and the schists.

HOW THE METALS ARE FOUND

In some localities fissures in rocks are found to contain metallic substances. Such fissures are frequently found partially filled with calcareous spar which forms the matrix in which the metals are inclosed.

Metallic veins are supposed to be partially filled by mechanical means, the particles of metallic substances being conveyed into them by the action of water or some other power, and partly by chemical action, or by sublimation or fumes rising from below.

Some metallic deposits appear to occur in situations where igneous rocks have intruded themselves. Gold is supposed to be found almost invariably under such circumstances. Such appears to be the case in the rich deposits near the Ural mountains, and also in California and in Australia. In all these places it is met with in quartz. It is in pebbles or sand of the same rock that it occurs in the beds of rivers, and in some cases is found spread over a large extent of country.

Copper, though frequently met with in veins, is also found in extensive masses or beds, interposed between layers of rock. The same remark applies to tin, lead, and silver. Iron is also met with in beds, and also in nodules or rounded masses, which occur in great abundance among some kinds of rock. The last-named is the most universally diffused of all metals, and the most useful.

[48-49]

A GEOLOGICAL VIEW OF THE GROWTH OF THE EARTH

Giving the geological ages, rock systems, strata and the development of life, with their relative positions and order of succession, according to the latest scientific knowledge. Many attempts have been made to compute from geological, physical, and other data the length of the period during which the earth has been in a solid state.

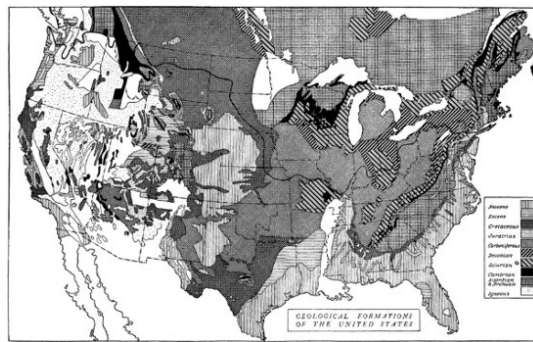

Geologists, however, are disinclined to accept any period much less than 100,000,000 years as sufficient for the elaboration of the present structure of the earth. It is indisputable that many millions of years, probably thirty or forty, must have elapsed while the great sedimentary rocks were being deposited. With respect to the larger features of the earth's surface, it is likely that two different kinds of movement are responsible. Where the contraction of the earth has caused a lessening of the support below the surface, there has been a subsidence of great areas. In the second place, where the rigid crust has been able to contract into a smaller space, great mountain ridges and folds have been formed. The subsidences which caused the ocean took place at different ages. The Atlantic Ocean probably dates from middle Cenozoic times; the Indian Ocean may be older; the Pacific suffered great modifications in comparatively recent times.

Life Ages of the Earth	Rock Systems	Series of Rock Strata	Characteristic Rocks	Forms of Life	Chief Economic Products
Cenozoic (se 'nō-zō'ik), or "Recent life." Estimated Age of Period, 3,000,000 years.	Quaternary (kwa-ter 'na-ri) or "fourth." Once supposed to be the fourth sedimentary system. Age of man.	Recent, or Human.	Alluvium, sand, gravel, mud, clay, marl, loess.	Man predominant.	Clay, peat, bog iron ore, marl, gold placers.
		Pleistocene (plīs 'tō-sēn), or "most recent." Glacial Period.	Drift, boulder clay, gravel, loess, silt, glacial deposits and other formations formed during glacial period.	Mammoth, mastodon, bear, bison, reindeer, musk-ox. Possibly man was living but that is uncertain.	Clay, gravel, gold placers.
		Pliocene (plī 'ō-sēn), or "more recent."	In East and West, land deposits predominate. Marine sands, clays, marls on Atlantic and Pacific coasts. Igneous rocks in West.	Plants and animals much as today, aside from human and domestic species.	Gold (in part placers), coal, oil, gas.
Tertiary (ter 'shi-a-ri), or "third". Once supposed to be the third sedimentary system, or Age of mammals.	Tertiary (ter 'shi-a-ri), or "third". Once supposed to be the third sedimentary system, or Age of mammals.	Miocene (mī 'ō-sēn), or "less recent."	On Atlantic coast: sand, clay, shell marl, diatomaceous earth. In West: sandstone, shale, and diatomaceous material. Extensive volcanic formations in Rocky Mountains and Great Basin region.	Land animals include elephants, camels, deer, oxen, horses, true apes, etc. Marine animals much like those today. Among plants, grasses become important; deciduous trees increase.	Silver, gold, coal, oil, gas, phosphate rock, diatomaceous earth.
		Oligocene (ōl 'ō-gō-sēn), or "a little more recent."	Limestone in Caribbean region, land deposits in West. Marine and fresh water beds on west coast. Many coal beds in Puget Sound.	Ancient dogs, cats, rabbits, squirrels, camels, and horses were represented.	Copper, silver.
		Eocene (ē 'ō-sēn), or "dawn of recent."	In Eastern States: clays, sands, greensand marls. In West: conglomerate, sandstone, shale, diatomaceous shale and igneous formations are developed. Many coal beds in Puget Sound. Fresh water beds in western interior.	Mammals flourished, including rodentia, carnivora, edentates, lemuroids, birds, reptiles, etc. Flora included figs, palms, bananas; willows, chestnuts, oaks, etc.	Gold, zinc, lead, coal, oil, gas.
		Upper.	In East: sand, clay, and greensand marl. In West:	Reptiles predominate: turtles, lizards,	

Mesozoic (<i>mēs-ō-zō-ic</i>), or "Middle life," Estimated Age of Period, 9,000,000 years.	Cretaceous (<i>krē-ta-she-us</i>) or "bearing chalk."	Lower.	sandstone, shale, limestone, chalk, extensive coal beds, various igneous rocks. Clay, sand, gravel on Atlantic coast and Gulf. Sedimentary and igneous rocks on west coast. Some non-marine beds in Texas.	crocodiles, flying reptiles, etc. Many waterbirds. Angiosperms predominate: larch, beech, walnut, tulip trees, etc. Reptiles abound. Flora includes cycadeous, conifers, horsetails; angiosperms appear.	Coal, oil, gas, copper, gold, china clay, fire clay, cement building stone.
	Jurassic (<i>jō-ras-sik</i>), or like the mass of the Jura Mountains. Age of Reptiles.	Upper. Middle. Lower.	Probably not represented in East. Sandstones, limestones and shales in West. Some "red beds" in western interior.	Ammonites, belemnites continue in great variety. Reptiles numerous and varied types. Flying reptiles and reptile-like birds appear.	Oil, gold.
	Triassic (<i>trī-ās-ik</i>), or in a triple series.	Upper. Middle. Lower.	In East sediments formed in shallow troughs between recently formed mountains. Considerable bodies of igneous rock, traps, and other flows and dikes. "Red beds" in West with salt and gypsum. Some igneous rocks on west coast.	Reptiles of enormous size dominate the land and sea. Mammals appear. Ammonites and belemnites dominate invertebrate life.	Salt, gypsum, a little coal in Virginia, copper, building stone.
Paleozoic (<i>pāl-æ-ō-zō-ic</i>), or "Old life." Estimated Age of Period, 24,000,000 years.	Carboniferous (<i>kār-bōn-if-er-us</i>), or coal-bearing. Age of Amphibians.	Permian (<i>per-mē-ān</i>), like those at Perm, Russia. Pennsylvanian , like those of Pennsylvania. Mississippian , or Lower Carboniferous.	In East fresh water sediments including coal; in West "red beds" probably of continental origin. Some marine sediments; salt and gypsum in red beds in Kansas. In Eastern States grits, sandstones, shales, limestone and coal. In Western States much limestone; no coal. Igneous rocks on west coast. Limestones predominate with sandstones near base and shales near top of series. Igneous rocks in California.	Reptiles become prominent in number and variety; inhabit fresh water, salt water and land. Plants abound; Marked development of land animals, including insects, spiders and scorpions. Lizards become important. Amphibians reach climax. Crinoids greatly developed. Amphibians appear. Plant life expands.	Salt and gypsum; some coal in Eastern States. Coal, oil, gas, iron ore, fire clay, phosphate rock. Oil, gas, lead, zinc, building stone, cement rock.
	Devonian (<i>de-vō-ni-an</i>) like those of Devonshire, England. Age of Fishes.	Upper. Middle. Lower.	Sedimentary rocks, limestones, sandstones, shales; igneous rocks in Maine, Nova Scotia, and New Brunswick.	Rapid changes in animal kingdom; shifting habitat; extensive development of fishes; sharks flourish. Plants are mainly small leaf and reed types.	Gas, oil, iron ore, phosphate rock.
	Silurian (<i>si-lū-ri-an</i>), in the land of the Silures, England. Age of Invertebrates.	Ontarian (<i>on-tā-rē-ān</i>), place name. Champlainian (<i>shām-plān-ē-ān</i>), place name.	Sedimentary rocks predominate; conglomerates, sandstones, shales, limestones, salt, gypsum. Igneous rocks in Nova Scotia, New Brunswick, and Maine.	Vertebrates appear; low forms of fishes. First reef building corals. Crinoids and brachiopods, important Cephalopods continue to dominate.	Iron ore, gas, salt, gypsum, cement rock.
	Ordovician (<i>ōr-dō-vish-ān</i>), a place name in Wales.	Cincinnatian (<i>sin-sin-nāt-ē-ān</i>), place name. Mohawkian (<i>mō-hōk-ē-ān</i>), place name. Lower.	Chiefly limestone with subordinate sandstone and shale. Rocks greatly folded in New York, in Taconic Mountain region.	Much as in the Cambrian. Remains are more abundant. Species more numerous; insects were present. Vertebrates appear. Low forms of fishes. Trilobites reach climax.	Oil, gas, lead, zinc, phosphate rock, manganese, marble.
Cambrian (<i>kam-bri-an</i>), from Cambria, the old name for Wales.	Saratogan (<i>sār-ā-tō-gān</i>), place name. Acadian (<i>ā-kād-ē-ān</i>), place name. Georgian (<i>jōr-gē-ān</i>), place name.	Mainly sandstones with some shales, and in Western States considerable limestone. At some places rocks are changed by pressure, especially in the Appalachian Mountains. Upper Cambrian covered larger area than lower Cambrian.	All great divisions of animal kingdom except vertebrates are represented; trilobites, brachiopods, sponges, graptolites, etc. Little evidence of vegetation, but it must have abounded as food for animals.	Lead, zinc, barite, copper.	
Proterozoic (<i>prō-ter-ō-zō-ik</i>) or "Former life." Estimated Age of Period, 18,000,000 years.	Algonkian (<i>āl-gōn-kē-ān</i>), from district of Algonquin Indians, north of St. Lawrence.	Keweenawian (<i>kē-wē-nāh-wān</i>), pertaining to Keweenaw Peninsula, Michigan. Huronian (<i>hu-rō-nē-ān</i>), rocks on borders of Lake Huron.	A great series of sandstones, limestones and shales, in middle portion of which are many enormous flows of lava. Three great series of sedimentary rocks, sandstone, shale and limestone, and iron formation. Contains also many great igneous bodies, acidic and basic. Lower members much metamorphosed by pressure.	Fossils rare or wanting. Rocks contain clear evidence of low forms of life.	Copper, silver. Principal iron ores of Lake Superior region; also copper, nickel, silver, cobalt, gold. Building stone and ornamental stone.
Archeozoic (<i>ār-kē-ō-zō-ic</i>), "Without life." Estimated Age of Period, 18,000,000 years.	Archean (<i>ār-kē-ān</i>), "oldest."	Laurentian (<i>law-ren-shi-an</i>), pertaining to rocks along the St. Lawrence River. Keewatin (<i>kē-wā-tīn</i>), rocks in a district of Manitoba, Canada.	Granitic rocks and gneisses that are believed to be granitic rocks metamorphosed by pressure. Formerly supposed to be older than Keewatin and regarded as the "original crust of the earth." A great schist series made up of lava flows, tuffs, and volcanic ashes. With these are subordinate sedimentary rocks; sandstone, shale, limestone, and iron ore formations nearly everywhere greatly metamorphosed by pressure. Includes the oldest rocks known.	Since the rocks are of igneous origin, they contain no organic remains. No fossils found, but carbonaceous schists and limestones are believed to indicate the presence of life.	Iron ores, precious metals, gems, apatite, rare earths, graphite, asbestos. Emery, building and ornamental stones.

Life Ages of the Earth	Rock Systems	Series of Rock Strata	Characteristic Rocks	Forms of Life	Chief Economic Products
Cenozoic (<i>se-nō-zō-ik</i>), or "Recent life." Estimated Age of Period, 3,000,000 years.	Quaternary (<i>kwa-ter-na-ri</i>) or "fourth." Once supposed to be the fourth sedimentary system. Age of man.	Recent, or Human.	Alluvium, sand, gravel, mud, clay, marl, loess.	Man predominant.	Clay, peat, bog iron ore, marl, gold placers.
		Pleistocene (<i>plīs-tō-sēn</i>), or "most recent." Glacial Period.	Drift, boulder clay, gravel, loess, silt, glacial deposits and other formations formed during glacial period.	Mammoth, mastodon, bear, bison, reindeer, musk-ox. Possibly man was living but that is uncertain.	Clay, gravel, gold placers.
		Pliocene (<i>plī-ō-sēn</i>), or "more recent."	In East and West, land deposits predominate. Marine sands, clays, marls on Atlantic and Pacific coasts. Igneous rocks in West.	Plants and animals much as today, aside from human and domestic species.	Gold (in part placers), coal, oil, gas.
		Tertiary (<i>ter-shi-a-ri-an</i>) or "third". Once supposed to be the third sedimentary system, or Age of mammals.	Miocene (<i>mī-ō-sēn</i>), or "less recent." Oligocene (<i>ōl-ē-gō-sēn</i>), or "a little more recent." Eocene (<i>ē-ō-sēn</i>), or "dawn of recent."	On Atlantic coast: sand, clay, shell marl, diatomaceous earth. In West: sandstone, shale, and diatomaceous material. Extensive volcanic formations in Rocky Mountains and Great Basin region. Limestone in Caribbean region, land deposits in West. Marine and fresh water beds on west coast. Many coal beds in Puget Sound. In Eastern States: clays, sands, greensand marls. In West: conglomerate, sandstone, shale, diatomaceous shale and igneous formations are developed. Many coal beds in Puget Sound. Fresh water beds in western interior.	Land animals include elephants, camels, deer, oxen, horses, true apes, etc. Marine animals much like those today. Among plants, grasses become important; deciduous trees increase. Ancient dogs, cat, rabbits, squirrels, camels, and horses were represented. Mammals flourished, including rodentia, carnivora, edentates, lemuroids, birds, reptiles, etc. Flora included figs, palms, bananas; willows, chestnuts, oaks, etc.
Mesozoic (<i>mēs-ō-zō-ic</i>), or "Middle Life." Estimated Age of Period, 5,000,000 years.	Cretaceous (<i>krē-ta-she-us</i>) or "bearing chalk." Jurassic (<i>jō-ras-sik</i>), or like the mass of the Jura Mountains. Age of Reptiles.	Upper. Lower. Upper. Middle. Lower.	In East: sand, clay, and greensand marl. In West: sandstone, shale, limestone, chalk, extensive coal beds, various igneous rocks. Clay, sand, gravel on Atlantic coast and Gulf. Sedimentary and igneous rocks on west coast. Some non-marine beds in Texas. Probably not represented in East. Sandstones, limestones and shales in West. Some "red beds" in western interior.	Reptiles predominate: turtles, lizards, crocodiles, flying reptiles, etc. Many waterbirds. Angiosperms predominate: larch, beech, walnut, tulip trees, etc. Reptiles abound. Flora includes cycadeous, conifers, horsetails; angiosperms appear. Ammonites, belemnites continue in great variety. Reptiles numerous and varied types. Flying reptiles and reptile-like birds appear.	Coal, oil, gas, copper, gold, china clay, fire clay, cement building stone. Oil, gold.

		Upper. Middle. Lower.	In East sediments formed in shallow troughs between recently formed mountains. Considerable bodies of igneous rock, traps, and other flows and dikes. "Red beds" in West with salt and gypsum. Some igneous rocks on west coast.	Reptiles of enormous size dominate the land and sea. Mammals appear. Ammonites and belemnites dominate invertebrate life.	Salt, gypsum, a little coal in Virginia, copper, building stone.
Paleozoic (<i>pāl-æ-ō-zō 'ic</i>), or "Old Life." Estimated Age of Period, 24,000,000 years.	Carboniferous (<i>kār-bōn-if 'er-us</i>), or coal-bearing. Age of Amphibians.	Permian (<i>per'-mē-ān</i>), like those at Perm, Russia.	In East fresh water sediments including coal; in West "red beds" probably of continental origin. Some marine sediments; salt and gypsum in red beds in Kansas.	Reptiles become prominent in number and variety; inhabit fresh water, salt water and land.	Salt and gypsum; some coal in Eastern States.
		Pennsylvanian , like those of Pennsylvania.	In Eastern States grits, sandstones, shales, limestone and coal. In Western States much limestone; no coal. Igneous rocks on west coast.	Plants abound. Marked development of land animals, including insects, spiders and scorpions. Lizards become important. Amphibians reach climax. Crinoids greatly developed. Amphibians appear. Plant life expands.	Coal, oil, gas, iron ore, fire clay, phosphate rock.
		Mississippian , or Lower Carboniferous.	Limestones predominate with sandstones near base and shales near top of series. Igneous rocks in California.	Rapid changes in animal kingdom; shifting habitat; extensive development of fishes; sharks flourish. Plants are mainly small leaf and reed types.	Oil, gas, lead, zinc, building stone, cement rock.
	Devonian (<i>de-vō 'ni-an</i>) like those of Devonshire, England. Age of Fishes.	Upper. Middle. Lower.	Sedimentary rocks, limestones, sandstones, shales; igneous rocks in Maine, Nova Scotia, and New Brunswick.	Rapid changes in animal kingdom; shifting habitat; extensive development of fishes; sharks flourish. Plants are mainly small leaf and reed types.	Gas, oil, iron ore, phosphate rock.
	Silurian (<i>si-lū 'ri-an</i>), in the land of the Silures, England. Age of Invertebrates.	Ontarian (<i>on-tā 'rē-ān</i>), place name.	Sedimentary rocks predominate; conglomerates, sandstones, shales, limestones, salt, gypsum. Igneous rocks in Nova Scotia, New Brunswick, and Maine.	Vertebrates appear; low forms of fishes. First reef building corals. Crinoids and brachiopods, important Cephalopods continue to dominate.	Iron ore, gas, salt, gypsum, cement rock.
		Champlainian (<i>shām-plān ē-ān</i>), place name.			
Ordovician (<i>ōr-dō-vīsh 'ān</i>), a place name in Wales.	Cincinnati (<i>sīn-sīn-nāt 'ē-ān</i>), place name.	Chiefly limestone with subordinate sandstone and shale. Rocks greatly folded in New York, in Taconic Mountain region.	Much as in the Cambrian. Remains are more abundant. Species more numerous; insects were present. Vertebrates appear. Low forms of fishes. Trilobites reach climax.	Oil, gas, lead, zinc, phosphate rock, manganese, marble.	
	Mohawkian (<i>mō-hōk 'ē-ān</i>), place name. Lower.				
	Saratogan (<i>sār-ā-tō 'gān</i>), place name.	Mainly sandstones with some shales, and in Western States considerable limestone. At some places rocks are changed by pressure, especially in the Appalachian Mountains. Upper Cambrian covered larger area than lower Cambrian.	All great divisions of animal kingdom except vertebrates are represented; trilobites, brachiopods, sponges, graptolites, etc. Little evidence of vegetation, but it must have abounded as food for animals.	Lead, zinc, barite, copper.	
Proterozoic (<i>prō-ter-ō-zō 'ik</i>) or "Former Life." Estimated Age of Period, 18,000,000 years.	Algonkian (<i>āl-gōn 'kē-ān</i>), from district of Algonquin Indians, north of St. Lawrence.	Keweenaw , (<i>kē 'wē-nāh-wān</i>), pertaining to Keweenaw Peninsula, Michigan.	A great series of sandstones, limestones and shales, in middle portion of which are many enormous flows of lava.	Fossils rare or wanting.	Copper, silver.
		Huronian (<i>hu-rō 'nē-ān</i>), rocks on borders of Lake Huron.	Three great series of sedimentary rocks, sandstone, shale and limestone, and iron formation. Contains also many great igneous bodies, acidic and basic. Lower members much metamorphosed by pressure.	Rocks contain clear evidence of low forms of life.	Principal iron ores of Lake Superior region; also copper, nickel, silver, cobalt, gold. Building stone and ornamental stone.
		Laurentian (<i>lāw-ren 'shī-an</i>), pertaining to rocks along the St. Lawrence River.	Granitic rocks and gneisses that are believed to be granitic rocks metamorphosed by pressure. Formerly supposed to be older than Keewatin and regarded as the "original crust of the earth."	Since the rocks are of igneous origin, they contain no organic remains.	Iron ores, precious metals, gems, apatite, rare earths, graphite, asbestos.
Archeozoic (<i>ar 'kē-ō-zō 'ic</i>), "Without Life." Estimated Age of Period, 18,000,000 years.	Archean (<i>ār-kē 'ān</i>), "oldest."	Keewatin (<i>kē-wā 'tīn</i>), rocks in a district of Manitoba, Canada.	A great schist series made up of lava flows, tufts, and volcanic ashes. With these are subordinate sedimentary rocks; sandstone, shale, limestone, and iron ore formations nearly everywhere greatly metamorphosed by pressure. Includes the oldest rocks known.	No fossils found, but carbonaceous schists and limestones are believed to indicate the presence of life.	Emery, building and ornamental stones.

THE SURFACE OF THE EARTH

MAP SHOWING THE DISTRIBUTION OF LAND AND WATER

Large illustration (222 kB)

LAND FORMS OF THE WORLD

The proportion of land to water upon the earth is as 27 to 72, or roughly *one-fourth* to *three-fourths*; the land covering fifty-three million square miles, the sea one hundred and forty-four million. The land consists of six great bodies called continents, and a multitude of small fragments called islands, which skirt the shores of the continents or dot the broad expanse of the sea.

THE DISTRIBUTION OF LAND AND WATER

By far the greatest proportion of land is in the northern hemisphere, and in temperate latitudes. Broadly speaking, the northern hemisphere is the hemisphere of land, and the southern hemisphere is the hemisphere of ocean. The earth could be bisected in such a way that one hemisphere contained almost no land, while the other was composed almost equally of land and water.

LOCATION OF THE CONTINENTS

The greater part of the land on the earth's surface is grouped into two great *hemispheres*, the Old and the New World. The former and far larger of these consists of Eurasia in the north, separated by ill-defined boundaries from Europe to the west and Asia to the east, and of Africa in the south, united to Eurasia by the narrow neck of the isthmus of Suez. The hemisphere of the New World is divided into North America and South America, united by the long, narrow isthmus of Central America. The island of Australia is also reckoned as a continent. It is believed that an island continent, Antarctica, surrounds the South Pole. Of islands not reckoned as continents, the largest is the polar island of Greenland.

CERTAIN RESEMBLANCES OF THE CONTINENTS

In comparing the continents, we at once notice certain resemblances. The first is the tapering to the south, which is seen in Greenland, North and South America, Africa, and Australia (Tasmania). Another is the southward-running peninsulas which characterize Europe and Asia. We may notice, too, that the general lines of the Old World, broad in the north, tapering in the south, resemble those of the New World, especially if we include Australia (Tasmania), and compare its position with that of South America. There is also a certain uniformity in the distribution of relief. Notice the so-called Mid-World and Pacific Mountain systems, which may be traced in the mountains of Central Europe, North Africa, Central Asia, the islands of the Pacific from Japan to New Guinea, and the lofty mountains of North, Central, and South America.

DIAGRAM SHOWING AVERAGE HEIGHT OF THE CONTINENTS

COMPARISON OF THE CONTINENTS

Continent	Asia	Africa	North America	South America	Europe	Australia	All Land
Area (million square miles)	16.4	11.1	7.6	6.8	3.7	3.0	55.0
Average Height (feet)	3,000	2,500	1,900	2,000	940	800	2,100
Highest Point (feet)	29,000	18,800	18,200	22,400	18,500	7,200	29,000
PERCENTAGE AT VARIOUS ALTITUDES (feet)							
Below Sea-Level	1.4	0.1	0.05	0.0	1.8	0.0	0.6
0 to 600 feet	23.3	12.5	32.25	40.0	53.8	29.8	26.7
600 to 1,500 feet	16.0	34.8	32.1	26.8	27.0	64.3	27.8
1,500 to 3,000 feet	21.7	27.6	13.3	16.8	10.0	4.1	19.3
3,000 to 6,000 feet	21.8	21.8	13.2	7.0	5.5	1.5	17.0
6,000 to 12,000 feet	10.0	2.8	8.4	5.0	1.7	0.3	6.0
Above 12,000 feet	5.8	0.4	0.7	4.4	0.2	0.0	2.6

THE SHAPING OF THE COAST

The coast line, or margin of sea and land, is an area rapidly wearing away under the ceaseless influence of the waves, and of the sand and rock, they are perpetually hurling to and fro. Coasts may be either flat or high, composed either of hard or soft rock, and either submerged or raised. A submerged coast is one where the land has sunk or the sea has risen, so that the low grounds and valleys are flooded. A raised coast is one where the land has risen or the sea has retired, and what was formerly the sea bottom is bared.

A flat coast is usually sandy, often bordered by sandhills and lagoons. It may be carved into cliffs, as in the clay cliffs of Norfolk, England. A raised coast is usually flat from the long-continued action of the waves during the period when it was submerged. Flat coasts have no good harbors.

A submerged coast differs according to the nature of the submerged region. If this was hilly or mountainous, with valleys running parallel to the shore, the coast will be ironbound and harbor-less unless the sea-level has risen sufficiently to give access to the valleys behind the first range of heights. If this happens, T-shaped gulfs are formed. Where the valleys open at right angles to the sea, they become bays, usually with excellent harbors. The hills between the valleys rise as peninsulas, or islands. If the land was flat before submerging took place, a flat coast is the result.

Where the land is composed of soft rocks, a more uniform coast-line results than where it is composed of harder rocks, or of hard and soft rocks mixed. The waves, in eating out the softer rocks, often form magnificent sea-caves, natural arches, and pinnacles.

THE COASTLINE OF THE VARIOUS CONTINENTS

EUROPE surpasses all the other continents in the magnitude of its indentations and projections. Three great peninsulas—the Balkan peninsula, Italy, and Spain, project into the Mediterranean; while Brittany, Denmark, and Scandinavia jut into the shores of the Atlantic. Even the British Isles are scarcely more than a projection of the continent.

ASIA is a second in the relative extent of its peninsula. Asia Minor on the west, Arabia, India, and Indo-China on the south, and China, Manchuria with Corea and Kamchatka, advancing into the waters of the Pacific, form a wide border of projecting lands, containing the richest regions of the continent.

NORTH AMERICA is considerably less indented. Florida, Nova Scotia and Labrador are more prominent on the Atlantic coast, and California Peninsula and Alaska on the Pacific.

The southern continents on the contrary, are nowhere deeply penetrated by the waters of the ocean. The Gulf of Arica in South America, the Gulf of Guinea in Africa, and the Great Australian Bight, are merely gentle bends in the coast line.

LOCATION OF THE GREAT PLAINS OF THE WORLD

Plains occupy nearly one-half of the surface of the continents. They are most extensive and unbroken on the Arctic slopes of the Old World, and in the interior of the two Americas.

Treeless plains, whose vegetation consists of grasses and other herbaceous plants, or stunted shrubs, occur in every continent, and are designated by a variety of terms. Wherever treeless plains are subject to periodical rains, they lose their verdure in the season of drought, and assume the aspect of a desert; but they resume their freshness on the return of the rain, and many are adorned with a great variety of beautiful flowers.

PLAINS OF THE OLD WORLD. The great Siberian plain extends from the northeastern extremity of Asia to the Ural Mountains and Caspian Sea; and the European plain stretches from the Ural westward, through Russia and North Germany, to the lowlands of Holland.

The plains of the Caspian Sea and western Siberia are dreary steppes, covered with coarse grasses, often growing in tufts, alternating with patches of heather, furze, dwarf birch, and other stunted shrubs; or old sea bottom, covered with salt efflorescence. Immense reaches of flat country, near the Arctic shores of Asia and Europe, consist of frozen marshes, called tundras, where mosses and lichens are almost the only vegetation. Those of eastern Europe and Asia are denominated steppes; while more limited treeless regions in western Europe are called landes and heaths.

On the alluvial plains of the Old World, civilization began and developed; and their inexhaustible fertility supplied the wants of the most populous nations of antiquity. The great centers of ancient civilization in Egypt, China, India and Babylonia, all had their growth in alluvial plains, built up and fertilized by the mighty rivers which traverse those countries.

PLAINS OF THE NEW WORLD. In North America the great *Central Plain* extends, with but slight interruptions, from the Arctic shores to the Gulf of Mexico. The fertile, treeless plains are termed "prairies" (meadows), while the sterile ones, east of the Rocky Mountains, are known as "the plains." There are vast cane fields and forests in the lower Mississippi Valley.

In South America the plains of the Orinoco basin, the *Selvas* of the Amazon, and the *Pampas* of the La Plata, form an uninterrupted series of lowlands which, continued by the plains of Patagonia to the southern extremity of the continent, extend over a distance of three thousand five hundred miles from north to south. The Spanish term "llano" (plain), and the Peruvian "pampa," designate the treeless plains of the Orinoco and La Plata basins. The Llanos of the Orinoco, during one-half of the year are covered by the richest pasturage, bright with flowers, but during the other half are a parched waste. The *Selvas* of the Amazon, a luxuriant forest, cover more than a million square miles; and the treeless Pampas, with their tall grasses and thickets of clover

and thistles, illustrate the endless richness and variety of nature.

Alluvial and marine plains generally have but a slight altitude, while the undulating plains are sometimes considerably elevated. The Mississippi Valley, at St. Louis, one thousand miles from the ocean, is hardly four hundred feet above the sea-level; and the Amazon, at an equal distance from the sea, does not reach two hundred and fifty feet. The marine plains adjacent to the Caspian and Aral seas are still lower, the larger portion being below the sea-level.

SITUATION, ELEVATION AND SOIL OF PLATEAUS

Plateaus are situated either between two lofty mountain chains, which form their margins, or descend by successive terraces to the nearest seas; or they pass, by gradations, from the base of high mountains to the low plains in the interior of the continents.

The Great American Basin, between the Rocky and Sierra Nevada Mountains, and the plateau of Tibet, between the Himalaya and Kuenlun mountains, are examples of the first position; and the table-land of Mexico, of the second. The third is seen in the high plains at the eastern foot of the Rocky Mountains, which descend from an altitude of five thousand or six thousand feet, at the foot of the mountains, to the low plains of the Mississippi basin.

The plateaus most remarkable for their elevation are, Tibet, from ten thousand to eighteen thousand feet above the sea; and the elongated valley-like highlands, from ten thousand to thirteen thousand feet high, between the two chains of the Andes, in South America. East Turkestan and Mongolia, in central Asia; the plateau of Iran, in western Asia; Abyssinia, and the vast plateau which occupies all the southern part of Africa; and the broad table-land which fills the western half of North America with a continuous mass of high land, range in height from four thousand to eight thousand feet.

The great peninsulas of Deccan, Arabia, Asia-Minor and Spain, the central plateau of France, and those of Switzerland, Bavaria, and Transylvania, vary from one thousand to four thousand feet in elevation.

SOIL AND CLIMATE OF PLATEAUS

The nature of the soil and climate of great plateaus is in general such as to render them the least useful portions of the continents. Sahara, with an average altitude of 1,000 feet, and the higher plateaus of Mongolia, Iran and parts of the American Basin, may serve as types.

Their surface consists of hardened sand and rock; of hillocks and plains of loose sand constantly shifting by the wind; and of immense tracts, as in Mongolia, covered with pebbles varying from the size of a walnut, or even less, to a foot in diameter: all indicating the original transporting, grinding and depositing of these materials by water.

Salt lakes without outlet occur in each, and salt efflorescence often covers the ground. A lack of rain to wash from the soil substances injurious to vegetation, and supply the water necessary for the growth of plants, leaves these plateaus generally sterile, and some of the most extensive are in part, if not wholly, deserts.

[55]

MOUNTAINS AND THEIR STRUCTURES

Mountains rise in long and comparatively narrow lines or ridges, the tops of which are often deeply indented, presenting to the eye the appearance of a series of peaks detached one from another. As each of these peaks or distinct elevations is called a mountain and often receives a separate name, the common designation chain or range of mountains is naturally applied to the whole.

The top of the ridge, from which the waters descend on opposite sides, is called the crest; and the notches between the peaks, from which transverse valleys often stretch like deep furrows down the slopes of the chain, are called passes.

HOW MOUNTAIN CHAINS FORM SYSTEMS

Mountain chains are seldom isolated, but are usually combined into *systems*, consisting of several more or less parallel and connected chains, with their intervening valleys,—as the Appalachian system, the Alps, and the Andes.

Most mountain chains seem to have been produced by tremendous lateral pressure in portions of the Earth's crust, causing either long folds, or deep fissures with upturned edges rising into high ridges, the broken strata forming ragged peaks.

TWO TYPES OF MOUNTAIN CHAINS

Mountains by folding are generally of moderate elevation, while mountains by fracture include the highest chains of the globe. The Appalachian Mountains in North America, and the Jura in Europe, are examples of the first; the Rocky Mountains, Andes, Alps and Himalayas, of the second.

Folded mountains are curved into long arches, either entire or broken at the summit and forming a system of long, parallel ridges, of nearly equal height, separated by trough-like valleys. Here and there, however, deep gaps, or gorges, cut the chains allowing the rivers to escape from one valley to another.

In systems of mountains produced by fracture, there is usually one main central chain, with several subordinate ranges. They have, however, less regularity and similarity among themselves than the parallel chains of mountains by folding.

The crests are deeply indented, cut down one-third or one-half the height of the range, forming isolated peaks and passes which present to the eye the appearance of a saw, called in Spanish *Sierra*; in Portuguese, *Serra*. Such ranges are frequently distinguished by these terms, as the Sierra Nevada, in North America; and the Serra do Mar, in Brazil.

HOW VALLEYS ARE FORMED

Valleys among mountains owe their existence primarily to folds or fissures in the Earth's crust, produced in the upheaving of the ranges; but they are subsequently deepened, widened and otherwise changed in form and extent, by the action of rains and frosts, and the streams to which they furnish a pathway. Most of the Alpine lakes, celebrated for their picturesque beauty, occupy deep basins at the outlet of transverse valleys.

Valleys in plains and plateaus are mainly, if not entirely, the result of the erosion, or wear of the surface, by running water.

Little rills, formed by the rains or issuing from springs, set out on their course down the slope of the ground, each wearing its small furrow in the surface. Uniting they form a rivulet which wears a broader and deeper channel; and the rivulets in turn combining, form rivers which produce still greater effects.

The great basin of the Mississippi for example, is one grand central valley, cut by the main stream in the line of lowest level, towards which the valleys of the Missouri, the Arkansas, the Ohio, and a multitude of smaller streams, all converge.

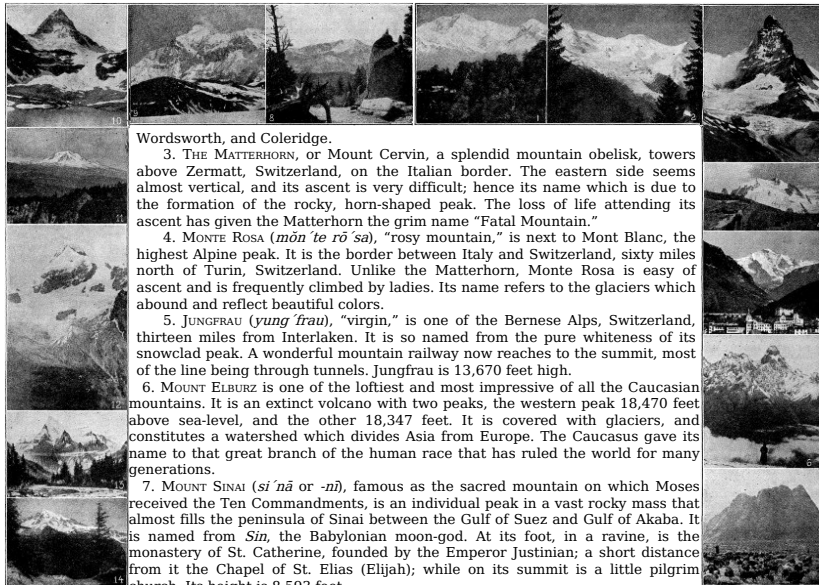

[56-57]

CELEBRATED MOUNTAIN PEAKS THAT STAND AS THE EARTH'S GREATEST SENTINELS

1. MOUNT EVEREST, the loftiest mountain in the world, is situated in Nepal, India, and rises to an ascertained height of 29,000 feet—almost six miles. It was named for Sir George Everest, an English engineer, and outline Surveyor-General of India. Everest is only one of numerous gigantic peaks of the Himalayas—often called the "Roof of the World"—and is apparently guarded against all attempts at ascent by a rampart of lofty pinnacles. It is best viewed from a point near Darjeeling, India, one hundred and twenty miles distant. From this point travelers are enthralled with the glistening peak of mountain piles as nowhere else on earth. Though a thousand times described, the view is so surpassingly sublime that its full glory can never be depicted in words.

2. MONT BLANC (*môn-blon-g*) is the highest mountain in Europe, and of the Alps. It is located between Great and Little St. Bernard passes, on the frontier of France, Switzerland and Italy; and is best seen and approached from the village of Chamounix (*shā-mo-nē*), France. It was first ascended in 1786, but frequently since, and, in 1893, an observatory was built on its summit. The Mont Blanc chain is famous for glaciers. Many great poets have described the majesty of Mont Blanc, among them, Goethe, Victor Hugo, Byron, Shelley,

Wordsworth, and Coleridge.

3. THE MATTERHORN, or Mount Cervin, a splendid mountain obelisk, towers above Zermatt, Switzerland, on the Italian border. The eastern side seems almost vertical, and its ascent is very difficult; hence its name which is due to the formation of the rocky, horn-shaped peak. The loss of life attending its ascent has given the Matterhorn the grim name "Fatal Mountain."

4. MONTE ROSA (*môn' te rô' sâ*), "rosy mountain," is next to Mont Blanc, the highest Alpine peak. It is the border between Italy and Switzerland, sixty miles north of Turin, Switzerland. Unlike the Matterhorn, Monte Rosa is easy of ascent and is frequently climbed by ladies. Its name refers to the glaciers which abound and reflect beautiful colors.

5. JUNGFRAU (*yung' frau*), "virgin," is one of the Bernese Alps, Switzerland, thirteen miles from Interlaken. It is so named from the pure whiteness of its snowclad peak. A wonderful mountain railway now reaches to the summit, most of the line being through tunnels. Jungfrau is 13,670 feet high.

6. MOUNT ELBURZ is one of the loftiest and most impressive of all the Caucasian mountains. It is an extinct volcano with two peaks, the western peak 18,470 feet above sea-level, and the other 18,347 feet. It is covered with glaciers, and constitutes a watershed which divides Asia from Europe. The Caucasus gave its name to that great branch of the human race that has ruled the world for many generations.

7. MOUNT SINAI (*si' nâ or -nî*), famous as the sacred mountain on which Moses received the Ten Commandments, is an individual peak in a vast rocky mass that almost fills the peninsula of Sinai between the Gulf of Suez and Gulf of Akaba. It is named from *Sin*, the Babylonian moon-god. At its foot, in a ravine, is the monastery of St. Catherine, founded by the Emperor Justinian; a short distance from it the Chapel of St. Elias (Elijah); while on its summit is a little pilgrim church. Its height is 8,593 feet.

8. PIKE'S PEAK. This famous mountain is six miles from Colorado Springs, Colorado, and may be ascended by a cog railway. It is one of the best-known summits of the Rocky Mountains, and rears its snowy crest to a height of 14,134 feet. On its top is one of the highest weather stations in the world. The view from the observatory is superb, embracing thousands of square miles of mountain and plain.

9. MOUNT ST. ELIAS, on the Alaskan side of the Canadian frontier, was long considered the highest peak in North America. It is a volcanic mountain, stands in a wild, inaccessible region, and is clothed almost from base to summit with eternal snow. Besides, there are huge glaciers, impassable precipices and yawning chasms. Its height is 18,020 feet. It was ascended by the Duke of the Abruzzi in 1897.

10. MOUNT ASSINIBOINE (*as-sin' i-boin*) is frequently called the "Matterhorn of the Canadian Rockies". It is 11,860 feet in height, and is located near the boundary of British Columbia and Alberta, about twenty miles south of Banff, in one of the most beautiful scenic regions in America. In the immediate vicinity there are geysers, caves, waterfalls, numerous lakes, natural bridges, and glaciers.

11. MOUNT POPOCATEPETL (*pô-pô-kâ-tâ-pet' l*) is one of the giant volcanic peaks standing guard over Mexico City. Its summit is perpetually covered with snow, but it may be ascended from Popo Park, the terminal of the railway which climbs its slope, to a height of 8,000 feet. The peak itself is 17,887 feet, at the apex of which is a huge crater sheathed with ice, from which clouds of vapor are continually ascending. No great eruption, however, has taken place since 1540. The most imposing spectacle of all from the summit is the remarkable formation of clouds below.

12. MOUNT SALCANTAY, one of the most beautiful peaks of the Andes, in Peru, is 21,000 feet in height. Its grandeur is enhanced by the presence of glaciers and the enveloping clouds. It rises to a sharp point with its sides covered with snow and ice, and lifts its head magnificently thousands of feet higher than the surrounding mountains. It has been recently explored by the Yale University expedition.

13. MOUNT ROBSON, the highest point in the Canadian Rockies, reaches an elevation of 13,700 feet. It is on the border between Alberta and British Columbia, one of the remarkable "show places" of the Canadian Rockies. All around it is the finest of scenery—huge mountains, snow-crested peaks, rushing rivers that swirl and foam, mysterious canyons and earth-strewn boulders.

14. MOUNT RAINIER (*râ' ner*) an isolated mountain of the Cascade Range, forty miles southeast of Tacoma, Washington, is an extinct volcano, 15,529 feet in height. There are still two craters at the summit which give off heat and sulphurous fumes. Thick forests cover the lower region of the mountain, while higher up there are fourteen glaciers. It is difficult of ascent, though frequently made. A bridle path leads to a point over 7,000 feet in elevation from which a magnificent view of several of the glaciers may be had.

MOUNT ARARAT, famed as the mountain where Noah's ark landed after the flood, as recorded in Genesis, is in the Turkish province of Armenia. Ararat is really a twin mountain, the two peaks of which are about seven miles apart, with an elevation of about 17,000 and 13,000 feet, respectively. They rise above a beautiful alluvial plain, and quite naturally the higher peak—Great Ararat—is the one made historically immortal as the motherland of the human race. From their isolation and bareness the two peaks are very impressive, and it is little wonder that Armenia regards these mountain tops as a crown of glory and all other lands as her daughters. Within her borders, too, she gives rise to the beautiful rivers Euphrates, Tigris, Pison, Araxes, and many others. The first modern ascent of the mountain was made in 1829, though often since.

REMARKABLE CANONS OF THE ROCKY MOUNTAIN PLATEAUS

Wonderful examples of valleys by erosion occur in the plateaus adjacent to the Rocky Mountains. The Grand Canon of the Colorado, three hundred miles long, has a depth of from three thousand to six thousand feet below the surrounding country. The sides of this tremendous gorge, which are nearly or quite precipitous, exhibit the successive geological strata down to the oldest rocks. A similar formation exists in the upper course of the Yellowstone, one of the main tributaries of the Missouri, and to a less extent in all the streams flowing through the high barren plateaus.

Valleys descending the slopes of mountains are formed in the same manner. The gathering drops make the rill, and the rill its little furrow; rills combine into rivulets, and rivulets make a gully down the hill-side; rivulets unite to form torrents, and these work with accumulating force, and excavate deep gorges in the declivities. Other torrents form in the same manner about the mountain ridge, and pursue the same work of erosion until the slopes are a series of valleys and ridges, and the summit a bold crest overlooking the eroding waters. The larger part of the valleys of the world are formed entirely by running water.

ISLANDS OF THE WORLD

CONTINENTAL AND OCEANIC ISLANDS

The multitude of small and apparently fragmentary bodies of land, called islands, form only about one-seventeenth part of the entire land surface of the globe.

Continental islands are situated in the immediate vicinity of the continents, and form properly a part of the continental structure. They have the same kinds of rocks and mountain forms, and the same varieties of plants and large animals, which are found on the neighboring coasts of the mainland.

The size of this class of islands varies extremely. Some are mere isolated rocks, while others occupy large areas, like the British Isles, Japan Islands and Madagascar; or, more extensive still, Papua and Borneo, each of which has an area exceeding two hundred thousand square miles.

The distinctive character of Oceanic islands is that they lie at a distance from the continents, in the midst of the ocean basins. They are always small, and, though sometimes forming lines, or bands, they more frequently occur in groups.

The rocks which make up the body of the continents and continental islands—sandstone, slate, granite, and the various metamorphic rocks—are entirely wanting in oceanic islands. The latter are composed either of volcanic substances, or of limestone. Hence they present much less variety in relief forms than the continental islands.

FORMS OF VOLCANIC ISLANDS

The islands of volcanic origin are more or less circular in outline; are usually considerably elevated, with rapid slopes; and are of moderate size. Sometimes two or more volcanoes, clustered together, form a single island of larger size and more irregular outline.

Occasional islands rise but little above the surface of the sea, their craters being filled by sea water. Many, however, rise to Alpine heights—like the peaks of Hawaii, in the Hawaiian Islands, nearly fourteen thousand feet in elevation; Pico de Teyde, in the Canaries, fourteen thousand feet; and Tahiti, in the Society Islands, over seven thousand feet above the level of the sea.

WONDERFUL STRUCTURE OF CORAL ISLANDS

Coral islands are among the most striking phenomena of the tropical seas. Whitsunday Island in the midst of the Pacific is an excellent example. Rising but a few feet above the surface of the ocean, it forms a narrow, unbroken, nearly circular ring, surrounding a central lagoon of quiet water. When first seen, it presents the aspects of an angry surf breaking on a white beach of coral sand, in strong contrast with the deep blue color of the sea. Behind this a garland of luxuriant vegetation, whose tropical beauty, enhanced by the noble cocoa-palm encircles the quiet waters of the lagoon, while all around spreads the broad blue sea.

TWO OF THE GREATEST MARVELS OF LAND AND SEA

THE GRAND CANYON OF THE COLORADO RIVER, ARIZONA

This greatest of nature's gorges is more than twelve miles across, a mile deep, and extends over two hundred miles in length. This whole vast space has been sculptured by the wear of the river through countless centuries. Its unparalleled magnitude, its architectural forms and suggestions, and its wealth of color effects create a picture that is grand beyond description.

THE BARRIER CORAL REEF OF AUSTRALIA

This vast reef of coral islands was built by a colony of coral insects, or polyps, as innumerable as the stars of the Milky Way. It rose from the floor of the ocean, builded out of myriads upon myriads of the dead skeletons of these marvellous insects.

COMBINATION OF VOLCANIC AND CORAL ISLANDS

A large number of volcanic islands in the Pacific are encircled by coral reefs, which, when near the shore, are called fringing reefs. When at a considerable distance, leaving a lagoon of quiet water between them and the volcanic island, they are termed barrier reefs.

CORAL REEFS AND THEIR BUILDERS

Coral reefs are masses of limestone originally secreted, in the form of coral, by minute polyps which live in countless numbers in the tropical seas. The coral produced by a single community of polyps grows chiefly upward; but multitudes of distinct communities often live so near together that the small lateral growth of each brings them into contact.

Their separate, fragile structures, gradually broken up and compacted by various means, are in time transformed into a solid mass, forming walls of coral rock frequently of enormous extent. The great barrier reef near the northeastern shores of Australia, the longest known, is not less than one thousand two hundred and fifty miles in length.

[60]

A LIVING SINGLE CORAL FROM THE PACIFIC OCEAN

The coral polyp is one of the master-builders of the world. It may be likened to a sea-anemone, but is inferior in muscular organization, and immensely superior in defensive organization.

Reef-building polyps do not live below the depth of one hundred or one hundred and twenty feet, and hence require a foundation near the surface. This is supplied by submarine mountains and plateaus, or the slopes of those volcanic cones which form the high islands.

Growing vertically, the reefs repeat at the surface the outlines of their bases, which fact gives rise to the circular figure both of atolls and reefs in mid-ocean, and to the elongated, wall-like form of reefs adjacent to the continents, like those of Florida and of Australia.

DISTRIBUTION OF CORALS

Reef-building polyps are confined to the tropical seas, where the winter temperature is not below sixty-eight degrees. Coral formations are most extensive in the Pacific Ocean, especially south of the Equator, and in the two great archipelagoes of the East and West Indies; but a large number of coral islands also occur in the Indian Ocean. The Coral Sea, east of northern Australia, is particularly remarkable for the great extent of its coral reefs.

THE ATOLL FORM OF ISLAND

The usual form of coral islands is that of a broken ring, numerous channels affording entrance into the lagoon. Such a group of islands is called an atoll, a Malay term, which has been adopted to designate these singular structures. The central lagoon enclosed by an atoll, is invariably shallow, seldom exceeding a few scores, or at most hundreds, of feet in depth; while the outer sea reaches a depth of thousands of feet at a short distance from the shore, showing that the atoll rests upon a submarine mountain.

Atolls are often clustered together in large numbers, forming extensive archipelagoes. Paumotu, or Low Archipelago, numbers eighty coral islands, nearly all of which are atolls; the Caroline, Gilbert and Marshall islands together contain eighty-four atolls, while the Laccadive and Maldive islands form two long double series of atolls extending eight hundred miles from north to south.

VOLCANOES, GEYSERS AND EARTHQUAKES

THE REMARKABLE SUBMARINE VOLCANO OF SANTORIN (*Sân-to-ré 'n*)
 In this little Bay of Santorin, enclosed by an island of the same name in the Grecian Archipelago, occurred probably the most remarkable volcanic exhibition known. During an eruption in 1866 flames issued from the sea rising sometimes to a height of twenty-five feet, and a dense column of white smoke mounted to an immense height. Within a few days a new island appeared which gradually became united to the present Santorin.

CAUSE, STRUCTURE AND LOCATION OF VOLCANOES

The primary cause of volcanoes, as of geysers, earthquakes and other similar phenomena of nature, is the intensely heated condition of the earth's interior. It is the same force that has produced the irregular features of the earth's surface—its mighty mountain chains, the sunken basins of the oceans, and its hills, valleys and gorges. Quite logically, volcanoes are most numerous and most intense along the deep mountain fissures which establish a ready communication between the interior and the surface of the earth. Consequently the significant facts about them are: (1) Nearly all volcanoes are either along the highest border of the continents, or in the great central zone of fracture; (2) most of the volcanic groups exhibit a linear arrangement; (3) the agent at work in these mighty engines is mainly vapor of water, or steam power.

WHAT VOLCANOES ARE AND HOW THEY ACT

The form of typical volcanic mountain is that of a cone, with a circular basin or depression, called a crater, at its summit. In the center of the crater is the mouth of a perpendicular shaft or chimney, which emits clouds of hot vapor and gases; and in periods of greater activity, ejects ashes, fragments of heated rock, and streams of fiery lava.

Volcanic ashes, when examined under a microscope, are found to be simply pulverized lava, frequently in minute crystals, and bear no resemblance to ashes in the ordinary sense of the term.

The lava stream, when flowing white hot from the crater, is not unlike a jet of melted iron escaping from a furnace, and moves at first with considerable rapidity. It soon cools on the surface, and becomes covered with a hard, black, porous crust, while the interior remains melted and continues to flow. If the stream is thick, the lava may be found still warm after ten or even twenty years.

The amount of matter ejected by volcanoes is very great. The whole island of Hawaii, the largest of the Hawaiian Islands, seems to be only an accumulation of lava thrown out by its four craters. All high oceanic islands are of the same character. Iceland, with an area of forty thousand square miles, is a vast table-land from three thousand to five thousand feet in elevation, composed of volcanic rock similar to the lavas still ejected by its numerous volcanoes.

VESUVIUS THE MOST REMARKABLE VOLCANO

Nearly all active volcanoes have intervals of comparative repose, interrupted by periods of increased activity, which terminate in a violent ejection of

matter from the interior, during which the volcano is said to be in a state of eruption.

The phenomena which characterize these differing phases of volcanic activity may be best made clear by describing them as actually observed in Vesuvius, one of the most carefully studied and most active volcanoes of modern times.

Vesuvius is a solitary mountain rising to the height of nearly 4,000 feet, from the midst of a highly cultivated plain which borders upon the shores of the Bay of Naples. Though the mountain has a regular conical form, two summits, very nearly equal in height, are visible from Naples—Monte Somma on the north, and Vesuvius proper on the south.

The eruption begins generally with a tremendous explosion which seems to shake the mountain to its very foundations, and hurls into the air dense clouds of vapor and ashes. Other explosions succeed rapidly, and with increasing violence, each sending up a white, globular cloud of steam, or aqueous vapor. This long array of clouds, accompanied by dark ashes, volcanic sand, and fragments of red-hot lava of all sizes, soon forms a stupendous column.

Finally the boiling lava overflows the rim of the crater, and descends in fiery torrents down the slopes; or, bursting the mountain by its weight, finds a vent through some fissure far below the summit. After the expulsion of the lava the eruption is generally near its end, though it does not necessarily terminate at once. Alternate phases of outbursting steam, ashes, and lava may continue with more or less violence for weeks or even months.

The sudden condensation of the enormous accumulation of hot vapor thrown into the air by the eruption, gives rise to striking atmospheric phenomena. Vivid flashes of lightning start from all parts of the column, and play about the clouds above; and often a local thunderstorm, formed in the midst of a clear sky, pours a heavy rain of warm water and ashes upon the slopes of the mountain. The hot, destructive mud torrents, created by these rains, have often been mistaken for lava streams.

The majesty of the spectacle is still greater at night. Though flames of burning gases are of rare occurrence, the clouds and columns of vapor are strongly illuminated by the reflection of the white-hot lava within the crater; and fragments of this lava constantly thrown into the air give the column all the brilliancy of a gigantic piece of fire-work. The sky itself, far and wide, partakes of the same vivid coloring, and the whole scene resembles a vast conflagration.

SIZE AND DISTRIBUTION OF VOLCANOES

In size they vary from mere mounds a few yards in diameter, such as the salses or mud-volcanoes near the Caspian, to Etna, 9,652 feet high, with a base thirty miles in diameter; Cotopaxi, in the Andes, 18,880 feet high; or Mauna Loa, in the Sandwich Isles, 13,600 feet high, with a base seventy miles in diameter and two craters, one of which, Kilauea, is the largest active crater in our earth, being seven miles in circuit.

Two great terrestrial zones include nearly all the known volcanoes of the globe, arranged in long bands or series, or in isolated groups.

FIRST ZONE. This includes the vast array of mountain chains, peninsulas, and bands of islands which encircle the Pacific Ocean with a belt of burning mountains. Within it occur, in the New World: (1) the Andes mountains, with three of the most remarkable series of volcanoes—those of Chili, Bolivia, and Ecuador—separated by hundreds of miles; (2) the volcanic group of Central America; (3) the series of Mexico; (4) the series of the Sierra Nevada and Cascade mountains; (5) the group of Alaska; and (6) the long series of the Aleutian Islands.

In the Old World are: (1) the series of Kamchatka and the Kurile Islands; (2) the group of Japan; (3) the series south of Japan, including Formosa, the Philippine and the Molucca Islands; and (4) the Australian series, including New Guinea, New Britain, New Hebrides, and New Zealand. In this vast zone there are not less than four hundred volcanoes, one hundred and seventy of which are still active.

SECOND ZONE. This contains the belt of broken lands and inland seas, which extending round the globe, separates the northern from the southern continents, and intersects the first zone, in the equatorial regions, nearly at right angles.

In it are: (1) the volcanic regions of Central America and Mexico, and the series of the Lesser Antilles; (2) the groups of the Azores and Canary islands (3) the Mediterranean islands and peninsulas, including all the active volcanoes of Europe; (4) Asia Minor with numerous extinct volcanoes; (5) the shores of the Red Sea and Persian Gulf, and the two Indias, rich in traces of volcanic action; (6) the East Indian Archipelago with hundreds of burning mountains; and (7) the Friendly Islands and other volcanic groups of the central Pacific.

In this zone there are no less than one hundred and sixty volcanoes, so that the two volcanic zones together contain five hundred and sixty, or five-sixths of all known.

ISOLATED VOLCANOES. The volcanoes not included in these two great zones are isolated, in the midst of the oceans, or in the broken polar lands. The most noted are the Hawaiian Island group, in the Pacific; Bourbon and Mauritius, in the Indian Ocean; Cape Verde Islands, Ascension, St. Helena, and Tristan da Cunha, in the Atlantic; Iceland and Jan Mayen, in the Arctic Ocean; and Erebus and Terror, in Antarctic.

EARTHQUAKES

Earthquakes are movements of the earth's crust, varying in intensity from a slight tremor or shaking of the ground to the most violent convulsions causing enormous destruction over wide areas.

KINDS OF MOTION OBSERVED IN EARTHQUAKES

The wave-like or undulatory motion is most common and least destructive. It appears to be the normal one, and it is possible that the others may be simply the result of various systems of waves intersecting one another. The waves either advance in one direction, like waves of the sea, or spread from a central point, like ripples produced by dropping a pebble into still water.

The earthquakes of the Andes are chiefly linear, being propagated along the mountains, with the undulations perpendicular to the direction of the ranges. The destructive earthquake at Lisbon, was a central one, the concentric waves gradually diminishing in intensity with increasing distance from the place of origin.

The vertical motion acts from beneath like the explosion of a mine, and when violent nothing can resist its force. The earthquake at Calcutta, in September, 1828, owed its great destructiveness to the fact that the main shock was vertical; and one in Murcia, Spain, in 1829, destroyed or injured more than three thousand five hundred houses.

The rotary or whirling motion is the most dangerous, but happily the rarest of all. In the great earthquake of Jamaica, in 1692, the surface of the ground was so disturbed that fields changed places, or were found twisted into each other.

EARTHQUAKE SHOCKS AND SOUNDS

Probably no part of the earth's surface is entirely free from vibration, but, fortunately, destructive earthquakes are confined to comparatively limited regions. In most cases each shock lasts only a few seconds, but the tremblings that follow may be continued for days, weeks, or even months. Noises of sundry kinds usually precede, accompany, or succeed an earthquake. Some earthquakes, however, are not attended by any subterranean sounds. This has been the case with some of the most destructive South American disturbances. Thus at the time of the terrible shock which destroyed Riobamba in Ecuador in 1797, a complete silence reigned. On the other hand, subterranean sounds may be heard without any earth-tremor being perceived.

The sound which accompanies many earthquakes is due to the transmission to the air of vibrations in the soil. To produce sound-waves in the air, the ground must vibrate like a drumhead. Hence no sound will be heard when the oscillations are horizontal.

The velocity of propagation of an earthquake is very variable. Thus in the case of the earthquake of Lisbon in 1755, it seems to have considerably exceeded one thousand feet per second, while in the Lisbon earthquake of 1761 the rate was three times greater. At Tokio, in 1881, the velocity, as estimated by Professor Milne, varied between four thousand feet and nine thousand feet per second.

DEPTH OF EARTHQUAKES. Various attempts have been made to estimate the depth at which earthquakes originate. Mallet was of opinion that the centrum of the Neapolitan earthquake of 1857 was probably five and one-half miles from the surface. The same eminent physicist thought that an earthquake

centrum probably never exceeded a depth of thirty geographical miles. According to Professor Milne, the angles of emergence of the earth-waves obtained during the Yokohama earthquake of 1880 showed that the depth of origin of that earthquake might be between one and one-half and five miles; and he gives a table, compiled from the writings of various observers, which exhibits the mean depths at which certain earthquakes have originated. These estimated depths range from 17,260 feet to 127,309 feet.

The area disturbed by an earthquake is generally proportionate to the intensity of the shock. The great earthquake of Lisbon disturbed an area four times as great as the whole of Europe. In the form of tremors and pulsations, Mr. Milne remarks, it may have shaken the whole globe.

In a violent submarine earthquake the ordinary earth-wave and sound-wave are accompanied by sea-waves. These waves may be twenty, sixty or even eighty feet higher than the highest tide, and are usually more dreaded than the earthquake shock itself in such regions as the maritime districts of South America. The greatest sea-wave on record is that which in 1737, is said to have broken near Cape Lopatka, at the south end of Kamchatka, two hundred and ten feet in height.

NOTABLY DESTRUCTIVE EARTHQUAKES

79. One accompanied by the eruption of Vesuvius; the cities of Pompeii and Herculaneum buried.
742. Awful one in Syria, Palestine, and Asia; more than 500 towns were destroyed and the loss of life surpassed all calculations.
936. Constantinople overturned; all Greece shaken.
1137. Catania, in Sicily, overturned, and 15,000 persons buried in the ruins.
1186. At Calabria; one of its cities and all its inhabitants overwhelmed in the Adriatic Sea.
1456. At Naples, 40,000 persons perished.
1537. At Lisbon; 1,500 houses and 30,000 persons buried in the ruins; several neighboring towns engulfed with their inhabitants.
1596. In Japan; several cities made ruins, and thousands perished.
1662. One in China, when 300,000 persons were buried in Pekin alone.
1693. One in Sicily, which overturned fifty-four cities and towns, and 300 villages. Of Catania and its 18,000 inhabitants not a trace remained; more than 100,000 lives were lost.
1726. Palermo nearly destroyed; 6,000 lives lost.
1731. Again in China; and 100,000 people swallowed up at Pekin.
1746. Lima and Callao demolished; 18,000 persons buried in the ruins.
1754. At Grand Cairo; half of the houses and 40,000 persons swallowed up.
1755. Quito destroyed.
1755. Great earthquake at Lisbon. In about eight minutes most of the houses and upward of 50,000 inhabitants were swallowed up, and whole streets buried. The cities of Coimbra, Oporto, and Braga suffered dreadfully, and St. Ubes was wholly overturned. In Spain, a large part of Malaga became ruins. One-half of Fez, in Morocco, was destroyed, and more than 12,000 Arabs perished there. About half of the Island of Madeira became waste; and 2,000 houses in the Island of Mytilene, in the Archipelago, were overthrown. This awful earthquake extended 5,000 miles; even to Scotland.
1759. In Syria, extended over 10,000 square miles; Baalbec destroyed.
1783. Messina and other towns in Italy and Sicily overthrown; 40,000 persons perished.
1797. The whole country between Santa Fe and Panama destroyed, including Cusco and Quito, 40,000 people buried.
1840. Awful and destructive earthquake at Mount Ararat, in one of the districts of Armenia; 3,137 houses were overthrown, and several hundred persons perished.
1842. At Cape Haytien, St. Domingo, which destroyed nearly two-thirds of the town; between 4,000 and 5,000 lives were lost.
1851. In South Italy; Melfi almost laid in ruins; 14,000 lives lost.
1852. At Philippine Isles; Manila nearly destroyed.
1853. Thebes, in Greece, nearly destroyed.
1854. St. Salvador, South America, destroyed.
1854. Amasca, in Japan, and Simoda, in Nippon, destroyed; Jeddo much injured.
1855. Broussa, in Turkey, nearly destroyed.
1857. In Calabria, Montemurro and many other towns destroyed, and about 22,000 lives lost in a few seconds.
1858. Corinth nearly destroyed.
1859. At Quito; about 5,000 persons killed, and an immense amount of property destroyed.
1868. Cities of Arequipa, Iquique, Tacna, and Chincha, and many small towns in Peru and Ecuador destroyed; about 25,000 perished.
1883. Krakatoa island, between Sumatra and Java, East Indies, was the scene of a series of volcanic discharges in May to August, 1883, constituting the most tremendous eruption known to history. A cubic mile of rock material was hurled into the air, and the explosions were heard 150 miles away. Violent atmospheric disturbances and gigantic sea-waves, the latter causing great loss of life, estimated at more than 30,000. As a result of the explosion, the north part of the island, including its highest peak, altogether disappeared.
1886. Shocks throughout eastern United States; at Charleston, S. C. 41 lives and \$5,000,000 worth of property lost.
1893. Islands of Zante and Stromboli, the former west of Greece, the latter one of the Lipari group, west of Calabria, Italy, severely shaken. Great loss of lives and property at Zante.
1906. Severe shocks in California wrecked San Francisco and adjacent towns, and caused the greatest fire in history, lasting two days. Great loss of life, and \$300,000,000 of property destroyed; over 300,000 homeless. Stanford University buildings were damaged to the extent of \$2,800,000, including the fine Memorial Church.
1906. At Valparaiso, Chile, causing great destruction of life and property.
1907. Large part of Kingston, Jamaica, destroyed.
1909. In Sicily and southern Italy, Messina and many towns and villages desolated. Appalling loss of life; thousands buried alive; the survivors homeless; one of the greatest earthquakes of modern times if not of all time.

GEYSERS

Geysers are eruptive hot springs found chiefly in volcanic districts, but particularly in the Yellowstone Park, Iceland, New Zealand, Tibet and the Azores. At intervals these fountains of hot water and steam sometimes rise to a height of two hundred feet. The eruptions occur at intervals varying from every hour to once a day.

All the geyser waters hold in solution a considerable quantity of silica. The highly heated water decomposes the felspar and other volcanic rocks, and becoming slightly alkaline with the soda or potash these contain, it is enabled to form a silicious solution. The silica taken up is deposited again round the mouth of the orifice. Minute plants termed algæ are known to live in the hot water, and to aid in throwing down the silica from solution to form the sinter deposits.

The cause of the periodical eruptions is probably to be found in the gradual increase of heat with the depth of the tube. In the middle and lower parts the temperature is far above the boiling-point (212° F.) at the ordinary pressure. But at last the lower portion rises to a position where the temperature is above the boiling-point at the pressure it there sustains, and then, flashing into steam, it huris the column above into the air. After playing for a few minutes the water falls back into the basin, and remains quiet for a time.

WONDERFUL GEYSERS OF THE YELLOWSTONE

The geysers of the Yellowstone region are probably the most picturesque and wonderful in the world. On the Firehole River alone there are probably fifty geysers, throwing columns of water to a height of from fifty to two hundred feet, while smaller jets rise occasionally to two hundred and fifty feet. The "Old Faithful" geyser, in this region, throws up a column of water six feet in diameter to a height of one hundred and fifty feet, at intervals of about an hour. Near the north entrance to the National Park, also, are the hot springs of the Gardiner River; here the "White Mountain," built up of terraces of white calcareous deposits, rises to a considerable height, with a diameter of one hundred and fifty yards at the top.

The geysers of Iceland are situated within sight of Mount Hekla and are the hottest springs in Europe. The principal geysers of this region are known as the "Great Geyser" or "Roarer," and the "Stroker" or "Churn."

The geysers of New Zealand attained celebrity chiefly on account of the beautiful terraces associated with them. Unfortunately, volcanic activity manifested itself throughout the region in 1886, resulting in the destruction of the terraces. The basins connected with these geysers, catching the overflow of water, are, like those of Yellowstone region, largely used by bathers, and are much resorted to by invalids.

The three localities mentioned are where geysers attain their highest development; but they also exist in many volcanic regions notably in Japan, South America, and the Malay Archipelago.

HOW THE EVER-MOVING WATERS OF THE EARTH GO ON THEIR MIRACULOUS JOURNEY FOREVER

The circulation of the waters of the earth is just as marvellous as that of the blood in the human body. First, it is drawn up from the sea by the sun and rises as vapor; the cool air condenses it first into cloud and then rain or snow; it runs together, forming springs and waterfalls and rivers; and finally it finds its way to the sea, where again the never-ending journey begins.

THE WATERS OF THE EARTH

THE WATERS UNDER THE EARTH

The underground lake in its magnificent setting of dazzling stone columns and stalactites in the Cheddar Caves, England. All these wonderful natural halls, chasms and snowy incrustations were formed by the age-long action of the water on the limestone rocks through which it filtered.

Water is found in Nature in three states or conditions—as ice, vapor or steam, and as simple water. These three forms have the same chemical composition—the substance being a compound of oxygen and hydrogen, represented by the formula H_2O ; but the physical condition depends entirely on its temperature. Under ordinary atmospheric conditions water is a *solid* below 32 degrees Fahrenheit; a *gas* above 212 degrees Fahrenheit, and a *liquid* between these temperatures.

The purest form of water which exists in nature is rain water, though this always contains a little oxygen and carbon dioxide dissolved from the air. To obtain pure water artificially, any ordinary water is distilled, when all the solids dissolved in it are left behind. River water and spring water always contain a small quantity of solid matter, the amount and nature of the dissolved solids depending on the nature of the rocks over which the water has flowed.

Geographically it may be considered under the four heads of *springs*, *rivers*, *lakes*, and the *ocean*, which taken together forms the *hydrosphere* of the earth.

WHERE SPRINGS HAVE THEIR SOURCE

SPRINGS, or the natural fountains of water, take their rise from reservoirs stored under ground. Water maintains a level, and hence the height to which a spring will rise depends on that of the level from which it is supplied. If the internal reservoir be on a hill, and the spring should gush out in a valley, the water may rise to a considerable height and form a natural fountain; but, on the other hand, if the reservoir be at some depth below the surface, the water may never reach the surface, and mechanical aid may be required to obtain it.

These internal reservoirs are in a great measure supplied by moisture derived from rain, snow, mist, and dew. The atmospheric water enters the earth through porous rocks, or by means of fissures, and continues to sink until arrested in its progress by rocks, such as clay, which will not permit the water to pass, or by faults which check it from spreading. The waters will then gush forth as a spring, of greater or less size, according to the supplies it may have received.

HOW MINERAL SPRINGS ARE FORMED

All springs contain a certain portion of air and gas, and also some solid matter, usually in the form of salts. When these salts are abundant, mineral springs are the result, which may be classified according to the character of their several properties, as acidulous, chalybeate, sulphurous, saline, calcareous, and silicious.

Acidulous or acid springs are those surcharged with carbonic acid gas.

Chalybeate springs are those in which iron, in the form of carbonate or sulphate, is held in solution.

Sulphur, in the form of sulphureted hydrogen or sulphate of lime, is the distinguishing ingredient in Sulphurous springs.

Saline springs are of two kinds—brine and medicinal; brine when containing a greater or less amount of chloride of sodium or common salt, and medicinal when containing other salts, as sulphate of soda, etc.

Calcareous springs are those highly charged with the salts of lime, and which have the property of petrifying substances placed within their reach, and also of depositing their contents, forming the stalactites and stalagmites of caverns, etc.

Silicious springs are so called from holding silica or flint in solution. The last-named are all hot or thermal as well as mineral springs, deriving their heat either from the natural heat of the earth at great depths, or from volcanic action. When occurring near volcanoes, they are frequently charged with bitumen, petroleum, naphtha, asphaltum, etc.

WHY WATER FLOWS FROM ARTESIAN WELLS

An important class of artificial springs or wells is known as Artesian Wells. Where bent pervious beds of rock lie between two bent impervious beds, so as to make a basin-shaped depression, lower in the middle than at the edges, the rain which sinks into the pervious rock where it reaches the surface will begin to gather in the central part of the porous rock as in a reservoir.

If a hole be now bored in the hollow of the upper impervious bed till it reaches the water-bearing stratum, the water will flow out at the top. The water thus obtained may have fallen a distance of many miles several months previously, and if the gathering-ground be high the issue at the well may be forced by the pressure of the water behind to a considerable height.

FORMATION, CHARACTERISTICS AND PECULIARITIES OF RIVERS

Rivers have their sources from springs or from the melting of accumulations of snow. They do not, however, receive their largest supplies from the actual summits of mountains, for copious springs are rarely met with in such situations, nor are glaciers formed on the highest points of mountains, but more usually on slopes of the upper mountain valleys. It is, accordingly, in the latter localities that many of the largest rivers take their rise.

WATERSHED. It not unfrequently happens that several rivers take their rise in one mountain ridge, some flowing in one direction, and others taking an opposite course. Such a ridge is termed a *watershed*. Thus the Rhine, the Rhone, and the Danube all take their rise in the Alps, the first discharging itself into the North Sea, the second into the Mediterranean Sea, and the last into the Black Sea.

BASIN. The portion of country drained by a river and its tributary streams is called its *basin*, from its catching the rains which fall within its circuit, and which the river carries to the sea. The largest river-basin in Europe is that of the Volga, in Asia, that of the Ganges, in Africa that of the Nile, in North America that of the Mississippi, and in South America that of the Amazon.

THE GREAT RIVERS OF THE WORLD

RIVER	Length in Miles	Emptying Into	Area of Drainage in Square Miles, etc.
Mississippi-Missouri (United States)	4,330	Gulf of Mexico	1,245,000
Nile (Egypt)	3,500	Mediterranean	1,050,000
Amazon (Brazil): the only large river with direct latitudinal course	3,300	At Ocean on the Equator	2,700,000
Yangtze-Kiang (China)	3,000	Yellow Sea	548,000
Congo (Central Africa)	2,900	Atlantic Ocean	1,430,000
Lena (Russia in Asia)	2,800	Arctic Ocean	856,000
Amur (Russia in Asia)	2,800	Gulf of Saghalin	772,000
Mekong (Indo-China)	2,800	China Sea	Nav. 200 miles
Yenisei (Russia in Asia)	2,700	Bay of Yenisei	1,000,000
Niger (West Africa)	2,600	Atlantic Ocean	808,000
Hoangho (China)	2,500	Gulf of Pe-Chi-Li	376,400
Obi (Russia in Asia)	2,300	Gulf of Obi	1,125,000
Plata-Parana (Argentina and Brazil)	2,300	Atlantic Ocean	2,300,000
Mackenzie (Canada)	2,300	Arctic Ocean	676,000
Volga (Russia in Europe)	2,200	Caspian Sea	560,000
St. Lawrence (United States and Canada)	2,200	Gulf of St. Lawrence	500,000
Yukon (Alaska)	2,200	Behring Sea	500,000
Indus (India)	2,000	Arabian Sea	373,000
Sao Francisco (Brazil)	1,800	Atlantic Ocean	249,000
Sir Daria (Turkestan)	1,800	Sea of Aral	175,000
Brahmaputra or Burrampooter (India)	1,800	Bay of Bengal	Nav. 800 miles
Rio Grande del Norte (U. S. and Mexico)	1,800	Gulf of Mexico	240,000
Danube (Austria-Hungary)	1,780	Black Sea	311,000
Saskatchewan-Nelson (Canada)	1,732	Hudson Bay	730,000
Euphrates (Turkey in Asia)	1,700	Persian Gulf	260,000
Zambesi (East Africa)	1,600	Indian Ocean	800,000
Ural (Russia in Europe)	1,500	Caspian Sea	85,000
Arkansas (United States)	1,500	Mississippi River	181,000
Orinoco (Colombia and Venezuela)	1,500	Atlantic Ocean	364,000
Ganges (India)	1,500	Bay of Bengal	409,000
Amu (Turkestan)	1,400	Sea of Aral	174,000
Columbia (United States)	1,400	Pacific Ocean	260,000
Dnieper (Russia in Europe)	1,400	Black Sea	203,000
Murray (Australia)	1,400	Indian Ocean	351,000

Don (Russia in Europe)	1,300	Sea of Azov	166,000
Orange (S. W. Africa)	1,200	Atlantic Ocean	370,000
Irawaddy (East India)	1,200	Indian Ocean	Nav. 800 miles
Colorado (United States)	1,100	Gulf of California	250,000
Senegal (West Africa)	1,100	Atlantic Ocean	270,000
Tigris (Turkey in Asia)	1,000	Euphrates and Persian Gulf	Nav. generally for small boats
Ohio (United States)	970	Mississippi River	201,000
Churchill (Canada)	900	Hudson Bay	Nav. by canoes
Magdalena (Colombia)	840	Caribbean Sea	Nav. 600 miles
Rhine (Germany)	800	North Sea	76,000
Cambia (West Africa)	750	Atlantic Ocean	Nav. 300 miles
Elbe (Germany)	720	North Sea	57,000
Fraser (British Columbia)	650	Gulf of Georgia	Nav. generally for small boats
Vistula (Germany, Poland)	600	Baltic Sea	120,000
Sacramento (United States)	600	Pacific Ocean	Nav. 300 miles
Tagus (Portugal)	570	Atlantic Ocean	32,000
Paranahiba (Brazil)	530	Atlantic Ocean	Nav. 400 miles
Guadiana (Spain)	510	Mediterranean Sea	32,000
Rhone (France)	500	Gulf of Lyons	38,000
Seine (France)	480	English Channel	30,000
Ebro (Spain)	470	Mediterranean Sea	32,000
Susquehanna (United States)	450	Chesapeake Bay	Not navigable
Potomac (United States)	450	Chesapeake Bay	Nav. to Washington, D. C.
Oder (Germany)	440	Baltic Sea	43,000
Po (Italy)	420	Adriatic Sea	29,000
Garonne (France)	380	Bay of Biscay	33,000
Hudson (United States)	350	New York Bay	Nav. to Troy; 150 miles
Loire (France)	200	Bay of Biscay	25,000
Thames (England)	200	North Sea	5,250

DELTA AND ESTUARIES. Owing to local peculiarities at the mouths of rivers, accumulations of sedimentary matter take place in the middle of the stream, dividing it into two or more branches. By these depositions *deltas* (so called from the Greek letter (Δ) delta) are formed—many of them, as those of the Mississippi and Orinoco and of the Rhine and the Ganges, being of great extent. Some rivers fall into the ocean through *estuaries* or wide channels, and are subject to a great swell or sudden rise of the waters when the tide enters.

PICTURE DIAGRAM GIVING A COMPARATIVE VIEW OF THE WORLD'S FAMOUS RIVERS AND MOUNTAINS

FIRST: Showing the comparative length of the rivers; where and how they take their rise; where and how they empty; their chief branches and connected lakes; and the principal cities located on their banks.

SECOND: Comparative height of mountains, arranged in groups by continents, showing the relative height of both mountains and continents. See next page for LOCATION and HEIGHT IN FEET of the various mountain peaks.

Large illustrations:
 Rivers (left-hand side) (480 kB)
 Rivers (right-hand side) (137 kB)
 Mountains (left-hand side) (187 kB)
 Mountains (right-hand side) (554 kB)

Most rivers are subject to an occasional, and in some instances to a periodical increase of volume. These seasons of flood are by no means regular, being partly dependent on the melting of the snows, and partly on occasional heavy falls of rain; and hence depend on the climatic variations of the country in which rivers originate.

FAMOUS MOUNTAIN AND OTHER ELEVATIONS OF THE WORLD

NOTE: The numbers refer back to the Picture Diagrams on the preceding page.

FRESHWATER AND SALT LAKES

Lakes are of different kinds. Some are mere tanks which receive the first outpourings of springs, others consist of basins or reservoirs which occur in the line of a river's course; some consist of basins or cavities, into which rivers flow, but which, on account of their depression or their mountainous cincture have no outlets; lakes are also formed in the craters of extinct volcanoes; and some lakes are periodic, or subject to have their basins alternately empty and full of water.

MOUNTAIN LAKES, which are valleys or chasms filled by streams, are long and narrow, rarely of extensive area, but often of great depth. Examples of this class are found in Lakes Champlain and George, among the Appalachian Mountains; Lakes Constance and Geneva, on the northern side of the Alps; and Lake Maggiore and Lake Como, on the south side; all of which are renowned for the loveliness of their shores, or the grandeur of the surrounding mountain scenery.

Lake Maggiore, which is hardly three miles wide, is, according to Italian engineers, 2,623 feet deep—more than double the depth of Lake Superior—its basin reaching 1,936 feet below the sea level.

The forms of mountain lakes are very irregular, for the water often covers several contiguous and connected valleys. This is the case in Lake Como, which has two long arms; and Lakes Lucerne and Lugano, each of which fills four distinct valleys, meeting one another nearly at right angles.

LAKES IN PLAINS. The lake basins in plains and plateaus are, usually, simple depressions in a comparatively uniform surface. The lakes are, therefore, often of great size, broad in proportion to their length, but of little depth compared with their area.

The largest lakes of the globe—the Caspian and Aral seas, and the great North American and African lakes—and the largest in Europe and South America, all belong to this class. Their vast expanse, together with the tameness of their shores, deprives them of the picturesque beauty of mountain lakes.

CHARACTERISTICS OF SALT LAKES. Numerous lakes in the interior of the continents, though receiving affluents, have no outlet. Their waters are chiefly lost by evaporation, though some portion may be absorbed by the sandy soil.

The surfaces of the continents having been the beds of the primeval oceans, the presence of salt in the soil is a natural consequence. FAMOUS SALT LAKES. The Great Salt Lake of Utah, in the Great American Basin, is one of the finest examples of its class. The Caspian and Aral seas, at the bottom of the vast depression between Europe and Asia, are the most extensive salt lakes. The former has about four times the area of Lake Superior; and the latter is a little larger than Lake Michigan.

The Caspian, though receiving the Volga, the largest river of Europe, evaporates so much water that its surface is about 83 feet lower than that of the Mediterranean, varying with the seasons. Many lakes in its neighborhood disappear entirely in the heat and drought of summer, leaving their beds covered with a crust of pure white crystalline salt.

THE REMARKABLE DEAD SEA, in Syria, is a lake in which the salt has accumulated until the water is converted into a heavy brine. It may be the remnant of an ancient sea of much greater extent, which has been gradually reduced in size by the excess of evaporation over the supply of water in its basin.

This celebrated body of water lies in the deepest part of a long chasm or valley, which is sunk not less than 4,000 feet below the level of the surrounding country. The surface of the lake is 1,286 feet, and its bottom 2,500 feet, below the level of the Mediterranean.

Its feeder, the river Jordan, flows almost throughout its entire course below the level of the sea, the only known instance of the kind. The beautiful lake of Tiberias, the scene of so many of the miracles of Jesus, which is but an expansion of the Jordan in its upper course, is about 650 feet below the surface of the Mediterranean.

HOW THE LAKES ARE DISTRIBUTED OVER THE GLOBE

Lakes are most numerous in the central and northern portions of Asia, Europe and North America. The southern continents, except Africa, have comparatively few.

ASIA is pre-eminently the continent of salt lakes. They occur in countless numbers, both in the steppes north of the Caspian and Aral, and in all the interior plateaus. Lakes of fresh water are also found among the Altai Mountains and adjacent chains. Lake Baikal, one of these, is the largest mountain lake known, being nearly 500 miles long.

EUROPE. The most characteristic and celebrated lakes are those which adorn the Alps of Switzerland and Scandinavia, and the less lofty mountain chains of the British Isles. But the largest lakes are found in the low lands and slight swells which surround the Baltic Sea, in western Russia and Sweden. Lakes Ladoga and Onega in Russia, and Wener and Wetter in Sweden, are the largest in Europe.

NORTH AMERICA is peculiarly rich in great lakes. No continent presents a more remarkable series than that which stretches from northwest to southeast, through the central plains, along the line of contact of the oldest geological formations of the continent. This series includes Great Bear and Great Slave lakes, Athabasca and Winnipeg, and the five great lakes of the St. Lawrence, with many of less area.

Innumerable small lakes are scattered throughout the middle portions of the central plain, and the northern and less regular part of the Appalachian mountain region; but south of the parallel of Lake Erie there is an almost entire absence of lakes, whether large or small.

Relative Size of Lakes of the Western Hemisphere

PRINCIPAL SALT-WATER LAKES OF THE WORLD

NAME	Location	Area in Square Miles	Mean Elevation in Feet
Black Sea	Asia and Europe	170,000	Sea-level

AFRICA. The great plateau lakes are typical of the continent. The Victoria Nyanza and Albert Nyanza, feeding the White Nile; Tanganyika, whose outlet is unknown; Tzana, at the head of the Blue Nile; and Lake Nyassa, in the Zambezi basin, all rest on the high plateaus of Central Africa. Lake Tchad alone, among large African lakes, is surrounded by low plains.

WATERFALLS AND RAPIDS. The variations in the slope of a river-bed, arising from unequal erosion, or from the original irregularities in the surface, give rise to rapids and falls.

The first occur where an increased slope causes the stream to flow with more than its average velocity. The second are caused by nearly perpendicular rocky walls, down which the foaming water descends in picturesque cascades, or imposing cataracts.

The famous "Cataracts of the Nile" are merely rapids which impede but do not entirely obstruct, the navigation as cataracts must. The so-called Falls of St. Anthony, in the upper Mississippi, and the rapids of the St. Lawrence, above Montreal, are among the finest rapids in American rivers.

The highest falls are in the upper course of rivers, in mountainous regions; the greatest and most imposing, in their middle course.

The Niagara Falls exhibit a most important industrial utilization of water power. The Falls of St. Anthony in the Mississippi, the Falls of Foyers in Scotland, the Rhine falls, the Rhone falls of Bellegarde, and the innumerable waterfalls of Scandinavia, Switzerland, and similar mountainous lands, are all utilized in this way. It has been proposed to convey power generated at the Victoria falls of the Zambezi to the Rand goldfield of the Transvaal, and a scheme for this is now being prepared.

FAMOUS WATER PICTURES OF THE NEW AND OLD WORLD

[81]

Niagara in winter presents a picture of frozen grandeur equaled nowhere else in the world.

The Rhine at Schaffhausen, Switzerland, rushes over rugged rocks on its way down from the highlands into the lovely and historic valley it has carved for itself on its way to the sea.

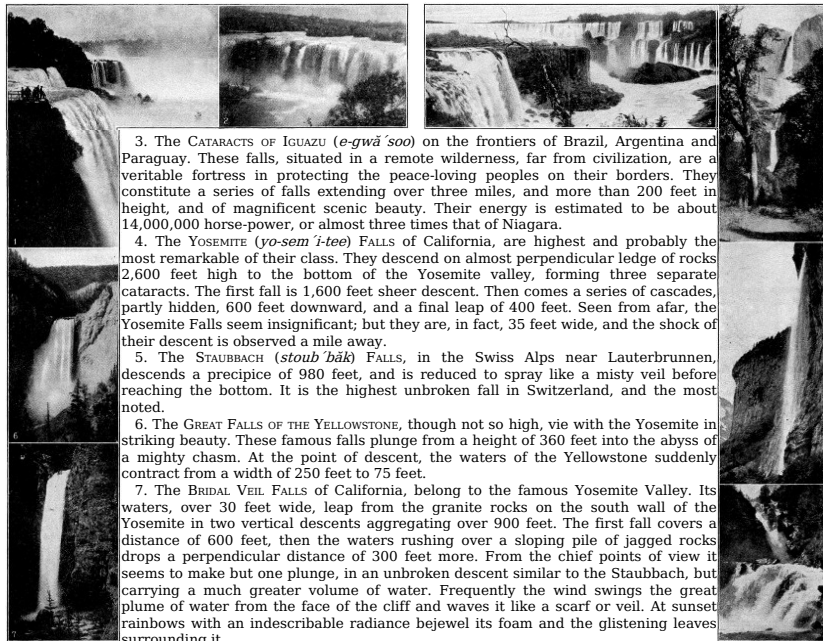

[82-83]

FAR-FAMED WATERFALLS THAT HAVE INSPIRED TRAVELERS AND WRITERS

1. The NIAGARA FALLS and rapids form one of the most impressive spectacles in the world. The Niagara River, which is the sole outlet of the great lakes, pours itself in two vast sheets over a precipice about 160 feet high. Goat Island, which is situated on the lip of the falls, divides the cataract into two sections—the Horseshoe, or Canadian fall, which is by far the more majestic, and the American fall of 167 feet. The volume of water which sweeps over this immense chasm is about 15,000,000 cubic feet per minute. The limestone edge of both falls is wearing away in the center, the Canadian fall now being V-shaped, and the American fall showing the same tendency, although its process of recession has begun more recently. For some distance below the falls there is smooth current, the mass of water which pours over the precipice sinking and only coming to the surface two miles below, where the rapids, more magnificent and wilder than those above the falls, begin, and culminate in the rapids of the Upper Whirlpool. Lower down the river is the whirlpool itself, where a sharp turn sends the waters hurling against the Canadian side; they then sweep round in a gigantic circle before they find a vent at right angle with their former course. The sight of the falls is equally awe-inspiring from the bridge on the lip of the fall, from the boat which plies from shore to shore below the cataract, or from the Cave of the Winds, reached from Goat Island. Although in summer the magnificence of the sight is extraordinary, it is in winter, when the wizardry of the frost is upon it, that it is superlatively beautiful. The falls were first discovered by Father Hennepin in 1678.

2. The FALLS OF JUANACATLAN (*hoo-ä-nä-kwt-län*), Mexico, are located near the island city of Guadalajara (*guä-dä-lä-hä-rä*) on the Rio Grande de Santiago. Though only 70 feet in height they are more than 600 feet wide, and as known as the "Niagara" of Mexico.

3. The CATARACTS OF IGUAZU (*e-gwā 'soo*) on the frontiers of Brazil, Argentina and Paraguay. These falls, situated in a remote wilderness, far from civilization, are a veritable fortress in protecting the peace-loving peoples on their borders. They constitute a series of falls extending over three miles, and more than 200 feet in height, and of magnificent scenic beauty. Their energy is estimated to be about 14,000,000 horse-power, or almost three times that of Niagara.

4. The YOSEMITE (*yo-sem 'i-tee*) FALLS of California, are highest and probably the most remarkable of their class. They descend on almost perpendicular ledge of rocks 2,600 feet high to the bottom of the Yosemite valley, forming three separate cataracts. The first fall is 1,600 feet sheer descent. Then comes a series of cascades, partly hidden, 600 feet downward, and a final leap of 400 feet. Seen from afar, the Yosemite Falls seem insignificant; but they are, in fact, 35 feet wide, and the shock of their descent is observed a mile away.

5. The STAUBBACH (*stoub bāk*) FALLS, in the Swiss Alps near Lauterbrunnen, descends a precipice of 980 feet, and is reduced to spray like a misty veil before reaching the bottom. It is the highest unbroken fall in Switzerland, and the most noted.

6. The GREAT FALLS OF THE YELLOWSTONE, though not so high, vie with the Yosemite in striking beauty. These famous falls plunge from a height of 360 feet into the abyss of a mighty chasm. At the point of descent, the waters of the Yellowstone suddenly contract from a width of 250 feet to 75 feet.

7. The BRIDAL VEIL FALLS of California, belong to the famous Yosemite Valley. Its waters, over 30 feet wide, leap from the granite rocks on the south wall of the Yosemite in two vertical descents aggregating over 900 feet. The first fall covers a distance of 600 feet, then the waters rushing over a sloping pile of jagged rocks drops a perpendicular distance of 300 feet more. From the chief points of view it seems to make but one plunge, in an unbroken descent similar to the Staubbach, but carrying a much greater volume of water. Frequently the wind swings the great plume of water from the face of the cliff and waves it like a scarf or veil. At sunset rainbows with an indescribable radiance bejewel its foam and the glistening leaves surrounding it.

8. The REICHENBACH (*ri 'ken-bāk*) FALLS near Meiningen, Switzerland, comprise five fine cascades in the Reichenbach River. The most gorgeous of these, known as the Upper Fall, makes a huge leap of 300 feet into a deep rocky basin, which then continues in several foaming and plunging cascades in general aspect not unlike the Niagara gorge.

[84]

THE OCEANS OF THE WORLD AND THEIR MYSTERIES

THE LAND AND WATER HEMISPHERES

The Oceans consist of one great fluid mass, and in extent covers three times the area of the dry land. There is also about three times as much land to the north of the equator as there is to the south of it. Though the waters of the ocean surround the land on every side, yet they are broken up into certain areas by the arrangement of the land portions, and to these various parts we give particular names.

The Atlantic Ocean, lying between the western shores of Europe and Africa and the east coast of America.

The Pacific Ocean, lying between the west coast of America and the east coast of Asia.

The Indian Ocean, lying between the south of Asia and the Antarctic circle.

The Arctic Ocean, lying within the Arctic circle.

The Antarctic Ocean, lying within the Antarctic circle.

VAST EXTENT OF THE OCEANS

THE ATLANTIC is the most branching of the oceans, and is especially distinguished by the number and great size of its inland seas. Two of these, the Mediterranean Sea and the Gulf of Mexico, lie in the warm regions; and two, Hudson Bay and the Baltic Sea, in colder latitudes.

The broader seas are represented by the Caribbean Sea, within the tropics and the Gulf of St. Lawrence and the North Sea in temperate latitudes. The Gulf of Guinea, and the Bay of Biscay, are examples of the more shallow coast waters.

THE PACIFIC is particularly rich in vast border seas, a continuous series of which lines the Asiatic and Australian coasts. Among these are the Behring Sea, enclosed by the peninsula of Alaska and the Aleutian Islands; Okhotsk Sea, enclosed by Kamchatka and the Kurile Islands; the Sea of Japan, and the North and South China seas; and the Arafura, Coral, and New Zealand seas, on the Australian Coast.

Only two inland seas of considerable size—the Gulf of California in North America, and the Yellow Sea in Asia—mark this entire basin.

THE INDIAN OCEAN is characterized by gulfs, two of which form the entire extension of the basin; namely, the Gulf of Bengal, and the Arabian Sea. It has also two inland seas of considerable extent, the Red Sea and the Persian Gulf, isolating the peninsula of Arabia from the adjacent continents; but border seas are wholly wanting in the Indian Ocean.

THE ARCTIC OCEAN is a partially enclosed sea, which a comparatively inconsiderable rise of the sea-bottom would convert into a true Mediterranean. Three openings connect it with the Pacific and Atlantic Oceans, namely, Behring Strait (narrow and shallow), Davis Strait, and the broad expanse of water lying between Norway and Greenland. Of these, the last is by far the most important, for through it the warm waters of the Gulf Stream find access to the Polar basin, and keep the sea free from ice throughout the year. This current is supposed to flow feebly along the coast of Siberia, until, deflected by the land, it becomes merged in the cold counter-currents which, passing along the eastern coasts of Greenland and Labrador, carry immense masses of ice into the Atlantic.

PICTORIAL DIAGRAM OF THE STRUCTURE OF THE EARTH IF THE WATERS WERE REMOVED

Ridges, mountains, plateaus, which may represent submerged continents of the past, and many an abyss that exceeds in depth the height of the highest mountains, are shown above. The shallow coasts, marked by the lightest shade, are part of the present Continental Shelf, and do not exceed six hundred feet in depth. Beyond this shelf, as a rule, the oceans rapidly attain great depths. Our knowledge of the ocean bed has been obtained from the extensive soundings.

Large images: [Map](#) (624 kB)
[Section](#) (191 kB)

THE ANTARCTIC OCEAN is situated about or within the antarctic circle. The great Southern Ocean is that part of the ocean which surrounds the world between the latitude of 40 degrees south and the antarctic circle. The northern portions of this band are often called the South Atlantic, South Indian and South Pacific, while the southern portions are usually called the Antarctic Ocean. The average depth of the continuous ocean which surrounds south polar land is about two miles; it gradually shoals toward antarctic land, which in some places is met with a short distance within the antarctic circle. Life is abundant in the surface waters, and at the bottom of the ocean.

[85]

HOW THE FLOOR OF THE

OCEAN APPEARS

As a rule the sea is shallowest near the land, though in a few cases there is a sudden descent to a great depth at a very short distance from the coast. Lowlands have usually shallow seas near the coast, and highlands deep water.

Along the American shores, in the latitude of New York, the depth, for a distance of more than 100 miles, is less than 600 feet; then suddenly the bed descends, by a steep slope, to the depth of 6,000 or 9,000 feet. After a comparatively narrow interval, a second terrace descends to the main basin, from 15,000 to 18,000 feet deep.

The bottom of the trough of the ocean, in general, is equally varied with that of the land surface of the globe, forming mountains, hills, valleys, tablelands, etc. In many parts these marine mountains reach above the surface and form islands. On the table land extending across the Atlantic between Newfoundland and Ireland is laid the submarine-telegraph cable which connects the two hemispheres.

THE DEPTH OF THE OCEANS. The average depth of the Pacific Ocean has been estimated at between 15,000 and 18,000 feet, which is slightly greater than that of the Atlantic. The deeper portions may be learned on reference to the [map](#). The western portion of the North Pacific in particular shows some very deep depressions. To the east of Japan lies a long deep trough which in one part has furnished the sounding of nearly five and one-half miles. This abyss is often called the Tuscarora Deep. South of the Ladrone Islands, in the Caroline Archipelago, there is also a deep abyss where an English ship, the *Challenger*, obtained a sounding of nearly 27,000 feet. In the Pacific soundings of over 30,000 feet have been made.

The Indian Ocean has an average depth of about 12,000 feet, and the deepest soundings have been taken on the eastern side. It is interesting to observe that the deepest sounding, about five and three-quarter miles, in the South Pacific somewhat exceeds the height of the highest mountain. Mount Everest has a height of 29,000 feet above the sea level. And it must also be noted that the mean height of the land, 1,000 feet, is only about one-twelfth the mean depth of the whole ocean, 12,000 feet. (See [colored map](#) showing comparative surfaces of land areas and ocean depths.)

INLAND AND BORDER WATERS. These enclosed basins belong to the structure of the continents, rather than to the oceans. All are shallow in comparison with the great basins with which they are connected, as is apparent from the depths given below.

The Gulf of Mexico is from 5,000 to 7,000 feet in depth. The deepest part of the Caribbean Sea, on a line connecting Porto Rico and Costa Rica, averages 7,000 feet, and near the latter it reaches a depth of 14,000; but the ocean, immediately outside of the Lesser Antilles, is more than 18,000 feet deep.

The Mediterranean is divided into two basins, by a rocky isthmus, from 50 to 500 feet below the surface, lying between Sicily and Cape Bon, in Africa. The western basin is over 9,000 feet in depth, and comparatively uniform; while the eastern is more irregular, varying from 6,000 near the center, to 13,000 feet, south of the Ionian Islands. The Red Sea has an irregular bottom, with an average depth of 3,000 feet, but in some places it reaches 6,000.

The Baltic Sea, being a simple depression in the great European plain, is but a few hundred feet deep. In the North Sea, the depth averages 300 feet, and rarely exceeds 600. The continent is here prolonged in the form of a submarine plain, whose highest portions form the British Isles.

The Border Seas of Asia, lying within the chain of continental islands, are only a few hundred feet in depth, while immediately without those islands, abrupt slopes descend to the great depths of the Pacific basin.

Smaller inlets are also of frequent occurrence, especially in districts where mountain ranges approach the borders of the ocean. Such are the *lochs* of Scotland, the *voes* of the Shetland Islands, and the *fjords* of Norway and Greenland. The term *lagoon* is usually applied to lake-like inlets.

SALT AND OTHER INGREDIENTS OF SEA-WATER. The waters of the ocean are salt, holding in solution various saline matters. The saline ingredients amount to rather more than thirty-five grains in a thousand grains of sea-water. The most abundant of these is chloride of sodium or common salt, which in general forms about a third of the whole. Besides this, sea-water contains some magnesia, lime, potash, and traces of iodine and bromine.

The following table exhibits the exact percentage composition of sea-water.

One hundred parts by weight of sea-water contain:

Water	96.470
Sodium Chloride	2.700
Magnesium Chloride	.360
Potassium Chloride	.070
Magnesium Sulphate	.230
Calcium Sulphate	.140
Calcium Carbonate	.003
Magnesium Bromide	.002
Traces of Iodides, Silica, etc., estimated	.025
	<u>100.000</u>

HOW THE SEA GETS ITS COLOR. The color of sea-water is due to the character of the skies and clouds above, and to vegetable and animal objects growing and living in it. The luminosity or phosphorescence of the ocean is due to the decay of animal and vegetable substances, but in some cases it arises from the presence of myriads of living animals, which, like the glow-worm and fire-fly of the land and air, have the power of emitting light.

OCEAN TEMPERATURE. The water of the ocean appears generally to agree with that of the climate in which it is situated. In warm latitudes the temperature of the deep sea diminishes with the depth below the surface until a certain depth is reached, below which it appears to retain an equable temperature, this being about 40 degrees Fahrenheit. In the Polar Seas, where the temperature of the surface is lower than 40 degrees the heat increases downward until it reaches that point. In latitude 70° the temperature of the ocean is considered to be the same at all depths.

HOW TIDES ARE FORMED BY ACTION OF THE MOON

The moon pulls the waters of the earth into a great double wave heaping it up on the side nearest to the moon and on the opposite side. As the earth rotates, this double wave moves round the earth, and the crests and troughs alternately produce high and low tide. Thus there are two high and two low tides daily, at intervals of about twelve hours, or half a Sun or day.

CAUSE OF THE TIDES, WAVES AND CURRENTS OF THE OCEANS

The waters of the ocean are retained in their bed by the attraction of gravitation. This power is great in proportion to the mass; and as the earth is of much greater mass than the particles of water on its surface, it attracts them and keeps them in their assigned places. But the sun and moon also possess this power of attraction, and notwithstanding their distance, attract and draw them up to a certain elevation. The vast mass of the waters being drawn up by the moon into a mountain or curve of water forms what is called the "great primary or tidal wave."

VAST OCEAN CAVERN AT CAPRI, WIDELY KNOWN AS THE "BLUE GROTTO"

This remarkable cavern, on the shore of the island of Capri, at the entrance of the Bay of Naples, is entered from the sea, and is one hundred and eighteen feet long and forty feet high, with a breadth of ninety-eight feet at its widest part. It derives its name from the wonderful blue reflection of the sun's rays through the water, which gives the interior its marvelous beauty and majesty. The cavern has been created by the ceaseless action of the tide.

EBB-TIDE AND FLOOD-TIDE. This drawing up of the waters of mid-ocean causes a recession from the shores, thus giving rise to ebb-tide, or low water. But when the temporary attraction ceases the waters flow back to their natural level, returning to shore and forming flood-tide, or high water. This culmination or rising of the waters in the great tidal wave takes place twice in twenty-four hours and fifty minutes. The combined influence of the sun and moon at new and full moon augments the size of this wave, and causes the "spring-tides" at those periods.

HEIGHT OF TIDES. High water at the various points along the coast is dependent on the return of this great wave, though some variations are caused by local peculiarities; and the height of the tide also varies greatly in different parts of the earth.

On the eastern coast of North America, the average rise of the tide is from nine to twelve feet. At the entrance to the Bay of Fundy, however, it rises eighteen feet, while at the head of that bay it reaches sixty, and in the highest spring tides, even seventy feet. At Bristol, in England, the spring tides rise to forty feet; and at St. Malo, on the south coast of the English Channel, they reach fifty feet.

THE MAELSTROM, CHARYBDIS AND HELL GATE

Differences in level, produced by high tides, cause currents which vary in force and direction with the condition of the tide, producing, in some cases, dangerous whirlpools. The famous Maelstrom, off the coast of Norway, is but a tidal current, which rushes with great violence between two of the Lofoden Islands, causing a whirling motion in the water which is reversed at each ebb and flow of the tide.

Such is, also, the famous whirlpool of Charybdis, in the Strait of Messina, and many others of less note. The powerful currents of Hell Gate, in the passage from Long Island Sound to New York Bay, are due to a similar cause, high water occurring at different hours in the bay and in the west end of the sound.

WHAT CAUSES THE WAVES OF THE OCEAN

The waves of the ocean, which are caused by the action of the wind, and which are called secondary or wind waves are of a totally different character from the tidal wave. The influence of the wind is supposed not to extend to a greater depth than forty or fifty feet, the deep sea, though raised in a great mass by the grand tidal movement, being free from agitation. Wind waves at a distance from the shore are comparatively low and long, but in shoal water they assume a greater curvature, and fall on the beach either in gentle ripples or in mighty breakers, according to the depth of the water and the force of the wind. The heavy swell which occasionally takes place, called the "ground sea," is supposed to originate in distant storms of wind.

THE RIVERS IN THE SEA

Currents in the ocean arise from various causes. They may be produced by long-continued gales of wind, by the melting of polar ice, or by any cause that may give rise to onward movements of limited portions of the great mass of waters. Other currents, and of these only is it necessary to speak in this connection, are permanent. The most remarkable of these are the polar currents and the equatorial currents.

POLAR CURRENTS are produced by the perpetual movement of the waters from the poles to the equator. In accordance with the laws of mechanics, an accumulation of the waters takes place on that part of the globe which has the greatest velocity of motion; and as the earth in turning on its axis moves with far greater velocity at the equator, the waters continually flow toward that line from the poles.

EQUATORIAL CURRENTS. This accumulation of the waters at the equator tends to produce the equatorial currents, which consist of the continuous progression of the tropical seas in a westerly direction. When the wave brought by the polar currents arrives—coming as it does from regions where it naturally has less velocity—it does not at once acquire the velocity of the earth's motion at the equator; and since the rotation of the earth is from west to east, this portion of the water lagging behind forms a stream or current which has an apparent motion from east to west, that is to say, apparent as regards the earth, but real in relation to the adjacent land and water. The trade winds, which in this zone blow constantly in the same direction, lend their aid in maintaining the equatorial current.

THE GREAT SYSTEMS OF OCEAN CURRENTS

An extensive system of currents appears to arise in the Antarctic Ocean. A current of cold water flowing northward joins the equatorial current in the Pacific. Entering the Indian Ocean, it maintains its westerly course until it approaches the shores of Africa; then bending southward it rushes through the Mozambique Channel, and doubling the Cape of Good Hope travels northward until it arrives at the Bight of Benin. This current then joins the equatorial current, and crossing the Atlantic from the coast of Guinea to that of Brazil, it is divided into two branches by the projecting headland of Cape San Roque, one flowing southward and the other northward.

THE GULF STREAM. After passing the Island of Trinidad, this great oceanic current enters the Gulf of Mexico, and there acquires a high temperature, and sweeping round that sea it again pours forth into the Atlantic, forming the most powerful of known currents, called the Gulf Stream. Issuing from the Gulf of Mexico, this current of warm water rushes with considerable force through the Bahama Channel; then taking a northerly course it travels along the eastern shores of North America, and at Newfoundland is turned to the eastward by an opposing cold current which sets in from Baffin's Bay. It now maintains an easterly direction, and crossing the Atlantic arrives at the Azores in about twenty-eight days, and divides its waters on the coast of France and Spain: one portion goes southward and at length joins the grand current which sets from the coast of Guinea; and another portion travels northward and skirts the western coasts of Europe. These currents are seldom more than 500 feet deep.

ATMOSPHERE, CLIMATE AND WEATHER

The atmosphere is the vast ocean of air that envelops the earth and makes life possible on our globe. It absorbs the heat and vapors caused by the action of the sun upon the surface of both land and water, and is the medium through which the ever-changing phenomena of *climate* and *weather* are produced. The two great forces of nature acting in connection with it are *gravitation* and *heat*, or solar radiation; and the results of their ceaseless action may be summed up as follows: (1) *Temperature*, or heat, which we soon learn to know by our senses, and to measure by the thermometer. (2) *Evaporation*, which changes the weight of the air by carrying invisible moisture through it. This change of *weight* is indicated by the barometer. (3) *Condensation*, producing fog, dew, rain, hail, and snow; all estimated accurately by the rain gauge or pluviometer. (4) *Motions*, as in the winds, varying from the gentle breeze to the awful cyclone, the force and velocity of which are indicated by the anemometer. (5) *Electricity*, producing lightning, thunder, magnetic and chemical changes in the atmosphere. (6) *Optical Phenomena*, such as rainbows, haloes, coronas, mirage, and the auroras.

THE ATMOSPHERE: ITS EXTENT, CHARACTER, USE AND EFFECT

The Earth is enveloped in its own atmosphere, which like a transparent covering surrounds it, and revolves with it. This atmosphere does not extend to more than forty or fifty miles above the earth's surface, and is higher at the equator than at the poles.

Large illustration (278 kB)

WHAT THE ATMOSPHERE IS COMPOSED OF

The atmosphere is an elastic fluid consisting of a mixture (not a compound) of oxygen and nitrogen, in the proportions of about twenty-one of the first to seventy-nine parts of the last named. It also contains a small quantity of carbonic acid gas, and a yet smaller quantity of ammonia; and water in the form of invisible vapor is always present in it, though the quantity is subject to great variations. All these substances move freely among each other, and are continually changing places: the oxygen being ever ready to perform the office assigned to it of sustaining life and combustion; the carbonic acid to promote the growth of vegetation; the nitrogen to perfect the fruits of the earth, and the vapor to descend to the thirsty ground, in the form of showers and dew.

The atmosphere is elastic, and therefore capable of expansion and compression; and is also a ponderable body. The consequence of these properties is, that it is much lighter and thinner in the upper regions than nearer the earth's surface; for at the sea-level its whole weight presses on its lower strata and gives it greater density. Ascending from the earth's surface it becomes gradually lighter and thinner, and at great elevations is so rarefied as to be unsusceptible of sustaining life.

HOW THE ATMOSPHERE IS WEIGHED AND MEASURED

The weight of the atmosphere at the level of the sea is equal to about fourteen and one-half pounds on every square inch of surface. This weight is balanced by a column of mercury thirty inches in height; but at an elevation of 18,000 feet it would be balanced by a column of only fifteen inches in height, and at 36,000 by one only seven and one-half inches in height. It is on this principle that the mercurial barometer has been constructed; and since the mercury in the barometer stands at the same point at all places at the sea-level, and falls in a regular ratio on ascending therefrom, this instrument forms a most useful standard for measuring altitudes.

As we ascend from the sea the atmosphere becomes colder; but, as with the density, the temperature does not appear to pass through regular gradations of change. From experiment, however, it has been assumed that the atmosphere loses one degree of heat by Fahrenheit's thermometer for every 350 feet of ascent; and hence even in the hotter regions very lofty mountains are covered with perpetual ice and snow.

DISTRIBUTION OF TEMPERATURE OVER THE EARTH

The amount of heat produced by the sun upon the Earth's surface, is greatest near the Equator, and diminishes gradually towards the Poles. Three general causes, each referable to the spherical form of the Earth, combine to produce the gradual diminution of temperature from the Equator to the Poles.

1. The angle at which the Sun's rays strike the surface. In the Equatorial regions they are perpendicular to the surface of the sphere, and there produce their maximum effect; but, on account of the curved outline of the globe, they fall more and more obliquely with increasing latitude, and the intensity of action diminishes proportionately. At the Poles their effect is practically nothing.

2. The area on which a given amount of heating power is expended, is least at the Equator, consequently the resulting heat is greatest. The area covered increases, and the effect diminishes, with the increasing obliquity of the Sun's rays in higher latitudes, which, as we have seen above, results from the spherical form of the Earth.

3. The absorption of heat by the atmosphere, as the Sun's rays pass through it, is least where they fall perpendicularly,—that is, in the Equatorial regions,—and increases, with their increasing obliquity, towards the Poles.

EFFECT OF THE MOTIONS OF THE EARTH

The Earth revolves constantly around the Sun, and at the same time rotates upon an axis inclined twenty-three and one-half degrees towards the plane of its orbit. In consequence of the inclination of the axis, the declination of the Sun, or its angular distance from the Equator, varies with the advance of the Earth in its orbit, causing periodical variations in the length of day and night, and, consequently, in temperature.

VERNAL EQUINOX. On the twentieth of March, at mid-day, the Sun is vertical at the Equator. Rising directly in the east it ascends the heavens to the zenith, and, descending, sets directly in the west.

The illuminated hemisphere extends from pole to pole, and embraces half of every parallel of latitude; hence every point on the Earth's surface is under the rays of the Sun during half of the diurnal rotation; the days and nights are equal all over the globe; and the heating power of the Sun is the same in both the northern and the southern hemisphere.

SUMMER SOLSTICE. As the Earth advances in its orbit the vertical Sun declines northward; and on the twenty-first of June, at the Summer Solstice, it is over the northern Tropic, twenty-three and one-half degrees from the Equator.

The illuminated hemisphere, extending ninety degrees on each side of the parallel of the vertical Sun, reaches twenty-three and one-half degrees beyond the North Pole; but, at the south, it barely touches the Antarctic circle. It embraces more than half of each parallel north of the Equator, hence throughout the northern hemisphere the day is longer than the night, the difference in their duration increasing with the latitude; and all points within the Arctic circle are in the light during the entire rotation.

In the southern hemisphere, less than half of each parallel being illuminated, the night is longer than the day, and within the Antarctic circle there is constant night. The heating power of the Sun is now at the maximum in the northern hemisphere, while in the southern it is at the minimum.

AUTUMNAL EQUINOX. On the twenty-second of September, the distribution of light and heat upon the two hemispheres is the same as at the Vernal, and at the *Winter Solstice*, on the twenty-second of December, it is the reverse of that at the Summer Solstice.

WHAT CAUSES THE SEASONS AND DAY AND NIGHT

[91]

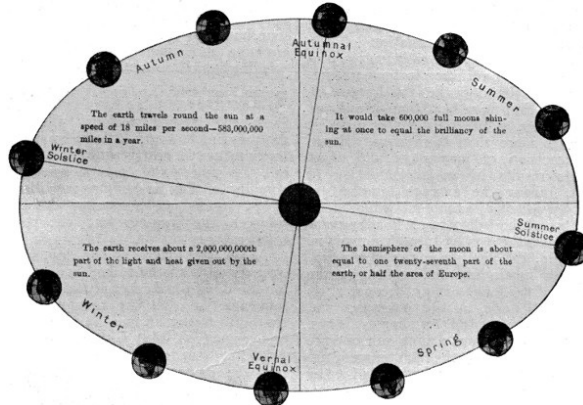

FIGURE ILLUSTRATING THE CHANGE OF SEASONS THROUGHOUT THE YEAR
The change of seasons is caused by the *revolution* of the earth around the sun, and the inclinations of the planes of the equator and ecliptic. These causes also account for the difference in the length of the days and nights and the difference in the height of the midday sun. The exact duration of the seasons we get by observing the dates of equinoxes and solstices.

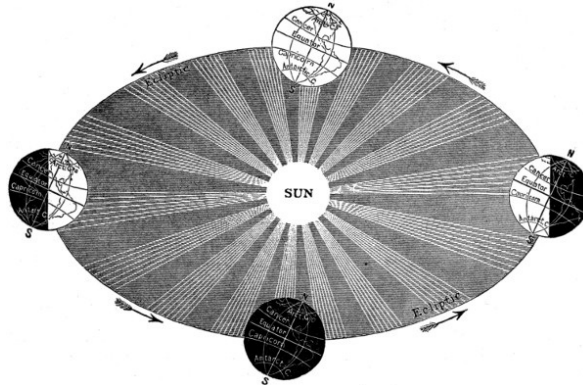

FIGURE SHOWING THE CAUSE OF DAY AND NIGHT
The *revolution* of the earth gives us the length of the year; its *rotation* on its axis, the length of the day and night, by causing the risings and settings and daily apparent motion of the sun and stars.

EFFECT OF UNEQUAL DAYS AND NIGHTS ON TEMPERATURE

[92]

The inequality in the length of the days in different parts of the year, occasioned by the inclination of the Earth's axis, is of itself sufficient to produce a marked variation in temperature.

During the day the Earth receives from the Sun more heat than it radiates into space; while during the night it radiates more than it receives. Hence a succession of long days and short nights results in an accumulation of heat, raising the average temperature and producing summer; while long nights and short days result in a temperature below the average, producing winter.

Again, the heating power of the Sun in each hemisphere is greatest at the period of the longest days, because of its greater altitude in the heavens; and least at the period of shortest days. Thus long days and a high sun operate together to produce the high temperature of summer; while long nights and a low sun cause the low temperature of winter.

The following table gives the length of the longest day, excluding the time of twilight, and of the shortest night, in the different latitudes, with the difference of duration in hours and minutes, thus exhibiting more clearly the above law.

TABLE OF UNEQUAL DAYS AND NIGHTS

LATITUDE	Longest Day	Shortest Night	Difference
Equator	12.0 hours	12.0 hours	00.0 hours
10°	12.7 "	11.3 "	1.4 "
20°	13.3 "	10.7 "	2.6 "
Tropics	13.5 "	10.5 "	3.0 "
30°	14.0 "	10.0 "	4.0 "

69½°	2 months	0.0 "	...
73.3°	3 "	0.0 "	...
78.3°	4 "	0.0 "	...
84°	5 "	0.0 "	...

LAW OF VARIATION OF DAY AND NIGHT

The inequality of day and night increases slowly in the tropical regions, but more and more rapidly towards the polar circles. Beyond these circles the Sun, in the hemisphere in which it is vertical, makes the entire circuit of the heavens, without sinking below the horizon, for a period varying from twenty-four hours to six months; while in the opposite hemisphere there is a corresponding period of continuous night.

RESULT OF THIS LAW IN DIFFERENT ZONES

In the tropical regions, where the days and nights vary little in length, the temperature is nearly uniform throughout the year; while the increasing inequality of day and night towards the Poles, causes an increasing difference between the summer and the winter temperature.

Again, the length of the day, in the summer of high latitudes, compensates for the diminished intensity of the Sun's influence; so that the temperature, in the hottest part of the day, may equal, or even exceed, that within the tropics. A summer day in Labrador or Petrograd may be as warm as one under the Equator; but in the former latitudes there are only a few days of extreme heat in the year, while with increasing nearness to the Equator the number of warm days constantly increases.

HOW THE SEASONS VARY IN DIFFERENT LATITUDES

The high latitudes have short, hot summers, and long, severe winters. The transition seasons, spring and autumn, on account of the very rapid change in the length of the days, are short and scarcely perceptible.

In the middle latitudes the summer and winter are more nearly equal in length, with less difference in the extreme temperatures; and the transition seasons are distinctly marked. Farther towards the Equator the summer increases in length, and the winter diminishes, while the tropical latitudes have constant summer.

WINDS AND OTHER AIR CURRENTS

The winds appear to be caused by partial changes in the density of the atmosphere in a great measure arising from a diverse distribution of heat. When air is warmed it becomes less dense, or, in other words, it occupies a greater space. If an adjacent stratum of air be cooler, it will on coming in contact with the warmer air expand and pour into space occupied by the latter, thus forming a current. The greater the difference between the temperature of the one or other portion, the greater will be the force which the cold portion will rush into the space occupied by the warm portion, or, in other terms, the more violent will be the wind. In temperate climates the winds are variable; but in some parts of the world they blow with great regularity, and in others are subject to periodical changes.

[93]

WHAT CAUSES THE TRADE-WINDS

The most remarkable of the regular winds are the trade-winds. The atmosphere at the surface between the tropics is much warmer than in the higher latitudes; and since air expands when heated, the light warm air of intertropical regions perpetually rises, and its place is as perpetually supplied by the colder air from the north and the south. If it were not for the Earth's rotation, these would be merely north and south winds; but like the equinoctial water-currents, these cool currents of air coming from regions which have not an equal velocity of rotation with the air at the equator, pause and hang back, and thus these aerial currents acquire a westerly direction, forming north-easterly constant winds in the northern hemisphere, and south-easterly in the southern hemisphere.

MONSOONS AND THEIR LOCATION

The monsoons or periodical winds of the Indian Ocean owe their origin to the same cause which gives rise to the trade-winds, though they acquire a different character in consequence of the proximity of the land. In the southern portions of the ocean which are remote from this cause of disturbance, the trade-wind blows with its wonted regularity; but in the seas occupying the region between the eastern coast of Africa on the one side, and the Malay peninsula and the island of Sumatra on the other, the course of the trade-wind is reversed for half the year. This change occurs from April to October; the sun at that period being vertical north of the equator, and the land in the adjacent regions acquiring in consequence a high temperature, and the air over the sea being cooler than that over the land, a south-west wind prevails. This wind, called the "south-west monsoon," commences at about three degrees south of the equator, and passing over the ocean arrives charged with moisture, and accordingly usually deposits copious supplies of rain in India and some of the adjoining territories. In the remaining half of the year, or from October to April, the wind assumes the ordinary north-easterly direction of the trade-wind.

Sea-breezes, which occur in regions bordering on the ocean in hot climates, are produced by causes similar to those which give rise to the south-west monsoon, but on a more limited scale of action, and changing their direction daily.

THE WHIRL OF THE HURRICANE

Hurricanes are storms of wind which sweep or whirl round a regular course, and are at the same time carried onward along the surface of the Earth. In the northern hemisphere the whirling motion follows the course of east, north, west, and south to east again, and in the southern hemisphere it takes the opposite course. In the Atlantic Ocean, the principal region of hurricanes lies to the eastward of the West India Islands. They are also frequent in the Indian Ocean, at no great distance from the island of Madagascar. The "typhoons" of the China seas, and the "ox-eye" of the Cape of Good Hope, are also revolving storms.

TORNADOES AND OTHER CHARACTERISTIC STORMS

The tornadoes of the western coast of Africa, the pamperos of South America, and the northers of North America appear to be of a different character, and not to possess a revolving motion. The sirocco of Italy and Sicily, and the solano of Spain, as also the simoon of Arabia, and the harmattan of western Africa, are all winds which owe their origin to the heated surfaces of Africa and Arabia. The principal difference between these winds appears to be, that the sirocco and the solano acquire some moisture in their passage across the Mediterranean, and therefore do not possess that extreme degree of aridity which forms the distinguishing character of the simoon and the harmattan.

[94]

CLOUDS—THEIR FORM AND CLASSIFICATION

Clouds are continually varying in their form and appearance, but may be classed under the four principal heads of the cirrus, the cumulus, the stratus, and the nimbus.

The cirrus is a light, fleecy cloud resembling a lock of hair or a feather.

The cumulus or summer cloud is generally massive and of a round form; sometimes of small size, and sometimes covering nearly the whole sky, and occasionally appearing in the horizon like mountains capped with snow.

The stratus is a horizontal, misty cloud sometimes observed on fine summer evenings comparatively near the ground, and often crossing the middle regions of mountainous or hilly districts.

The nimbus or rain cloud has a uniform gray tint; it is fringed at the edges when these are displayed, but usually covers the whole sky. The region of clouds is a zone extending in the atmosphere from about one to four miles above the Earth. The most elevated clouds, which are light and fleecy, are those comprehended under the name of cirrus, and the lowest are those which are called stratus.

The cirro-cumulus, cirro-stratus, and cumulo-stratus are only modifications and combinations of the above-named principal classes.

FORMS OF ATMOSPHERIC VAPOR

Warm air is capable of holding suspended a larger quantity of moisture than cold air, and therefore the amount of vapor present in the atmosphere is subject to great variations.

WHAT CAUSES DEW

These facts also account for the formation of dew, which is caused by the reduction of the temperature and the deposition of the moisture which the warmer atmosphere of the day had held in suspension. Dews will hence be usually most abundant when cool nights succeed warm days, and on a clear night than when the skies are obscured by clouds, because a cloudless sky is usually much colder than a beclouded one. It is also essential for the copious formation of dew, that the ground or other substance on which it is deposited should be much cooler than the superincumbent air; for if the ground be warm it will impart its temperature to the air near its surface and dew will not be formed.

FORMATION OF MISTS AND FOGS

When the ground or water is warmer than the air, mists and fogs are frequently formed; and since water and marshy surfaces cool less rapidly than dry land, mists and fogs are of more common occurrence in low, damp situations than in dry, elevated districts. They are formed by the condensation of the vapor, or, in other terms, its transformation into the minute globules of water, which instead of descending to the earth in the form of dew, remain suspended above the land or the water.

RAIN, HAIL AND SNOW

Clouds are formed by the condensation of vapor at considerable but various elevations in the atmosphere. Vapor is always invisible, clouds, therefore, are not vapor but water, and consist of a fine watery powder, the size of each particle being exceedingly minute; and consequently they are so light that clouds formed of an accumulation of such particles are readily borne forward by the winds. Clouds are sometimes suddenly formed and as suddenly disappear, probably owing to sudden and partial changes of temperature. When a considerable difference of temperature prevails in the aerial currents which may come in contact with the local atmosphere, a further condensation takes place, and the particles of this fine watery powder unite into drops, and, becoming heavier, fall to the earth in the form of *rain, hail or snow*.

SNOW AND SNOW-CRYSTALS

Vapor condensed in air having a temperature below thirty-two degrees Fahrenheit freezes, or passes to a crystalline form, producing snow. Snowflakes occur in a great variety of forms, which usually present the outline of either a regular hexagon or a six-pointed star.

Their size depends upon the temperature and the relative humidity of the air through which they fall, for, like raindrops, they increase by successive additions from the vapors with which they come in contact in descending. Thus in mild weather they are much larger than in very cold weather.

[95]

1. **Cirrus** (*sir'rus*).—Small curl-like clouds, usually high in the heavens. 2. **Cirro-stratus** (*sir-ro-strā'tus*).—Intermediate between the cirrus and stratus. 3. **Cirro-cumulus** (*sir-ro-kū'mu-lūs*).—Resembling the scales of mackerel. 4. **Alto-cumulus** (*al'tō-kū'mu-lūs*).—High cumulus clouds. 5. **Alto-stratus** (*ältō-strā'tūs*).—High stratus clouds. 6. **Strato-cumulus** (*strā'to-kū'mu-lūs*).—Forms of cumulus and stratus combined. 7. **Nimbus** (*nim'būs*).—A rain cloud. 8. **Cumulus** (*kū'mū-lūs*).—A conical heap of clouds. 9. **Cumulo-stratus** (*kū'mū-lo-strā'tūs*).—Intermediate between the cumulus and the stratus. 10. **Stratus** (*strā'tūs*).—Arranged in a horizontal band or layer. 11. **Fracto-stratus** (*frāk'tō-strā'tūs*).—Broken forms of stratus. 12. **Fracto-cumulus** (*frāk'to-kū'mu-lūs*).—Broken forms of cumulus.

[96]

THE BEAUTIFUL CRYSTAL-FORMS OF SNOWFLAKES

1-3. Six-rayed stars. 4-13, 18-25. Combinations of six-rayed stars with decorated flat surfaces. 14, 16, 17. Combinations of stars and columns. 15. A true pyramid.

When the lower air is warm enough partially to melt the crystals, they form minute balls. When raindrops, formed in the upper air, fall through a cold current, they are often frozen, producing *sleet* instead of snow.

WHERE PERMANENT SNOW EXISTS

Though the winter snows upon the plains, and the slopes of mountains of medium height, disappear during the warm season; yet, in all latitudes, the tops of high mountains are covered with a layer of permanent snow, which the summer heat of these great altitudes is not sufficient to melt.

The lower limit of perpetual snow, called the snow line, is found, within the tropics, about three miles above the level of the sea. In temperate latitudes it occurs at the height of a little less than two miles; and at the northern limit of the continents, it is about half a mile above the level of the sea, or, perhaps, even less than this.

On the Arctic Islands, vast fields of snow remain permanently, at a few hundred feet above the sea level.

The winter snows, falling into the icy waters of the polar oceans, are but partially dissolved; and, remaining upon the freezing surface, they help to form those vast ice floes which encumber the polar seas at all times.

[97]

The following table gives the observed height of the snow line in the different latitudes:—

HEIGHT OF THE SNOW LINE

Lat. N.	New World	Feet
75°	North Greenland	2,300
54°	Unalaska	3,500
48°	Mt. Baker, Oregon, about	8,000
43°	Rocky Mountains	12,500
39°	Rocky Mountains	14,500
38°	Sierra Nevada	11,000
19°	Popocatepetl, Mexico	14,900
5°	Tolima, Columbia	15,300
Lat. S. 1°	Andes of Ecuador	15,800
17°	Andes of Bolivia, west side	18,500
17°	Andes of Bolivia, east side	15,700
33°	Andes of central Chili	14,700
42°	Andes of Patagonia	6,000
54°	Andes of Straits of Magellan	3,700
75°	Bear Island	600
71°	Mageroe, Cape North	2,300
67°	Sulitelma, Lapland	3,800
61°	Scandinavian Alps	5,300
50°	Altai Mountains	7,000
46°	Alps, north side	8,800
46°	Alps, south side	9,200
43°	Caucasus	11,000
35°	Hindu Kush	13,000
31°	Himalaya, south side	16,200
31°	Himalaya, north side	17,400
12°	Abyssinian Mountains	14,000
Lat. S. 3°	Kilimanjaro	16,000
44°	New Zealand Alps	7,500

HOW SNOW AND ICE FORM GLACIERS AND ICEBERGS

Glaciers (from the French *glace*, ice) are vast streams of ice which descend from the lower edge of the perpetual snows, like long icicles from a snow-covered roof. They follow the windings of the Alpine valleys, and terminate abruptly in a massive wall of ice, from beneath which the waters of the melting glacier escape, through a large icy vault.

MOST FAMOUS GLACIER REGION

The mountain systems in the middle latitudes, with abundant snows and alternate warm and cold seasons, are most favorable to the formation of glaciers. The best known, and probably the most remarkable glaciers are those of the high Alps, in the heart of which are Mont Blanc, Monte Rosa, and the Bernese Alps. Late explorers have found large glaciers in the Caucasus and in the Himalayas, the last being of the grandest proportions. In the Scandinavia are many which descend, in the deep western fiords, nearly to the sea level.

In the New World glaciers are less frequent. On Mount Shasta and Mount Rainier fine examples are in evidence. By far the most extensive glaciers however, are found on the snow-covered islands of the polar oceans. Vast masses of ice, broken from the ends of these glaciers, form the enormous *icebergs* (mountains of ice) which are so numerous in the polar seas, and are transported by the currents even to middle latitudes.

CLIMATE AND WEATHER

The term *climate* is used to express the combination of temperature and moisture which prevails at any particular place, or, in more familiar terms, the prevailing *weather*.

The most prominent causes of diversity of climate are the heat of the sun, the respective position of land and water, and the elevation of land above the level of the sea. To these may be added, as producing considerable though less marked effects, the nature of the soil, the prevailing winds, the position of mountain ranges, and the currents of the ocean.

THE SUPREME INFLUENCE OF THE SUN

The sun is the grand agent in diffusing heat over the earth's surface. While the sun is above the horizon of any place, that place is receiving heat; and when the sun is below the horizon, it is parting with it by the process called "radiation." Whenever therefore the sun remains more than twelve hours out of the twenty-four above the horizon of any place, and consequently less than twelve hours below, the general temperature of that place will be above average; and when the reverse occurs, it will be below average. If the temperature depended solely on the heat of the sun, then indeed a tolerably accurate view of the respective climates of the zones of the globe might easily be assumed; but it is so greatly modified by other circumstances, that considerable differences prevail in countries situated in the same parallels of latitude.

HOW AFFECTED BY POSITION OF LAND AND WATER

The relative position of the land and water is an essential cause of this diversity. The waters of the ocean are of very equal temperature, and have a tendency to moderate both heat and cold, wherever their influence extends. Thus when a cold wind passes over the sea, it becomes warmed, while a hot wind becomes cooled; and thus islands generally experience milder winters and more temperate summers than continents. Such countries are said to possess an insular climate. But when any region experiences great severity of cold in winter and a high degree of heat in summer, it is said to possess an extreme or excessive climate. The most striking instances of an extreme climate are drawn from places like Yakutsk, situated in the depths of Siberia, where the difference between the average temperature of winter and summer amounts to the astonishing sum of 101 degrees Fahrenheit.

THE LIFE-GIVING SUN SENDING HEAT AND LIGHT

The sun is the great life-giver of our earth. Its waves of light and heat and electricity come to the earth through a measureless ocean of ether and make it a living rather than a dead world. The above illustration shows how these waves are constantly bombarding the earth, and not only giving it life but contributing to it the glory of the seasons, the wonders of color, and the brilliant effects of light which we see in the skies and call Auroras, or Northern and Southern Lights.

[Large illustration \(347 kB\)](#)

INFLUENCE OF ELEVATIONS

A gradual decrease in temperature takes place in the ascent from the sea to the line of perpetual snow. This line, which is called the snow-line, varies in different latitudes, and sometimes, owing to local causes, differs on the same latitude; as a general rule, however, a gradual decrease in elevation of the snow-line takes place as we recede from the equator north and south. The height of this line within the tropics varies from 16,000 to 17,000 feet above the level of the sea, and in the northern hemisphere meets the level at about the eightieth parallel.

MODIFICATIONS BY PREVAILING WINDS, MOUNTAINS AND OCEAN CURRENTS

Countries where the prevailing winds sweep across a wide expanse of ocean are not subject to extremes of heat and cold. Thus the climate of oceanic islands is always moderate, and the climates of all coasts are more equable than in the interior of continents.

Climate is also modified greatly by the position of mountain ranges, especially when ridges extend east and west, screening it from the north or leaving it exposed unsheltered in that direction.

Thus the Carpathians screen Hungary from the cold blasts of the north; while Poland, to the north of that range, and therefore unprotected from those piercing winds, suffers from a very cold and humid atmosphere.

The currents of the ocean are likewise potent agents in the formation of climates, and render places which would otherwise be uninhabitable, fit for man's habitation. Thus the Polar currents coming to the equatorial regions cool, and the Gulf Stream making its way to Polar regions warms, otherwise extreme temperatures.

RAINLESS AND RAINY REGIONS OF THE EARTH

In some parts of the Earth extensive tracts exist where rain is never known to fall, and if at all only at intervals, and then in small quantities. The rainless districts of the New World include the flat territories of northern Chili and Peru, some parts of Mexico, and some parts of California. In the Old World an extensive rainless band extends from the western shores of Africa to the central regions of Asia, including the Great Sahara Desert, Egypt, part of Arabia, and the Desert of Gobi. Countries so circumstanced, unless like Egypt rendered fertile by the irrigation of a great river, constitute the most arid and desolate regions of the earth.

The quantity of rain which falls in any region depends greatly on local causes, such as the variations of the surface, the prevailing winds or the proximity of the ocean. Rain is usually more copiously deposited in mountains and well-wooded islands than in any other description of surface.

In tropical regions the rains follow the sun, i. e., when the sun is north of the equator, the rains prevail in the northern tropic, and when south of that line in the southern tropic. This forms the rainy and dry seasons to which countries so situated are subject. This does not, however, apply to the whole intertropical regions, for in a zone extending from the fifth to the tenth parallels on each side of the equator there are two rainy and two dry seasons.

In the narrow belt called the variables, between the regions of the north and south trade-winds, rain is almost incessant, accompanied by thunder and lightning. In many parts of the intertropical regions during the rainy season the rain pours down in such torrents that a larger quantity falls in a few hours than in a whole month in temperate North America.

[98]

[99]

[100]

TRAVELERS GROUPED ON THE SANDS OF THE SAHARA, TERRORIZED BY AN APPROACHING SIMOON

The dreaded Simoon of the desert is a whirlwind of terrific force that raises great gyrating clouds of sand, and sweeps forward with suffocating effect upon both man and beasts. It frequently darkens the sky at midday, and sometimes lightning accompanies it caused by the friction of the sand and air, though no rain falls. The Simoon seldom lasts more than twenty minutes.

NATURE WONDERS OF ELECTRICITY AND LIGHT

[101]

Electricity produces an infinity of changes in the natural world. It may be artificially elicited or called forth by friction; or by contact of certain substances and the action attendant on this contact. In the one case it is termed ordinary, and in the other case voltaic or galvanic electricity.

All substances are supposed to contain a certain portion of electricity, and if by friction or other means any substance acquires more electrical action than it would naturally possess, it is said to be positively electrified; and if less, it is said to be negatively electrified. Substances when positively electrified attract or draw toward them other substances which are in a state of negative electricity, or even those which are in a natural state, but will repel or force from them substances which are positively electrified. The sudden contact of bodies in an opposite state of electricity is attended with vivid light called the "electric spark," and accompanied by explosion and shock.

EARTH AND AIR FORM NATURE'S ELECTRIC BATTERY

The earth is always in a state of positive electricity, and the air when pure in a state of negative electricity. Atmospheric air, however, is subject to incessant variations, and hence its "electrical equilibrium" or natural electrical state is subject to be disturbed. This equilibrium will be restored when an explosion has taken place, and thus it is that in peculiar states of the atmosphere thunder storms act a beneficial part in restoring the air to a normal condition. The intensity of electrical action is greater during the day than at night and also in summer than in winter; and diminishes from the equator to the poles.

Electricity is perpetually effecting great changes in the earth's crust, and in very many instances acts on the principal of voltaic electricity, the action in such cases being produced by long-continued currents.

LIGHTNING—THE ELECTRICAL DISCHARGE IN THE HEAVENS

Lightning is the dazzling light produced by an electrical discharge passing between clouds which are oppositely electrified, or between the clouds and the earth. Lightning flashes have been distinguished as zigzag or chain lightning, sheet and globular lightning.

The first has the aspect of a sharply defined chain of fire, and moves at the rate of 250,000 miles per second. Its zigzag course is attributed to the resistance of the air, condensed in the passage of the electrical discharge, which is sufficient to turn it aside frequently in the direction of less resistance.

Sheet lightning includes the expanded flashes which occur during a storm, and the heat lightning, seen on summer evenings, when no clouds are visible, which is supposed to be the reflection of a storm taking place below the horizon.

Globular lightning is seen on rare occasions, when the electrical discharge takes the form of a ball of fire, and descending with less rapidity, is visible for several seconds. In certain conditions of the atmosphere, globes or spires of electrical light, called St. Elmo's fire, are seen tipping the extremities of bodies in contact with the earth, like church spires, or masts of ships.

All the conditions which give rise to electrical excitement in the atmosphere are much more intense in warm than in cold latitudes; hence the thunder storms of the tropical regions greatly exceed, both in frequency and in violence, those of temperate and cold climates.

THE AURORA BOREALIS, OR NORTHERN LIGHTS

This phenomenon is frequently observed in the northern heavens. It occurs in many forms, but the most common is that of a luminous arch whose summit is in the magnetic meridian of the place of observation, and from which vivid flashes of light dart towards the zenith. A like phenomenon in the southern heavens is denominated the Aurora Australis. Auroras are most frequent and brilliant in the polar regions, and diminish in intensity towards the equator.

RAINBOWS, HALOS AND CORONAS

Rainbows are arches of prismatic colors, formed by the reflection of rays of light from within drops of water. The rays, which are refracted in entering the drops, are reflected from their posterior surfaces, and again refracted as they re-enter the air, the colors being separated by their unequal refrangibility.

Halos and coronas are circles of prismatic colors which, in certain states of the atmosphere, surround the Sun and the Moon.

Halos are supposed to be occasioned by the presence, in the atmosphere, of small ice crystals which act as minute prisms, decomposing and refracting the light which passes through them.

Coronas are seen when a light mist is floating in the air, and are supposed to be formed by reflection from the external surface of the globules of vapor.

COLORS OF THE SKY AND CLOUDS

The azure tint of the cloudless sky is due to the decomposition and refraction of light, as it passes through layers of air successively increasing in density. The blue and violet, being more refrangible than other colors of the solar spectrum, are diffused through the atmosphere; and being reflected from its particles, they impart to it their own color.

The clouds, floating in the atmosphere, absorb the more refrangible rays, and reflect the less. At sunrise and sunset, when the light traverses the greatest depth of atmosphere, all the colors are absorbed except the red and the yellow; and these, being deflected from the particles of vapor, produce the brilliant coloring of sunrise and sunset.

THE MYSTIFYING MIRAGE

The mirage is an optical phenomenon in which images of distant objects are seen, reflected beneath, or suspended in the heavens above. Occasionally, also, objects are seen double, being repeated laterally instead of vertically.

The mirage is caused by the refraction and reflection of light as it passes from denser to rarer strata of air. It is most frequent in arid plains, where the soil, exposed to the burning rays of the sun, becomes intensely heated, and, in consequence, the strata of air near the ground are less dense than those above.

In this case rays of light passing from any distant object, as a tree, to the ground, are refracted more and more towards the horizontal, until finally they are reflected from a horizontal layer of the heated air, and reach the eye from beneath. Then an image of the object is seen as if mirrored in the tranquil waters of a lake.

THE MAGNIFICENT CURTAINS OF LIGHT THAT FORM THE AURORA BOREALIS

USEFUL MINERALS OF THE EARTH

[103]

HOW MINERALS ARE IDENTIFIED

Minerals can be identified and distinguished by various physical properties and by ascertaining their chemical composition. The chief distinguishing physical properties are crystalline form, cleavage, hardness, and specific gravity.

Each mineral or special class of minerals has its own definite geometrical shape or crystalline form. The crystals of each mineral have also a tendency to break or cleave most readily in a particular direction. The term hardness, as applied to minerals and other solid bodies, is used to indicate resistance to being scratched or the power to scratch. The harder of two bodies is the one which will scratch the other, and which resists being scratched by that other.

CRYSTALS THE MOST BEAUTIFUL OF MINERAL FORMS

There are three general classes of crystals—calcareous, silicious and gypsum—but by far the most important are the silicious crystals because of their great hardness. These include quartz or rock crystal—which is quite common—and the so-called *precious stones*, among which are the diamond, rubies, sapphires, etc., a description of which will be found in the [Dictionary of Minerals](#).

To find the relative hardness of substances, a scale has been arranged, beginning with the softest mineral (talc) and ending with the hardest (diamond). The minerals of the scale, therefore, are so arranged that each will scratch any other mineral of lower number in the scale, or be scratched by any of higher number.

SCALE OF HARDNESS

MINERAL	CHEMICAL NAME
1. Talc.	1. Magnesium silicate.
2. Gypsum (or rocksalt).	2. Calcium sulphate or Sodium chloride.
3. Calc-spar.	3. Calcium carbonate.
4. Fluor-spar.	4. Calcium fluoride.
5. Apatite.	5. Calcium phosphate.
6. Felspar.	6. Potassium and aluminum silicates.
7. Quartz (rock-crystal).	7. Silica.
8. Topaz.	8. Aluminum fluosilicate.
9. Corundum (sapphire, ruby).	9. These gems are crystallized alumina.
10. Diamond.	10. Crystallized carbon.

As a first inquiry into the chemical composition of a mineral, dilute hydrochloric or sulphuric acid is tried. All *carbonates* effervesce when placed in acid or when acid is dropped upon them, while quartz and all the *silicates* show no effervescence when so treated.

The table on [pages 104-7](#) contains a brief description of the distinctive physical features of a number of the very common or important minerals.

DICTIONARY OF IMPORTANT MINERAL PRODUCTS

Aluminum, a metal which does not occur in nature in the free state, but for the most part in combination with silica, as a silicate of aluminum, in clay and many minerals. As extracted from clay by a series of very difficult chemical operations, it forms a white metal, very ductile and malleable, and susceptible of a high polish. On account of its lightness, aluminum is highly valued; it forms excellent alloys.

Bauxite (aluminum hydrate) is the only ore. It is mined in France, Ireland, Austria, Arkansas, Alabama and Georgia, and is refined by electric processes. It is used largely as an addition to iron and steel, preventing bubbles and waste in castings; in electrical work, and for purposes where a light, strong metal is necessary, as in certain machinery, hulls for small boats, etc. Refineries are located in Switzerland, France, Great Britain and United States.

Cryolite (fluoride of aluminum and sodium), a mineral mined only in Greenland, was formerly used as an ore but is now utilized in the manufacture of alum and soda.

Alum (a sulphate) is made from cryolite or clays.

Corundum (aluminum oxide) is, next to the diamond, the hardest natural mineral. Canada, North Carolina, Alabama and India have mines of corundum. Emery is produced chiefly in Greece and Asia Minor. Corundum and emery are powdered for use as abrasives in wheels, sharpening stones, polishing powder and cloth.

Emery is an impure form of corundum.

Feldspar is a silicate of aluminum with other metals. It is mined in Canada, Pennsylvania, Connecticut, New York, Maine and Norway, and ground up for use in pottery making.

Clay is chiefly silicate of aluminum and other metals. **Kaolin** is its purest form. The properties of clay vary with its composition, as china clay, fire clay, pipe clay, brick clay.

Clays are found in all parts of the world as a result of the decomposition of other rocks.

The location of manufacturing centers of pottery of all kinds and of bricks, is dependent on clay deposits. In pottery making, Ohio, New Jersey and Pennsylvania lead the United States. Abroad, fine china is made in France, Germany, Austria, England, Japan, and China.

TABLE FOR THE IDENTIFICATION OF COMMON MINERALS; THEIR SCIENTIFIC AND COMMON NAMES AND CHIEF CHARACTERISTICS

Name of Mineral	Common Name	Composition	Hardness	Lustre	Color	Streak	Cleavage or Fracture	Crystallization and Occurrence	Tenacity etc.	Diaphaneity	Varieties	Remarks
Amphibole. (<i>ām' tī-bōh</i>)	...	Silicate of magnesium, calcium, aluminum, iron, etc.	5-6	Glassy to dull.	Black or light to dark green.	White.	Perfect in two directions at angle of 124°.	Prismatic crystals with hexagonal cross-section, common; also cleavable masses.	Brittle to tough.	Opaque to transparent.	Actinolite (green, transparent). Asbestos (fibrous, dull). Hornblende (black).	Common constituent of igneous and metamorphic rocks. Valueless.
Arsenopyrite. (<i>ār' sēn-ō-pyīr' tē</i>)	Mispickel.	Sulphide and arsenide of iron.	6	Metallic.	Silver, yellowish, or light grayish white.	Black.	Good in two directions at an angle of 112°. Not evident on fine grained material.	Crystals resemble a double-edged axe. Occurs also coarse to fine granular.	Brittle.	Opaque.	...	Principal ore of arsenic and sometimes carries gold. Gives sparks and garlic odor when struck with a hammer. Yellow tarnish.
Barite. (<i>bā' rīt</i>)	Barytes. Heavy spur.	Sulphate of barium.	3	Glassy to stony.	White, yellow, blue or brown.	White.	Perfect in one direction; two other good cleavages at right angles to the first and at 101° with each other.	Diamond shaped or rectangular tabular, or prismatic crystals and platy masses.	Brittle.	Transparent to translucent.	...	Used to adulterate white lead and give weight to paper. Often associated with lead ores. Very heavy.
Biotite. (<i>bī' ō-tīt</i>)	Black Mica.	Hydrous silicate of aluminum, potassium, magnesium and iron.	2½-3	Glassy to almost metallic.	Black or dark brown.	White.	Very perfect in one direction, yielding thin sheets.	Six-sided tabular crystals, and as scales, plates, or scaly masses.	Flexible and elastic.	Opaque to transparent.	...	Common constituent of igneous rocks. May be brittle when altered. Valueless.
Calcite. (<i>kāl' sīt</i>)	Lime. Calespar.	Carbonate of Calcium.	3	Glassy to earthy.	Colorless or white when pure, all colors when impure.	White.	Perfect in three directions at angles of about 105° or 75°.	Prismatic or tabular six-sided crystals; also granular, cleavable, or earthy masses.	Brittle.	Transparent to opaque.	Marble (granular). Limestone (dull, compact). Chalk (soft, white, earthy). Mexican Onyx (compact, banded).	Effervesces vigorously in hydrochloric acid of any strength and temperature. Used as flux, building or ornamental stone, to make lime, etc.
Chalcocite. (<i>kāl' kō-sīt</i>)	Copper Glance.	Sulphide of copper.	3	Metallic; dull when impure or tarnished.	Dark gray. Tarnishes black or green.	Lead-gray.	No cleavage, smooth conchoidal fracture.	Usually very compact masses; six-sided, tabular crystals rare.	Slightly sectile.	Opaque.	...	An important ore of copper. Cuts easily, yielding a highly polished surface.
Chalcopyrite. (<i>kāl' kō-pīr' tē</i>)	Copper Pyrites. Fools gold.	Sulphide of copper and iron.	4	Metallic.	Bright brass-yellow. Often tarnished iridescent.	Greenish black.	No cleavage. Uneven fracture.	Occurs massive or in scattered particles. Crystals usually have four triangular faces.	Brittle.	Opaque.	...	One of the most important ores of copper and often carries silver and gold. Is often mistaken for the latter.
Copper.	...	Native metallic	2½-3	Metallic.	Copper-red.	Copper-red.	No cleavage. Hackly	Masses, plates, scales,	Malleable sectile.	Opaque.	...	The value and uses of

Corundum. (<i>kô-rûn 'dûm</i>)	...	Oxide of aluminum.	9	Glassy.	All colors; usually gray or brown when massive.	White.	Often parts readily into almost rectangular pieces whose faces are cross-hatched.	branching aggregates and octahedral crystals, usually distorted. Prismatic or tabular six-sided crystals; also granular and pseudo-cleavable masses.	Brittle to tough.	Translucent to transparent.	Ruby (red). Sapphire (blue, etc.). Adamantine. Spar (massive). Emery (granular, impure).	A very valuable gem mineral and a fine abrasive. See plate I, figures 10, 11 and 13.
Epidote. (<i>êp 'î-dôt</i>)	...	Basic silicate of calcium, aluminum and iron.	6-7	Glassy to dull.	Dark green or greenish brown (crystals) to light yellowish green.	White.	Perfect in one direction.	Slender, deeply grooved prismatic crystals and cleavable to fine granular masses.	Brittle.	Transparent to opaque.	...	Common constituent of metamorphic rocks. Rarely cut as a gem.
Fluorite. (<i>flôô 'or-it</i>)	Fluor Spar. Fluorine.	Calcium fluoride.	4	Glassy.	All colors; green, violet, purple, colorless and white, the commoner.	White.	Cleaves easily into octahedrons, i. e., in four directions, at angles of 109° or 71°.	In groups of crystals, usually cubical; also in cleavable masses. Sometimes granular.	Brittle.	Transparent to translucent.	Rock fluorite (finely granular and usually very impure and hard).	Used as a flux in smelting ores, and in several arts and trades.
Galenite. (<i>gâ-lê 'nît</i>)	Galena. Lead.	Sulphide of lead.	3	Metallic.	Bluish lead, gray. Tarnishes black.	Lead-gray.	Perfect cubical, i. e., in three directions at angle of 90°.	Cubical crystals, often with triangular faces on the corners; also, cleavable to granular masses.	Very Brittle.	Opaque.	Steel galena (very fine grained masses). Often rich in silver.	Most important lead and silver ore. Often contains the latter metal with sometimes gold and other elements.
Garnet.	...	Silicate of various elements: calcium, aluminum and iron are commonest.	6½-7½	Glassy to resinous.	Commonly some shade of red; also brown, yellow, white, black, green.	White.	No cleavage. Uneven fracture.	Complex, rounded crystals, glassy masses and granular.	Brittle.	Transparent to opaque.	...	An important abrasive and a beautiful gem. Found in metamorphic rocks. See plate I, figures 8 and 15.
Gold.	...	Native metallic gold with a little silver, copper, etc.	2½-3	Metallic.	Golden yellow to nearly silver-white.	Yellow to nearly white.	No cleavage. Hackly fracture.	Nuggets, plates, scales, wires; branching aggregates and distorted crystals, usually octahedral.	Malleable sectile.	Opaque.	Based upon and named after any impurities that may be present.	The value and uses of gold are well known.
Graphite. (<i>graph 'î</i>)	Black Lead. Plumbago.	Carbon.	1-2	Metallic to dull.	Dark gray to black.	Dark gray.	Perfect in one direction. Cleavage faces are apt to be curved. Not shown if finely granular.	Imbedded scales and foliated, granular or compact masses. Rarely in six-sided, tabular crystals.	Sectile Flexible.	Opaque.	...	Used in the manufacture of lubricants, infusible crucibles, and "lead" pencils.
Gypsum. (<i>jîp 'sûm</i>)	...	Hydrous sulphate of calcium.	1½-2	Pearly, silky, vitreous, dull.	White, gray, red, yellow or other tints due to impurities.	White.	Very perfect in one direction; two others show as cracks at angle of 114°, on the perfect cleavage faces.	Diamond shaped crystals, and cleavable, fibrous, granular, foliated or compact masses.	Sectile, Thin flakes, flexible.	Translucent to transparent.	Selenite (cleavable, transparent). Satin spar (white, fibrous, silky). Alabaster, (white, fine grained).	Is carved into vases, statues, etc., and forms plaster of paris when calcined and ground. Is a precipitate rock.
Halite. (<i>hâ 'lît</i>)	Rock salt.	Chloride of sodium.	2½	Glassy.	Colorless or white when pure. Yellow, brown, red, etc., when impure.	White.	Perfect cubic i. e., in three directions at angle of 90°.	Cubical or octahedral crystals; also cleavable, granular or compact masses.	Brittle.	Translucent to transparent.	...	Tastes salty. Enormous quantities are used to season food, in various arts and trades, and as a source of sodium and its salts. A precipitate rock.
Hematite. (<i>hêm 'â-tîl</i>)	Red oxide of iron.	Oxide of iron.	5½-6½	Metallic to earthy.	Black when metallic; reddish black when dull, red when earthy.	Red.	No cleavage; may have a parting in one direction producing a platy structure. Uneven fracture.	Complex, tabular or rounded crystals; also platy, oolitic, earthy, micaceous, and kidney shaped masses.	Brittle.	Opaque.	Specular iron (mirror-like plates or crystals). Red Ochre or Ruddle (red, earthy).	The most important ore of iron, and is also used to make cheap paint, polishing powder, etc.
Limonite. (<i>lî 'môn-îl</i>)	Yellow oxide of iron.	Hydrous oxide of iron.	5-5½	Dull, silky, varnish-like.	Yellow, brown or nearly black.	Yellow or yellowish brown.	No cleavage. Uneven fracture.	Botryoidal or stalactitic forms with a radiating fibrous structure and a varnish-like surface, also earthy masses and concretions.	Brittle.	Opaque.	Bog iron ore (porous, earthy, often encloses vegetation). Yellow ochre or umber (earthy with clay, etc.).	Commonest, but most impure ore of iron, and is also used to make cheap yellow and brown paint.
Magnetite. (<i>mag 'net-îl</i>)	Magnetic iron ore.	Oxide of iron.	5½-6½	Metallic to dull.	Iron-black.	Black.	No cleavage. Sometimes parts in four directions at angles of 109° and 71°. Uneven to subconchoidal fracture.	Octahedral crystals, and coarse to fine granular, laminated, or compact masses.	Brittle.	Opaque.	Lodestone (a natural magnet).	The only black, brittle, magnetic mineral, and a very pure and valuable ore of iron.
Malachite. (<i>mâl 'â-kîl</i>)	...	Hydrous carbonate of copper.	3½-4	Silky to dull.	Green, often nearly black on exposed surfaces.	Green. Paler than the color.	No cleavage. Uneven fracture.	Massive, as botryoidal crusts with a radiating structure and silky lustre, and as slender crystals	Brittle.	Translucent to opaque.	...	Is an ore of copper and is used as an ornamental stone and in jewelry. Azur-malachite is

Muscovite. (<i>mūs 'kovīt</i>)	Mica, isinglass. White Mica.	Hydrous silicate of potassium and aluminum.	2-2½	Glassy. Pearly on cleavage faces.	White or light tints of other colors, particularly gray, brown or green.	White.	Very perfect in one direction, yielding thin sheets.	Six-sided, tabular crystals, and as scales, plates, or scaly masses.	Flexible and elastic.	Transparent to translucent.	...	malachite mixed with blue azurite. See plate 1, figure 4. Used in stove doors, as insulation in electrical apparatus, and for spangling or frosting paper and fabric.
Orthoclase. (<i>ór 'tho-klās</i>)	Feldspar. Potash.	Silicate of potassium and aluminum.	6	Glassy to stony.	Flesh-red, gray, yellow, white or colorless.	White.	In two directions at angle of 90°, one direction slightly less perfect than the other.	Thick-set square or six-sided crystals, or cleavable masses or grains.	Brittle.	Transparent to opaque.	Sanadine (transparent crystals or grains imbedded in igneous rocks).	Associated with quartz and mica in many rocks. Used in making glass and porcelain. Next to quartz in frequency of occurrence.
Pyrite. (<i>pír 'it</i>)	Pyrites. White iron. Fools gold.	Sulphide of iron.	6-6½	Metallic.	Pale to deep brass-yellow. Tarnishes brown or iridescent.	Black.	No cleavage. Conchoidal to uneven fracture.	Cubical, octahedral, or complexly rounded crystals, coarse to fine granular, and massive.	Brittle.	Opaque.	...	Used in making sulphuric acid and often contains so much gold, silver and copper as to make it an ore of these metals.
Pyrolusite. (<i>pír 'ó-lū sīt</i>)	...	Oxide of manganese.	1-2½	Metallic to dull.	Black to dark steel-gray.	Sooty black.	May appear to have good cleavage in one direction but usually shows none.	Occurs as radiating prismatic layers, velvety crust and granular to compact masses. Soils the fingers.	Brittle.	Opaque.	...	Has many uses and is valuable. Usually associated with a very fine grained, hard, black mineral that is often botryoidal.
Pyroxene. (<i>pír 'óks-ēn</i>)	...	Silicate of magnesium, calcium, aluminum and iron.	5-6	Glassy to dull.	Black or light to dark green.	White to greenish.	Poor in two directions at angle of nearly 90°. May have a fine platy parting.	Prismatic crystals with square or octagonal cross-section; also foliated and massive.	Brittle.	Transparent to opaque.	Diopside (light green, glassy). Diallage (light green, dull, foliated). Auagite (black).	A common constituent of igneous rocks. Diopside is sometimes used as a gem.
Quartz. (Pheno-crystalline).	...	Oxide of silicon.	7	Glassy.	White or colorless when pure. All colors when impure.	White or light tints.	No cleavage. Single crystal has conchoidal fracture, otherwise the fracture is uneven.	Six-sided prism terminated by a six-sided pyramid; also massive, coarse to fine granular, and as sand.	Brittle.	Transparent.	Rock crystal (colorless, transparent). Amethyst (purple). Rose (pink). False topaz or Citrine (yellow). Smoky quartz or Topaz (brown or gray). Milky (white). Ferruginous (iron stained).	The commonest of all minerals. A constituent of most rock. Great quantities are used as a flux in smelting, as abrasives, and in the manufacture of glass and porcelain. The transparent varieties of pleasing tints are used as gems. Water-clear spheres are very valuable.
Quartz. (Crypto-crystalline).	Dull to earthy.	No cleavage. Conchoidal fracture.	Very fine grained massive, botryoidal, nodular, or filling or lining cavities in rocks.	Brittle.	Translucent to opaque.	Chalcedony (drab). Carnelian (red, translucent). Jasper (red, brown, yellow, opaque). Heliotrope or Bloodstone (dark green with red spots). Flint (dark gray concretions). Agate (banded or particolored). Onyx (agate with flat layers). Petrified wood (wood replaced by quartz).	...
Serpentine. (<i>sér 'pēn-tin</i>)	...	Hydrous silicate of magnesium and iron.	4+	Wax-like, silky, earthy.	Light to dark green, yellow, brownish red, variegated.	White.	No cleavage. Conchoidal fracture when massive.	Compact, massive or coarse to fine fibrous. The two habits are often in parallel layers.	Tough. Fibres are flexible.	Translucent to opaque.	Precious or noble (massive, translucent). Chrysolite (silky, fibres). Verde antique (massive with calcite).	Chrysolite is the best commercial asbestos. Other varieties are used as ornamental stone and occasionally in jewelry.
Siderite. (<i>síd 'ér-īt</i>)	...	Carbonate of iron.	3½-4	Glassy to earthy.	Light to dark brown or gray. Tarnishes reddish brown or brownish black.	White to yellowish.	Very perfect in three directions at angle of 107° and 73°. Not evident when fine grained.	Cleavable masses, coarse to fine, granular and at warped crystals that resemble distorted cubes.	Brittle.	Translucent to opaque.	Sphaerosiderite or Clay-ironstone (concretions of fine grained siderite mixed with clay).	The most valuable ore of iron, but is rather uncommon. The impure clay-ironstone is fairly common in sediments.

Sphalerite. (<i>sāl 'ér-īt</i>)	Blende, Jack Rosin zinc, zinc, etc.	Sulphide of zinc.	3½-4	Resinous to nearly metallic.	Commonly yellow, brown, black or red; sometimes green or white.	White, yellow or brown.	Very perfect in six directions at angles of 60°, 90° and 120°.	Complexly rounded or modified cubical crystals; also cleavable, coarse to fine granular masses, and botryoidal, etc.	Brittle.	Transparent to opaque.	...	The commonest zinc ore and an impure variety furnishes most of the cadmium of commerce. Associated with galenite and silver minerals.
Stibnite. (<i>stīb nīt</i>)	...	Sulphide of antimony.	2	Metallic.	Light gray. Cleavage faces appear silver white when reflecting light.	Lead-gray.	Perfect in one direction, yielding blade-like strips which are bent or hatched perpendicular to their length.	Sharp, vertically grooved, prismatic crystals and in cleavable masses with a bladed structure.	Very brittle.	Opaque.	...	The chief source of antimony and its salts. Sometimes carries gold and silver.
Talc. (<i>tālk</i>)	Talcum.	Hydrous silicate of magnesium.	1-1½	Waxy to dull. Pearly on cleavage faces.	White, light green, gray; other colors when impure.	White to greenish.	Perfect in one direction, yielding thin flexible plates. Not shown on the fine grained soapstone.	Foliated, coarse to fine granular, or compact masses. Feels greasy to soapy.	Tough sectile.	Transparent to translucent.	Steatite or soapstone (granular, impure, hardness up to 2½). French chalk (white, fine grained soft).	Used in making porcelain, polishing powder, lubricants, gas jets, tinted plasters, paper, soap, leather dressing, talcum powder, slate pencils, and in other ways. Often contains enough silver to make it a valuable ore of this metal as well as copper.
Tetrahedrite. (<i>tef 'ra-he 'drīt</i>)	Gray copper.	Sulph-antimonite of copper.	3-4½	Metallic.	Gray.	Gray, brown, or reddish.	No cleavage. Uneven, granular fracture.	Crystals have four triangular faces. Occurs usually granular massives.	Brittle.	Opaque.	...	Often contains enough silver to make it a valuable ore of this metal as well as copper.
Tourmaline. (<i>tōōr 'mā-līn</i>)	Schorl.	Silicate of boron and various other bases varying with the variety.	7-7½	Glassy to resinous.	All colors. Interior and exterior or opposite ends of a crystal may differ in color.	White.	No cleavage. Uneven to poor conchoidal fracture.	Vertically lined, prismatic crystals with spherical triangular cross-sections. Also columnar or compact massive.	Very brittle.	Transparent to opaque.	Schorl (black). Rubellite (pink). Indicolite (blue). Achroite (white).	A popular semi-precious gem. When heated (not above 212° F.), will usually pick up bits of paper. Opposite ends of crystals have different forms. Often a constituent of metamorphic rocks.
Zoisite. (<i>zoīs īt</i>)	...	Silica, alumina, lime, peroxide of iron, water.	6	Pearly.	White, gray, yellow, brown.	Uncolored.	Parallel cleavage; sometimes fibrous.	Occurs in trimetric crystals; also massive.	Brittle.	Transparent, translucent.	...	Often a constituent of metamorphic rocks.

Name of Mineral	Common Name	Composition	Hardness	Lustre	Color	Streak
Amphibole. (<i>ām 'fī-bōl</i>)	...	Silicate of magnesium, calcium, aluminum, iron, etc.	5-6	Glassy to dull.	Black or light to dark green.	White
Arsenopyrite. (<i>ār 'sēn-ō-pīr īt</i>)	Mispickel.	Sulphide and arsenide of iron.	6	Metallic.	Silver, yellowish, or light grayish white.	Black.
Barite. (<i>bā rīt</i>)	Barytes. Heavy spur.	Sulphate of barium.	3	Glassy to stony.	White, yellow, blue or brown.	White.
Biotite. (<i>bī 'ō-tīt</i>)	Black Mica.	Hydrous silicate of aluminum, potassium, magnesium and iron.	2½-3	Glassy to almost metallic.	Black or dark brown.	White.
Calcite. (<i>kāl 'sīt</i>)	Lime. Calespar.	Carbonate of Calcium.	3	Glassy to earthy.	Colorless or white when pure, all colors when impure.	White.
Chalcocite. (<i>kāl 'kō-sīt</i>)	Copper Glance.	Sulphide of copper.	3	Metallic; dull when impure or tarnished.	Dark gray. Tarnishes black or green.	Lead-gray.
Chalcopyrite. (<i>kāl 'kō-pīr īt</i>)	Copper Pyrites. Fools gold.	Sulphide of copper and iron.	4	Metallic.	Bright brass-yellow. Often tarnished iridescent.	Greenish black.
Copper.	...	Native metallic copper.	2½-3	Metallic.	Copper-red. Tarnishes green to black.	Copper-red.
Corundum. (<i>kō-rūn 'dūm</i>)	...	Oxide of aluminum.	9	Glassy.	All colors; usually gray or brown when massive.	White.
Epidote. (<i>ēp 'ī-dōt</i>)	...	Basic silicate of calcium, aluminum and iron.	6-7	Glassy to dull.	Dark green or greenish brown (crystals) to light yellowish green.	White.
Fluorite. (<i>floo 'or-īt</i>)	Fluor Spar. Fluorine.	Calcium fluoride.	4	Glassy.	All colors; green, violet, purple, colorless and white, the commoner.	White.
Galenite. (<i>gā-lē 'nīt</i>)	Galena. Lead.	Sulphide of lead.	3	Metallic.	Bluish lead, gray. Tarnishes black.	Lead-gray.
Garnet.	...	Silicate of various elements: calcium, aluminum and iron are commonest.	6½-7½	Glassy to resinous.	Commonly some shade of red; also brown, yellow, white, black, green.	White.
Gold.	...	Native metallic gold with a little silver, copper, etc.	2½-3	Metallic.	Golden yellow to nearly silver-white.	Yellow to nearly white. Dark gray.
Graphite. (<i>graph īt</i>)	Black Lead. Plumbago.	Carbon.	1-2	Metallic to dull.	Dark gray to black.	Dark gray.
Gypsum. (<i>jīp 'sūm</i>)	...	Hydrous sulphate of calcium.	1½-2	Pearly, silky, vitreous, dull.	White, gray, red, yellow or other tints due to impurities.	White.
Halite. (<i>hā īt</i>)	Rock salt.	Chloride of sodium.	2½	Glassy.	Colorless or white when pure. Yellow, brown, red, etc., when impure.	White.
Hematite. (<i>hēm 'ā-tīt</i>)	Red oxide of iron.	Oxide of iron.	5½-6½	Metallic to earthy.	Black when metallic; reddish black when dull, red when earthy.	Red.
Limonite. (<i>lī 'mōn-īt</i>)	Yellow oxide of iron.	Hydrous oxide of iron	5-5½	Dull, silky, varnish-like.	Yellow, brown or nearly black.	Yellow or yellowish brown. Black.
Magnetite. (<i>mag 'net-īt</i>)	Magnetic iron ore.	Oxide of iron.	5½-6½	Metallic to dull.	Iron-black.	Black.
Malachite. (<i>māl 'ā-kīt</i>)	...	Hydrous carbonate of copper.	3½-4	Silky to dull.	Green, often nearly black on exposed surfaces.	Green. Paler than the color.
Muscovite. (<i>mūs 'kovīt</i>)	Mica, isinglass. White Mica.	Hydrous silicate of potassium and aluminum.	2-2½	Glassy. Pearly on cleavage faces.	White or light tints of other colors, particularly gray, brown or green.	White.
Orthoclase. (<i>ōr 'thō-kīās</i>)	Feldspar. Potash.	Silicate of potassium and aluminum.	6	Glassy to stony.	Flesh-red, gray, yellow, white or colorless.	White.
Pyrite. (<i>pīr īt</i>)	Pyrites. White iron. Fools gold.	Sulphide of iron.	6-6½	Metallic.	Pale to deep brass-yellow. Tarnishes brown or iridescent.	Black.
Pyrolusite. (<i>pīr 'ō-lū 'sīt</i>)	...	Oxide of manganese.	1-2½	Metallic to dull.	Black to dark steel-gray.	Sooty black.
Pyroxene. (<i>pīr 'ōks-ēm</i>)	...	Silicate of magnesium, calcium, aluminum and iron.	5-6	Glassy to dull.	Black or light to dark green.	White to greenish.
Quartz. (Pheno-crystalline).	...	Oxide of silicon.	7	Glassy.	White or colorless when pure. All colors when impure.	White or light tints.

Quartz. (Cryptocrystalline).	Dull to earthy.
Serpentine. (<i>sēr 'pēn-tīn</i>)	...	Hydrous silicate of magnesium and iron.	4+	Wax-like, silky, earthy.	Light to dark green, yellow, brownish red, variegated.	White.
Siderite. (<i>sīd 'ēr-īt</i>)	...	Carbonate of iron.	3½-4	Glassy to earthy.	Light to dark brown or gray. Tarnishes reddish brown or brownish black.	White to yellowish.
Sphalerite. (<i>sfāl 'ēr-īt</i>)	Blende, Jack Rosin zinc, zinc, etc.	Sulphide of zinc.	3½-4	Resinous to nearly metallic.	Commonly yellow, brown, black or red; sometimes green or white.	White, yellow or brown.
Stibnite. (<i>stīb 'nīt</i>)	...	Sulphide of antimony.	2	Metallic.	Light gray. Cleavage faces appear silver white when reflecting light.	Lead-gray.
Talc. (<i>tālk</i>)	Talcum.	Hydrous silicate of magnesium.	1-1½	Waxy to dull. Pearly on cleavage faces.	White, light green, gray; other colors when impure.	White to greenish.
Tetrahedrite. (<i>tet 'ra-he 'drīt</i>)	Gray copper.	Sulph-antimonite of copper.	3-4½	Metallic.	Gray.	Gray, brown, or reddish.
Tourmaline. (<i>tōōr 'mā-līn</i>)	Schorl.	Silicate of boron and various other bases varying with the variety.	7-7½	Glassy to resinous.	All colors. Interior and exterior or opposite ends of a crystal may differ in color.	White.
Zoisite. (<i>zois 'īt</i>)	...	Silica, alumina, lime, peroxide of iron, water.	6	Pearly.	White, gray, yellow, brown.	Uncolored.

Name of Mineral	Cleavage or Fracture	Crystallization and Occurrence	Tenacity etc.	Diaphaneity	Varieties	Remarks
Amphibole. (<i>ām 'ī-bōd</i>)	Perfect in two directions at angle of 124°.	Prismatic crystals with hexagonal cross-section, common; also cleavable masses.	Brittle to tough.	Opaque to transparent.	Actinolite (green, transparent). Asbestos (fibrous, dull). Hornblende (black).	Common constituent of igneous and metamorphic rocks. Valueless.
Arsenopyrite. (<i>ār 'sēn-ō-py'r 'īt</i>)	Good in two directions at an angle of 112°. Not evident on fine grained material.	Crystals resemble a double-edged axe. Occurs also coarse to fine granular.	Brittle.	Opaque.	...	Principal ore of arsenic and sometimes carries gold. Gives sparks and garlic odor when struck with a hammer. Yellow tarnish.
Barite. (<i>bā 'rīt</i>)	Perfect in one direction; two other good cleavages at right angles to the first and at 101° with each other.	Diamond shaped or rectangular tabular, or prismatic crystals and platy masses.	Brittle.	Transparent to translucent.	...	Used to adulterate white lead and give weight to paper. Often associated with lead ores. Very heavy.
Biotite. (<i>bī 'ō-tīt</i>)	Very perfect in one direction, yielding thin sheets.	Six-sided tabular crystals, and as scales, plates, or scaly masses.	Flexible and elastic.	Opaque to transparent.	...	Common constituent of igneous rocks. May be brittle when altered. Valueless.
Calcite. (<i>kāl 'sīt</i>)	Perfect in three directions at angles of about 105° or 75°.	Prismatic or tabular six-sided crystals; also granular, cleavable, or earthy masses.	Brittle.	Transparent to opaque.	Marble (granular). Limestone (dull, compact). Chalk (soft, white, earthy). Mexican Onyx (compact, banded).	Effervesces vigorously in hydrochloric acid of any strength and temperature. Used as flux, building or ornamental stone, to make lime, etc.
Chalcocite. (<i>kāl 'kō-sīt</i>)	No cleavage, smooth conchoidal fracture.	Usually very compact masses; six-sided, tabular crystals rare.	Slightly sectile.	Opaque.	...	An important ore of copper. Cuts easily, yielding a highly polished surface.
Chalcopyrite. (<i>kāl 'kō-pīr 'īt</i>)	No cleavage. Uneven fracture.	Occurs massive or in scattered particles. Crystals usually have four triangular faces.	Brittle.	Opaque.	...	One of the most important ores of copper and often carries silver and gold. Is often mistaken for the latter.
Copper.	No cleavage. Hackly fracture.	Masses, plates, scales, branching aggregates and octahedral crystals, usually distorted.	Malleable sectile.	Opaque.	...	The value and uses of copper are well known. Often carries some silver.
Corundum. (<i>kō-rūn 'dūm</i>)	Often parts readily into almost rectangular pieces whose faces are cross-hatched.	Prismatic or tabular six-sided crystals; also granular and pseudo-cleavable masses.	Brittle to tough.	Translucent to transparent.	Ruby (red). Sapphire (blue, etc.). Adamantine. Spar (massive). Emery (granular, impure).	A very valuable gem mineral and a fine abrasive. See plate I, figures 10, 11 and 13.
Epidote. (<i>ēp 'ī-dōt</i>)	Perfect in one direction.	Slender, deeply grooved prismatic crystals and cleavable to fine granular masses.	Brittle.	Transparent to opaque.	...	Common constituent of metamorphic rocks. Rarely cut as a gem.
Fluorite. (<i>floo 'or-īt</i>)	Cleaves easily into octahedrons, i. e., in four directions, at angles of 109° or 71°.	In groups of crystals, usually cubical, also in cleavable masses. Sometimes granular.	Brittle.	Transparent to translucent.	Rock fluorite (finely granular and usually very impure and hard).	Used as a flux in smelting ores, and in several arts and trades.
Galenite. (<i>gā-lē 'nīt</i>)	Perfect cubical, i. e., in three directions at angle of 90°.	Cubical crystals, often with triangular faces on the corners; also, cleavable to granular masses.	Very Brittle.	Opaque.	Steel with galena (very fine grained masses). Often rich in silver.	Most important lead and silver ore. Often contains the latter metal with sometimes gold and other elements.
Garnet.	No cleavage. Uneven fracture.	Complex, rounded crystals, glassy masses and granular.	Brittle.	Transparent to opaque.	...	An important abrasive and a beautiful gem. Found in metamorphic rocks. See plate I, figures 8 and 15.
Gold.	No cleavage. Hackly fracture.	Nuggets, plates, scales, wires; branching aggregates and distorted crystals, usually octahedral.	Malleable sectile.	Opaque.	Based upon and named after any impurities that may be present.	The value and uses of gold are well known.
Graphite. (<i>graph 'īt</i>)	Perfect in one direction. Cleavage faces are apt to be curved. Not shown if finely granular.	Imbedded scales and foliated, granular or compact masses. Rarely in six-sided, tabular crystals.	Sectile Flexible.	Opaque.	...	Used in the manufacture of lubricants, infusible crucibles, and "lead" pencils.
Gypsum. (<i>jīp 'sūm</i>)	Very perfect in one direction; two others show as cracks at angle of 114°, on the perfect cleavage faces.	Diamond shaped crystals, and cleavable, fibrous, granular, foliated or compact masses.	Sectile, Thin flakes, flexible.	Translucent to transparent.	Selenite (cleavable, transparent). Satin spar (white, fibrous, silky). Alabaster, (white, fine grained).	Is carved into vases, statues, etc., and forms plaster of paris when calcined and ground. Is a precipitate rock.
Halite. (<i>hā 'līt</i>)	Perfect cubic i. e., in three directions at angle of 90°.	Cubical or octahedral crystals; also cleavable, granular or compact masses.	Brittle.	Translucent to transparent.	...	Tastes salty. Enormous quantities are used to season food, in various arts and trades, and as a source of sodium and its salts. A precipitate rock.
Hematite. (<i>hēm 'ā-tīt</i>)	No cleavage; may have a parting in one direction producing a platy structure. Uneven fracture.	Complex, tabular or rounded crystals; also platy, oolitic, earthy, micaceous, and kidney shaped masses.	Brittle.	Opaque.	Specular iron (mirror-like plates or crystals). Red Ochre or Ruddle (red, earthy).	The most important ore of iron, and is also used to make cheap paint, polishing powder, etc.
Limonite. (<i>lī 'mōn-īt</i>)	No cleavage. Uneven fracture.	Botryoidal or stalactitic forms with a radiating fibrous structure and a varnish-like surface, also earthy masses and concretions.	Brittle.	Opaque.	Bog iron ore (porous, earthy, often encloses vegetation). Yellow ochre or umber (earthy with clay, etc.)	Commonest, but most impure ore of iron, and is also used to make cheap yellow and brown paint.
Magnetite. (<i>mag 'net-īt</i>)	No cleavage. Sometimes parts in four directions at angles of 109° and 71°. Uneven to subconchoidal fracture.	Octahedral crystals, and coarse to fine granular, laminated, or compact masses.	Brittle.	Opaque.	Lodestone (a natural magnet).	The only black, brittle, magnetic mineral, and a very pure and valuable ore of iron.
Malachite. (<i>māl 'ā-kīt</i>)	No cleavage. Uneven fracture.	Massive, as botryoidal crusts with a radiating structure and silky lustre, and as slender crystals forming velvety surfaces.	Brittle.	Translucent to opaque.	...	Is an ore of copper and is used as an ornamental stone and in jewelry. Azurmalachite is malachite mixed with blue azurite. See plate I, figure 4.
Muscovite. (<i>mūs 'kovīt</i>)	Very perfect in one direction, yielding thin sheets.	Six-sided, tabular crystals, and as scales, plates, or scaly masses.	Flexible and elastic.	Transparent to translucent.	...	Used in stove doors, as insulation in electrical apparatus, and for spangling or frosting paper and fabric.
Orthoclase. (<i>ōr 'thō-klās</i>)	In two directions at angle of 90°, one	Thick-set square or six-sided crystals, or	Brittle.	Transparent to opaque.	Sanadine (transparent crystals or grains imbedded in igneous rocks).	Associated with quartz and mica in many rocks. Used in making glass and porcelain.

	direction slightly less perfect than the other.	cleavable masses or grains.				Next to quartz in frequency of occurrence.
Pyrite. (<i>pīr 'īt</i>)	No cleavage. Conchoidal to uneven fracture.	Cubical, octahedral, or complexly rounded crystals, coarse to fine granular, and massive.	Brittle.	Opaque.	...	Used in making sulphuric acid and often contains so much gold, silver and copper as to make it an ore of these metals.
Pyrolusite. (<i>pīr 'o-lū 'sīt</i>)	May appear to have good cleavage in one direction but usually shows none.	Occurs as radiating prismatic layers, velvety crust and granular to compact masses. Soils the fingers.	Brittle.	Opaque.	...	Has many uses and is valuable. Usually associated with a very fine grained, hard, black mineral that is often botryoidal.
Pyroxene. (<i>pīr 'ōks-ēn</i>)	Poor in two directions at angle of nearly 90°. May have a fine platy parting.	Prismatic crystals with square or octagonal cross-section; also foliated and massive.	Brittle.	Transparent to opaque.	Diopside (light green, glassy). Diopside (light green, dull, foliated). Auagite (black).	A common constituent of igneous rocks. Diopside is sometimes used as a gem.
Quartz. (Pheno-crystalline).	No cleavage. Single crystal has conchoidal fracture, otherwise the fracture is uneven.	Six-sided prism terminated by a six-sided pyramid; also massive, coarse to fine granular, and as sand.	Brittle.	Transparent.	Rock crystal (colorless, transparent). Amethyst (purple). Rose (pink). False topaz or Citrine (yellow). Smoky quartz or Topaz (brown or gray). Milky (white). Ferruginous (iron stained).	The commonest of all minerals. A constituent of most rock. Great quantities are used as a flux in smelting, as abrasives, and in the manufacture of glass and porcelain. The transparent varieties of pleasing tints are used as gems. Water-clear spheres are very valuable.
Quartz. (Crypto-crystalline).	No cleavage. Conchoidal fracture.	Very fine grained massive, botryoidal, nodular, or filling or lining cavities in rocks.	Brittle.	Translucent to opaque.	Chalcedony (drab). Carnelian (red, translucent). Jasper (red, brown, yellow, opaque). Heliotrope or Bloodstone (dark green with red spots). Flint (dark gray concretions). Agate (banded or particolored). Onyx (agate with flat layers). Petrified wood (wood replaced by quartz).	...
Serpentine. (<i>sēr 'pēn-tīn</i>)	No cleavage. Conchoidal fracture when massive.	Compact, massive or coarse to fine fibrous. The two habits are often in parallel layers.	Tough. Fibres are flexible.	Translucent to opaque.	Precious or noble (massive, translucent). Chrysotile (silky, fibres). Verde antique (massive with calcite).	Chrysotile is the best commercial asbestos. Other varieties are used as ornamental stone and occasionally in jewelry.
Siderite. (<i>sīd 'ēr-īt</i>)	Very perfect in three directions at angle of 107° and 73°. Not evident when fine grained.	Cleavable masses, coarse to fine, granular and at warped crystals that resemble distorted cubes.	Brittle.	Translucent to opaque.	Sphaerosiderite or Clay-ironstone (concretions of fine grained siderite mixed with clay).	The most valuable ore of iron, but is rather uncommon. The impure clay-ironstone is fairly common in sediments.
Sphalerite. (<i>sḥāl 'ēr-īt</i>)	Very perfect in six directions at angles of 60°, 90° and 120°.	Complexly rounded or modified cubical crystals; also cleavable, coarse to fine granular masses, and botryoidal, etc.	Brittle.	Transparent to opaque.	...	The commonest zinc ore and an impure variety furnishes most of the cadmium of commerce. Associated with galenite and silver minerals.
Stibnite. (<i>stīb 'nīt</i>)	Perfect in one direction, yielding blade-like strips which are bent or hatched perpendicular to their length.	Sharp, vertically grooved, prismatic crystals and in cleavable masses with a bladed structure.	Very brittle.	Opaque.	...	The chief source of antimony and its salts. Sometimes carries gold and silver.
Talc. (<i>tālḥ</i>)	Perfect in one direction, yielding thin flexible plates. Not shown on the fine grained soapstone.	Foliated, coarse to fine granular, or compact masses. Feels greasy to soapy.	Tough sectile.	Transparent to translucent.	Stearite or soapstone (granular, impure, hardness up to 2½). French chalk (white, fine grained soft).	Used in making porcelain, polishing powder, lubricants, gas jets, tinted plasters, paper, soap, leather dressing, talcum powder, slate pencils, and in other ways.
Tetrahedrite. (<i>teḥ 'ra-he 'drīt</i>)	No cleavage. Uneven, granular fracture.	Crystals have four triangular faces. Occurs usually granular massive.	Brittle.	Opaque.	...	Often contains enough silver to make it a valuable ore of this metal as well as copper.
Tourmaline. (<i>tōōr 'mā-līn</i>)	No cleavage. Uneven to poor conchoidal fracture.	Vertically lined, prismatic crystals with spherical triangular cross-sections. Also columnar or compact massive.	Very brittle.	Transparent to opaque.	Schorl (black). Rubellite (pink). Indicolite (blue). Achroite (white).	A popular semi-precious gem. When heated (not above 212° F.), will usually pick up bits of paper. Opposite ends of crystals have different forms.
Zoisite. (<i>zoīs 'īt</i>)	Parallel cleavage; sometimes fibrous.	Occurs in tri-metric crystals; also massive.	Brittle.	Transparent, translucent.	...	Often a constituent of metamorphic rocks.

Antimony and Bismuth. Antimony is produced in Germany, France, Italy, Hungary, United States, Japan and other countries.

Bismuth comes mainly from Bolivia and Australia. Some is produced in Saxony and England.

Stibnite (antimony sulphide) is the chief ore of antimony. Bismuth occurs in small amounts in a pure state and also combined with sulphur.

These metals form many alloys such as type metal, anti-friction metals, white metal, babbitt metal, fusible metals.

Tartar emetic and other antimony compounds are used in medicine and dyeing.

Amber is a fossil resin found chiefly along the shores of the Baltic. It is used in making mouthpieces for pipes, cigar holders, beads and other articles.

Arsenic. Germany, England, Canada, the United States and Spain produce the ores. Chemical laboratories transform them into the useful compounds.

Arsenopyrite (arsenic and iron sulphide), orpiment and realgar (sulphides of arsenic) and the sources of arsenic.

Arsenic (white arsenic, arsenious acid or oxide of arsenic), paris green and other compounds and salts are prepared.

Sheep dip, rat poison, insecticides, embalming fluid, pigments and dyes are prepared with arsenic compounds. Arsenic salts are used in preparing certain coal-tar colors.

Asphaltum (or mineral pitch) is a bituminous mineral substance found more or less pure, in some localities. The pitch lake of Trinidad and the Bermudez lake at the mouth of the Orinoco in Venezuela, are the largest known deposits of moderately pure asphalt. Smaller deposits of high grade occur in Utah, Cuba and the Barbadoes.

Rock asphalt consists of sandstone or limestone impregnated with asphalt. Much asphalt is produced in refining certain grades of petroleum—such as those obtained in California and Texas.

Rock asphalts are mined in France, Switzerland, Sicily, California, Kentucky and Oklahoma.

For paving rock asphalts are much used in Europe. Trinidad and Venezuelan asphalts are exported in large quantities to the United States and Europe. For paving, these lake asphalts are mixed with broken stone, sand and petroleum residuum.

Pure varieties (gilsonite, marjak, glance pitch) are made into black varnish, used for insulating, etc.

Barium is mined in the United States and Germany.

Barytes or barite is a heavy, white mineral (barium sulphate). It is used as a substitute or adulterant for white lead in paints, and in making oxygen.

Bismuth. See *antimony*.

Building Stones are quarried for local use in all parts of the world.

Granite, syenite, gneiss, basalt and other hard or durable rocks.

Only stone of exceptional beauty is shipped to a great distance. Scotland, Norway, Massachusetts, Maine and other localities produce fine stones.

Calcium has no commercial use in the metallic state. Its compounds, both natural and artificial, are of great economic importance.

Limestone (calcium carbonate) is a very common rock used for building. It may be of almost any color and coarse or fine in texture. It is found and utilized in all parts of the world. In the United States, Pennsylvania, Illinois, Ohio, Indiana, New York and Missouri are the chief producers.

Lime is used in chemical industries and mortar.

Marble is a name applied to limestones suitable for polishing or ornamental work. *Mexican onyx* is translucent. Fine marbles are quarried in Italy, Egypt, France, Spain and Greece. Vermont, Georgia, Tennessee and New York supply the greater part of the marble used in the United States. Handsome marbles are imported from Carrara, Italy, and other parts of Europe. Mexican onyx is also imported.

Chalk comes mainly from the south of England. We export some Portland cement and import a little from Europe.

Chalk is of peculiar soft texture; *whiting* is prepared chalk used to make putty and paints; *precipitated chalk* is similar.

Lime is made by burning (calcining) common limestones. *Portland* and *hydraulic cements* are prepared by calcining siliceous limestones or a mixture of limestone and clay.

They are of enormous commercial importance, being used in concrete construction work. Europe and the United States produce large quantities. Pennsylvania is the leading state in this industry.

Buildings (both commercial and residences) are now being extensively constructed of cement—in the former case being re-enforced by iron rods.

Chloride of lime (or bleaching powder), *acetate of lime, calcium carbide* and many other compounds are of industrial value.

Gypsum (hydrous calcium sulphate) is used in fertilizers. Plaster is prepared by calcining (burning) gypsum. *Plaster of paris* is its purest form. *Alabaster* is compact white gypsum. It is a common mineral mined in many parts of the world. Michigan, Kansas, New York, Ohio and other states produce it. Fertilizers and plaster use up large quantities of this mineral. Plaster of paris is used for casts, decorative plaster work, cement, etc.

Fluorite (calcium fluoride) is a less common mineral. Mined in England, Kentucky and Illinois. It is used in chemical manufacture and as a flux for ores.

Phosphate rock (chiefly calcium phosphate) is important in the preparation of fertilizers, and chemicals containing phosphorus. It is found in deposits of organic origin in South Carolina, Florida, Tennessee, the West Indies, Canada, Spain, France, Germany and England.

The natural phosphates are treated with sulphuric acid as a first step in the manufacture of phosphatic fertilizers. Exported in large amount to Germany, England and other countries.

Carborundum, or carbide of silicon, is harder than any known substance but the diamond. Much is manufactured at Niagara Falls, by electrically heating a mixture of coke, sand and salt. It is used for making polishing powder, in grinding wheels, sharpening stones, abrasive cloth, etc.

Cerium. See *rare metals*.

Chrome is mined in Asia Minor, Greece, Canada, New Caledonia and California. Its salts are prepared in chemical laboratories.

Chromite (oxide of chromium and iron) is the only ore.

Bichromate of potash is the most important compound. It, together with chromic acid, is used in tanning soft leather. A small percentage added to steel makes it very hard and suitable for burglar-proof safes, tools, etc. Salts of chrome are used for dyes and pigments, such as chrome yellow, chrome green, etc.

Coal is one of the most important of all rocks and first among fuels. It consists chiefly of carbon, and is universally regarded as of vegetable origin.

Several theories as to the origin of coal have been put forth from time to time. The one now generally accepted is that the rank and luxuriant vegetation which prevailed during the carboniferous age grew and decayed upon land but slightly raised above the sea; that by slow subsidence this thick layer of vegetable matter sank below the water, and became gradually covered with sand, mud, and other mineral sediment; that then, by some slight upheaval or gradual tilting up of the sea bottom, a land surface

was once more formed, and covered with a dense mass of plants, which in course of time decayed, sank, and became overlaid with silt and sand as before. At length, thick masses of stratified matter would accumulate, producing great pressure, and this, acting along with chemical changes, would gradually mineralize the vegetable layers into coal.

In passing from wood or peat to coal, the proportion of carbon increases, while that of oxygen and hydrogen decreases, these substances being given off in the form of marsh-gas and carbonic acid gas in the process of decay.

Deposits occur in almost all parts of the world, but many are almost entirely undeveloped; as, for example, the coal fields of China. The largest production is in the United States, Wales, England, Germany, Austria, Russia and Australia. Mines are worked in India, Japan, Mexico, South America, South Africa, China and the Philippines. Pennsylvania, Ohio, West Virginia, Alabama, Indiana, Iowa and many other states mine coal in great amount. Pennsylvania produces nearly all of the anthracite and a large quantity of bituminous coal.

Bituminous coal, coking coal, non-coking coal, cannel coal, cherry coal, splint coal, gas coal, steam coal, etc., are all varieties of soft coal and contain a considerable percentage of volatile matter.

Bituminous coal is the fuel which runs the factories, railways and steamships of the world. The distillation of coal tar and the utilization of its numerous by-products, is one of the best examples of modern economy which turns waste material into useful products and large profits. Much coke is made without saving the by-products.

By distillation, bituminous coal yields gas, ammonia, coal tar and coke. Coal tar products are numbered by the thousand. Among them are naphtha, benzene, oil of mirbane, perfumes, flavors, drugs, saccharine, aniline and other dyes, phenol, carbolic acid, salicylic acid, naphthaline, photographic developers, creosote, oils, tar and pitch.

Anthracite coal is almost pure carbon.

Cobalt is a metal the ores of which are sparingly distributed. It generally occurs as Speiss-cobalt, cobalt-glace (or cobaltite), wad, cobalt-bloom, linnæite and skutterudite. Its minerals are found chiefly in the Erzgebirge Mountains, Sweden, Norway, Chile, in silver ores near Coleman township, Ontario, in Oregon (as garnierite), and in New Caledonia. The metal itself is of a gray color with a reddish tinge, brittle, hard, and very magnetic.

Many of its compounds are valued on account of the brilliance and permanence of their colors. The protoxide of cobalt, is employed in the form of smalt in the production of the blue colors in porcelain, pottery, glass, encaustic tiles, fresco-painting, etc., and forms the principal ingredient in Old Sevres Blue, Thenard's Blue, etc. The chlorid of cobalt, dissolved in much water, may be employed as a sympathetic ink. In dilute solutions, it is of a faint pink color, which is not observable upon paper; but when heated before the fire, it loses water, and becomes blue, and the writing is then capable of being read.

Copper is, next to iron, the most important metal in use. Its greatest production is in the United States, in Arizona, Montana, Michigan, and Utah. Spain, Japan, Chili, Australia and Germany produce smaller amounts. The metal is purified by smelting, and refined, often by electrolytic methods. There are many ores.

Chalcopyrite and **bornite** (sulphides of copper and iron) are widely distributed.

Chalcocite (copper sulphide) is mined in Montana, **malachite** and **azurite** (carbonates of copper) in Arizona and metallic copper in Michigan.

Copper matte is the crude metal as it comes from the smelter.

Brass and **bronze** are alloys of copper with zinc, tin, aluminum, etc.

Copper sulphate (blue vitriol) is the most important chemical compound of copper.

The value of copper has increased within recent years, due to its enormous use in electrical work. Aside from this, copper is employed in large amount in the various alloys into which it enters, and in coins, utensils, printing plates, etc. Copper sulphate is extensively used in electrical apparatus dyes, chemical work and as an antiseptic. Large amounts of manufactured copper are exported to Europe. Smaller quantities of ores, matte and regulus are imported from Mexico, South America and other countries. Copper wire is extensively used by telephone and telegraph companies.

Diamond. See **gems**.

Gems, or Precious Stones are those which, because of their beauty, hardness, and rarity, are prized for use in ornamentation, especially in jewelry. The diamond, ruby, sapphire, and emerald are the only stones which are, strictly speaking, entitled to be called "precious" in this sense; but the opal, on account of its beauty, is often classed with the precious stones; as is also the pearl, which is really not a stone, but a secretion of a shellfish.

[110]

Alexandrite.—A variety of chrysoberyl found in the mica slate of the Ural mountains. It is of a rich garnet color by artificial light, by daylight of a dark moss green. It is the only stone that so changes. The finest specimens of alexandrite are nearly as valuable as diamonds.

Amethyst.—A variety of crystallized quartz of a purple or bluish-violet color, of different shades. It is much used as a jeweler's stone. The lighter colored ones come from Brazil, the deep purple ones from Siberia. In value they are about the same as the garnet.

Beryl.—A very hard mineral of much beauty when transparent. It occurs in hexagonal prisms, commonly of a green or bluish-green color, but also yellow, pink and white. It is a silicate of aluminum and glucinum. Beryls are very rich in colors.

Bloodstone.—A green siliceous stone sprinkled with red jasper, whence the name.

Cameo.—A figure cut in stone or shell that is composed of different colored layers. The value depends on the artistic merit of the engraved figure.

Carbuncle.—A beautiful gem of a deep red color (with a mixture of scarlet), found in the East Indies. When held up to the sun it loses its deep tinge, and becomes of the color of a burning coal.

Carmelian.—A variety of chalcedony, of a clear, deep red, flesh-red, or reddish-white color. It is moderately hard, capable of a good polish, and often used for seals. It is now used but little.

Cat's-eye.—A variety of quartz or chalcedony exhibiting opalescent reflections from within, like the eye of a cat. The name is given to other gems affording like effects, especially the chrysoberyl.

Chalcedony.—A translucent variety of quartz, having usually a whitish color, and a luster nearly like wax.

Dendrite.—A stone or mineral in which are branching figures, resembling shrubs or trees, produced by a foreign mineral, usually by an oxide of manganese, and the moss agate.

Diamond.—A precious stone or gem excelling in brilliancy, beauty of prismatic colors, and remarkable for extreme hardness. It is found in many hues—green, rose, straw, yellow, etc.—but the straw-colored ones are the most common. The diamond is a native carbon, occurring in isometric crystals, often octahedrons, with rounded edges. It is the hardest substance known. Diamonds are said to be of the first water when very transparent, and of the second and third water as the transparency decreases.

Diopside.—A crystallized variety of pyroxene (a silicate of lime and magnesia), of a clear, grayish-green color; also called muscite.

Emerald.—A precious stone of a rich green color; it is the most valuable variety of beryl. (See **beryl**.)

Epidote.—A mineral, commonly of a yellowish-green color, occurring granular, massive, columnar, and in crystals. It is a silicate of alumina, lime, and oxide of iron, or manganese.

Fluorite.—Calcium fluoride, a mineral of many different colors, white, yellow, purple, red, etc., often very beautiful. When crystallized it is commonly in cubes with perfect octahedral cleavage. Some varieties are used for ornamental vessels. Also called fluor spar, or simply fluor. The colored varieties are often called false ruby, false emerald, false topaz, false sapphire, and false amethyst.

Flint.—A massive, somewhat impure variety of quartz, in color usually of a gray to brown or nearly black. (See **quartz**.)

Garnet.—A mineral having many varieties, differing in color and in their constituents, but with the same general chemical formula. The commonest color is red; the luster is vitreous, or glassy; and the hardness is greater than that of quartz, about half as hard as the diamond. Besides the red varieties there are also white, green, yellow, brown and black ones.

The garnet is a silicate with various bases. The transparent red varieties are used as gems. The garnet was the carbuncle of the ancients. Garnet is a very common mineral in gneiss and mica slate.

The finest specimens of red garnets come from Arizona and a single carat stone is worth about two dollars. A green variety that comes from Russia is worth about half as much as the diamond.

Heliotrope or bloodstone.—A green siliceous stone sprinkled with jasper, as if with blood, whence the name.

Hyacinth.—A red variety of zircon, sometimes used as a gem. It resembles closely a dark Spanish topaz, and is worth a little more than the garnet.

Indicolite.—A variety of tourmaline of an indigo-blue color.

Iolite.—A silicate of alumina, iron, and magnesia, having a bright blue color and a vitreous or glassy luster. It is remarkable for its dichroism, and is also called dichroite.

Jacinth.—Same as **hyacinth**.

Jade.—A stone commonly of a pale to dark green color, but sometimes whitish. It is hard and very tough, capable of a fine polish, and is used for ornamental purposes and for implements, especially in eastern countries and among many primitive peoples.

Jasper.—An opaque, impure variety of quartz, of red, yellow, and other dull colors, breaking with a smooth surface. (See **quartz**.)

Labradorite.—A kind of feldspar, commonly showing a beautiful play of bluish-gray colors, and, hence, much used for ornamental purposes. The finest specimens come from Labrador.

Lapis-lazuli or lazuli.—A mineral of a fine azure-blue color, usually occurring in small rounded masses. It is essentially a silicate of alumina, lime, and soda, with some sodium sulphide. It is often marked by yellow spots or veins of sulphide of iron, and is much valued for ornamental work.

Moonstone.—A nearly pellucid variety of feldspar, showing pearly or opaline reflections from within.

The best specimens come from Ceylon. Their value is not much more than the expense of cutting.

Obsidian.—A kind of glass produced by volcanoes. It is usually of a black color and opaque, except in thin splinters.

Onyx.—Chalcedony in parallel layers of different shades of color. It is used for making cameos, the figure being cut in one layer with the next layer as a background (see **cameo**). It is stained black and used to make mourning jewelry.

Opal.—A mineral consisting, like quartz, of silica, but inferior to quartz in hardness and specific gravity. The precious opal shows a peculiar play of colors of delicate tints and it is highly esteemed as a gem. One kind, with a varied play of colors in a reddish ground, is called harlequin opal. The fire opal (which comes from Mexico) has colors like the red and yellow of flame. This is not the cheap variety commonly called Mexican opal.

[111]

CELEBRATED HISTORIC DIAMONDS OF THE WORLD

Name and Possessor		Carats (Cut)	Carats (Uncut)	Discovered	
1.	Great Mogul	Indian Moguls	280	...	17th Cent.
2-11.	Pitt or Regent	King of Prussia	136 $\frac{7}{8}$	410	1702

3-5. Florentine	Emperor of Austria	139½
4-12. Star of the South	Brazilian Government	127	254	1853
6. Sancy	Czar of Russia	53½	83	15th Cent.
7. Green Diamond	Dresden Museum	40
8-10. Koh-i-noor	Crown of England	280 (Old)	...	B. C. 56
		106¼ (New)	...	
9. Hope	Mrs. E. B. McLean, Washington, D. C.	44½

[112]

OTHER NOTED DIAMONDS

Cullinan I	King Edward VII	561½	3,025¾	1905
Cullinan II		309¾		
Braganza	King of Portugal	Never Cut	1,680	1741
Rajah of Mattan	Rajah of Mattan (Borneo)	367.9	787½	1756
Orloff	Czar of Russia (scepter)	194¾
Tavernier	Stolen in 1792	...	242½	1668
King of Portugal		138½	150	1775
Light Yellow	Stewart (diamond)	...	288½	...
Shah	Czar of Russia	86
Nassac	Lord (Marquis of) Westminster	78½	89½	...
Porter Rhodes	Found in South America	...	150	1872
Blue		67½	112	...
Pigott	Bought by Messrs. Rundell and Bridge	49
Dudley	Earl of Dudley	49½	88½	...
Star of South Africa		46½	83½	1867
Pasha of Egypt	Khedive of Egypt	40
Charles the Bold		28

Pearl.—A shelly concretion, usually rounded, having a brilliant luster, with varying tints, formed in the mantle, or between the mantle and shell, of certain bivalve mollusks (especially in the pearl oysters and river mussels) and sometimes in certain univalves. Its substance is the same as nacre or mother-of-pearl. Pearls which are round, or nearly round, and of fine luster, are highly prized as jewels. They are sold by carat grains instead of carats.

Rhodonite.—Manganese spar, or silicate of manganese, a mineral occurring crystallized and in rose-red masses. It is almost entirely used for ornamental purposes, in slabs, blocks, etc.

Rock crystal or mountain crystal.—Any transparent crystal of quartz, particularly of limpid or colorless quartz. A sphere of rock crystal of absolutely perfect clearness, about five inches in diameter, is worth at least twenty thousand dollars.

Rose quartz.—A variety of quartz which is pinkish red.

Rubellite.—A variety of tourmaline varying in color from a pale rose-red to a deep ruby, and containing lithium. It is a little more valuable than the garnet.

Ruby.—A precious stone of a carmine-red color, sometimes verging to violet, or intermediate between carmine and hyacinth red. It is a crystallized variety of corundum. The ruby from Siam is of a dark color and is called oxblood ruby. It has about the same value as the diamond. The ruby from Burmah, called the pigeon-blood ruby, is of a lighter color and several times more valuable than the oxblood ruby.

Sapphire.—A variety of native corundum or aluminium sesquioxide. As the name of a gem the term is restricted to the transparent varieties of blue, pink, yellow, and other colors. The best specimens of the blue variety are nearly as valuable as the diamond. The sapphire is next to the diamond in hardness.

Sard.—A variety of carnelian, of a reddish-yellow or brownish color.

Sardonyx.—A variety of onyx consisting of sard and white chalcedony in alternate layers. (See **onyx**.)

Spinel.—A mineral occurring in octahedrons of great hardness and various colors, as red, green, blue, brown, and black, the red variety being the gem spinel ruby. It consists essentially of aluminum magnesium, but commonly contains iron and sometimes also chromium. The fine specimens of spinel ruby are worth rather more than half as much as the diamond.

Topaz.—A mineral occurring in rhombic prisms, generally yellowish and pellucid, also colorless, and of greenish, bluish, or brownish shades. It sometimes occurs massive and opaque.

Tourmaline.—A mineral occurring in three-sided prisms. Black tourmaline is the most common variety, but there are also other varieties, as the blue (indicolite), red (rubellite); also green, brown, and white. The red and green varieties, when transparent, are valued as jewels. The finest ones come from Maine, and are worth four or five times as much as garnets.

Turquoise.—A hydrous phosphate of alumina containing a little copper. It has a blue, or bluish-green color, and usually occurs in kidney-shaped masses with a nodular surface like that of a bunch of grapes. The finest specimens are worth nearly half as much as diamonds.

Verd antique.—A mottled-green, serpentine marble, also a green porphyry, which is called oriental verd antique.

Zircon.—A mineral usually of a brown or gray color. It consists of silicon and zirconium, and is harder than the garnet. The transparent varieties are used as gems. The red variety is called Hyacinth; a colorless, pale yellow, or smoky-brown variety from Ceylon is called jargon.

Gold, a metal valued on account of its scarcity, color, luster, and power of resisting oxidation. It is found in nearly all parts of the world. South Africa and the United States are the leading producers. Australia, South America and parts of Europe possess important gold fields.

Gold is separated from gravel (placer mines) by washing with water. The particles of metal, being heavy, sink and can be collected. Rock containing gold is crushed to fine powder and the gold combined with mercury (amalgamation). Low-grade ores are treated with a solution of cyanide of potassium which dissolves the gold and the metal is later separated.

Chloride of gold, used in photographic work, is its only important compound. Pure gold is called twenty-four carats fine. A smaller figure indicates that the metal is alloyed to harden it.

Gold is used for money, jewelry, gold leaf (gilding) and in dentistry. It is almost always alloyed with copper and silver. Gold is the world's accepted standard of value. Shipments of gold go from one country to another chiefly to balance international business dealings. Government treasuries and bank vaults are the chief storehouses for gold, either as bullion or coin.

[113]

Graphite is almost pure carbon. It is produced in Bohemia, Ceylon, Italy, Germany, Mexico and the United States. The deposits in Ceylon are the largest in the world. Much of that mined in New York and Alabama is of very high grade.

Plumbago or black lead is used in making crucibles, lead pencils, lubricants for heavy machinery, stove polish, foundry facings, paint, etc.

Artificial graphite is made from coal or coke by an electric process.

Powdered graphite is mixed with fine clay in greater or less proportion and then molded and baked to form such articles as crucibles and lead for pencils. Graphite is imported from Ceylon to the United States, and lead pencils from Europe.

Iron is the most useful of all metals. The United States, Germany, Great Britain, Spain and France are the greatest producers of iron. Its ores occur in almost all parts of the world. Hematite is mined in Minnesota, Michigan, Alabama and other parts of the United States and in Germany, England, France, Spain, Russia, etc. Limonite is also widely distributed. Pig iron is made by smelting iron ore in a blast furnace. The ore, mixed with limestone, is melted by burning coke, coal or charcoal.

Pyrite (iron pyrites, or fool's gold) is found in Spain and many other parts of the world and is valuable in the preparation of sulphuric acid (oil of vitriol), but useless as an iron ore.

Hematite (sesquioxide of iron) is the ore which supplies three-fourths of the iron of commerce.

Limonite brown (hematite) is a hydrous oxide and furnishes nearly one-fourth of the world's supply of the metal. Magnetite and siderite are less common ores.

Pig iron is the crude form of the refined metal and is transformed into cast iron, wrought iron and steel in their multitudinous forms.

These three forms of iron differ in hardness, strength, elasticity, malleability, etc., according to the amounts of carbon, sulphur, phosphorus, manganese and other elements.

Ochers and metallic paints are iron oxides. **Prussian blue** and **copperas** are iron compounds.

The United States manufactures more iron and steel than any other country. Almost half of the production is in Pennsylvania. **Cast iron** appears in many articles but is weaker than other forms of iron. **Wrought iron** contains less impurity and is used for bars, plates, wire, structural material and parts of machinery. **Steel** (Bessemer, Siemens-Martin, open hearth, etc.) contains more carbon than wrought iron, possesses both strength and hardness, and is used for rails, structural material, machinery, tools, wire rope, sheet steel, etc. Its hardness may be increased by tempering. The United States imports iron ore from Cuba and Spain, pig iron from Great Britain and a little manufactured iron and steel from Europe. We export large quantities of manufactured iron and steel.

Lanthanum. See **rare metals**.

Lead is the softest, heaviest, most malleable and most easily melted of the common metals. Its ores are found in many countries but the main supply is from the United States, Spain, Germany and Mexico. The chief lead mines of the United States are in Missouri, Idaho, Utah, Colorado and Kansas. Much lead bullion is from smelters where silver ores are reduced.

Galena (lead sulphide) is the only important ore; it often carries a considerable percentage of silver. Carbonates and sulphates of lead are less common. **Solder** and **type metal** are alloys of lead with tin and antimony. **White lead** is a carbonate, **red lead** and **litharge** are oxides. **Chrome yellow** and **orange mineral** are lead compounds used as pigments.

The chief use of metallic lead is in piping, sheet lead, shot and alloys. Large amounts of ore are transformed not into metallic lead but into white lead for use in paints. Lead ores and lead bullion are imported from Mexico. England is the greatest importer of lead and lead ores.

Lithium is the metallic base of the Alkali lithia. The metal is of a white, silvery appearance, and is much harder than sodium or potassium, but softer than lead. It is the lightest of all known solids, its specific gravity being little more than half that of water. It comes principally from South Dakota, California and Sweden.

In chemical laboratories it is converted into lithium carbonate for medicinal tablets and mineral waters.

Magnesium is a metal widely distributed over the globe, and chiefly mined in Austria, Germany and Greece. The metal is used in flash powders for photographic use, and in chemical manufacture, in fireproofing and lining furnaces.

Magnesite (magnesium carbonate) is used in making carbon dioxide gas and epsom salts and for preparing magnesia (calcined magnesia).

Dolomite (magnesium calcium carbonate) is common limestone, used for building. Found in many parts of the world. Calcined dolomite is used for lining iron furnaces.

Talc (hydrous magnesium silicate), soapstone or steatite, is a soft mineral. Mined in Maryland, Virginia, North Carolina, etc., and in Europe. It is made into laundry tubs, firebrick, hearthstones, girdles, slate and tailor's pencils, gas tips, etc. Imported in small amount from France and Italy.

Meerschaum or sepiolite (magnesium silicate), comes from Asia Minor and New Mexico. It is easily carved and made into pipes and cigar holders. Austria and France use large quantities. It is largely imitated.

Asbestos is a fibrous variety of serpentine (a magnesium silicate). Mineral wool is an artificial fibrous mineral. It is mined in Quebec, Canada. Another variety of asbestos comes from Italy. Mines have been recently discovered in Wyoming. It is used as a fireproofing material. This mineral fiber is spun and woven into fireproof fabrics for theater curtains or made into felt building paper, pipe covering, etc.

Mercury (or quicksilver) is a heavy metal which is liquid at ordinary temperatures. It is produced in Spain, the United States, Austria, Italy and Russia. California supplies most of this country's quota. It is obtained by distillation of the ore.

[114]

Cinnabar (sulphide of mercury) is the source of the metal, although a little is found in nature in the pure state.

Vermilion (artificially prepared cinnabar) is used in paints.

Calomel and **corrosive sublimate** are used in medicine and **fulminates** of mercury in explosives.

It is used principally in the extraction of gold and silver from their ores by amalgamation. Employed in thermometers and barometers, silvering mirrors, and in making amalgams for dental work.

Mica is a common mineral found in rocks in many parts of the world. It is mined in India, Canada, North Carolina and South Dakota. Several varieties occur (muscovite, biotite, etc.)—valuable only when found in large sheets which can be split smoothly. Transparent sheets are used for lamp chimneys and stove doors. It is also employed in electrical work, and lubricating. Some is imported from India.

Molybdenum. See **rare metals**.

Nickel is found in the ores pyrrhotite and garnierites, mined in largest amount in New Caledonia and Canada. Norway produces other ores.

Garnierite (a silicate of nickel and magnesium) is the common ore. Magnetic iron pyrite (**pyrrhotite**) often carries several per cent of nickel. Sulphides and other compounds occur. **German silver** contains nickel, copper and zinc. It enters into other alloys.

France and Germany refine nickel from imported ore, chiefly from New Caledonia. Nickel steel, being especially hard and tough is used for armor plate, special machinery and wire rope. Nickel is extensively used for cheap electro plating.

Nickel and nickel oxide are exported to Holland and England from the United States and ores and matte are imported from Canada.

Petroleum (or coal oil) is obtained from wells in the United States, Russia, Dutch East Indies, Galicia, Roumania and other countries. More than half of the world's output is

from the United States, the leading districts being (1) Kansas and Oklahoma, (2) California, (3) Illinois, (4) Pennsylvania and (5) Texas. Crude oil is transported from the wells for hundreds of miles through pipe lines to the refineries.

In its crude state, petroleum is a dark colored liquid. It yields by distillation, first: light oils, *gasoline, naphtha, benzine*; second: *illuminating oils, kerosene, headlight oil*, etc.; third: *lubricating oils, engine oil, cylinder oil, machine oil*; fourth: *petroleum residuum* (for asphalt paving) and *coke*. *Petrolatum, vaseline* and *paraffin wax* are by-products in petroleum refining.

American kerosene oil is exported to all parts of the globe. Crude oil is also exported as well as other petroleum products.

Platinum is a rare metal found with gold, iridium and other rare metals in placer mines. It comes chiefly from Russia. Smaller amounts from Colombia, California, Canada and Australia.

It is used in the terminals of incandescent electric lamps, and also employed by chemists, jewelers and dentists.

Potash (or potassium) is an alkaline metal. Chlorides, sulphates, etc., are found in Germany. Wood ashes and sugar beet refuse furnish much of the world's potash. Stassfurt, Germany, possesses the only known large deposit of natural potash salts. These salts are the source of potash in many chemical industries and in fertilizers. It is exported in large amount from Germany to England, France and America.

Quartz (silica) is of many varieties, crystalline to amorphous.

Rock flint is mined in Connecticut and Pennsylvania, and also comes from the chalk cliffs of England and France.

Sandstones are quarried and used for building in almost all parts of the world. Pennsylvania, Ohio, and New York supply the greatest quantities in the United States.

Honestones and *whestones* are mostly sandstone, and in this country are largely quarried in Arkansas, Michigan and New Hampshire.

Rock crystal is employed for lenses. Many semiprecious stones are varieties of quartz, as *agate, moss agate, onyx, sard, chalcedony, chrysoptase, jasper*, etc.

Rock flint and *quartz sand* are used in making glass and pottery.

Outside of building stones, quartz is used in greatest amount in making glass and pottery. For glass it is melted with alkali (soda ash) and either lime or lead oxide. Glass is either blown or molded. Belgium, Austria, Germany, France, Great Britain and the United States manufacture glassware. Pennsylvania, Indiana and New Jersey are the leading states.

Radium is the most characteristic of those substances which possess the property of radio-activity—i.e. have the power of producing photographic or electric effects by a process identical with or analogous to radiation. The property was first observed in *uranium* by Becquerel in 1896—hence the name "Becquerel rays." In 1898 Schmidt and Madame Curie discovered almost simultaneously that the compounds of *thorium* had the same radio-active property; and further elaborate investigations led to the discovery of *polonium, radium*, and *actinium*, as new substances with radio-active properties. Polonium was the name given by M. and Mme. Curie to the radio-active component of bismuth separated from pitchblende. Its activity is transient. In the new field of research thus opened up important work has been done by Rutherford, Crooks, Ramsay, Soddy, Huggins, and others.

Radium is derived from *pitchblende*, in which it exists in very small quantities. After a long-continued process of fractional crystallization it has been prepared in the form of a tolerably pure salt. The process of obtaining the element is very tedious. One to two kilograms of impure radium bromide can be procured from a ton of pitchblende residue only after processes extending over months. For the remarkable chemical properties of radium, see further under **Radio-activity**.

Rare Metals. These include chiefly the following: *Tungsten, molybdenum, vanadium* and *uranium*. They are found in Colorado, Arizona, Germany, England and Sweden. The ores of these metals are unusual minerals, and the metals themselves are used in making special high grades of steel. Their salts are used in dyeing.

Thorium, cerium, lanthanum and *yttrium*, found in North Carolina, Norway, Brazil and Ceylon, are also to be classified under this head. Monazite, samarskite, thorite and other rare minerals contain these elements. They are used in preparing the mantles for incandescent gas lights.

Silver, the more common precious metal, is produced in greatest amount in the Rocky Mountains and the Andes. The United States, Mexico, Australia, Bolivia, Chili, Peru and Germany contribute nearly the entire supply. Montana, Colorado, Nevada and Utah lead in silver production in the United States. The ores are usually smelted and refined to purify the metal.

Argentiferous galena (lead ore) is the commonest ore of silver. The amount of silver per ton varies greatly. Zinc and copper ores often carry silver. Many sulphides of silver (argentite, pyrargyrite, etc.) are found, as well as chlorides and bromides (cerargyrite and bromyrite). *Chloride* and *nitrate of silver* are used in photography.

Silver is manufactured into innumerable articles for household use and personal adornment. The cheapest articles are not solid (sterling) but are electrically plated with a very thin coating of silver. Silver coins form the bulk of the currency of the world, although in most countries gold is the standard.

Sodium is the most important alkaline metal, and has a wide use.

Salt (rock salt, sea salt, lake salt, halite or sodium chloride) is the commonest natural compound of sodium. Important for food and in chemical manufacture.

Rock salt is mined in Germany, Austria, Spain, England, Louisiana, Kansas, India and other parts of the world. Obtained by evaporating salt water from wells in England, Michigan, New York, Ohio and China, or by evaporating salt water in the West Indies, Great Salt Lake, etc.

Besides its use for meat packing, curing fish, domestic purposes, etc., it is employed in silver refining, and the preparation of hydrochloric acid, soda ash, carbonate of soda and other chemical products.

Soda niter (nitrate of sodium) is a very easily soluble mineral. It is found in quantity only in the deserts of northern Chili, and is exported in large amounts to Europe and America for fertilizer and the manufacture of nitric acid and other chemicals.

Borax (hydrous sodium borate) occurs in nature in an impure form and is prepared also from calcium borates. Borates are found in Tuscany, Central Asia, California and Nevada, and in South America.

Borax and boracic acid are used in pottery manufacture, for the preservation of meat, in dyeing and in medicine.

Strontium is found in Germany, Scotland, Texas and New York. Strontianite (strontium carbonate) and celestite (strontium sulphate) contain this element. Strontium salts are used in sugar refining and making red fire.

Sulphur or brimstone is found in a pure state in volcanic regions or associated with gypsum and limestone. Pyrite (sulphide of iron) is also a source of sulphur compounds.

Sicily, Italy, Japan, Louisiana and Utah have mines of native sulphur, which is used in manufacturing sulphuric acid, gunpowder, matches, as a disinfectant, for bleaching and vulcanizing rubber.

Blue vitriol, green vitriol and alum are sulphates. Sulphur is imported from Sicily and Italy.

Thorium. See **rare metals**.

Tin is less abundant than most of the common metals. The Malay peninsula and nearby islands (Banca and Billiton) produce over half the tin ore of the world. The remainder is mined in Bolivia, Australia, Tasmania and Cornwall, England. Small deposits occur in the United States.

Tin melts at a low temperature and is easily refined.

Cassiterite (tin oxide) is the only important ore. This mineral is commonly found as pebbles (stream tin) in gravel.

Tinplate and alloys containing tin are of enormous importance in the arts. Of these, *bronze* is chief. *Gun metal, pewter, solder, type metal* and *britannia metal* are other alloys.

Salts of tin are used in dyeing, glass making, etc.

Tinplate, used for tin cans, roofing and kitchen utensils, is made by dipping sheet iron or steel in a bath of melted tin, thus covering it with a thin layer of tin. Tinplate is manufactured in the United States and imported from England. Tin metal is imported from England and Straits Settlements.

Tungsten. See **rare metals**.

Uranium. See **rare metals**.

Vanadium. See **rare metals**.

Zinc is one of the most useful metals. Germany, United States and Belgium supply most of the zinc. In this country, Missouri and Kansas lead in zinc production.

Sphalerite or blend (zinc sulphide) is the chief ore. Carbonates, silicates and oxides of zinc are found. Crude zinc (*spelter*) is distilled from roasted ore.

Brass, German silver and other alloys contain zinc. *Galvanized iron* consists of a coating of zinc on sheet iron. *Zinc oxide* (zinc white) resembles white lead and is used in paints.

Used in electric batteries, making hydrogen, zinc etchings, etc. The greatest amount of zinc is used in alloys and zinc compounds. Zinc and zinc ores are both imported and exported by the United States, the imports exceeding the exports. Zinc oxide is exported in larger amount than any other form.

HOW AND WHERE WE GET THE SALT FOR OUR FOOD

THE PRODUCTIVE CALIFORNIA SALT BEDS

The United States produces one-fourth of the entire output of the world. Salt was one of the first two great articles of international commerce in the history of the world trade.

AN UNDERGROUND PASSAGE WAY THROUGH SOLID SALT

The most wonderful salt mines in the world are those of Galicia, in Austria. In this region there is a mass of salt estimated to measure 500 miles in length, 20

- Acanthodus** (*a-kan-thō' dus*).—Fossil fish, having thorn-like fins.
- Aërodynamics** (*ā-ēr-ō-dī-nam' iks*).—The science which treats of the air and other gaseous bodies under the action of force, and of their mechanical effects.
- Aërognosy** (*ā-ēr-ōg' nō-sy*).—The science which treats of the properties of the air, and of the part it plays in nature.
- Aërolite** (*ā-ēr-ō-lit*).—A stone, or metallic mass, which has fallen to the earth from distant space; a meteorite; a meteoric stone.
- Aërology** (*ā-ēr-ōl' ō-jy*).—That department of physics which treats of the atmosphere.
- Aerometer** (*ā-ēr-ōm' ē-tēr*).—An instrument for ascertaining the weight or density of air and gases.
- Ammonites** (*am' mo-nit*).—Fossil mollusks of spiral form, found in all strata from the palæozoic to the chalk; very numerous, varying greatly in size; all now extinct; sometimes called snakestones.
- Anemology** (*ān-ē-mōl' ō-jy*).—The science of the wind.
- Anemometer** (*ān-ē-mōm' ē-tēr*).—An instrument for measuring the force and velocity of the wind; a wind gauge.
- Attrition** (*āt-trīsh' ūn*).—The act of rubbing together; friction; the act of wearing by friction, or by rubbing substances together; abrasion.
- Aurora** (*aw-rō' rā*).—The rising light of the morning; the dawn of day; the redness of the sky just before the sun rises.
- Aurora Borealis** (*bō' rē-ā' līs*), i. e., northern daybreak; popularly called northern lights. A luminous meteoric phenomenon, visible only at night, and supposed to be of electrical origin. This species of light usually appears in streams, ascending toward the zenith from a dusky line or bank, a few degrees above the northern horizon. Occasionally the aurora appears as an arch of light across the heavens from east to west. Sometimes it assumes a wavy appearance. They assume a variety of colors, from a pale red or yellow to a deep red or blood color.
- The **Aurora Australis** (*aws-trā' līs*) is a corresponding phenomenon in the southern hemisphere, the streams of light ascending in the same manner from near the southern horizon.
- Barometer** (*bā-rōm' ē-tēr*).—An instrument for determining the weight or pressure of the atmosphere, and hence for judging of the probable changes of weather, or for ascertaining the height of any ascent.
- Calamites** (*kal' a-mits or kal' a-mi' tēz*).—Reed-like plants, found in coal.
- Carboniferous** (*kār' bōn-īf' ēr-ūs*).—Producing or containing carbon or coal.
- Conglomerate** (*kōn-glōm' ēr-āt*).—Pudding stone, composed of gravel and pebbles cemented together.
- Corona** (*kō-rō' nā*).—A circle, usually colored, seen in peculiar states of the atmosphere around and close to a luminous body as the sun or moon.
- Cosmogony** (*kōs-mōg' o-nj*).—The creation of the world or universe; a theory or account of such creation.
- Cosmology** (*kōz-mōl' ō-jy*).—The science of the world or universe; or a treatise relating to the structure and parts of the system of creation, the elements of bodies, the modifications of material things, the laws of motion, and the order and course of nature.
- Crystallography** (*kris' tal-lōg' rā-fy*).—The science of crystallization, teaching the system of forms among crystals, their structure, and their methods of formation.
- Cyclone** (*sī' klōn*).—A violent storm, often of vast extent, characterized by high winds rotating about a calm center of low atmospheric pressure. This center moves onward, often with a velocity of twenty or thirty miles an hour.
- Denudation** (*dēn' ū-dā' shūn or dē' nū*).—The laying bare of rocks by the washing away of the overlying earth, etc.; or the excavation and removal of them by the action of running water.
- Deposit**.—A body of ore distinct from a ledge; pocket of gravel or pay dirt.
- Diplacanthus** (*dip-lā-kān' thus*).—A fish, belonging to Acanthodii, known only by fossil remains in Old Red Sandstone.
- Drifts**.—Tunnels leading off from the main shaft, or from other tunnels or levels, through and along the vein.
- Drift Matter**.—Earth, pebbles and bowlders that have been drifted by water, and deposited over a country while submerged.
- Druse** (*dru-s*).—A cavity in a rock, having its interior surface studded with crystals and sometimes filled with water.
- Elephas** (*el' e-fas*).—The Latin name for Elephant. The primitive elephant was what is known as the Mammoth.
- Fata Morgana** (*fā' tā' mōr-gā' nā*).—A kind of mirage by which distant objects appear inverted, distorted, displaced, or multiplied. It is noticed particularly at the Straits of Messina, between Calabria and Sicily, Italy.
- Fire-damp**.—An explosive carburetted hydrogen of coal mines.
- Fissures**.—Seams or crevices in rocks formed by volcanic or earthquake action, and when filled subsequently by metal or metallic ores they become fissure veins.
- Fog**.—Watery vapor condensed in the lower part of the atmosphere and disturbing its transparency. It differs from cloud only in being near the ground, and from mist in not approaching so nearly to fine rain.
- Geography** (*jē-ōg' rā-fy*).—The science which treats of the world and its inhabitants; a description of the earth, or a portion of the earth, including its structure, features, products, political divisions, and the people by whom it is inhabited.
- ASTRONOMICAL, or MATHEMATICAL GEOGRAPHY treats of the earth as a planet, of its shape, its size, its lines of latitude and longitude, its zones and the phenomena due to the earth's diurnal and annual motions.
- PHYSICAL GEOGRAPHY or PHYSIOGRAPHY treats of the conformation of the earth's surface, of the distribution of land and water, of minerals, plants, animals, etc., and applies the principles of physics to the explanation of the diversities of climate, productions, etc.
- POLITICAL GEOGRAPHY treats of the different countries into which the earth is divided with regard to political and social institutions and conditions.
- Geology** (*jē-ōl' ō-jy*).—The science which treats: (a) Of the structure and mineral constitution of the globe; structural geology. (b) Of its history as regards rocks, minerals, rivers, valleys, mountains, climates, life, etc.; historical geology. (c) Of the causes and methods by which its structure, features, changes, and conditions have been produced; dynamical geology.
- Goniatites** (*gō-ni-a-ti' tēz*).—Fossil remains of Ammonites, many species of which are found in Devonian and Carboniferous Limestone.
- Hail** (*hāil*).—Frozen rain, or particles of ice precipitated from the clouds, where they are formed by the congelation of vapor. The separate particles are called hailstones.
- Harmattan** (*hār-māt' tan*).—A dry, hot wind, prevailing on the Atlantic coast of Africa, in December, January, and February, blowing from the interior or Sahara. It is usually accompanied by a haze which obscures the sun.
- Hoarfrost** (*hōr' frōst*).—The white particles formed by the congelation of dew; white frost.
- Hydrography** (*hī-drōg' rā-fy*).—The art of measuring and describing the sea, lakes, rivers, and other waters, with their phenomena.
- Hygrometer** (*hī-grōm' ē-tēr*).—An instrument for measuring the degree of moisture of the atmosphere.
- Ignis fatuus** (*īg' nis' fāt' ūūs*).—A phosphorescent light that appears, in the night, over marshy grounds, supposed to be occasioned by the decomposition of animal or vegetable substances, or by some inflammable gas,—popularly called also Will-with-the-wisp, or Will-o'-the-wisp, and Jack-with-a-lantern, or Jack-o'-lantern.
- Ichthyosaurus** (*īk-thē-ō-saw' rūs*).—A large marine reptile, known only by fossil vertebrae and other bones, found in oolite rocks.
- Labyrinthodon** (*lab-i-rin' thō-don*), or Mastodon. A large animal, belonging to Amphibia, remains of which are found in Upper Trias rocks and strata.
- Lepidodendron** (*lep-i-dō-dēn' dron*).—Coal-plants, belonging to the Lycopods, of which very many remains are found in coal.
- Lepidosteus** (*lep-i-dōs' te-us*).—Bony-pike fish, the fossil remains of which are found in rocks and earth strata.
- Lightning** (*līt' nīng*).—A discharge of atmospheric electricity, accompanied by a vivid flash of light, commonly from one cloud to another, sometimes from a cloud to the earth. The sound produced by the electricity in passing rapidly through the atmosphere constitutes thunder.
- Lithology** (*lī-thōl' ō-jy*).—The science which treats of rocks, as regards their mineral constitution and classification, and their mode of occurrence in nature.
- Lode** (*lōd*).—A metallic vein; a longitudinal fissure or chasm filled with ore-bearing matter and having well-defined side walls; lode, lead, vein and ledge are synonymous; a mineral vein in the rock.
- Mastodon** (*mas' tō-don*).—An extinct elephant-like mammal of America, whose teeth have a nipple-like surface.
- Metallurgy** (*mēt' al-lēr-jy*).—The art of working metals, comprehending the whole process of separating them from other matters in the ore, smelting, refining and parting them; sometimes, in a narrower sense, only the process of extracting metals from their ores.
- Meteorology** (*mē-tēr-ē-ōl' ō-jy*).—The science which treats of the atmosphere and its phenomena, particularly of its variations of heat and moisture, of its winds, storms, etc.
- Min'er'al' o-gy** (*min-er-āl' ō-jy*).—The science which treats of minerals, and teaches how to describe, distinguish, and classify them.
- Mist** (*mīst*).—Visible watery vapor suspended in the atmosphere, at or near the surface of the earth; fog.
- Monsoon** (*mōn-sōn*).—A wind blowing part of the year from one direction, alternating with a wind from the opposite direction—a term applied particularly to periodical winds of the Indian Ocean, which blow from the southwest from the latter part of May to the middle of September, and from the northeast from about the middle of October to the middle of December.
- Oceanography** (*ō' shan-ōg' rā-fy*).—A description of the ocean.
- Oceanology** (*ō' shan-ōl' ō-jy*).—That branch of science which relates to the ocean.
- Oreography** (*ō-rē-ōg' rā-fy*).—The science of mountains; orography.
- Palæotherium** (*pā-lē-ō-thē' ri-um*).—A tapir-like mammal, having canine teeth, known only by fossil remains found in Tertiary rocks.
- Pampero** (*pām-pā' rō*).—A violent wind from the west or southwest, which sweeps over the pampas of South America and the adjacent seas, often doing great damage.
- Parheliion** (*pār-hēl' yūn or hē' lī-ōn*).—A mock sun appearing in the form of a bright light, sometimes near the sun, and tinged with colors like the rainbow, and sometimes opposite to the sun. The latter is usually called an *antherion*. Often several mock suns appear at the same time.
- Petrology** (*pē-trōl' ō-jy*).—The science which is concerned with the mineralogical and chemical composition of rocks, and with their classification; lithology.
- Physiography** (*fīz-ē-ōg' rā-fy*).—The science which treats of the earth's exterior physical features, climate, life, etc., and of the physical movements or changes on the earth's surface, as the currents of the atmosphere and ocean, the secular variations in heat, moisture, magnetism, etc.; physical geography.
- Plesiosaurus** (*plē-zī-ō-saw' rūs*).—An oolithic reptile with crocodile-like head, known by fossil remains, chiefly vertebrae, found in lias and oolitic rocks, named from its fossil remains being found near those of the ichthyosaurus.
- Pneumatics** (*nū-māt' iks*).—That branch of science which treats of the mechanical properties of air and other elastic fluids, as of their weight, pressure, elasticity, etc.
- Pterodactyl** (*ter-ō-dāk' tīl*).—Winged lizard: extinct reptile; fossil remains found in Kentish chalk.
- Pyroscope** (*pīr' ō-skōp*).—An instrument for measuring the intensity of heat radiating from a fire, or the cooling influence of bodies. It is a differential thermometer, having one bulb coated with gold or silver leaf.
- Rainbow**.—A bow or arch exhibiting, in concentric bands, the several colors of the spectrum, and formed in the part of the hemisphere opposite to the sun by the refraction and reflection of the sun's rays in drops of falling rain. Besides the ordinary bow, called also primary rainbow, which is formed by two refractions and one reflection, there is also another often seen exterior to it, called the secondary rainbow, concentric with the first, and separated from it by a small interval. It is formed by two refractions and two reflections, is much fainter than the primary bow, and has its colors arranged in the reverse order from those of the latter.
- Seismology** (*sīs-mōl' ō-jy*).—The science of earthquakes.
- Seismometer** (*sīs-mōm' ē-tēr*).—An instrument for measuring the direction, duration, and force of earthquakes and like concussions.
- Simoon** (*sī-mōn*).—A hot, dry, suffocating, dust-laden wind, that blows occasionally in Arabia, Syria, and the neighboring countries, generated by the extreme heat of the parched deserts or sandy plains.
- Sirocco** (*sī-rōk' kō*).—An oppressive, relaxing wind from the Libyan deserts, chiefly experienced in Italy, Malta, and Sicily.
- Sivatherium** (*siv-a-thē' ri-um*).—A large four-horned antelope, known by fossil remains found in Pliocene rocks of Hindustan.
- Strophomena** (*strō-fōm' ē-nā*).—A genus of shell-like animals similar to the nautilus, found in numerous fossil forms in Lower Silurian and the carboniferous strata.
- Tornado** (*tōr-nā' dō*).—A violent whirling wind; specifically a tempest distinguished by a rapid whirling and slow progressive motion, usually accompanied with severe thunder, lightning, and torrents of rain, and commonly of short duration and small breadth; a small cyclone.
- Typhoon** (*tī-fōn*).—A violent whirlwind; specifically, a violent whirlwind occurring in the Chinese seas.
- Wind**.—Air naturally in motion with any degree of velocity; a current of air.
- Zosterites** (*zos-ter-i' tēz*).—Sear-wracks: marine plants, resembling sea-weeds, with small naked flowers, found at the bottom of the sea.

THE VEGETABLE KINGDOM

[121]

RELATION AND DISTRIBUTION OF PLANT AND ANIMAL LIFE

Life in the world is represented by the *Vegetable* and *Animal* kingdoms. Plants and animals, unlike minerals, grow from germs, and develop into individuals with definite forms and organs. After a limited existence they die, their species being perpetuated by seed or offspring. The *functions* of plants and animals in nature are, however, entirely unlike. Plants are rooted in the soil; animals are free to move over the land, through the water or air. The plant, moreover, transforms the lifeless, inorganic elements (earth and air) into organic matter and thus prepares food for the animal. In its quiet, steady growth it gathers a store of force which the animal uses up in action. Thus the distribution of vegetation regulates that of animal life. Besides, vegetation clothes the surface of the land with that rich mantle of verdure and flowers which is its greatest ornament.

All living things are termed *organisms*, and the science which takes account of them with special regard to their common characteristics is termed *Biology*, or Life-lore. The classification and life-history of plants are the objects of that part of biology known as *Botany*. That part similarly occupied with the study of animals is known as *Zoology*.

Throughout the entire realm of nature, in the *animal* world as well as in the *vegetable*, the development of life increases in energy, and in the variety and perfection of the types, with the increasing intensity of light and heat, from the poles to the equator.

TROPICAL LIFE

Within the tropics, under the stimulating rays of a vertical Sun, grow the most dense and varied forests, the most expanded foliage, and the largest and the most brilliant flowers. Here, also, are found the most delicious fruits, the most powerful aromatics, the greatest variety of plants capable of affording sustenance to man, and the largest number of those which contribute to the luxuries of civilized life.

In the tropical regions, also, are found the greatest variety of land animals; with the highest types, the greatest stature, the most intense activity, and the keenest intelligence exhibited in the brute creation.

WHERE THE MOST POWERFUL ANIMALS ARE FOUND

This zone is the home of the gigantic elephant and giraffe; of the lion and the tiger, the most powerful of all the beasts of prey; and of the gorilla, chimpanzee, and orang-outang, of all animals most resembling men.

Here, also, are the ostrich, the largest and most powerful of birds; the condor, surpassing in size all other birds of flight; and the humming-birds of South America, the smallest of the feathered tribes, unsurpassed in brilliancy of coloring, rapidity of motion, and grace of form.

In the same zone are those enormous reptiles, the crocodile and the boa-constrictor, with the hooded snakes and other serpents of most deadly venom; and insects of all sizes in indescribable profusion.

LIFE IN THE TEMPERATE ZONES

In the Warm-Temperate Zone, though the Sun never reaches the zenith, yet during the long summer his rays are almost vertical; while the winter is so mild that snow and ice are of rare occurrence.

Here the vegetable world is less prodigal in species, and less luxuriant in growth, than in the tropical regions; still, verdure is continuous throughout the year, and fruits and flowers succeed each other almost without interruption.

The animal world shows a similar, though less marked, decrease in the exuberance of life. The higher orders are less numerous, the individuals less gigantic and powerful; yet the antelopes, among the most graceful of animals, and the camel, one of the most useful, especially characterize this zone.

HOW THE LIFE OF THE TEMPERATE ZONE DIFFERS FROM THAT OF WARMER ZONES

In the Temperate Zone, farther from the tropics, and receiving the Sun's rays with greater obliquity, all the forms of vegetable growth are more modest than in the preceding. The forests are less dense and varied, the foliage is less luxuriant, and flowers of brilliant hues are confined to shrubs and herbaceous plants.

Though useful plants are numerous, yet scarce a species is of value in its spontaneous growth; and, above all, the long dormant season, when the trees and shrubs are bare and apparently lifeless, stamps the vegetation of this zone with an aspect of inferiority.

The animal world still shows a large number of noble species; yet there are some orders which, like the plants, are dormant during the winter; while many of the birds migrate to warmer climes. Associated with deciduous forests, boundless fertile prairies, and arid steppes—are the bear, the wolf, the lynx, the bison, and many species of elk and deer.

ORIGINAL HOME OF OUR DOMESTIC ANIMALS

Here is the home of the horse, the ass, and many varieties of oxen, sheep, and goats,—those animals which, domesticated by man, have accompanied him to all climes, adapting themselves to all circumstances. The American turkey, the European pheasant, and the Asiatic parents of many of our domestic fowls, also belong to the temperate zone; together with a multitude of song birds, whose sober plumage, contrasting so gloomily with the brilliant colors of their neighbors of the tropics, is compensated by the sweetness of their notes. Here, also, is the home of the honey-bee, and of the silk-worm, almost the only insects directly useful to man.

LIFE IN THE COLD ZONES

In these regions, where the sun is always low, and in winter is above the horizon but a small part of the time, all nature becomes increasingly

[122]

monotonous. The conifers, with their stiff forms and sombre hues, impart a dreary aspect even to the summer landscape; and, during the long winter, all life seems suspended.

The animal world, however, is more rich and varied than the vegetable.

Here we meet the great moose and the brown bear, the beaver and other rodents, in large numbers; the sable, the mink, the ermine, and a host of other animals whose fine, soft furs form one of the main resources of this inhospitable climate.

In the Arctic Zone—where the forests give place to dwarf trees, stunted or creeping shrubs, mosses, and lichens—the reindeer, the musk-ox, and the white bear are the only representatives of the larger land animals, though the smaller furry tribes are still numerous.

The sea, however, more genial in its temperature than the land, swarms with living creatures of innumerable species, among which are the largest representatives of the animal kingdom. The whale, the walrus, and the seal, inhabit the Arctic seas; with every grade of marine life, down to the animalculæ, which are so numerous as to give their color to great areas of sea-water; and water-fowl, without number, and of many varieties, enlivens the icy shores.

CHIEF DIVISIONS OF THE PLANT KINGDOM

The great divisions of the science of plant life, or botany, are: Structural Botany which treats of the gross anatomy of plants; Plant Histology, of their minute anatomy; Plant Morphology, of the forms of plants and their organs; Plant Physiology, of the functions of these organs; Systematic Botany, of the relationship and classification of plants; Geographical Botany, of the distribution of plants over the surface of the globe; Paleobotany, of the vegetable life of past ages and the successive appearance in the world of the great classes of plants, as traced in their fossil remains; and Economic Botany, which deals with the products of plants and their uses.

It is in the last division of the subject that our greatest practical interest lies, and, consequently, it is best to reverse the general order of treatment pursued by many botanists. Foremost in importance are those plants grown for food, which form the great products of *agriculture*, *gardening* and *horticulture*. Scarcely less important are those which yield fibers used for industrial purposes, such as cotton, flax, jute and hemp; nor must we forget those producing vegetable oils, rubber, and the large number of drugs so valuable to the science of medicine in the alleviation of suffering.

(See page 176 for scientific classification of the Vegetable or Plant Kingdom.)

AN AUTUMN HARVEST OF BEAUTY AND PLENTY

I. CEREALS, GRASSES AND FORAGE PLANTS

Among all the plants in the world, the first place must be given to the food-producing cereals upon which our very existence depends. The most important among these are undoubtedly wheat, barley, oats, rye, rice, Indian corn or maize, millets, sorghum and others less widely used. More than one-half the whole population of the world subsists to a great extent on rice, and the vital importance of wheat needs no demonstration. For our present purposes the use of the word "cereal" is extended to include buckwheat and other starch-yielding plants, but these are not true cereals.

HOW OUR CEREALS WERE DEVELOPED

The cereals are members of a great family of the grasses which have been cultivated by man from time immemorial. Originally, no doubt, they were wild plants which attracted attention owing to the comparatively large quantities of foodstuffs they yielded, the ease with which they could be collected, and their edible qualities. Now, in the majority of cases, the original wild forms are no longer known, and as is common with plants cultivated in many lands and during long periods, innumerable species and varieties have been evolved as the result of selection by man of the forms which appeared desirable for one or other of their qualities.

HOW THE WORD "CEREAL" ORIGINATED

Their very name—cereals or cerealia—indicates the great value attached to them in early historic times. These are so named after the goddess Ceres, as the Romans called her—Demeter of the Greeks—the patroness of agriculture and all the fruits of the earth.

WHERE THE CEREALS GROW

In the temperate regions of the world wheat is the principal cereal grown, and there are many different varieties suited to varying conditions. As we go farther north, barley, oats and rye increase in importance, and although they are grown for special purposes along with wheat, it is important to note that they will thrive in countries and under conditions not suited to wheat. Starting again from the temperate zones and traveling north or south, as the case may be, we enter the warmer countries where wheat cultivation is often associated with that of rice, corn, sorghum, etc. In the tropics, however, wheat will not thrive at low elevations, but rice, corn, sorghum and various millets form the great cereal crops, their relative importance varying in different countries.

The grasses proper grow upon our meadows, pastures, fields and in the woods and are only used as food for cattle.

HOW THE BOTANIST DESCRIBES CEREALS AND GRASSES

The roots of most kinds of grasses are persistent; the stems are hollow and knotty, and the leaves consist of sheaths and discs. Their flowers are arranged either in spikes or panicles, and are essentially the same in form as those of the herbs. In the interior there is an ovary, from which project two pistils with feathery styles. Close to the ovary are three stamens, with very long filaments and large anthers. These internal organs are generally surrounded by two tender bracts called the *paleæ*, and two harder outer bracts forming the *glumes*. In the grasses also self-fertilization does not take place, the wind here taking the place of the insects. Consequently the anthers are suspended from long filaments, and contain a quantity of pollen. As the grasses do not need to attract insects, their flowers are small with little color, and have no scent; nor do they secrete honey. The fruit is enclosed in a husk.

Alfalfa (*Medicago sativa*) is a cultivated hay and pasture plant, yielding per annum, without reseeding, three to six or more cuttings of hay, averaging a ton each and often much more, for an indefinite period. It is the richest forage plant known, and while old in history is comparatively new to the agriculture of North America.

Alfalfa thrives on all soils except those too wet or having too much acidity. The former calls for drainage and the latter demands lime. Besides its abundance of rich forage, the leaves of which approximate the value of wheat bran in animal rations, it is highly prized as a soil improver, as it restores and enriches the land in which it grows, and improves extraordinarily the physical character of the soil. Its roots reaching to great depths, make it drought-resistant; they also gather much nitrogen from the air, and it yields assuredly whether the season be wet or dry. It has been demonstrated the greatest fertilizing and soil renovating plant known to agriculture.

For hay it is cut whenever the first blossoms appear or when sprouts for a new growth from the root crowns are discovered, which in some regions is every month in the year. It is relished by all live stock, and is particularly valuable in dairy husbandry, affording at lowest cost important ingredients of the well balanced feeding ration. As pasturage it is excellent for hogs and horses, but ruminants, such as cattle and sheep are not safely grazed upon it, owing to its liability to cause bloat, which if not promptly treated may bring speedy death.

Alfalfa requires a carefully prepared seedbed, with a thoroughly fine, smooth surface, as the seeds are small. From fifteen to twenty pounds of seed per acre are generally sown, although often much more, or less, either with drills or broadcast, preferably in early fall and without a nurse crop. Where the winters are long or severe from two to ten tons of hay per acre in a season, and from two to seven bushels of seed.

Blue-Grass (*Poa pratensis*), frequently designated Kentucky Blue Grass, is a perennial, and the most highly prized pasture grass, but is not a profitable hay plant. Its growth has a wider range than timothy. It is sown in autumn or spring, the former being preferable, as it can endure cold better than heat, and thrives rather best when partially shaded. One approved way is to sow the seed on snow, where the ground is free from weeds. It is broadcasted at the rate of about one bushel of seed in the chaff to the acre. Blue-grass is an extremely aggressive and persistent plant voluntarily spreading among and displacing others where it has not been sown. Its taking possession of and thriving on land that has not been cultivated is not uncommon. The seed weighs fourteen pounds to the bushel.

ENGLISH BLUE-GRASS or Meadow Fescue (*Fescuca elatior*) is a valuable and hardy grass either for mowing or pasture. It thrives on soils not too dry, and being long lived, is especially valuable for permanent pastures. It is sown either in the spring or fall, by drilling or broadcasting from one to three pecks per acre for seed, and three pecks to an acre for pasture. It is harvested and handled much the same as wheat. Kansas produces nearly seventy-five per cent of the seed raised in America and ninety per cent of the total for the United States is exported, Germany being the largest taker. This grass is very nutritious and grazing animals are fond of it. A bushel of seed weighs twenty-two pounds, and the yield of seed per acre is from five to fifteen bushels.

Brome-grass (*Bromus inermis*) is a vigorous, hardy perennial pasture and hay plant, with strong, creeping rootstocks, and is valuable for dry regions. It is not adapted to a rotation, as its sod becomes too matted and tough for comfortable cultivation. Owing to this tendency, after three or four years of hay cropping its better use is for pasture. It yields luxuriantly, is rich in flesh-forming elements, and much relished by farm animals. It is sown broadcast, in spring or fall, eighteen to twenty pounds of seed to the acre. The seed is chaffy and weighs but fourteen pounds per bushel.

Barley is grown chiefly in the states of Minnesota, California, Wisconsin, North and South Dakota, in the order named, these states raising seventy-five per cent of the output grown in the United States. It is used as food for live stock, and as an article of commerce is in demand principally for the making of malt in brewing beer, but in California and other western states, where Indian corn does not flourish, barley is used as a substitute grain for horses and mules. About two bushels to the acre are sown in the spring, with a drill or a broadcast seeder. It is admirably adapted as a nurse crop, as it stands up well and does not shade the ground so much as many other plants.

Barley for malting should be cut before fully ripe and put in well-capped shocks to cure; the price paid is largely governed by the color acquired in curing, which should be bright. A bushel weighs forty-eight pounds, and the yield is from twenty-five to forty bushels per acre.

Buckwheat (*Fagopyrum esculentum*) is a grain of minor importance, its flour being used as human food, mostly in the form of griddle cakes. The plant is esteemed for plowing under in summer, to supply humus, and its blossoms for the honey bee. Most of it is grown in New York and Pennsylvania, and it does well in soils too poor for most other crops. It is sensitive to frost, and used as a sort of catch crop, sown generally about the beginning of July, broadcast. Forty bushels, weighing forty-eight pounds per bushel, is a maximum yield.

Clover (*Trifolium pratense*). In the states east of the Missouri river *red clover* is highly esteemed. It has much the same qualities as alfalfa, except it is a biennial, enduring but

[123]

[124]

[125]

two years without re-seeding and at best gives two cuttings of hay per year, aggregating two to three tons. It is from the second cutting that seed is usually saved. Four quarts of seed is a common quantity to sow per acre. Red clover makes excellent hay, except for horses. Its seed, like that of alfalfa, weighs sixty pounds per bushel, and its yield is from one to five bushels per acre.

WHITE CLOVER (*Trifolium repens*) is a very useful pasture and honey plant, but is not used for hay. It spreads rapidly, and is widely used for sowing with other pasture grasses.

ALSIKE CLOVER (*Trifolium hybridum*) is largely sown on lands not well adapted to red clover, where land is either too wet or too dry for the latter, and it does not require so sweet a soil.

THE COSTLIEST EARS OF CORN IN THE WORLD

The champion ten ears of corn shown in the illustration average ten and one-half inches in length and seven and three-quarters in circumference, each ear carrying twenty rows of kernels, the depth of the kernels being three-fourths of an inch, and the average weight of each ear was twenty ounces. They were sold at the rate of \$2,345 per bushel or \$335 for the ten ears. The champion single ear of corn was sold at the Omaha National Corn Show for \$85.

Corn (*Zea mays*). Indian corn, or maize is a product native to America, an annual, and is the most important member of the grass family. It is America's foremost cereal, with a wider adaptability than any other, and is grown in every state and territory. The temperate climate of the Central States is most favorable to it, and Illinois, Iowa, Nebraska, Missouri, Indiana, Kansas and Ohio are the leading states in its planting. The bulk of the world's production of maize is grown in this country, although it is an important crop in Hungary, Italy, Egypt, South Africa, and other parts of the world.

ECONOMIC USES.—Corn is of primary importance as a food for live stock, enormous quantities being used to fatten cattle and swine.

The manufacture of starch and other products from corn is an industry of increasing magnitude. The chief starch derivatives are dextrine and glucose or grape sugar (used in brewing beer and as a substitute for true sugar).

Corn oil may be called a by-product in starch manufacture, yet the annual value of corn oil is greater than that of cornstarch produced in the United States. It is used in soap and paints. Vulcanized by heating with sulphur, it forms a widely used adulterant and substitute for rubber.

Among the dozens of useful products made from corn are corn meal, corn grits, hominy, breakfast foods, beer, whisky, alcohol, cologne spirits, cornstarch, dextrine, glucose, grape sugar, corn sirup, corn oil, soap, rubber substitute and cattle foods.

A special variety of corn is raised to make cob pipes. Compressed corn pith is packed between the double hulls of warships. Corn husks are used in mattresses and paper is made in very limited amount from the leaves and stalks. Large amounts of popcorn, plain and candied, are eaten in the United States.

METHODS OF CULTIVATION.—Owing to its widespread growing, the methods of corn culture vary greatly, and no rigid rules can be laid down for all conditions. For maximum results the cornfield must be rich in humus, its soil finely pulverized, mellow and well drained. Many successful growers in the so-called corn states find these conditions best assured by plowing deeply in the fall, turning under liberal quantities of organic matter such as stable and barnyard manure and leaving the subsoil upturned to benefit from the action of the elements during winter, following with the disk harrow or other like implement in the spring. Planting is done when the soil is thoroughly warmed and when danger of frost is past.

There are two methods of planting commonly practiced, one by drilling or dropping the seed (three or four grains) in hills with a machine drawn by horses and completing two rows at once. The other is planting with an implement known as a lister, dropping and covering one grain in a place in the bottom of a furrow, at intervals of eight to twelve inches. The latter method is quite extensively followed in the more western of the corn states, such as Kansas, Oklahoma and Nebraska. The lister is a plow and planter combined, with moldboards at once turning the soil to the right and left, opening a furrow, dropping and covering the seed at the same time, economizing labor, time and expense. Corn is planted about two inches deep, and if in hills or rows generally three and one-half feet apart each way. A bushel of fifty-six pounds of seed suffices for planting nearly eight acres. For soiling, forage or ensiling it is planted more thickly.

Cultivation, with horse-drawn cultivators, cleaning one row at a time, and by some implements two rows, repeated three or four times in a season, is given to kill weeds, aid in the retention of moisture, and aerate the soil. This begins in many instances before the plants appear, and often in the earlier stages is done with a harrow and later by using the cultivator, upon which the operator usually rides.

HARVESTING, done after the grains have become hardened is by cutting the stalks from the hills where grown, by hand or machinery, and standing them in large shocks to be husked later, or, husking the ears directly from the stalks without cutting or shocking. No machine equal to human hands has yet been invented for husking corn. The yield ranges from twenty-five to one hundred bushels of sixty pounds, shelled, or seventy pounds unshelled, per acre. The stalks and husks, whether harvested or not are used as food for live stock, and somewhat in manufactures.

Emmer, See [Spelt](#).

Johnson Grass (*Sorghum halapense*) is a coarse perennial, most extensively grown in the South or the Gulf States, for hay. It spreads so persistently and is so difficult to eradicate that its growing is frowned upon by most of the best authorities. One bushel of seed, or thirty-five pounds per acre is about the quantity sown. It is propagated by roots also. Never plant Johnson grass with the expectation of destroying it.

Millet (*Panicum miliaceum*) is a native of the East Indies, and is about three feet high; each panicle contains five to six hundred grains. Hungarian grass is one of the most common grown for hay and grain. In the United States they are principally grown for forage. It is a general rule to sow after corn planting has been done but they may be safely sown considerably later, as a catch crop when the regular hay crop is short or a probable failure. Millets are excellent for ensilage, and a succession of cuttings for that purpose or for soiling can be easily secured by sowing at intervals of two or three weeks from early May to late July. The seed is sown broadcast or with grain drills, mostly broadcast, at the rate of two to three pecks per acre, for hay and somewhat less for seed. The hay is harvested and handled after the manner of other hay crops, and the seed crop as that of other small grains. Well drained, rich, warm, loam soils are preferable for millet, and it does not prosper on thin or poor land. A crop of millet leaves the soil where it grew in a delightful condition of tilth. Its yield of seed is from twenty to forty bushels per acre.

Oats (*Avena sativa*) have a broad panicle; the individual ears are two-rowed, with and without beards. Another much-cultivated species are the bearded oats (*A. orientalis*). The greater portion of the oats crop of the United States is grown in the north central states, more than one-half in the six states of Illinois, Iowa, Minnesota, Wisconsin, Nebraska and Ohio, ranking in order named. Russia is also a large producer and it is cultivated throughout the temperate parts of the civilized world. The yield per acre ranges from twenty-five to one hundred bushels, weighing thirty-two pounds. Oats thrives best in cool weather with abundant moisture, and in the principal oats territory should be sown as early as possible in the spring—earlier than any other spring grain. The ground for oats should be plowed, but it is not uncommon to merely disk harrow the land before sowing. If the latter, about four bushels is sown to the acre, broadcast or drilled, but on well prepared ground ten to twelve pecks of clean, graded seed is sufficient. In the main the oats crop is harvested, stacked and threshed as other small grains.

Oats is used chiefly for horse feed, and in lesser amounts for making oatmeal and breakfast foods.

The manufacture of oatmeal is of relatively small importance since the more nourishing products of wheat are increasingly used.

Orchard Grass (*Dactylis glomerata*) is a hardy, nutritious perennial, growing two to five feet high, that does well in either shade or sunshine. It flourishes in nearly every state between the Mississippi River and the Rocky Mountains, and is profitably grown in all the states east of the Mississippi River lying between thirty-five degrees and forty-seven degrees north latitude, but is partial to a rich soil. Two to three bushels of seed are sown to the acre, from about the middle of March to the middle of April. It provides either hay or pasturage, and is prized for the latter, as "it comes early and stays late."

Rape (*Brassica napus*) is a valuable farm crop, supplies an abundance of succulent green food in a short time, for soiling or pasture, especially for sheep and swine, being ready to use ordinarily six weeks after sowing, and is prized chiefly as a catch crop. Three pounds of seed per acre sown in rows thirty inches apart is customary, and the favorite is the Dwarf Essex.

Redtop, or Herd's Grass (*Agrostis alba*) is a meadow grass and also one of the best pasture plants. It prospers on land where blue-grass, timothy and clover are not thrifty. It is most at home in a moist soil, flourishing in swampy places unfit for almost any other useful grass, and it also has ability to withstand severe drought. On thin soil it makes excellent pasture, but yields lightly of hay. It may be sown in the fall or spring, alone, or with a nurse crop. For meadow, it is best sown alone, using one bushel of seed in the chaff, or half as much if winnowed. A bushel of re-cleaned seed weighs thirty-five pounds.

Rice (*Oryza sativa*) is grown in nearly all the warmer countries of the earth, and forms the daily food of many millions of people. It is estimated that one-third of the people of the world live principally on rice.

There are two general varieties—the mountain rice and the marsh rice, the latter being the most cultivated. It is usually grown in swampy land or else on irrigated fields. In most countries rice is grown in the most primitive fashion. Immense irrigating plants and modern agricultural machinery make possible the large production in parts of the United States.

It is the chief crop in southeastern Asia, from India through Indo-China, a great part of China, southern Japan and many islands of the Pacific. Rice of excellent quality is raised in Texas, Louisiana and South Carolina, and an amount about equal to the production of this country is imported from eastern Asia.

ECONOMIC USES.—Rough rice or paddy (rice in the hull) is first hulled by machinery and then the grains are polished or whitened. The rice polish, which consists of the powdered outer coats, is a very nourishing cattle food. Saké, the national drink of Japan, is a weak alcoholic liquor brewed from rice. Rice straw is of enormous use in Asia, being employed for hundreds of purposes, some of them as unexpected as the making of bags, ropes and sandals. Rough rice and clean rice are the common commercial articles.

Rye (*Secale cereale*) is cultivated in all northern countries. The stalk grows up to six feet, and the ears are double-rowed with a long beard. The grain is dark green and very mealy, and furnishes a good bread. It is cultivated in the cold climates of northern Europe, especially in Russia. Only small amounts are grown in the United States.

The leading rye states, in order of yields, are Pennsylvania, Michigan, Wisconsin, New York and Minnesota, which together raised nearly two-thirds of the crop.

It is usually sown at the same time as winter wheat, or earlier, one and a half to two bushels of seed per acre, and its habits and treatment are essentially the same. Its yield per acre is from twenty to fifty bushels, weighing fifty-six pounds. It is noted for its ability to thrive and yield fairly on soils too poor for the more important cereals. Rye is used for breadmaking, live stock food, and in the manufacture of malt and alcoholic beverages. It is the chief breadstuff in parts of Russia, Scandinavia and Germany. It also furnishes valuable pasturage late in the fall and early spring, for which it is extensively sown where early tame grasses do not prosper. Its straw is in considerable demand for various uses, such as the making of paper, filling horse collars, for packing and otherwise.

Sugar-Cane (*Saccharum officinarum*), a tree-like grass, grows nine to fifteen feet high, and contains in its pith a sweet sap, from which our raw sugar is obtained. The sugar-cane is a native of the East Indies, but it is now grown in India, Cuba, Hawaii, Java, Brazil, Mauritius, Louisiana and other parts of the tropics and subtropics. India's large production is consumed locally and enters little into export trade. Louisiana produces all made in the United States, except ten thousand to fifteen thousand tons, annually, from Texas. Cane for molasses and sirup is grown more or less in all of the Gulf Coast states.

METHOD OF CULTIVATION.—It requires a fertile soil, rich in humus. Sandy and clay loams are both good, but alluvial soils are best. In preparing for sugar cane the soil is thrown up by plows in beds six to seven feet wide. In planting, furrows are opened, and in these the cane stalks, one, two or three are laid side by side, covering by plows. It is cultivated largely after the manner of corn, care being taken to leave the rows well ridged up by the last cultivation, to facilitate drainage. The quantity of cane required for planting an acre ranges from four to six tons. Two and sometimes three crops or cuttings are had from one planting. Yields of forty to forty-five tons of stripped cane per acre are not uncommon, although half those quantities are considered creditable averages for large plantations.

MANUFACTURE.—After harvesting, sugar cane is carried (usually by rail) promptly to the mill, where the juice is pressed out. Modern mills have nine rollers, arranged in three sets. The trash, or bagasse, is almost dry when it leaves the last rollers and is used as fuel to run the mill. The juice is boiled down, generally in vacuum pans heated by steam, and the sugar crystals which form are separated from the molasses in centrifugals.

PRODUCTS.—Raw cane sugar, brown to yellowish in color, produced by evaporation of the juice in open pans (muscovados), and crystals from vacuum pans are both important commercially. White sugar, granulated, loaf and pulverized, as commonly sold, is more nearly chemically pure than most other articles of commerce. Molasses, from cane juice boiled in open pans, is palatable for human food, and, like all cane molasses, is fermented and distilled to make rum.

Sorghum is a cultivated grass of many varieties (*Panicum*, *Setaria*, *Andropogon*, etc.) Guinea corn, kaffir corn, broom corn and other names are employed to distinguish the different kinds. They may, however, be divided into two classes: the *Saccharine* or sweet sorghums and the *non-saccharine*. The sweet sorghums are grown for making sirup, but principally for forage and hay, and yield heavily, from five to fifteen tons per acre. The seed being somewhat bitter is not entirely relished by animals, but it finds a ready

[126]

[127]

market for seeding purposes. For hay about a bushel of seed is sown to the acre, and for fodder and seed about ten pounds per acre is planted in rows and cultivated.

KAFFIR CORN, a by far the most valuable of the non-saccharine sorghums. Its grain, of which it yields from thirty to sixty bushels per acre, has a feeding value approximating that of Indian corn, and its forage after the seed heads have been removed is valuable feed for live stock.

MIL O is one of the non-saccharine sorghums especially adapted to dry regions, and the most successful summer grain crop for the southern half of the plains country. It does not rank with the sweet sorghums and Kaffir corn as forage, being principally valued for its seed, which makes a satisfactory substitute for Indian corn.

JERUSALEM CORN is also a non-saccharine sorghum. It is cultivated mostly in the cooler climates of the dry regions. It will mature in a short season, and is quite productive of seed, but its fodder yield is light.

BROOM-CORN, a non-saccharine sorghum, is grown only for its brush for making brooms. It is a hardy plant, withstanding dry weather well, and is grown chiefly in Oklahoma, Illinois and Kansas. There are two varieties—the Standard and Dwarf, the former growing taller and producing the longer brush.

In adaptability sorghums cover about as wide a range of soils and climate as corn, and are noted for their drought-resisting powers. Kaffir corn is especially adapted to hot, dry and semi-arid portions of the West, where corn is uncertain, and there it is regarded with increasing appreciation.

In some places the juice of sorghum is boiled down to make sirup or sugar. Common brooms are made of the tops of the Broom-corn.

Spelt (*Triticum Spelta*) is chiefly cultivated in south Germany, but is also grown in a small way in some of our northwestern states. It is sown in both fall and spring, dealt with the same as other wheats, and some authorities recommend it as a very hardy drought-resistant grain for semi-arid regions. About seven pecks of seed are sown to the acre, and the yield is from twenty-five to sixty bushels per acre. The small ears are arranged on a brittle stalk, and consist of three or four blooms, of which, as a rule, only two are fruitful. Spelt is, generally, not bearded. The corn furnishes a white bread. When unripe, it is manufactured into a soup, which is highly esteemed.

Timothy (*Phleum pratense*) is a popular and most widely used hay plant in America, and also extensively seeded with other grasses for pasture, prospering best in moist loams. It yields the year following its sowing, grows from one and a half to four feet high, and twelve to fifteen pounds of seed are sown per acre. The chief timothy region is the northern half of the United States, east of the 100th meridian, where it is usually sown in the fall with winter wheat, or in the spring with oats. Forty-five pounds of seed make a bushel.

[128]

Wheat (*Triticum vulgare*), does not grow as high as the rye, but has a thicker stalk and thicker ears, which are composed of several small ears. In each little ear there are generally four seeds. There are, as a rule, no beards; but, on the other hand, there is often a short spur at the top of the ears. It grows in temperate climates, the largest crops being raised in United States (especially in Minnesota, North Dakota, Ohio, South Dakota and Kansas); Central Europe (Russia, France, Austria-Hungary and Italy); India, Argentina, Canada and Australia. The area of wheat production is steadily increasing and wheat raising has become an important industry in newly developed countries, such as parts of British America, West Australia and Manchuria.

CULTIVATION.—The soil conditions in the Middle West are most favorable for giving quality. Its rich prairies contain large amounts of decaying vegetable matter, and because of the lime and alkaline substances in these soils, the elements of plant food are readily available, particularly the nitrogen in the soil, that contributes so largely to the glutinous character of the wheat.

Wheat is more than ordinarily adapted to machine farming and the invention of the successful reaper was largely responsible for the rapid increase of wheat acreage in America. In many parts of the wheat region immense plows drawn by traction engines and turning six to twelve and more furrows are employed. In other portions where operations are large many fields are plowed only once in two or three years. For various reasons, among which may be mentioned the control of weeds and the conserving of moisture in the soil, early plowing for winter wheat is preferable, and where the rainfall is scant very satisfactory conditions are obtained by stirring the surface soil with disc harrows only.

The average quantity of seed sown per acre is between four and five pecks, varying with the quality, the locality, method and time of seeding and the whim of the sower. The yield ranges from ten to sixty bushels per acre, the bushel weighing sixty pounds.

Wheat is mostly sown with drills, the old method of sowing broadcast having been mostly abandoned. By drilling a more even distribution and covering of the seed, and a better stand and yield of grain may be confidently expected.

In harvesting small areas the self-binding reaping machine is popular. This cuts the standing grain and binds it in sheaves of convenient size which are stood in shocks of three or four dozen bundles each, whence it is either threshed direct or put in stacks for threshing at a more convenient season. On larger areas and especially where the wheat is quite ripe, the header is commonly and widely used. This clips off the heads of grain, and elevates them into large receptacles called barges, set on wagons, leaving the straw standing. Usually when headed the grain is put directly into stacks, and threshed at convenience.

ECONOMIC PRODUCTS.—Its commercial varieties, hard, soft, red, white, etc., differ in percentage of starch and gluten.

The whole grain is ground into graham flour, made into breakfast foods and used in brewing.

From parts of the grain are prepared whole wheat flour, white flour, middlings, bran, wheat grits, wheat starch, macaroni, spaghetti, etc.

Wheat flour may be said to be the standard foodstuff of modern civilized man.

Macaroni is made from special varieties of hard, glutinous wheat.

Wheat straw is plaited into braids (Leghorn, etc.) for hat making, and is used like the straw from other grains for packing material and as bedding for animals.

Straw braids come largely from Italy, China and Japan.

The principal countries exporting wheat are United States, Russia, Argentina, Canada, Roumania, India and Australia.

II. KITCHEN VEGETABLES

Among the commercial products of the world, vegetables are a most important item, and their value as foodstuffs needs no emphasizing. The inhabitants of the world could subsist without animal-flesh, could scarcely subsist entirely on cereals, but they most certainly could not subsist without vegetables. Practically every nation, savage and civilized alike, cultivates a few plants for use as vegetables. The vegetables we know and prize most are one and all the result of long cultivation, the origin of most being lost in antiquity. The world has been ransacked, and for the vegetables cultivated in America nearly every country under the sun has been laid under contribution.

Asparagus (*Asparagus officinalis*). The common Asparagus is a native of Great Britain, Russia and Poland. It is one of the oldest as well as one of the most delicious of our garden vegetables. It was cultivated in the time of Cato the Elder, 200 B. C.; and Pliny mentions a sort that grew in his time near Ravenna, of which three heads would weigh a pound. As many of our best gardeners contend, adaptation of soil, together with thorough cultivation, alone explains the difference in this vegetable, as offered in our markets or seen in our gardens.

Bean (*Phaseolus vulgaris*) is cultivated in many countries for the sake of its seed and husks. By cultivation many varieties have been produced, of which the following are the best known: **BROAD BEAN**, an important article of food in Europe and western Asia, and valuable forage plant, grown in gardens and as a field crop. All species of the bean have a very high food value; are relatively cheap in price, but much less easily digested than cereals. **LIMA BEAN**, widely cultivated in tropical Africa, sparingly in temperate regions. Production in the United States most extensive in California. **NAVY OR KIDNEY BEAN**, extensively grown in the United States, over one hundred and fifty varieties of which are in cultivation as a garden vegetable, "string beans," fodder and for food. The closely related "frijole" is universally grown in Mexico and Spanish American countries where it ranks next to maize as a staple food. **SOY BEAN**, the common bean of China and Japan is grown in immense quantities. Various preparations form a part of the daily food. It is now grown in Europe and southern and southwestern United States as forage and soiling crop.

[129]

NEWEST VEGETABLES GROWN IN AMERICAN GARDENS

UDO—This fine salad vegetable comes from Japan, is similar to asparagus, and much easier to grow. It has a fresh taste like lettuce with an agreeable flavor. There are numerous ways of serving it, but it is possibly best simply boiled and seasoned like asparagus. It will grow in any soil suitable for asparagus.

THE CHAYOTE, or Vegetable Pear, is large, green and pear-shaped, with a texture somewhat like a squash, and a flavor more delicate than a cucumber. It is grown on lowlands near the coast, in a moderately warm climate. Its keeping qualities are remarkable, making it an excellent winter vegetable. Both roots and stalks are also edible.

THE BUR ARTICHOKE, long imported from France, may now be successfully grown in this country. It is used like the cauliflower in many ways but commands a higher price. The scalelike leaves make a delicious salad when pulled apart after boiling, and may be served on lettuce with either mayonnaise or French dressing.

THE PETAISI, or Odorless Cabbage, is much superior to the ordinary cabbage, and is wholly without disagreeable odor. It does not closely resemble cabbage in appearance; it is rather tall than squat, and the leaves cluster around the stalk compactly. It requires cultivation similar to cabbage but is not transplanted. It is served after the fashion of cabbage.

Brussels Sprouts, or Bud-bearing Cabbage (*B. oleracea bullata minor*) originated in Belgium, and has been cultivated around Brussels from time immemorial, although it is only within the last fifty years that it has become generally known in this country. It is so named on account of its peculiar habit, producing a bud-like cluster of leaves in the

[130]

axil of each leaf from the base to the top of the stem. These buds or sprouts are the parts of the plant that are eaten, and are highly esteemed for their delicate flavor and wholesome quality. Brussels sprouts is one of the hardiest of green winter vegetables. As a rule, the shorter-stemmed strains have the largest and most compact sprouts, and are consequently the most favored. As regards cultivation, the plant, like all of the cabbage tribe, requires deep, rich soil to bring it to fullest perfection.

Cabbage (*Brassica oleraceae*) is found in a wild state in various parts of Europe and in southern England, always on maritime cliffs. It is a biennial, with fleshy lobed leaves covered with a glaucous bloom; altogether so different in form and appearance from the cabbage of our gardens that few would believe it could possibly have been the parent of so varied a progeny as are comprised in the Savoy, Brussels Sprouts, Cauliflower, Broccoli and other numerous varieties. Over one hundred fifty varieties are enumerated. The common or cultivated cabbage is well known, and from a very early period has been a favorite culinary vegetable in almost daily use throughout the civilized world.

Carrot (*Daucus*) of which there are about twenty species are mostly natives of the Mediterranean countries. The common carrot is a biennial plant and is universally cultivated for the sake of its root. In all varieties of the wild plant this is slender, woody and of a very strong flavor; and that of the cultivated variety is much thicker and more fleshy, much milder in its flavor and qualities. Its color is generally red, but sometimes orange or yellowish white.

Cauliflower (*B. oleracea botrytis cauliflora*) is of great antiquity, but its origin is unknown, although it is usually ascribed to Italy. To the English and Dutch gardeners we are chiefly indebted for it has attained. Heads of immense size are now grown for the market. It is by no means uncommon to see a head perfectly sound and smooth, fully ten inches in diameter, and, contrary to the usual rule, size is not obtained at the expense of quality, the larger, if differing at all, being more tender and delicious. The varieties of the Cauliflower are numerous.

Celery (*Apium graveolens*). The plant is hardy, and is largely cultivated in the United States, Canada and Europe. In cultivation, however, abundant nutrition has greatly modified its properties, and two principal forms have arisen. The first sort is the common celery, where the familiar long blanched succulent stalks are produced by transplanting the seedlings into richly manured trenches, which are filled up as the plants grow, and finally raised into ridges over which little more than the tops of the leaves appear; and a supply is thus insured throughout the whole winter. The other form is the turnip-rooted celery, or celeriac.

Cucumber (*Cucumis sativus*). The common cucumber is distinguished by heart-shaped leaves, which are rough with hairs approaching to bristles, and oblong fruit. It is a native of the middle and south of Asia, and has been cultivated from the earliest times. Its fruit forms an important article of food in its native regions, the south of Europe, etc., and an esteemed delicacy in colder countries, where it is produced by the aid of artificial heat. Many varieties are in cultivation, with fruit from four inches to two feet long, rough, smooth, etc.

VEGETABLE MARROW (*Cucurbita ovifera*) is closely allied to the cucumber, and is supposed to have been originally brought from Persia. Like the cucumber it is a tender annual, but succeeds out of doors in summer in this country.

Many other members of the cucumber family are cultivated as esculents, notably in the warmer parts of the world. Of these the chief are Pumpkins, Melon Pumpkin, Water Melon, Chocho, Bottle Gourd, Squash.

Egg-plant (*Solanum melongena*). The egg-like fruit known as egg-apple, etc., is a favorite article of food in the East Indies, and has thence been introduced to most warm countries. It varies in size from that of a hen's egg to that of a swan's egg, in color from white or yellow to violet. Egg-plants are much grown in the United States, where "Jew's-apple" is one of the names for the fruit.

Kale, or Borecole (*B. oleracea acephala*) is distinguished by its leaves being beautifully cut and curled, of a green or purple color, or variegated with red, green, and yellow, never closing so as to form a heart, nor producing edible flower heads like a Cauliflower. Its leaves and tender shoots are not only edible but form one of the most useful green vegetables.

Lentils (*Ervum Lens*), a slender plant supposed to be native of Western Asia, Greece and Italy. The Lentil was introduced into Egypt as a cultivated plant at an early date, and from this center spread east and west. It is a weak, straggling plant, rarely exceeding eighteen inches high, often much more dwarfed, having pinnate leaves terminating in tendrils. The flowers are white, lilac, or pale blue, small and formed like those of a pea. There are three varieties of lentil recognized in the countries in which it is cultivated: the small brown, which is the lightest flavored and the best esteemed for soups and haricots; the yellow variety, which is slightly larger; and the lentil of Provence, France, which has seeds as large as a small pea, but is better appreciated as fodder for cattle than for food for man.

Lettuce (*Lactuca sativa*). The garden lettuce is supposed to be a native of the East Indies, but is not known to exist anywhere in a wild state, and from remote antiquity has been cultivated as an esculent and particularly as a salad. It has a leafy stem, oblong leaves, a spreading, flat-topped panicle, with yellow flowers, and a fruit without margin. It is now generally cultivated in all parts of the world where the climate admits of it.

Melon (*Cucumis melo*), a plant of the same genus with the cucumber, much cultivated for its fruit. The melon is an annual, with trailing or climbing stems, lateral tendrils, rounded, angular leaves, small, yellow flowers and large round or somewhat ovate fruit. The varieties in cultivation are very numerous, some of them distinguished by a thick and warty rind, some by a rind cracked in a net-like manner, some by ribs and furrows, some by a perfectly smooth and thin rind; they differ also in the color of the flesh of the fruit, which is green, red, yellow, etc.; and in the size of the fruit, which varies from three or four inches to a foot or more in diameter. They are widely cultivated in the United States, ranking fifth in acreage among vegetables. New Jersey leads in production, growing about one-seventh of entire crop. Cultivation under irrigation is highly developed in Colorado. They are often called cantaloupe in the markets.

Mushroom. See **Cryptogams**.

Okra or Gumbo (*Hibiscus esculentus*) is a generally used food plant most commonly employed in soups in the East and West Indies and also in the southern United States. It was anciently grown in tropical Africa and Egypt, and is now diffused in tropical countries and in the southern United States.

Onion (*Allium Cepa*) is extensively cultivated throughout the world, and is grown in every state in the United States, New York and Ohio leading in production. Bermuda and Spanish varieties are now grown in California. It was cultivated by the ancient Egyptians; also by the Greeks and Romans. Many other important vegetables are allied to the onion, viz.: Leek, Shallot, Onion, Chives and Garlic. All of these are highly esteemed in cookery.

Parsnip (*Pastinaca*), an annual, biennial, or perennial herb, with carrot-like, often fleshy root and pinnate leaves. The parsnip has long been cultivated for the sake of its root, which in cultivation has greatly increased in size and become more fleshy. The flavor is disliked by some, as well as the too great sweetness, but highly relished by others; and the root of the parsnip is more nutritious than that of the carrot. The crop is also on many soils of larger quantity; and although the parsnip delights in a very open, rich soil, it will succeed in clayey soils far too stiff for the carrot.

Pea (*Pisum sativum*) has been cultivated from very remote times. The pea plant is covered with a delicate, glaucous bloom, and its white or pale violet flowers are familiar to all. The pods are pendulous, smooth, deep green and variable in size and may contain any number up to thirteen (rarely more) peas. The peas when ripe are also variable, some being white and round, others blue and wrinkled, and a few large, irregular, and dull green. They are cultivated in Europe, Asia and the United States. Chiefly used as green vegetable, but also for fodder. Ranks seventh in acreage among minor vegetables in the United States.

Peppers or Capsicums or Chillies (*Capsicum annuum* and *C. frutescens*) are widely cultivated in the warmer parts of both hemispheres. The fruits vary considerably in shape and size, and when green are cooked and eaten as a vegetable.

Potato (*Solanum tuberosum*) is the greatest of vegetable gifts to man. Its cabbage-like stalks have a height of from eighteen to twenty inches; its leaves are solitary and pennate; its large pentagonal blossoms are white, reddish or violet; its fruit is a green berry. Attached to its underground runners are those bulbs which serve as food to many millions of people, and from which starch, sago, sugar of grapes and brandy are prepared.

The potato stands second only to corn as the most important contribution of America to the food plants of the world. Preëminently the most important vegetable grown in Europe and America. The world crop is enormous, exceeding five billion bushels; in bulk surpassing by about one-half the world crop of wheat, corn or oats. Germany, Russia, Austria-Hungary, France, the United States and Great Britain are the chief producers in order named. Germany grows one-third of the world crop, Russia one-fifth. In the United States they are grown in every state and territory; also in Hawaii and Alaska.

Their cultivation was even ancient in Peru. It was widely diffused from Chile to Colombia at time of Spanish discovery, but there were no evidences of culture in Mexico or by North American Indians. It was introduced into what is now North Carolina and Virginia late in the sixteenth century; taken to Europe first by the Spaniards early in the sixteenth century and to England by Sir Walter Raleigh in 1585. SWEET POTATOES are the thickened roots of *Ipomoea Batatas*, a climbing plant. This plant is extensively cultivated in most tropical countries, although not known in a wild state. The root contains much starch and saccharine matter. They are second only to the potato in the United States, being widely grown in the South—Georgia, North Carolina, Alabama, South Carolina and Tennessee producing over half of the total crop, which in acreage and value is about one-fifth that of the potato.

Radish (*Raphanus sativus*) is a well-known plant, the root of which is a valuable salad; it has been cultivated from a remote period. It is now possible to have a supply the whole year round. Crisp, tender radishes with delicate flavor are only obtained by quick growth on rich, moist soil. The earliest crops are grown in frames on hotbeds, the crop being ready about five weeks from sowing. The earliest sowing outdoors can be made from December to February in sheltered sunny positions, the beds being covered with a thick layer of litter. There are round, oval and long-rooted varieties.

Tomato or Love-apple (*Lycopersicum esculentum*). The fruit of this plant is fleshy, usually red or yellow, divided into two, three or more cells containing numerous seeds imbedded in pulp. The tomato is one of a genus of several species, all natives of South America, chiefly on the Peruvian side. In the warmer countries of the United States, Europe and other countries in which the summer is warm and prolonged, it has long been cultivated for the excellent qualities of the fruit as an article of diet. The tomato is extensively grown as a field crop for canneries in the United States, and in the North is one of the chief winter-forcing crops. It is exceeded in acreage only by the watermelon and sweet corn among the minor vegetables. In the United States the crop exceeds thirty million bushels, nearly half of which is grown in Maryland and New Jersey.

Turnip (*Brassica rapa*). Although the turnip is of great value for feeding stock, it is not very nutritious, no less than nine to ninety-six parts of its weight actually consisting of water. One of the best early varieties is purple top strap leaf. Early flat Dutch is also good. The Swedish turnip, or *ruta бага*, which was introduced into cultivation from the north of Europe more recently than the common turnip, and has proved of very great value to the farmer, is regarded by some botanists as a variety of the same species, and by some as a variety of *B. napus*, but more generally as a variety of *B. campestris*, a species common in cornfields and sides of ditches in Britain and the north of Europe.

Watermelon (*Citrullus vulgaris*). The most popular melon in cultivation, is extensively grown in warm climates throughout the world, but most abundantly in southern Russia and the southern United States. It leads all minor vegetables in acreage, being surpassed only by the major vegetables, potato and sweet potato. Texas, Georgia, North Carolina and Missouri are the chief growers in the order named. Very anciently it was cultivated by Egyptians.

Yam (*Dioscorea alata*). Yams, the tubers of various species of *Dioscorea*, are cultivated in nearly all tropical countries. Yam tubers abound in farinaceous matter and often reach a large size. They resemble but are inferior to the sweet potato.

PLANTING TABLE FOR GARDEN VEGETABLES

Time given is for latitude of New York. Each one hundred miles north or south will make a difference of from five to seven days in the season. The distances given here indicate the distance apart the plants should stand after thinning. The seed should be sown much nearer together. CLASS A. These plants may be started early (in the greenhouse or hotbed, in early spring, or outdoors in the seedbed later), and afterwards transplanted to their permanent location. CLASS B. These crops usually occupy the ground for the entire season. CLASS C. These are quick maturing crops which, for a constant supply, should be planted at several different times in "succession"—a week or two weeks apart. CLASS D. These are crops which often may be cleared off in time to permit planting another quickly maturing crop, usually of some early variety. CLASS E. These crops are supplementary to those in Class D and may be used to obtain a second crop out of the ground from which early crops have been cleared.

Name and Variety	Time to Plant	Class	How to Plant and Care for
Asparagus (Plant).	April.	B	Plant 4 inches deep, at distance of 1 foot; in rows 3 feet apart; heavily manured, spreading the roots out evenly. Do not cut for use until <i>second</i> spring. Keep bed clean; cut off tops in the fall. Transplant third spring.
Asparagus (Seed).	April-May.	B	Seed 2 to 4 inches apart, in rows 15 inches apart; 1 inch deep.
Beans, Bush	March 15, under glass.	B	Tender. Set out in May. Plant 2 inches deep in rows 2 feet apart.
Lima , Burpee Improved.	May 1, outside.		
Beans, Pole	May 15, outside.	B	Tender. Plant 2 inches deep in hills 4 feet apart. Pinch off at 6 feet high. 1 pint of seed to 50 hills.
Lima , King of Garden.	Ready in 10 weeks.		
Beans, String .	April 15, outside.	C	Tender. Plant 2 inches deep in rows 2 feet apart, 6 inches apart in row. 1 pint of seed to 75-foot row.
Bountiful.	May 1, outside.		
Hodson Wax.	May 15, outside.		
Bountiful.	June 1, outside.		
Hodson Wax.	June 15, outside.		
Bountiful.	July 1, outside.		
Hodson Wax.	July 15, outside.		
Bountiful.	Ready in 6		

Beets. Eclipse. Crimson Globe.	weeks. March 1, under glass. April 15, outside. May 15, outside. June 15, outside. July 15, outside. Ready in 9 weeks.	A-D B-E	Transplant outside in April. Hardy. Plant 1 inch deep in rows 2 feet apart, 6 inches apart in row. Soak seed over night. 1 ounce of seed to 50 feet. Winter in sand or pits.
Brussels Sprouts. L. I. Half Dwarf.	March 15, under glass. May 1, under glass. Ready in 20 weeks.	A-E	Plant ½ inch deep in rows 2 feet apart, 1 foot apart in row. 1 ounce of seed to 1500 plants. Hang in cellar for winter.
Cabbage. Copenhagen Market. Drumhead Savoy.	March 1, under glass. March 1, under glass. May 1, under glass. Transplant to garden. Ready in 18 weeks.	A-C	Hardy. Plant ½ inch deep in rows 3 feet apart, 2 feet apart in row. Manure well. 1 ounce of seed to 2500 plants. Winter in pits upside down.
Carrot. Half-long Danvers.	April 1, outside. June 1, outside. Ready in 15 weeks.	C-B	Hardy. Plant ½ inch deep in rows 1½ feet apart, 6 inches apart in row. 1 ounce of seed to 100 feet. Winter in sand or pits.
Cauliflower. Dwarf Erfurt.	March 1, under glass. April 1, under glass. May 1, under glass. Transplant to garden.	A-C-E	Hardy. Plant ½ inch deep in rows 3 feet apart, 2 feet apart in row. 1 ounce seed to 2500 plants. Manure well.
Chard. Lucullus.	April 15, outside. Ready in 8 weeks.	...	Hardy. Plant 1 inch deep in rows 2 feet apart, 1 foot apart in row. 1 ounce of seed to 50 feet.
Celery. Golden Self-blanching. Fin de Siecle.	March 1, under glass. April 15, under glass. Ready in 18 weeks.	A-E	Hardy. Set out in May. Barely cover. Rows 3 feet apart, ½ feet apart in row. Rich, moist soil. Transplant twice. 1 ounce of seed to 3000 plants. In August bank up to blanch. Winter in pits.
Corn. Golden Bantam. Evergreen. Country Gentleman. Mexican. Country Gentleman.	April 1, under glass. April 15, outside. May 1, outside. May 1, outside. May 15, outside. June 1, outside. June 1, outside. June 15, outside. July 15, outside. Ready: Early 9 weeks. Late 11 weeks.	B-E	Tender. Set out in May. Plant 2 inches deep in rows 4 feet apart, 2 feet apart in row. Manure and remove suckers. 1 quart of seed to 200 hills.
Cucumber. Cool and Crisp.	March 15, under glass. May 1, outside. June 1, outside. July 1, outside. Ready in 9 weeks.	A-B	Tender. Set out in May. Plant 1 inch deep, 4 feet apart. 1 ounce of seed to 50 hills.
Endive. Green Curled.	July 1, outside. Ready in 8 weeks.	A-E	Hardy. Plant in rows 2 feet apart, 1 foot apart in row. 1 ounce of seed to 100-foot row. Transplant to dark cellar to blanch for winter.
Eggplant. Black Beauty.	March 1, under glass, with good heat. Transplant to garden. Ready in 15 weeks.	A-B	Very tender. Plant ½ inch deep in rows 3 feet apart, 2 feet apart in row. Rich and moist soil. 1 ounce of seed to 1000 plants. Store dry for late fall use.
Kale. Dwarf Scotch. Siberian.	May 15, under glass. Transplant to garden like cabbage. July 1, outside. Ready in 20 weeks.	E	Hardy. Plant ½ inch deep in rows 2 feet apart, 1 foot apart in row. 1 ounce of seed to 200 feet. Mulch for winter.
Lettuce. May King.	March 1, under glass. March 15, under glass. Outside every 2 weeks to Sept. 1. Ready in 6 weeks.	C	Hardy. Plant ¼ inch deep in rows 1½ feet apart. Rich soil. 1 ounce of seed to 3000 plants. Shade and water in summer.
Muskmelon. Emerald Gem. Osage. Early Hackensack.	May 1, outside. May 1, outside. May 1, outside. Ready in 6 weeks.	A-B	Plant 1 inch deep in hills four feet apart. Pinch off ends of shoots. Make special soil of sand and manure. 1 ounce of seed to 50 hills.
Watermelon. Cole's Early. Halbert Honey. Cole's Early. Halbert Honey.	May 1, outside. May 1, outside.	B	Tender. Plant 1 inch deep in hills 6 feet apart. Make special soil of sand and manure. Pinch off ends of shoots. 1 ounce of seed to 30 hills.
Onion. Yellow Danvers. Prizetakers.	April 1, plant sets. Seeds April 15, outside. Seeds April 15, outside. Ready in 18 weeks from seed.	A-B	Hardy. Plant seeds ½ inch deep; sets 2 inches deep in rows 2 feet apart. 1 ounce of seed to 150 feet. Dig and dry for winter. 1 quart sets to 100 feet.
Parsley. Triple Curled.	April 15, outside. Ready in 8 weeks.	B	Hardy. Plant ½ inch deep in rows 2 feet apart, 6 inches apart in row. Soak seeds over night. Seeds are slow to start. 1 ounce of seed to 150-foot row.

Parsnip. Hollow Crown.	April 15, outside. Ready in 15 weeks.	B	Hardy. Plant ½ inch deep in rows 1½ feet apart. Seeds start slowly. 1 ounce seed to 200 feet. Winter in place or in pits. Improved by frost.
Peas. Thomas Laxton. Juno. Telephone.	April 15, outside. May 1, outside. May 1, outside. May 15, outside. June 1, outside. June 15, outside. July 1, outside. July 15, outside. Ready in 8 weeks.	B-E	Hardy. Plant early varieties 4 inches deep and late varieties 3 inches deep. Early in double rows and late in rows 3 feet apart. Moist soil. 1 quart of seed to 150 feet.
Pepper. Chinese Giant.	March 1, under glass. Set out in May. Ready in 20 weeks.	A	Very tender. Plant ½ inch deep in rows 2 feet apart. Start in good heat. Hang in cellar for winter.
Potatoes. Noroton Beauty. Gold Coin.	April 1 (early). May 1 (early). May 15 (main crop). Ready in 12 weeks.	B	Plant early varieties 2 inches deep, and late varieties 5 inches deep in rows 3 feet apart. 1 peck to 100-foot row. 8 or 10 bushels to acre. Sprout before planting.
Pumpkin. Winter Luxury.	May 15, outside. Ready in 15 weeks.	B	Tender. Plant 6 feet apart. Manure. 1 ounce of seed to 50 hills. Winter warm and dry.
Radish. French Breakfast.	March 7, under glass and every 2 weeks. Ready in 4 weeks.	C	Hardy. Plant ½ inch deep. 1 ounce of seed to 100 feet. Soil light and rich.
Rhubarb (Plant).	April.	B	Set out root-clumps at distance of 2 to 3 feet, in rows 3 to 4 feet apart. Give them dressing of bone meal and soda in the spring.
Salsify. Mammoth Sandwich Island.	April 15, outside. Ready in 18 weeks.	B	Hardy. Plant ¼ inch deep in rows 2 feet apart. 1 ounce of seed to 100 feet. Winter in place or in pits.
Spinach. Victoria. New Zealand.	April 1, outside. April 15, outside. May 1, outside. May 1, outside. June 1, outside. Sept. 1, outside. Ready in 5 weeks.	A-B-E	Hardy. Plant 1 inch deep in rows 1½ feet apart. 1 ounce of seed to 200 feet. Very rich soil. Winter under straw cover.
Squash. Crookneck. Delicata. Early Golden Custard. Crookneck. Hubbard.	March 15, under glass. May 15, outside. May 15, outside. May 15, outside. Ready in 7 weeks. May 15, outside. Ready in 15 weeks.	B	Tender. Plant 1 inch deep, 4 feet apart. Hubbard 6 feet apart. Winter warm and dry. 1 ounce of seed for 25 hills. For Hubbard make special soil of sand and manure.
Tomato. Earliana. Crimson Cushion.	March 1, under glass. April 1, under glass. Set out in May. Ready in 18 weeks.	B-A	Tender. Plant ½ inch deep in rows 3 feet apart, 3 feet apart in row. Keep hotbed cool. Pinch off side shoots. 1 ounce of seed to 2000 plants. Hang in cellar for early winter.
Turnip. Early Milan White.	April 17, outside. June 15, outside. Ready in 9 weeks.	C	Hardy. Plant ½ inch deep in rows 1½ feet apart. 1 ounce of seed to 200 feet. Winter in pits.

[134]

**PLANTING TABLE FOR GARDEN VEGETABLES—Continued
Especially Adapted to Southern United States**

Name and Variety	Time to Plant	Class	How to Plant and Care for
Artichoke, Jerusalem.	March 1, outside. Ready in 6 to 8 months.	...	Hardy Perennial. Plant tubers 6 inches deep in rows 5 feet apart, 2 feet apart in row. Light soil and sun. 2 quarts of tubers to 100 feet. Fine for soup or boiled and creamed, or salad or pickles.
Asparagus. Palmetto.	December, outside. Ready in February or March.	B	Hardy. Plant 2-year roots 8 inches deep in rows 2 feet apart, 1 foot apart in row. Rich and moist mulch with manure all summer, salt well.
Beans. Valentine or Refugee or Golden Wax.	Cold-frames or green-house. September 1 and every two weeks thereafter. Ready in 6 weeks.	B-C	Tender. Plant seeds 2 inches deep in rows 1½ feet apart, 4 inches apart in row. Not too rich soil. 1 quart for 150 feet.
Beets. Eclipse or Crimson Globe.	Sept. 1, outside. Oct. 1, outside. Ready in 9 weeks.	A-D B-E	Hardy. Plant 1 inch deep in rows 1½ feet apart. Thin to 4 inches apart. Deep soil, no fresh manure. 1 ounce to 50 feet. Soak seed over night.
Chard. Lucullus.	Sept. 15, cold-frame.	...	Almost hardy. Grow like beets. Use outside leaves, leaving crown to grow. Use for greens, or leaf stalks like asparagus.
Brussels Sprouts.	Seed-bed August 1. Transplant outside September 15. Ready in 4 months.	A-E	Hardy. Plant seeds ½ inch deep in rows 2 feet apart, 1½ feet apart in row. Cultivate like cabbage. 1 packet of seed enough.
Cabbage. Wakefield or Savoy or Winingstadt.	Seed-bed August 15. Transplant outside September. Ready in 4	A-C-E	Hardy. Plant seeds ½ inch deep. Plant rows 3 feet apart; 1½ feet apart in rows. Moist, manure and cultivate well. 1 packet of seed enough. Set plants deep.

	months.		
Carrots. Half Long or Long Orange.	Aug. 15, outside. Oct. 1, outside. Ready 12 to 15 weeks.	C-B	Hardy. Plant ½ inch deep in rows 1½ feet apart, 4 inches apart in row. 1 ounce for 200 feet. Seed slow to start.
Cauliflower. Early Snowball or Dwarf Erfurt.	Seed-bed September 1. Transplant to cold-frames October 1. Ready in 4 months.	A-C-E	Almost hardy. Plant seed ½ inch deep in rows 2 feet apart, 1½ feet apart in row. Moist, rich and manure. 1 packet of seed enough. Blanch heads by tying up.
Collards.	Cultivate like cabbage.	...	A non-heading cabbage not equal to it in quality.
Cucumber. English Telegraph.	Sept. 15, greenhouse. Oct. 15, greenhouse. Nov. 15, greenhouse. Dec. 15, greenhouse. Day heat, 85°. Night heat, 65°. Ready in 6 to 8 weeks.	A-B	Tender. Plant 1 inch deep, 5 feet apart. 1 ounce for 50 hills. Moist, rich soil. Pinch out main stem when 2 feet long. Pinch outside branches at 6 or 8 feet. Leave only 3 side branches to a plant and only half the fruit. Do not fertilize blossoms.
Cress, Water.	Outside in water. September 1. Ready in 3 months.	...	Hardy. Sow in quiet pool near running water. Start seed on mud, then flood 3 inches deep. 1 packet of seed enough.
Endive. Green curled or Self-blanching.	Sept. 1, outside. Nov. 1, outside or in cold-frames. Ready in 3 months.	A-E	Hardy. Plant ½ inch deep in rows 1½ feet apart. Thin to 10 inches apart in row. Light, rich soil, deep. 1 ounce for 100 feet. Can transplant like lettuce. Tie up heads for blanching 2 weeks before use.
Eggplant. Round Purple.	Aug. 15, greenhouse. Dry heat, day, 90°. Dry heat, night, 65°. Ready in 4 or 5 months.	A-B	Very tender. Plant ½ inch deep, 2 feet apart. Rich and moist soil. 1 packet enough. Blossoms should be fertilized by hand.
Kale. Dwarf Scotch or Tall Scotch.	Aug. 15, seed-bed. Sept. 15, set outside. Sept. 15, start some. October, set outside. Ready in 3 or 4 months.	E	Hardy. Plant ½ inch deep in rows 1½ feet apart, 1 foot apart in row. Deep sand and mold. 1 ounce to 200 feet. When top is cut off for use, side shoots will start.
Kohlrabi. Early Vienna.	October 1, outside. Ready in 2 to 3 months.	C	Hardy. Plant ½ inch deep in rows 1½ feet apart, 6 inches apart in row. 1 ounce for 150 feet. Grow and use like turnip.
Lettuce. May King or California Butter or Boston Market.	Seed-bed September 15 and every 2 weeks after. Transplant into cold-frames.	C	Almost hardy. ¼ inch deep, 6 inches apart each way. Light, rich soil. 1 ounce for 2000 plants.
Muskmelon. English: Sutton's Ar. Sutton's Emerald Gem.	August 15, greenhouse. Dry heat, day 90°. Dry heat, night, 70°. Ready in 4 to 5 months. Sets ready 2 months.	A-B	Tender. Plant 1 inch deep in hills 5 feet apart. Manure. Light soil. 1 ounce for 50 hills. Blossoms to be fertilized by hand. Pinch off tip of vine when first blossoms come.
Onions. Prizetaker or Multiplier or Globe.	July 1, outside, seed. Sept. 1, outside, sets. Ready in 4 to 5 months.	A-B	Hardy. Plant seed ½ inch deep, sets 2 inches deep in rows 1½ feet apart. Moist, rich soil and sun. 1 ounce of seed for 150 feet. 1 quart of sets for 100 feet.
Parsley.	September 1, outside. Soak seeds over night. Ready in 2 months.	B	Hardy. Plant ¼ inch deep in rows 1½ feet apart. 1 packet seed enough. Seeds slow to start.
Parsnip. Hollow Crown.	September 1, outside.	B	Hardy. Plant ½ inch deep in rows 1½ feet apart, 3 inches apart in row. Seeds slow to start. Rich, deep soil. 1 ounce for 200 feet.
Peanuts. Virginia or Georgia.	April 1, outside.	...	Plant 3 inches deep in hills 2 feet apart. Light, deep soil. Shell before planting.
Peas. Nott's Excelsior. Gradus or Tom Thumb. Extra Early (smooth varieties). Marrow Fat.	In cold-frames. September 15 and every 2 weeks. Ready in 2 to 3 months. Outside same dates (always an uncertain crop). Outside, December 1 (more hardy, less quality).	B-E	Almost hardy. Plant 4 inches deep in rows 2 feet apart. Moist, not too rich. Soak over night. 1 pint to 100 feet.
Pepper. Sweet Spanish or Sweet Mountain.	August 1, greenhouse. Moist heat, day, 90°. Moist heat, night, 70°. Ready in 4 months.	B	Tender. Plant seeds ½ inch deep, 2 feet apart. 1 packet of seed enough. Need not fertilize blossoms.
Potato. Irish Cobbler or other earlies.	August 1, outside. For new potatoes all	B	Hardy. Plant whole in rows 3 feet apart, 1 foot apart in row. Moist, light, rich soil. 8 bushels per acre.

Potato, Sweet. Yellow Yam or Georgia Yam.	winter. Ready in 3 months. Bed thickly in March. Transplant the sprouts outside May 1. Ready in 6 months.	...	Very deep sand. Rows 3 feet apart, 2 feet apart in row. 3 pounds to 100-foot row. Dig as wanted through the winter.
Radish. French Breakfast or Scarlet Turnip.	Oct. 1, outside. Oct. 15, outside. Nov. 1, outside. Cold-frames November 1 and every 10 days. Ready in 6 weeks.	C	Hardy. Plant ½ inch deep in rows 8 inches apart. 1 ounce to 100-foot row.
Salsify. Sandwich Island.	Outside, August 1 and September. (A difficult crop in the South). Ready in 5 months.	B	Hardy. Plant ¼ inch deep in rows 1½ feet apart, 4 inches apart in row. Water freely.
Spinach. Viroflay. New Zealand.	Sept. 1, outside. Oct. 1, outside. Nov. 1, outside. (doubtful crop). Sept. 1, cold-frame. (A sure abundant product all winter).	A-B-E	Almost hardy. Plant 1 inch deep in rows 1½ feet apart, 3 inches apart in row. 1 ounce for 150 feet.
Strawberries. Lady Thompson or Hefflin or Hoffman.	Transplant every year in October. Ready in February or March.	...	Hardy. Rows 2 feet apart, 1 foot apart in rows. Rich, sandy loam. Mulch in summer. No stable manure. Confine to single crowns.
Tomato. Beauty or Perfection.	Aug. 15, greenhouse. Sept. 15, greenhouse. Oct. 15, greenhouse. Ready in 4 months.	B-A	Tender. Plant ½ inch deep, 1½ feet apart. 1 packet of seed enough. Pinch out tips at desired height. Pinch out all side shoots. Fertilize blossoms by hand.
Turnip. Early Milan.	October 1, outside. Ready in 2 to 3 months.	C	Hardy. Plant ½ inch deep in rows 1½ feet apart, 3 inches apart in row. 1 ounce for 200 feet. Moist and rich soil.

[136]

III. THE FRUIT TREES

The fruit trees are cultivated for the sake of their fruit. They bear either kernel fruit, when their seed kernels are enclosed in cores of parchment-like formation; or stone fruit, when the seed kernel is enclosed in a hard shell, which is in its turn enclosed in some succulent pulp; or shell fruit, when the fleshy interior is enclosed in a hard shell.

Almond, a small tree belonging to the rose family, native to northwest Africa. The flowers are solitary and generally pink, and appear before the lance-shaped leaves. The fruit is egg-shaped, downy externally, with a tough, fibrous covering and a wrinkled stone. It has long been widely cultivated, and many varieties exist, differing in the hardness of the stone and in the flavor of the seed. **SWEET ALMONDS** include the large thin-shelled Jordan (from the French *jardin*), the Valencia almond, imported as a dessert fruit from Malaga, the smaller Barbary and Italian forms, and the California product. The **BITTER ALMOND** yields an essential oil, employed in confectionery, but dangerous from sometimes containing prussic acid.

Apple (*Pyrus Malus*), grows wild in forests, but it is found artificially improved everywhere in gardens and orchards. Its bark is generally smooth; its wood somewhat soft; its leaves oval-shaped and about double the length of their stalks; its blossoms are white with reddish margins. Fruit horticulture has produced many species of apples in the course of time, and they are now the most important fruit of the temperate zone, area of production, consumption, and variety of product being considered, ranking with the grape, olive, orange, lemon and banana, among the six leading fruits of the world. North America is preëminently the leading apple growing region. In the United States, New York, Pennsylvania, and Ohio produce about one-third of the total crop.

The cultivation of the apple is prehistoric. Abundantly used by Lake Dwellers of the Stone Age in Italy and Switzerland.

CACAO FRUIT OR PODS

Each pod contains some sixty seeds, arranged in five or eight rows (mostly five); the seeds are white when they are fresh, but brown and covered with a fragile skin or shell when dried. These seeds, which are not unlike beans or almonds, are imbedded in a mass of mucilaginous pulp, of a sweet but acid taste. The seeds only require to be extracted, cured and dried, to become the cacao-beans of commerce.

Apricot (*Prunus Armeniaca*). The tree attains a height of thirteen to sixteen feet, and shows its blossoms in the months of March and April. Its smooth leaves are oval, doubly serrated; and its white blossoms have a tinge of red. Its globular, velvet-like, downy fruits are a favorite dish for dessert.

Apricots are extensively grown in north India, Persia, south Europe and Egypt. Although grown in New York, the crop is only commercially important in California and Oregon, whence large quantities of the fresh and dried fruit are shipped to the eastern states and abroad.

HOW THE COCOA BEANS ARE DRIED AND ROASTED

[137]

Small crops of beans are spread out on the ground, or on a tray, or on a piece of matting, and dried in the sun. In other cases, artificial heat is used in specially constructed and equipped drying-houses.

The beans are roasted, similar to coffee, in large iron drums to increase the aroma, make them more soluble in water, and improve their flavor. After being ground, and mixed with sugar, the product becomes chocolate—and is used in many ways.

Cultivation in China antedates 2000 B. C. It was introduced into Europe at the time of Alexander the Great, about 325 B. C.

Bread-fruit (*Artocarpus incisa*), grows upon the islands of the Pacific Ocean, and has also been transplanted to those parts of America which lie in the Torrid Zone. It attains a very great height, and bears fruits weighing from three to four pounds. The latter are cut into slices, and after being dried and roasted are used as food. These fruits, when pounded and mixed with milk of the cocoanut, form a dough, which is either consumed raw or baked into bread. All parts of this tree are useful; its yellow wood is used for the construction of houses, from its fibres articles of clothing are made, and its sap is used for making birdlime. Its large leaves serve as tablecloths and napkins, and its blossoms when dried are an excellent tinder. The bread-fruit tree is therefore much cultivated.

Butternut (*Juglans cinerea*), a North American species of walnut. Its dark yellow wood takes a fine polish, and is used in cabinet work; the bark yields a brown dye, and the brown-husked, rugged nuts contain oil, and are very pleasant in flavor.

Cacao (*Theobroma cacao*), a small tree, native to Mexico, Central America and the north of South America, is cultivated also in Brazil, Guiana, Trinidad and Grenada. It has large, oblong, pointed, entire leaves and clusters of flowers with rose-colored calyx and yellowish petals. The fruit is yellow, from six to ten inches long, and from three to five broad, oblong, blunt, with ten longitudinal ridges externally, and five chambers, containing ten or twenty seeds each, internally. The thick, tough rind is almost woody. The seeds are dried, roasted, bruised, and winnowed, so as to remove their testa from the cocoa-nibs or cotyledons. These contain more than fifty per cent of fat or cocoa-butter, part of which is generally removed in the process of "preparing" cocoa. It is used in making chocolate "creams." Cocoa is also a valuable article of food; contains a gently stimulating alkaloid, theobromine, a fragrant essential oil and a red coloring matter. Sugar and vanilla or other flavoring are added in the preparation of chocolate.

Cherry (*Prunus avium*), is a stately tree of from twenty-five to forty-five feet in height. It has a pyramidal crown; its smooth bark splits crosswise; its leaves are elliptical, and covered with down on their lower sides; its blossoms are snowy white and its fruits sweet and of different colors. The latter furnish an agreeable nourishment, whether consumed raw, boiled, or preserved. Cherry-brandy is also made from them. The Cherry is cultivated in temperate regions of Europe, Asia, and the United States, and included among the fifteen leading fruits of the world. Ranks about eighth among fruits of the United States. Pennsylvania and California lead in production.

It was grown before the Christian Era in western Asia and southern Europe, and is mentioned in Vergil's *Georgics*.

Cinnamon (*Cinnamomum zeylanicum*), is largely grown in Ceylon. The bark is stripped off two-year-old shoots in May and November and dried in the sun, undergoing a slight fermentation. It rolls up into quills, the thinnest being the best. Cinnamon contains a fragrant essential oil and has long been valued as a spice. It has also some medicinal value as a cordial and stomachic. It is also cultivated for bark in Brazil, West Indies, Egypt, and Java, but cultivation is now declining in favor of coffee.

Clove (*Eugenia caryophyllata*), a small evergreen spice tree, native of the Moluccas. The fruits are imported as mother cloves, and the stalks are used to adulterate the spice when ground. The whole plant is aromatic from the presence of the essential oil of cloves, which occurs to the extent of sixteen to eighteen per cent in the flower-buds. The dried flower buds are the cloves of commerce. Cultivated on many tropical islands and coasts, chiefly in the Moluccas, Sumatra, Java, Mauritius, Zanzibar, Jamaica, and French Guiana. The oil of cloves is widely used in flavoring and perfumery and also in medicine.

Cocoa-nut (*Cocos nucifera*), a small genus of palms. The cocoa-nut palm is apparently a native of the Indian Archipelago, but has been dispersed throughout the tropics from early times, flourishing especially near the sea. It has a cylindrical stem reaching two feet in diameter, and from sixty to one hundred feet in height; a crown of pinnate leaves, each eighteen to twenty feet long, with a sheathing and fibrous base, succeeded by bunches of from ten to twenty fruits. These are about a foot long, six or eight inches across, three-sided, with a stony shell and one seed filling its cavity. The seed contains a fleshy kernel and a milky liquid. No tree of the tropics has so many uses, every part of it being employed, and in southern India furnishing several of the chief necessities of life. The wood of the outer part of the stem is used, under the name of Porcupine wood, for inlaying; the leaves for thatch, mats, hats, etc.; the fibrous part under the name of coir, for cordage, etc.; the shell for bottles, cups, spoons, and when properly burned, for excellent charcoal and lamp-black. The solid white kernel contains thirty-six per cent of oil known as copra oil, from which, by pressure, the solid stearine used for candles is separated from the liquid lamp-oil. The "milk," when fresh, is an agreeable drink; and from the sap sugar is obtained, and, by fermentation, toddy, from which vinegar and by distillation, arrack are prepared. It is extensively cultivated on the coasts of India, the East and West India Islands, and Brazil, and recently in Florida.

Coffee Tree (*Coffea Arabica*), originally a native of Africa attains a height of twenty-five to thirty feet. It is generally, however, kept at a much inferior height, in order to facilitate the collection of the fruit. Its leaves are evergreen; its blossoms white and fragrant. The fruit is a red berry about the size of a cherry, which contains two kernels, lying closely side by side: the coffee beans. These coffee beans are used everywhere for the preparation of that coffee which has become an indispensable beverage for many millions of people. Commercially it is of great importance, being largely grown in Brazil, Mexico, Central America, West Indies, Arabia, Java, Sumatra, Ceylon, India, and Hawaii. Brazil leads with a production of over one-half of the world's crop. In the United States the consumption greatly exceeds that of tea.

Beginning of its cultivation is uncertain, but not ancient. It was introduced for cultivation in South America by the Dutch in 1718.

Date or Date-Palm (*Phoenix dactylifera*), a tree sixty to eighty feet high, with large pinnate leaves, cultivated in immense quantities in north Africa, western Asia and southern Europe. The stem is covered with leaf scars, and the flowers each have three sepals and three petals. The wood of the stem is used in building; huts are built of its leaves; the petioles are made into baskets and the fibre surrounding their bases into ropes and coarse cloth; the young leaf-bud or "cabbage" is sometimes eaten as a vegetable, or, if tapped, it yields a sugary sap which may be fermented; and even the seeds are ground into meal for camels. In central Arabia and some parts of north Africa the fruit forms the staple food of the inhabitants, camels, horses, and dogs. It is the chief source of wealth in Arabia. It was very anciently cultivated in Egypt and Babylonia and is the *palm* of the Bible.

SCENES IN THE PRODUCTION OF THE COFFEE BERRY

THE COFFEE PLANT IN FLOWER

FROM FLOWER TO RIPE "CHERRIES"

METHOD OF DRYING COFFEE ON WOODEN TRAYS IN THE OPEN AIR, AS STILL PRACTICED IN ARABIA AND OTHER ORIENTAL COUNTRIES

WOMEN OF JAVA HULLING COFFEE
The "cherries" when gathered contain two seeds, or coffee beans. The coverings are removed from the seeds by "hulling."

SIZING, OR SORTING THE COFFEE BEANS FOR THE MARKET BY PASSING THEM THROUGH SIEVES MESHES

Fig (*Ficus Carica*). The common fig is a native of the East. It is a low deciduous tree or shrub (fifteen to twenty-five feet), with large, deeply-lobed leaves, which are rough above and downy beneath. The branches are clothed with short hairs, and the bark is greenish. The fruit is produced singly in the axils of the leaves, is pear-shaped, and has a very short stalk; the color in some varieties is bluish-black; in others, red, purple, yellow, green or white. The fig is extensively cultivated in subtropical countries, particularly in Spain, Italy, and southern France, in Europe, and in southwestern Asia. It is also grown in the Gulf States and in California. All dried figs in the United States are produced in California. Commercial figs come largely from Asiatic Turkey, though Smyrna figs are now established in California.

Grape-fruit or Shaddock (*Citrus decumans*), a tree, which, like the other species of the same genus, is a native of the East Indies, and has long been cultivated in the south of Europe. It is readily distinguished by its large leaves and broad-winged leaf-stalk; it has very large white flowers, and the fruit is also very large, sometimes weighing ten or even fourteen pounds, roundish, pale yellow; the rind thick, white, and spongy within; bitter; the pulp greenish and watery, subacid and subaromatic. It is a pleasant, cooling fruit, and much used for preserves. Finer and smaller than the shaddock proper is the Pomelo (also called Pummelo, and grape-fruit) a variety rather larger than an orange which bears its fruit in clusters. It was anciently cultivated and much prized fruit in India, China, East Indies and Pacific Islands. Now successfully established in Florida and California, and rapidly becoming popular table fruit in the United States.

Lemon (*Citrus Limonum*), a small tree or shrub closely related to the orange, apparently truly indigenous in the north of India, carried to Palestine and Egypt by the Arabs, and to Italy by the Crusaders, and now naturalized in the West Indies and elsewhere. The fruit is oval, and ends in a nipple-like point; the rind is thin, smooth, and not readily separable; and the juice is acid. There are numerous varieties, including the citron, bergamot, lime, and sweet lime. Cultivation in the United States is limited mostly to Southern California.

Lime (*Citrus acida*), is a variety of orange with small flowers, and small, very acid, fruit, varying in form but ending, like the lemon, in a nipple-like boss. It is said to have been anciently cultivated in India, from whence it has been widely diffused in tropical countries. It is widely imported in temperate regions, but sparingly used, being much less popular than the lemon. Now successfully grown in Florida, which produces a small crop.

Mango (*Mangifera indica*), a small tree indigenous to tropical Asia, but now cultivated throughout the tropics. It has scattered, entire leaves and small pink or yellow flowers. Though its glossy leaves make it valuable for shade, it is chiefly valued for its fruit, which varies considerably in size and flavor. In an unripe state it is used in pickles; but in India is largely eaten when ripe as a dessert fruit. The seeds, bark and resin have some medicinal value, apparently as astringents, and the wood, though soft, is used as timber.

Maté or Paraguay Tea (*Ilex paraguayensis*), a species of holly growing in Paraguay and south Brazil, which furnishes the chief non-alcoholic drink of South America. Though used immemorially by the Indians, the tree was first cultivated by the Jesuits. The dried leaves are packed in skins or raw hides containing about two hundred pounds each. The infusion is prepared in a calabash or maté, usually silver-mounted, boiling water and sugar, with milk or lemon-juice, being added to the leaves (yerba), and the beverage taken very hot through a metal or reed tube or bombilla with a strainer at one end. Maté contains 1.85 per cent of caffeine, acting as a restorative, much as tea does; but, being bitter, the taste for it has to be acquired.

Mulberry (*Morus*), allied to the nettle, hemp, and elm families. The **BLACK MULBERRY**, mainly cultivated for its fruit, is perhaps a native of Armenia, but was early introduced into Greece, where its leaves are still used for feeding silkworms. The **ASIATIC SPECIES**, or the **WHITE MULBERRY**, of which there are numerous varieties, mostly with white fruit, is that mainly cultivated in Japan, China, India and Italy for the silkworm. The fibrous inner bark of the **PAPER MULBERRY** is made into paper by the Chinese and Japanese, and into tapa cloth in the South Sea Islands. The so-called fruit is formed from a whole cluster of flowers which become fleshy, turn color and sweeten while they enlarge until they meet those of the other flowers, enclosing the true fruits, small dry capsules. Extensively grown for market near large cities in Europe and the United States.

Nutmeg (*Myristica fragrans*), an evergreen tree native to the East Indies, and now in cultivation in the East and West Indies and Brazil. The fruit is pear-shaped and about two inches across. The seed has a thin, hard shell enclosing the nutmeg, which is mottled in appearance. The largest and roundest nutmegs are the best, and though generally about one hundred and ten to the pound, they may be as few as sixty-eight. Nutmegs contain about twenty-five per cent of nutmeg butter or oil of mace, a vegetable fat now considerably employed in soap-making.

Olive (*Olea europæa*), a very valuable small tree, seldom more than thirty feet high, of slow growth, but sometimes exceeding twenty feet in girth and seven centuries in age. The wild olive has squarish, spinous branches; opposite evergreen, leathery, shortly-stalked leaves, hoary on their under surface, and small white flowers. The cultivated olive (var. *sativa*) differs in its rounder branches which have no spines, longer leaves and larger fruit. For pickling, the fruits are gathered unripe, soaked in an alkaline lye, and then bottled in brine. For oil, the ripe fruit, which usually yields sixty to seventy per cent, is squeezed, yielding virgin oil, and the marc or cake is wetted and re-pressed, and the kernels crushed and boiled to yield a second and third quality. The tree grows best on light or calcareous soils near the sea, and the value attached to its oil as an article of food in countries where butter can with difficulty be preserved made the tree from early times the symbol of peace and good-will. It is extensively cultivated in Mediterranean Europe, Syria, South Africa, Australia and California.

Orange (*Citrus Aurantium*), small evergreen trees, probably a native of southern China and Burma, but grows wild and spinous in Indian jungles. The scattered glossy leaves are remarkable for their double articulation, having one joint at each end of the winged leaf-stalk. The fragrant white or pinkish flowers have five sepals, five petals, and branched stamens. The fruit has a leathery rind, containing large spindle-shaped cells filled with watery juice. As the fruit takes some months to ripen, it occurs on the tree at the same time as the next year's blossoms. There are two chief varieties or sub-species, the sweet or China orange, and the bitter, bigarade or Seville orange, but the Mandarin and Tangerine oranges are sometimes ranked as a distinct species. The principal orange-growing sections of the United States are Florida, Louisiana and California.

The **MANDARIN ORANGE** or **CLOVE ORANGE** has fruit much broader than long, with a rind very loosely attached to the flesh, and small leaves; the **TANGERINE ORANGE** is apparently derived from the mandarin. It is grown in Florida. The **JAFFA ORANGE** has now a great reputation. The **MAJORCA ORANGE** is seedless. The **KUM-QUAT** from China and Japan, is little bigger than a gooseberry, and grows well in Australia. The **NAVEL ORANGE**, nearly seedless, is a favorite variety with California growers.

Orange trees are often extremely fruitful, so that a tree twenty feet high and occupying a space of little more than twelve feet in diameter sometimes yields from three thousand to four thousand oranges in a year. One tree in Florida has often borne ten thousand oranges in a single season. The orange tree attains an age of at least one hundred to one hundred and fifty years. Young trees are less productive than old ones, and the fruit is also less juicy, has a thicker rind, and more numerous seeds.

Palms were called by Linnæus "the princess of the vegetable kingdom," and comprising over one thousand species, chiefly natives of the tropics. They have mostly cylindrical, unbranched stems, bearing a tuft of large, often gigantic, leathery leaves at the top, the leaves being torn into segments. The leaves are sometimes spattered, and in most

cases have a fibrous sheathing base to the leaf-stalk. The terminal leaf-bud is the "cabbage" which, in some species, is eaten. The fruit varies very much, with a hard seed, as in the date; drupaceous, as in the cocoa-nut; or covered with woody reflexed scales, as in the sago palm. The use of palms are innumerable. Beams, veneers, canes, thatch, fibre for cordage and matting, fans, hats, bowls, spoons, sago, sugar, wine, spirits, food, oil and wax are only some among the number. See also [DATE](#), [BETEL-NUT](#), [COCOA-NUT](#).

Peach (*Amygdalus persica*), probably a native of China. The nectarine is merely a smooth-fruited variety, differing, however, in flavor. The stone in both is coarsely furrowed. The flowers which appear before the leaves, are of a delicate pink. The fruit in the peach has a separable woolly skin. Though deliciously flavored and refreshing, since it contains eighty-five per cent of water and eight per cent of pectose and gum, it does not contain much nutriment. Peaches grow extensively in Europe and Asia and second only to the apple as an orchard fruit in the United States. California, Michigan, Georgia and Texas lead in production.

Pear (*Pyrus communis*), is a tree belonging to the same genus as the apple. It grows from thirty to seventy feet high, with a pyramidal outline; branches spinous in the wild state; leaves scattered and somewhat leathery; flowers in clusters; fruit with a fleshly-enlarged stalk, core near the apex and parchment-like, and black seeds. Gritty particles, due to groups of wood-cells, occur in the flesh. They are widely cultivated in temperate regions, but chiefly in France and the United States. Ranks fourth among American orchard fruits, being preceded by the apple, peach and plum. Chiefly grown in California, New York and Michigan.

Pecan (*C. illinoensis*), is a large, slender tree reaching a maximum height of one hundred and seventy feet and a diameter of six feet. It grows in moist soil, especially along streams, from Indiana to Iowa and Missouri, south to Kentucky and Texas. It is cultivated in the Southern States for its sweet, edible nut, which forms an important article of commerce.

Persimmon, the Virginian date-plum (*Dios pyros virginiana*), a moderately-sized tree of the United States, belonging to the ebony tribe, the round orange fruit of which, though austere, becomes edible when affected by frost. They are fermented into a beer and distilled for spirit in the Southern States. The bark has medicinal properties.

Plum (*Prunus domestica*), a small fruit-tree, native to Asia Minor and the Caucasus, and naturalized in most temperate parts of the world. The Damson or Damascus variety was grown by the Romans from very early times. Large quantities of many varieties, both home and foreign are grown, which are eaten raw, in tarts, and in preserves, or, when dried as *prunes*. Extensive cultivation is carried on throughout temperate regions. Third most important orchard fruit in the United States, exceeding eight million bushels, California growing two-thirds. All prunes produced in the United States grown in the Pacific States; first prune orchard planted at San Jose, California, in 1870.

Pomegranate (*Punica Granatum*), long valued in hot countries for the refreshing pulp of its fruit. It is a tree, fifteen to twenty-five feet in height, native to West Asia and North Africa. It has opposite, simple, entire leaves, and the flower has five scarlet or white petals. The fruit has a tough, leathery gold-colored, but partly reddened, exterior and numerous seeds each surrounded by a reddish pulp. This varies in flavor in the numerous cultivated varieties. The rind is rich in tannin, and is employed in tanning Morocco leather.

Walnut (*Juglans regia*), or COMMON WALNUT is a native of Persia and the Himalayas, but has long been cultivated in all parts of the south of Europe. It is a tree of sixty to ninety feet, with large spreading branches. The leaves have two to four pairs of leaflets, and a terminal one. The ripe fruit is one of the best of nuts. It yields a bland fixed oil, which, under the names of walnut oil and nut oil, is much used by painters as a drying oil. The timber of the walnut is of great value, and is much used by cabinet-makers. The wood of the roots is beautifully veined. Both the root and the husks of the walnut yield a dye, which is used for staining light-colored woods brown. Very similar to the common walnut, but more valuable, is the BLACK WALNUT of North America, found in most parts of the United States, except the most northern. See also [BUTTERNUT](#).

IV. FRUIT-BEARING SHRUBS AND PLANTS

The trees previously mentioned are woody plants with only one stem, which begin to form branches at some distance from the ground. The shrubs, on the contrary, are woody plants in which the stem forms branches close to the ground, or even underground.

Banana (*Musa sapientium*), a handsome plant, long cultivated in tropical and sub-tropical countries for its fruit. The sheathing bases of the large, oblong leaves form a false stem twenty to thirty feet high. The spikes of irregular flowers are succeeded by a branch of one hundred to two hundred fruits, weighing together from fifty to eighty pounds. The long, berry-like fruits, as they ripen, convert nearly all their starch into sugar and pectose, and form a valuable article of food, the staple food in many tropical countries, producing forty-four times the weight of food per acre yielded by the potato. It is produced in enormous quantities in the West Indies and Brazil, and shipped in constantly increasing volume to the United States and Europe. Beginning with a few hundred bunches in 1870, consumption in the United States has increased to upwards of five million dollars worth annually. Banana flour is becoming a staple article of food.

Its cultivation antedates historical records in India. Pliny mentions that the Greeks under Alexander the Great saw it in India.

The banana plant is the most wonderfully productive fruit in the world. It is a native of Asia, but most of our bananas come from the New World. Here the plant is full grown and the bananas ripe. From the time the suckers are planted to the gathering of the fruit is less than a year, so rapidly does the plant come to maturity.

Blueberry. See [Huckleberry](#).

Cassava (*Manihot utilisima*), the bitter cassava, and *M. Aipi*, the sweet cassava, are both natives of tropical America. Both are shrubby plants, the former with yellow poisonous roots and seven-lobed leaves, the latter with reddish wholesome roots and five-lobed leaves. The coarsely-grated roots are baked into cassava cakes, from which the intoxicating drink piwarrie is prepared. The juice of the poisonous kind is rendered harmless by boiling, and is then the delicious sauce known as cassareep. If allowed to settle, it deposits a large quantity of starch, known as Brazilian arrowroot when simply sun-dried, or as tapioca when partly converted into dextrine by roasting on hot plates. It was long cultivated in Brazil, and, after Spanish discovery, extended to Africa and Asia.

Cranberry (*Oxycoccus*), a small evergreen shrub, that grows in bogs and marshy grounds, and is a small wiry shrub with creeping, thread-like branches, and small oval leaves rolled back at the edges. The berries are an excellent antiscorbutic, and hence furnish an excellent addition to sea stores. The American cranberry (*O. macrocarpa*) is larger and more upright with bigger leaves and berries. Large quantities are exported to Europe and other varieties are also imported into Britain and Germany from Russia and other parts of northern Europe.

Currant (*Ribes rubrum*), is an important shrub, bearing red, black and white fruit. Its branches are not prickly; its leaves have three to five lobes, greenish-yellow blossoms and the berries hang in clusters like grapes. It is often planted in gardens for the sake of its fruit, but is also found in a wild state. Black currants are extensively grown in Continental Europe, Scotland and Canada; sparingly in the United States. In France the *liqueur de cassis* is made from the fruit. Red currants are very widely grown in Europe and the United States, chiefly for jellies. New York and Michigan lead in production.

The method of gathering bananas is practically the same wherever they are grown, and here we see the bunches being brought to the railway. Bananas need a great deal of water. They will only grow in a warm, damp atmosphere and if much rain does not fall they must be supplied with water artificially. This is done by having canals between the rows of plants.

Elder (*Sambucus*) has thorny branches, elliptical, serrated leaves and single, white blossoms which grow in such numbers that they sometimes resemble snow. Its fruit is black and blue. It grows from three to six feet high in copses, hedges and forests. Few of the species are considered of much value though *S. Canadensis* is used to make a domestic wine and jelly. The most ornamental of the species is *S. pubens*, which has large, loose panicles of bright scarlet berries. This species is occasionally found in moist high grounds from New York southward. It is very abundant and beautiful on the slopes of the Alleghany Mountains.

Gooseberry (*Ribes Grossularia*) has branches covered with spines, brown-reddish blossoms and berries of green, yellow or reddish color, which stand singly on the young

[143]

[144]

shoots. It is frequently planted in gardens, and has many varieties. It is highly prized in northwestern Europe; not cultivated in southern Europe, and reaches highest perfection in England. In the United States, while widely grown, is of minor importance, ranking sixth among small fruits, being preceded by the strawberry, raspberry, blackberry, cranberry and currant.

Grape (*Vitis Labrusca*) has a climbing, knotty trunk, which sometimes attains a length of thirty to fifty feet; its leaves have from three to five lobes, and are coarsely serrated; its small, fragrant, greenish blossoms stand in panicles. The fruit of many varieties of vine, which have been produced by cultivation in the course of thousands of years is very different in color, size and flavor. It is either consumed raw and dried, or manufactured into wine.

In the United States the first vineyard was planted by Lord Delaware in 1610, but not extensively grown until after the introduction of the Concord grape during the last century. While the Concord, Catawba, Isabella, Hartford and most of the cultivated varieties originated from the wild northern fox or plum grape, *Vitis Labrusca*, the Clinton grape was derived from the wild species, *Vitis riparia*, and most of the American wine grapes from the native summer grape, *Vitis aestivalis*.

Since 1860 grape culture has made remarkable progress, the last census showing a crop exceeding eight million dollars in value. New York produces one-third of the American grape crop and is followed by Ohio, Pennsylvania, Michigan, Illinois, Indiana, Missouri and Kansas, in order named. Notwithstanding the extensive culture of the European grape in the Pacific States, the American grape constitutes three-fifths in value of all grape products of the United States. Millions of young vines have been shipped to Europe to be top grafted with the European vine.

The grape shares leading rank with the apple among the world fruits. Chief products: raisins, currants and wine of great commercial importance. Raisin production largest in Spain, but important in southwestern Asia, Australia and California. *Currants* are small, seedless raisins, mostly grown in Greece (name derived from Corinth). Wine is made throughout the world, total production estimated at four billion gallons, France, Italy and Spain contributing about three-fourths of this enormous amount. The European grape products of California—wine, raisins and table grapes,—amount in value to two-fifths of all grape products of the United States.

Remotely ancient in Egypt. Used by Lake Dwellers of the Bronze Age in Italy. Cultivated by the Phoenicians, Hebrews, Greeks and Romans. Introduced into China 120 B. C. **Huckleberry.** The popular name of the genus *Gaylussacia*, of which there are several species. The *Dwarf* huckleberry, the *Blue* huckleberry and the *Black* huckleberry are common throughout the United States, the latter being the huckleberry of the Northern States. In New England the name is commonly restricted to the black berry species in distinction from the blue berry. The shrubs range in height from about three feet to twelve feet high. In New England canning huckleberries is an extensive if not exceedingly profitable industry. The crop is first picked by hand and afterwards with a "blueberry rake." The Indians long ago gathered the fruit and dried it for use during wintertime.

Pepper Plant (*Piper nigrum*) is found all over the Torrid Zone. Its berries stand to the number of twenty to thirty on one spike; at first they are green, then they turn red, and finally black. The black pepper is prepared from the unripe fruit, the white from the ripe fruit, which loses its black shell by being put into salt water (sea water). Pepper is now the most commonly and widely used spice. It is extensively cultivated in East and West Indies, Siam and Malay Peninsula, whence millions of pounds are exported.

Cayenne pepper, or chili is much grown in tropical Africa and America, but less generally used than black pepper.

Pistacia is a small tree, about twenty feet high, and native to Persia and Syria, but now cultivated in all parts of southern Europe and northern Africa. Flowers in racemes, fruit ovate and about the size of an olive. Pistachio nuts are much esteemed; but readily become rancid. Oil is expressed from them for culinary and other uses.

A PINE-APPLE PLANTATION IN FLORIDA

Pine-apple (*Ananassa sativa*) is highly esteemed and much cultivated for its fruit. It has a number of long, serrated or smooth-edged, sharp-pointed, rigid leaves, springing from the root, in the midst of which a short flower-stem is thrown up, bearing a single spike of flowers, and therefore a single fruit. From the summit of the fruit springs a crown or tuft of small leaves; capable of becoming a new plant; the pine-apple, in cultivation, being propagated entirely by crowns and suckers, as, in a state of high cultivation, perfect seed is almost never produced. The pine-apple is a native of tropical America, and is found wild in sandy maritime districts in certain parts of South America, but has been very much changed by cultivation. It is extensively grown in Florida, and in the West Indies for shipment to northern markets and to Europe. Increasing outdoor plantations have also been developed in the Azores, the Hawaiian Islands, northern Africa, Queensland, and the Bahamas. Florida supports upward of fourteen million plants. Great care is requisite in the cultivation of the pine-apple, which without it is generally fibrous and coarse, with little sweetness or flavor, and with it one of the most delicate and richly flavored of fruits.

WHERE TEA GROWS AND IS CULTIVATED

A TEA PLANTATION IN THE BEAUTIFUL HILL COUNTRY OF CEYLON

The most productive tea gardens are at an elevation of about one thousand feet, the land at this altitude being generally of an undulating character, well watered, and the climate sufficiently humid to encourage leaf-production.

The plants are ready for plucking when three years old, at which time they send out numerous leaf-shoots, known as "flush." The plucking season begins in September and lasts until June of the following year, during which period each bush is plucked about sixteen times.

For producing superior fruit in winter the Smooth Cayenne and Black Jamaica are two of the best and most reliable, and the Queen is the most highly esteemed for summer fruiting. The Spanish is the variety commonly grown in Florida. A spirituous liquor (Pine-Apple Rum) is made from the pine-apple in some warm countries.

Raspberry (*Rubus Idaeus*), the most valued of all the species of *Rubus*. The wild raspberry has scarlet fruit and is found in thickets and woods throughout the whole of Europe and northern Asia. It was early introduced into the United States, but those now grown originated in native American varieties. The black raspberry, is largely grown in New York and Ohio as a commercial industry. The red variety is widely grown in the United States, but production is small compared to that of the black raspberry. Among the more promising varieties of the blacks are Gregg, Ohio and Kansas. Cuthbert is one of the best of the red varieties. The raspberry has long been in cultivation for its fruit. The root is creeping, perennial; the stems only biennial, bearing fruit in the second year, woody, but with very large pith. The raspberry is the leading bush fruit of the United States and second only to the strawberry among small fruits. New York, Michigan, Ohio and Pennsylvania, ranking in the order named, grow over one-half of the total crop, which exceeds seventy-five million quarts. The berries are consumed raw or in a preserved state, or are manufactured into raspberry juice, wine and cordial.

Tea (*Camellia theifera*) is a plant of which there are two well-known varieties: (1) Assam tea; and (2) China tea. The Assam variety, known as "indigenous" tea, is a tree of vigorous growth attaining a height of thirty to forty feet with a leaf from eight to ten inches in length. The China variety is a comparatively stunted shrub, growing to a height

of twelve to fifteen feet, with a rounder leaf about three and one-half inches in length, and calyx covered with soft, short hairs. These two varieties have resulted in a hybrid which combines the hardy character of the China with the other features of the indigenous, now largely cultivated on the hills of India and Ceylon, and known as "hybrid-Assam." The hybrids vary much in productiveness.

The tea-plant will flourish in all parts of the tropical and subtropical zones where the rainfall is over sixty inches and evenly distributed throughout the year. In Ceylon it grows from sea-level to an altitude of seven thousand feet.

The tea-plant is not particular as to soil, but it succeeds best on new forest-land containing plenty of humus. As is the case with cacao, coffee and other economic plants, tea grown on rich, alluvial soil is stronger than tea grown on poorer land, though the latter is often of more delicate flavor.

Chinese teas may be classified thus: Monings, or black leaf teas are grown in the north of China, and shipped from Hankow and Shanghai. Green teas are shipped from Shanghai and consist of Gunpowder, Imperial, Hyson, Young Hyson and Twankay. Kaisows or Red-leafs are grown farther south and are shipped from Foo Chow.

The United States and Canada consume nearly all the tea exported from Japan, all of which is of light character, consisting mostly of Oologs and greens. Tea has been grown with success in South Carolina and experimentally elsewhere in the United States.

MANUFACTURE.—The first process is to spread the green leaf thinly on hessian trays in the withering house, where it is exposed to a free current of air—a very important operation, which takes from twelve to forty-eight hours. When the leaf is tough and flaccid, like an old kid glove, it is ready for rolling. The old or Chinese system of rolling was by hand. Now this process is performed by machinery, and in India and Ceylon tea is not manipulated after plucking. The rolled leaf is now ready for fermentation, an operation requiring close attention. It is placed in drawers or on tables and covered. The state of the weather hastens or retards the process; in hot, dry weather the leaf will be sufficiently fermented or oxidized in twenty minutes, in cold wet weather it may take hours. Whenever the leaf assumes a bright copper color it must be fired; over-fermentation is a fatal error.

The difference between black and green teas is simply this: if the tea is fired immediately after rolling it is green tea; if it is fermented it becomes black tea. After firing the manufacture is complete, and the tea is what is known as "unassorted," which contains all the different grades into which tea is usually separated. Sorting by hand sieves is still done in small factories, but in large factories machinery is used.

V. FLOWERS AND OTHER ORNAMENTAL PLANTS

We cultivate in our gardens plants of all kinds, which give us great pleasure on account of their lovely blossoms or their agreeable odors. They are no longer luxuries, but have become necessities of life; and never have they become so extensively grown and widely appreciated as now. There are plants suited for sunny and shaded aspects and for various positions, from the mossy dell to high and dry situations in the country; from the area to the housetop in the town. Only knowledge is wanted for making the best selections for different purposes and sites, with information on culture for the uninitiated to achieve satisfactory results.

Plants and flowers grown in gardens are embraced in three groups: 1. ANNUALS, 2. BIENNIALS, and 3. PERENNIALS, the last-named being divided into two sections: (a) *herbaceous*, with soft or succulent stems that die in the winter; and (b) *shrubby* perennials with woody stems that survive the winter.

ANNUALS are those flowers which are born, grow, flower, ripen seeds, and die within a year. They never push growths a second season after flowering, because the roots die as well as the tops and branches. The common scarlet Poppy is a typical example.

BIENNIALS are those plants which are raised from seeds in the spring or early summer and require the whole season to make their growth preparatory to flowering the next year, dying after ripening seeds.

PERENNIALS differ from the above in living more than two years. All plants, such as hardy border flowers, that die down and spring up again from the root-stock year after year are perennials—herbaceous. Roses and other flowering shrubs are also perennials, but not herbaceous. *Orchids*. One of the best examples of herbaceous perennials is that of the Orchids, the most popular of which are the Odontoglossums and the Cattleyas.

FLORIST'S FLOWERS. This term has been applied to a number of plants which under cultivation and by selection or hybridization have produced from seed varieties of improved form, habit or color. The plants included under this title are constantly being added to, and great impetus given to the cultivation of hardy flowers and plants in recent years. The following are representative of this class:

Begonia. Named in honor of M. Begon, a French patron of botany. All the species of Begonia are interesting and beautiful winter ornaments of the hot-house or green-house, of the simplest culture in any rich soil if allowed an abundant supply of water. There are several tuberous-rooted species and varieties. They have large, showy flowers, and succeed well in a moist, shady border. The tubers should be kept warm and dry during the winter. They are readily propagated by cuttings, seeds, or division of tubers.

Carnation (*Dianthus caryophyllus*) is an almost hardy herbaceous perennial plant, a native of southern Europe. The Greeks and Romans used it for making chaplets whence it was called "coronation." It is a favorite exhibition flower, of many varieties, forms and colors; but the red, white, pink and yellow predominate. Carnations are among the plants which can be grown in the atmosphere of cities, but they are intolerant of shade. Propagation is usually effected by the process of layering, but cutting, seeds, and divisions are also employed.

Cattleya. What the rose and carnation are among garden plants, the Cattleya is among Orchids, preëminently beautiful. Not a species but possesses claims of the strongest nature on the culturist's attention, either for its delicate loveliness or the rich and vivid coloring of its large and handsome flowers. They are natives of the temperate parts of South America, and in cultivation are found to succeed in a lower temperature than is necessary for the majority of plants of the same order. The plants grow vigorously, and consequently flower in perfection. The colors of the flowers run through all the shades of white, rose, rosy-lilac, crimson and carmine, nor is even yellow absent.

Dahlia. This, through constant improvement, has become one of the indispensable flowers. It derived its name from the Swedish botanist Dahl. Dahlias are known as show, fancy, pompon, single and cactus. They vary from the single type, not unlike a daisy, with broad rays, to the tiny, tightly-quilled, formal "pompon," and to the "cactus-flowered," resembling a chrysanthemum; and their lines are equally varied. Yellow, lilac, white and the deepest maroon, are found in innumerable combinations. It is necessary to lift the roots in late autumn, and, having ripened them in a shed, to store them for the winter in a cool, dry place, where the temperature will not fall below thirty-two degrees Fahrenheit. In the spring, the separate tubers may be planted in deep, rich soil; or the roots may be placed in February in a hot-bed, and when the young shoots which form are about three and a half inches long, they may be separated, together with a small piece of the tuber, and potted in small pots, which should be placed in the hot-bed until the young plants are ready to be hardened, preparatory to being planted outdoors.

Geranium. Our native species, called "crane's bill," from the beak-like appearance of the fruit, have palmately lobed or cleft leaves. The flowers have unusually bright-colored petals. The plants commonly cultivated in gardens and greenhouses under the name of Geraniums are species of Pelargonium. There are about one hundred and twenty-five species, mostly natives of the Cape of Good Hope, prized on account of the brilliant colors, of the flowers and the shape and markings of the leaves.

The most popular method of propagating is by cuttings, which can be rooted in pots or boxes of light soil placed in a greenhouse, or even a cottage window, at any time from spring to autumn, provided the soil is not kept very moist. Good loam is the best potting material, and beyond a little sand it needs no addition. Firm potting is a point to be well observed. Avoid coddling.

Gloxinia is the florists' name for plants belonging to the genus *Sinningia*, tropical American plants. They have beautiful, many-colored, funnel-shaped flowers and velvety leaves. Seeds should be sown in February; and if the young plants are carefully potted, they flower the first year. They require the temperature of a warm greenhouse during the summer months; but as the leaves die away in autumn, the roots may be stored in a dry place, merely protected from cold. They like a sandy soil, containing abundance of leaf-mould and heat.

Lily (*Lilium*) in its many forms is one of the noblest and most beautiful of all bulbous plants. About forty-five species are natives of the north temperate zone, many of which are prized for the size and beauty of the flowers. The WHITE LILY (*L. candidum*), a native of the Levant, with large white flowers, has long been in cultivation in gardens. The EUROPEAN ORANGE LILY (*L. bulbiferum*), with large, orange-colored flowers, is a well-known and very showy ornament in flower gardens. The TIGER LILY (*L. tigrinum*) has a stout stem two to five feet high with beautiful orange-colored flowers, spotted with purple. It is a native of China but has escaped from cultivation in many parts of the United States.

PROUD COLOR BEAUTIES OF THE LAND OF FLOWERS

1. ANTIRRHINUM. 2. THE ODONTOGLOSSUM. 3. POPPIES. 4. GLOXINIA. 5. CORNFLOWERS. 6. NASTURTIUMS. 7. THE CATTLEYA FOBIA. 8. FOXGLOVE.

Nasturtium, the generic name of a plant of the *cruciferae* or mustard family, and the common name of the widely different genus *tropaeolum*. The best known of these is *Tropaeolum tricolorum*, one of the most generally cultivated annuals. It has tuberous roots, and such very weak and slender stems, that it is found necessary always to train them over a wire frame, as they are quite unable to support themselves. The stem climbs six or eight feet; the flowers vary from yellow to orange, scarlet and crimson. The unexpanded flower buds, and the young fruit while still tender, are pickled in vinegar. The dwarf varieties of this form bushy, rounded tufts about a foot high, and are used for bedding; some of them have flowers of exceedingly rich colors.

Odontoglossum. Unquestionably the most popular genus of Orchids. Very many of the species have been introduced into the green-house, and are greatly prized by cultivators for their magnificent flowers, which are remarkable both for their size and the beauty of their colors. Many of the species have pure white flowers, variously mottled; and some have a powerful odor of violets. With but few exceptions, they require to be grown in a moderately cool house. They are propagated by division, and grow like the other varieties of Orchids.

Tulip (*Tulipa*). A genus of upward of eighty species of hardy bulbous plants. Between forty and fifty species are known, mostly natives of the warmer parts of Asia. The most famous of all florists' flowers is the garden tulip (*T. gesneriana*), which is from eighteen inches to two feet high, with a smooth stem, bearing one erect, large flower. The tulip is still most sedulously cultivated in Holland, especially at Haarlem, whence bulbs are largely exported; but attention is almost exclusively devoted to the cheaper varieties, which are used in hundreds of thousands for the purposes of decoration in gardens and rooms throughout winter and spring. Tulips are propagated by offset bulbs, and new varieties are raised from seed. Another species of tulip cultivated in gardens is the sweet-scented tulip, or Van Thol tulip (*T. suaveolens*), which has yellow or red flowers, inferior to those of the common garden tulip in beauty, but prized for their fragrance, and for appearing more early in the season.

[148]

[149]

ROSES AND ROSE CULTURE

Roses are perhaps the most universally admired of all flowers, and few respond so well to the care of the cultivator. The earlier they are planted in the autumn (October 15th to November 15th) the better they will grow. Spring planting is fairly successful, provided the roots are kept moist when out of the ground. Time, April 15th to May 15th.

Roses enjoy deeply worked and fertile soil, and may be grown in specially prepared beds, or as borders. An open position, with a south or southeast exposure is preferable. Pruning should be done toward the end of March. When especially large blooms are desired, only one should be borne on each stem, the remainder of the buds being removed.

DESIRABLE VARIETIES FOR THE ROSE GARDEN

HYBRID PERPETUALS.—These produce handsome blooms in varied colors in the summer followed by a more or less bountiful supply in the autumn. Hardest of the garden roses.

Varieties:

- Frau Karl Druschki.—An ideal white rose.
- Jacqueminot (Jack Rose).—Brilliant scarlet.
- Paul Neyron.—Dark rose; largest of all.
- Magna Charta.—Bright pink; a favorite.
- George Arends.—Splendid soft pink.

HYBRID TEAS.—These possess the freedom of growth of the foregoing with much of the delicacy of flowers for which Tea-scented Roses are admired. The most satisfactory for the general garden.

Varieties:

- Robert Huey.—One of the largest bright reds.
- The Lyon.—Deep coral pink verging on yellow.
- White Killarney.—One of the best pure whites.
- La France.—Clear, satiny pink.
- Burbank.—Rich pink.
- Richmond.—Brilliant crimson.

TEA AND NOISETTES.—Loveliness with profuseness are combined in this section. Much tenderer than the Hybrid Teas; sweet scented. The Noisette is an excellent climber for walls.

Varieties:

- The Bride.—Pure white.
- Perle des Jardins.—Beautiful rich yellow.
- Papa Goutier.—Dark crimson.
- William Allen Richardson.—Deep orange-yellow flowers.
- Garland.—Semi-double, blush and white.
- Longworth Rambler.—Splendid autumn climber; flowers, semi-double and crimson.

HARDY CLIMBERS.—Popular and showy.

Varieties:

- American Pillar.—Large, single, pink flowers.
- Excelsa.—Finest of crimson ramblers.
- Hiawatha.—Single, brilliant crimson.
- Dorothy Perkins.—Soft shell-pink, fragrant.
- Lady Gay.—Delicate cerise-pink which change to creamy white.
- Wichmoss.—A "Moss" rose, light bluish-pink, fragrant.

HYBRID BRIERS.—Hardy semi-climbing roses.

Varieties:

- Lord Penzance.—Beautiful contrasting shades.
- Refulgence.—Dazzling scarlet, in clusters.
- Juliet.—Rosy red with reverse petals of old gold.

THE "BABY RAMBLERS."—Dwarf, "perpetual bloomers."

Varieties:

- Phyllis.—Beautiful pink.
- Jessie.—Bright cherry-red, white center.
- Orleans.—Brilliant red, white center.
- Snowball.—White, free flowering.

JAPANESE AND CHINESE.—

Varieties:

- Blairii (China).—Vigorous climber for sunny walls; flowers, blush and rose.
- Rugosa (Japanese).—No pruning is needed; flowers, white, rose and violet.

GUIDE FOR THE BEST ANNUAL FLOWERS

[150]

Common and Botanical Name; Hints on Cultivation	Color, Height and Time in Bloom	Kind of Soil and Light Required
BLOOMING IN MAY		
Pansies (<i>Viola tricolor</i>), generally wintered in frames, but protected with leaves often survive the winter outdoors.	Various; 7 inches; 8 weeks.	Rich, light; partial shade.
Trailing Catchfly (<i>Silene pendula</i>).—For succession from May 15th to July 15th sow outdoors September 1st, and again in early spring.	Pink, white; 12 inches; 4 weeks.	Light, rich loam; sun.
Cornflower (<i>Centaurea Cyanus</i>).—With moisture and frequent picking will bloom longer.	Blue; 24 inches; 10 weeks.	Light; sun.
Calliopsis (<i>Coreopsis tinctoria</i>).— <i>Calliopsis elegans</i> is one of the best browns among flowers.	Yellow and brown; 24 inches; 12 weeks.	Light; sun.
BLOOMING IN JUNE		
Giant Spider Plant (<i>Cleome spinosa</i>).—Usually planted in the front of shrubbery.	Rosy purple; 36 inches; 4 weeks.	Light; sun.
Ageratum (<i>Ageratum conyzoides</i>).—Sow seed under glass in March. For edging.	Blue; 8 inches; 16 weeks.	Rich, light; sun or half shade.
Annual Phlox (<i>Phlox Drummondii</i>).—Remove fading flowers daily.	Various; 12 inches; 12 weeks.	Rich, moist; sun.
Monkey Flower (<i>Mimulus luteus</i>).—Spotted petals. Flowers somewhat resemble a snapdragon.	Various; 36 inches; 6 weeks.	Rich, moist; shade.
Three-colored Gilia (<i>Gilia tricolor</i>).—A profuse bloomer. Sow seeds where plants are to grow by May 1st, and it will bloom in late June.	Various; 24 inches; 8 weeks.	Any good; sun.
Shirley Poppy (<i>Papaver Rhæas</i>).—A form of the common corn poppy. Sow seeds in the poppy bed in early September or April.	Various; 24 inches; 2 weeks.	Good, moisture; sun.
Sweet Pea (<i>Lathyrus odoratus</i>).—Manure and moisture cause abundance of blossoms. Sow seed March 20th near New York. Cut flowers daily.	Various; 72 inches; 8 weeks.	Heavy, rich loam; sun.
Candytuft (<i>Iberis umbellata</i>).—Sow early where plants are to stand.	Various; 8 inches; 4 weeks.	Good; sun.
Petunia (<i>Petunia hybrida</i>).—Grow somewhat apart from low plants because straggling.	White, pink; 12 inches; 16 weeks	Good; sun.
Western Wallflower (<i>Erysimum asperum</i>).—For May bloom sow in September, for June flowers sow in April.	Orange; 18 inches; 4 weeks.	Dry; sun.
Antirrhinum or Snapdragon (<i>Antirrhinum majus</i>).—Sow in hotbed in February for June bloom.	Various; 24 inches; 12 weeks.	Rich, moist sun.
BLOOMING IN JULY		
Lavatera (<i>Lavatera tri</i>).—Sow early May where plants are to grow.	Pink, white; 24 inches; 5 weeks.	Light, rich; sun.
Clarkia nerifolia (<i>Clarkia elegans</i>).— <i>Clarkia pulchella</i> is also useful for edging beds.	White, lilac, pink; 24 inches; 6 weeks.	Light, rich; sun or half shade.
Large-flowered Godetia (<i>Eurotia Whitneyi</i>).—The large-flowered species. Some with spotted throats.	White, lilac, pink; 12 inches; 6 weeks.	Good; sun.
Early Cosmos (<i>Cosmos binnatus</i>).—Very rich soil makes it bloom too late.	White, pink, crimson; 48 inches; 8 weeks.	Light; sun.
Sweet Alyssum (<i>Alyssum maritimum</i>).—Blooms till frost. Trim back moderately when flowers fade.	White; 8 inches; 14 weeks.	Light; sun.
Nicotiana affinis (<i>Nicotiana glauca</i>).—Very fragrant at night. Plants usually started in cold frame.	White; 36 inches; 12 weeks.	Light; sun or part shade.
Sander's Nicotiana (<i>Nicotiana Sanderæ</i>).—More satisfactory as a greenhouse plant, steadily improving.	Various; 36 inches; 12 weeks.	Light, rich; sun or part shade.
Arctotis grandis (<i>Arctotis grandis</i>).—Petals white above, lilac beneath. Blue-centered daisy.	White and lilac; 18 inches; 14 weeks.	Light, rich; sun.
Stock, Gilliflower (<i>Matthiola incana</i> , var. <i>annua</i>).—For July bloom sow February in greenhouse or hotbed.	Various; 18 inches; 12 weeks.	Deep, rich; sun.
Annual Larkspur (<i>Delphinium Ajacis</i>).—Sow seeds in September outdoors to have flowers July 1st.	Various; 18 inches; 8 weeks.	Good, light; sun.
Bedding Lobelia (<i>Lobelia Erinus</i>).—Blooms till frost in partial shade if watered.	Blue; 10 inches; 12 weeks.	Light, rich, moist; half shade.
Wishbone Flower (<i>Torenia Fournieri</i>).—Set five inches apart in two or three lines.	Blue; 8 inches; 12 weeks.	Light, rich, moist; half shade.
Phacelia congesta (<i>Phacelia congesta</i>).—An interesting little plant for border edge.	Blue; 12 inches; 6 weeks.	Light, rich; sun.
African Marigold (<i>Tagetes erecta</i>).—Colors range from deep orange to sulphur yellow.	Yellow; 36 inches; 16 weeks.	Rich; sun.
California Poppy (<i>Eschscholzia Californica</i>).—Sow early in border edge. Avoid transplanting.	Yellow; 15 inches; 16 weeks.	Rich; sun.
Giant Tulip (<i>Hunnemannia fumarifolia</i>).—Bushy in habit. Sow seeds in May outdoors.	Yellow, red; 24 inches; 8 weeks.	Rich; sun.
Annual Gaillardia (<i>Gaillardia pulchella</i>).—Best kinds belong to var. <i>picta</i> . Profuse bloomer.	Crimson, red, yellow; 24 inches; 14 weeks.	Rich, light; sun.
Salvia or Scarlet Sage (<i>Salvia splendens</i>).—Don't place near pink flowers. Start indoors in March.	Red; 36 inches; 14 weeks.	Good; sun or half shade.
Youth and Old Age (<i>Zinnia elegans</i>).—Rather stiff, but splendid for mass effects in garden.	Various; 36 inches; 14 weeks.	Rich; sun.
Rose Moss (<i>Portulaca grandiflora</i>).—Sow outdoors June 1st. It self-sows freely.	Various; 6 inches; 14 weeks.	Light, sun.
Balsam (<i>Impatiens Balsamina</i>).— <i>Balsamina hortensis</i> strain is best. Pinch plants once.	Various; 24 inches; 6 weeks.	Light, rich, moist; sun.
Painted Tongue (<i>Salpiglossis nuala</i>).—Beautiful venation. Best started under glass.	Various; 18 inches; 8 weeks.	Rich, light; sun.
Verbena .—Sow indoors in February to get earliest bloom.	Various; 12 inches; 10 weeks.	Rich, light, moist; sun.
BLOOMING IN AUGUST		
Three-Colored Chrysanthemum (<i>Chrysanthemum carinatum</i>).—Sometimes called "painted daisy."	Various; 24 inches; 8 weeks.	Rich, light; sun.
Mourning Bride (<i>Scabiosa atropurpurea</i>).—Sown in April for early August bloom.	Various; 24 inches; 8 weeks.	Rich, light; sun.
China Asters (<i>Callistephus Chinensis</i>).—Dig in wood ashes around roots to prevent diseases.	Various; 24 inches; 6 weeks.	Rich, light; sun.
Everlasting (<i>Helichrysum bracteatum</i>).—This shade is by far the most desirable.	Deep red; 36 inches; 8 weeks.	Light, rich; sun.
Didiscus (<i>Trachymene cærulea</i>).—Sow <i>Didiscus cæruleus</i> under glass in April.	Light blue; 24 inches; 8 weeks.	Rich, light; sun.
BLOOMING IN SEPTEMBER		
China Aster (<i>Callistephus hortensis</i>).—Dig in wood ashes to prevent aster disease.	Various; 24 inches; 4 weeks.	Light, rich; sun.

[151]

Cosmos (<i>Cosmos bipinnatus</i>).—Dig around it and jolt it in midsummer.	Pink, white and red; 6 inches; 2 weeks.	Fairly good; sun.
BLOOMING IN OCTOBER		
Autumn Crocus (<i>Colchicum autumnale</i>).—They begin to bloom in September.	Purple, white, pink; 4 inches; 4 weeks.	Rich, light; sun.
Datsch's Aster (<i>Aster Datschi</i>).—Latest aster of its color in trade.	White; 36 inches; 3 weeks.	Good, deep; sun.
Himalayan Aster (<i>Aster trinervis</i>).—Latest aster of its color in trade.	Violet-purple; 30 inches; 3 weeks.	Good, deep; sun.
Tea Rose (<i>Rosa Chinensis</i>).—Last bloom of the monthly or tea rose.	Various; 24 inches; 2 weeks.	Rich, deep; sun.
Perennial Larkspur (<i>Delphinium sp.</i>).—Cut back larkspur after annual bloom.	Blue; 24 inches; 2 weeks.	Rich, deep; sun.
Everbloom Torch Lily (<i>Kniphofia Pfitzerii</i>).—Store roots of <i>Tritoma Pfitzerii</i> in cellar over winter.	Orange-scarlet; 36 inches; 6 weeks.	Rich, deep; sun.
BLOOMING IN NOVEMBER		
Pompon Chrysanthemum (<i>Chrysanthemum Indicum</i>).—Buttons one-half inch across or flowers one inch across.	Various; 36 inches; 4 weeks.	Rich, loam; sun.

GUIDE FOR THE BEST PERENNIAL FLOWERS

Common and Botanical Name; Hints on Cultivation	Color, Height and Time in Bloom	Kind of Soil and Light Required
BLOOMING IN MARCH		
Anemone or Hepatica (<i>Hepatica triloba</i>).—For wild garden or rock garden. Evergreen.	Blue, lilac, pink, white; 5 inches; 3 weeks.	Rich, drained loam; shade.
BLOOMING IN APRIL		
Bluebell (<i>Mertensia Virginica</i>).—Leave undisturbed for years. Foliage dies in summer.	Blue; 16 inches; 3 weeks.	Rich loam; sun.
Shooting Star (<i>Dodecatheon Meadia</i>).—Its English name is very descriptive.	Pink; 8 inches; 3 weeks.	Good; partial shade.
Wild Sweet William (<i>Phlox divaricata</i>).—The tallest of the early phloxes.	Blue; 16 inches; 4 weeks.	Rich; sun or shade.
Sweet Violet (<i>Viola odorata</i>).—Blooms again in autumn.	Blue; 8 inches; 6 weeks.	Heavy rich; sun or shade.
Rock Cress (<i>Arabis albidia</i>).—For edgings, carpeting bare spots, covering banks, etc.	White; 4 inches; 3 weeks.	Any; sun.
Large-Leaved Saxifrage (<i>Saxifraga sp.</i>).—The different species known to the trade as <i>Saxifraga Megasea</i> generally appear in early April.	White, blue, pink; 12 inches; 2 weeks.	Any; partial shade.
Moss Pink (<i>Phlox subulata</i>).—Spreads rapidly. Moss-like foliage. Carpets ground.	Pink; 6 inches; 4 weeks.	Good; full sun.
English Primrose (<i>Primula vulgaris</i>).—Some moisture is necessary to produce fine blossoms.	Yellow; 9 inches; 3 weeks.	Light rich; full sun.
Leopard's Bane (<i>Doronicum plantagineum</i> , var. <i>excelsum</i>).—Showiest early flower of the daisy family. Flowers sometimes four inches across. Give scattering bloom all season.	Yellow; 10 inches; 4 weeks.	Any; sun or semi-shade.
Poppy Mallow (<i>Callirhoe involucrata</i>).—Hardy. May bloom again in late summer.	Red, purple; 9 inches; 8 weeks.	Good sun.
BLOOMING IN MAY		
Spiderwort (<i>Tradescantia Virginiana</i>).—For mixed borders, wild garden or front of shrubbery.	Violet, blue; 24 inches; 12 weeks.	Good; sun or half shade.
Many-Leaved Lupine (<i>Lupinus polyphyllus</i>).—Easily raised from seed. Soil must not dry quickly.	Blue, white; 36 inches; 4 weeks.	Rich, heavy; sun or shade.
Common Columbine (<i>Aquilegia vulgaris</i>).—Also grow <i>A. chrysantha</i> (yellow), and <i>A. Canadensis</i> (red).	Violet, white; 36 inches; 5 weeks.	Rich; sun or shade.
German Iris (<i>Iris Germanica</i>).—Plant rhizomes flat, cover half their depth. Best transplanted after bloom. Keep from contact with manure.	Various; 24 inches; 3 weeks.	Good; sun.
Scotch Pink (<i>Dianthus plumarius</i>).—Evergreen. Don't cover with litter in winter.	White, pink; 10 inches; 2 weeks.	Good; sun.
Garden Heliotrope (<i>Valeriana officinalis</i>).—Sweet spicy fragrance; rapid spreader; an old favorite.	White; 36 inches; 3 weeks.	Good; sun or half shade.
Yellow Larkspur (<i>Delphinium nudicaule</i>).—Grows wild near streams in northern California, a pretty, early variety for the garden.	Yellow; 12 inches; 10 weeks.	Deep, rich, sandy loam; sun.
Brown and Yellow Corn Flower (<i>Lepachys columnaris</i> , var. <i>pulcherrima</i>).—Grown as an annual for bedding. Start indoors in March; it will bloom June to September.	Brown and yellow; 24 inches; 12 weeks.	Any good; sun.
Lily-of-the-Valley (<i>Convallaria majalis</i>).—Divide every four or five years if crowded. Plant six or seven pips in a bunch.	White; 8 inches; 3 weeks.	Good, heavy; partial shade.
Bachelor's Button (<i>Ranunculus acris</i> , var. <i>flore pleno</i>).—Easiest to raise of the yellow buttons.	Yellow; 18 inches; 5 weeks.	Good, moist; partial shade.
Cowslip (<i>Primula officinalis</i>).—Small flowers well above leaves. Water during drought.	Yellow; 8 inches; 3 weeks.	Moist, deep, light; part shade.
Lemon Lily (<i>Hemerocallis flava</i>).—This sweet scented flower is the best Hemerocallis.	Yellow; 18 inches; 4 weeks.	Good; sun or partial shade.
Early Peony (<i>Pæonia officinalis</i>).—This European species is the parent of the early peonies; blooms fortnight before the Chinese peonies.	Red, white; 6 inches; 8 weeks.	Rich, heavy; sun.
Carolina Phlox (<i>Phlox ovata</i>).—A rich color for the front of a bed.	Rosy red; 8 inches; 4 weeks.	Good, light; sun.
Bleeding Heart (<i>Dicentra spectabilis</i>).—Commonly planted in fall. Sold by bulb dealers also.	Rosy red; 18 inches; 4 weeks.	Rich, light; sun.
Pyrethrum (<i>Chrysanthemum coccineum</i>).— <i>Pyrethrum roseum</i> dies from too much moisture in clay soil. Wilts if too dry.	Pink, white; 24 inches; 5 weeks.	Rich, deep, light; sun.
English Daisy (<i>Bellis perennis</i>).—Best to winter in cold frames. Water freely while growing.	Pink, white; 6 inches; 8 weeks.	Rich, rather heavy; sun.
Siberian Primrose (<i>Primula cortusoides</i>).—One of the latest primroses. Flowers one inch across.	Pink; 12 inches; 5 weeks.	Dry, rich; sun.
BLOOMING IN JUNE		
Perennial Larkspur (<i>Delphinium formosum</i>).— <i>D. Zalil</i> is yellow, two feet. <i>D. elatum</i> is blue, six feet. <i>D. Chinensis</i> is a dwarf kind, two feet.	Blue; 24 inches; 6 weeks.	Rich, well-drained, heavy; sun.
Canterbury Bells (<i>Campanula Medium</i>).—Biennial, needs winter protection. Var. <i>calycanthema</i> best.	Blue, white, pink; 24 inches; 5 weeks.	Rich, not too light; sun.
Foxglove (<i>Digitalis purpurea</i>).—Short-lived perennial but self-sows. Highest type is var. <i>gloxiniæflora</i> , best sown in August; wintered in cold frames.	Purple; 36 inches; 5 weeks.	Light, good, moist; sun; shade.
Beard-Tongue (<i>Pentstemon diffusus</i>).—Tall slender spikes of light purplish blue flower.	Blue; 24 inches; 3 weeks.	Good soil; partial shade.
Japanese Iris (<i>Iris lævigata</i>).—Largest flowered iris. Needs more moisture.	Various; 48 inches; 4 weeks.	Rich, moist; sun.
Siberian Columbine (<i>Aquilegia Sibirica</i>).—Give columbine seeds light soil; plants rather heavy soil.	Light blue; 24 inches; 4 weeks.	Rich, dry; sun or half shade.
False Indigo (<i>Baptisia australis</i>).—Resembles the lupine.	Blue; 36 inches; 3 weeks.	Good; sun.
Douglas' Clematis (<i>Clematis Douglasi</i>).—Bell-shaped flowers darker within than without.	Blue; 24 inches; 3 weeks.	Rich, light loam; sun.
Jacob's Ladder (<i>Polemonium œruleum</i>).—Likes moisture. An old-time flower.	Blue, white; 24 inches; 4 weeks.	Rich, deep loam; sun.
Amsonia (<i>Amsonia Tabernæmontana</i>).—Subshrub with willow-like leaves. Grows well in shrubbery.	Blue; 24 inches; 4 weeks.	Good; sun.
Goat's Beard (<i>Aruncus astilboides</i>).—Feathery-spiked flowers. Fine cut foliage.	White; 24 inches; 3 weeks.	Good; sun.
Pearl Achillea (<i>Achillea Ptarmica</i> , var. <i>Pearl</i>).—Fence in roots with a square of boards.	White; 24 inches; 12 weeks.	Rich; sun.
Phlox Miss Lingard (<i>Phlox maculata</i> , var. <i>Miss Lingard</i>).—Healthiest and best variety of common early perennial garden phlox.	White; 18 inches; 6 weeks.	Rich; sun.
Gas Plant (<i>Dictamnus Fraxinella</i>).—Will also grow in partial shade. Very long-lived.	White, pink; 24 inches.	Rich, heavy; sun.
Hardy Yucca (<i>Yucca flaccida</i>).— <i>Yucca filamentosa</i> of nurserymen, not of botanists. Transplant only in early spring. Makes new plants every year by suckers.	White; 60 inches; 4 weeks.	Rich, light loam; sun.
Golden Marguerite (<i>Anthemis tinctoria</i>).—Divide every year. Var. <i>Kelwayi</i> best.	Yellow; 12 inches; 10 weeks.	Good; sun.
Perennial Coreopsis (<i>Coreopsis lanceolata</i>).—Don't let it go to seed.	Yellow; 18 inches; 10 weeks.	Good; sun.
Woolly Yarrow (<i>Achillea tomentosa</i>).—Carpets the ground in early June.	Yellow; 8 inches; 4 weeks.	Dry, rich; sun.
Perennial Gaillardia (<i>Gaillardia aristata</i>).—The yellow with maroon disk is perhaps the best. Blooms steadily till frost if fading flowers are cut.	Yellow; 12 inches; 16 weeks.	Good, light; sun.
Thin-Leaved Coneflower (<i>Rudbeckia triloba</i>).—Biennial, but blooms first year and self-sows.	Yellow; 36 inches; 5 weeks.	Rich, moist; sun.
Wild Indigo (<i>Baptisia tinctoria</i>).— <i>Baptisia australis</i> , blue, is showier.	Yellow; 24 inches; 4 weeks.	Good; sun.
German Catchfly (<i>Lychnis Viscaria</i>).—Beautiful, old-fashioned, long-lived in congenial situation.	Deep red; 9 inches; 3 weeks.	Good, light; sun.
Late or Chinese Peony (<i>Pæonia Chinensis</i>).—Flowers best in rather heavy soil, with moisture in spring and summer. Single varieties are exquisite.	Crimson, white, pink; 30 inches; 3 weeks.	Very rich, deep; sun.
Oriental Poppy (<i>Papaver orientale</i>).—The variety <i>bracteatum</i> —deep red—is the best.	Red; 36 inches; 2 weeks.	Rich; sun.
Sweet William (<i>Dianthus barbatus</i>).—Biennial but self-sows.	Various; 12 inches; 5 weeks.	Light, rich; sun.
Japanese Pinks (<i>Dianthus Chinensis</i> , var. <i>Heddewigii</i>).—Best treated as annual. Start indoors.	Various; 9 inches; 12 weeks.	Light, rich; sun.
Coral Bells (<i>Heuchera sanguinea</i>).—Graceful racemes of delicate flowers. Blooms all summer.	Crimson; 18 inches; 12 weeks.	Good; sun or half-shade.
Fire Pink (<i>Silene Virginica</i>).—It cannot stand much moisture.	Crimson; 18 inches; 8 weeks.	Good; sun or half shade.
BLOOMING IN JULY		
Fremont's Clematis (<i>Clematis Fremonti</i>).—A western bush clematis for the hardy border.	Bluish purple; 24 inches; 3 weeks.	Deep, rich; sun.
Beard-Tongue (<i>Pentstemon ovatus</i>).—Short-lived but very free blooming while it lasts.	Blue; 36 inches; 3 weeks.	Moist; sun.
True Monkshood (<i>Aconitum Napellus</i>).—This plant lives longer in partial shade.	Blue; 48 inches; 3 weeks.	Rich; partial shade.
Japanese Bellflower (<i>Platycodon grandiflorum</i>).—Largest easily grown flower of the bellflower family.	Blue, white; 18 inches; 4 weeks.	Light loam; sun.
Double Feverfew (<i>Chrysanthemum Parthenium</i>).—Gives many white buttons.	White; 18 inches; 12 weeks.	Rich; sun.
False Chamomile (<i>Boltonia asteroides</i>).—Like a wild aster. Very profuse of bloom.	White, violet; 60 inches; 4 weeks.	Any good; sun.
Bugbane (<i>Cimicifuga racemosa</i>).—For shrubby back of border, or wild garden.	White; 60 inches; 4 weeks.	Good; partial shade.
Meadow Rue (<i>Thalictrum polygamum</i>).—For wild garden or shrubbery. Fern-like foliage.	White; 60 inches; 4 weeks.	Moist; sun.
Perennial Phlox (<i>Phlox paniculata</i>).—See also <i>Phlox maculata</i> in June.	White, pink, red, blue; 36 inches; 4 weeks.	Rich, moist; sun.
Hollyhock (<i>Althæa rosea</i>).—Dig dry Bordeaux about crowns in spring; spray under side of leaves weekly with ammoniacal copper carbonate.	White, pink, red; 72 inches; 4 weeks.	Deep, rich, heavy; sun.

Double Perennial Sunflower (<i>Helianthus decapetalus</i> , var. <i>multiflorus</i>).—Divide every two years. Flowers deteriorate.	Yellow; 60 inches; 6 weeks.	Any good; sun.
Shining-Leaved Coneflower (<i>Rudbeckia nitida</i>).—Plenty of moisture suits it best.	Yellow; 24 inches; 4 weeks.	Any good; sun.
Golden Glow (<i>Rudbeckia laciniata</i> , fl. pf.).—Wonderfully prolific. Divide annually. Getting common.	Yellow; 72 inches; 3 weeks.	Any good; sun.
Pitcher's Sunflower (<i>Helianthus laevis</i>).—Earlier than sunflowers, smaller. Var. <i>Pitcheriana</i> best.	Yellow; 6 weeks.	Good; dry; sun.
Gay Feather (<i>Liatris pycnostachya</i>).—Very striking. Plant in groups of five or more.	Pink; 48 inches; 3 weeks.	Good; sun.
Purple Coneflower (<i>Echinacea purpurea</i>).—Rather coarse but effective flowers. Sometimes four feet high.	Pinkish; 24 inches; 6 weeks.	Good; deep; sun.
Bee Balm (<i>Monarda didyma</i>).—Rapid spreading. Place next to white phlox.	Red; 36 inches; 8 weeks.	Good; sun.
BLOOMING IN AUGUST		
Long-Leaved Veronica (<i>Veronica longifolia</i>).—The best is var. <i>subsessilis</i> .	Blue; 36 inches; 3 weeks.	Deep, rich; sun.
Stoke's Aster (<i>Stokesia cyanea</i>).—Hardy near Boston. An unusually fine shade of blue.	Blue; 18 inches; 4 weeks.	Well drained, light, rich; sun.
Mist Flower (<i>Conoclinium coelestinum</i>).—Easily grown. Light blue color.	Blue; 18 inches; 4 weeks.	Any good; sun.
Joe-Pye Weed (<i>Eupatorium purpureum</i>).—For back of broad border, or shrubby.	Purple; 96 inches; 4 weeks.	Any good; sun.
Arkansas Ironweed (<i>Vernonia Arkansana</i>).—Flowers by August 1st. For shrubby or wild garden.	Purple; 96 inches; 6 weeks.	Rich, deep; sun.
New York Ironweed (<i>Vernonia noveboracensis</i>).—Bushy. May be placed near <i>V. Arkansana</i> .	Purple; 60 inches; 6 weeks.	Rich, deep; sun.
Lyon's Turtlehead (<i>Chelone Lyoni</i>).—Resembles pentstemons. Don't allow to suffer from drought.	Purplish; 24 inches; 4 weeks.	Rich, partial shade.
Baby's Breath (<i>Gypsophila paniculata</i>).—Beautiful misty white flower. Effective in bouquets.	White; 24 inches; 3 weeks.	Rich, light; sun.
Marshmallow (<i>Hibiscus Moscheutos</i>).—They have deep crimson or purple eyes.	Rose, white; 60 inches; 3 weeks.	Rich; sun.
Showy Coneflower (<i>Rudbeckia speciosa</i>).—Moisture will increase the size of the flower.	Yellow; 24 inches; 6 weeks.	Good; sun or half shade.
Showy Sunflower (<i>Helianthus laetiflorus</i>).—Spread too rapidly for a crowded border.	Yellow; 72 inches; 6 weeks.	Good; sun.
Long-headed Coneflower (<i>Lepachys columnaris</i>).—Resembles black-eyed Susan.	Yellow; 24 inches; 6 weeks.	Good; sun.
Canadian Goldenrods (<i>Solidago Canadensis</i>).—Goldenrods all welcome in the wild garden.	Yellow; 48 inches; 5 weeks.	Any good; sun.
Yarrow, Milfoil (<i>Achillea Millefolium</i>).—Pink kind is var. <i>roseum</i> . Sink boards around it.	Pinkish; 24 inches; 8 weeks.	Any good dry; sun.
Butterfly Weed (<i>Asclepias tuberosa</i>).—Has big woody root. Transplant young seedlings.	Orange; 24 inches; 5 weeks.	Good, dry; sun.
Cardinal Flower (<i>Lobelia cardinalis</i>).—Does well in garden soil. Water freely.	Red; 36 inches; 5 weeks.	Deep, moist; partial shade.
Showy Stonecrop (<i>Sedum spectabile</i>).—Give good drainage. Best of the tall stonecrops.	Pink; 18 inches; 6 weeks.	Good, rich; sun.
False Chamomile (<i>Botania latissuama</i>).—Satisfactory for back of border. Spreads considerably.	Pinkish; 60 inches; 5 weeks.	Rich, deep; sun.
BLOOMING IN SEPTEMBER		
Fischer's Aconite (<i>Aconitum Fischeri</i>).—Early frost does not harm this beautiful flower.	Blue; 60 inches; 4 weeks.	Rich, deep, partial shade.
Blazing Star (<i>Liatris graminifolia</i>).—A singular and strikingly beautiful flower.	Rosy, purple; 36 inches; 3 weeks.	Rich, good; sun.
Tartarian Aster (<i>Aster Tataricus</i>).—Tallest of all asters. Many other good blue kinds.	Blue; 72 inches; 3 weeks.	Any good; sun.
New England Aster (<i>Aster Novæ Angliæ</i>).—The rose variety is better.	Purple; 48 inches; 3 weeks.	Any good; sun.
Giant Daisy (<i>Chrysanthemum uliginosum</i>).—Spreads rapidly. For back of borders. Rather heavy soil.	White; 60 inches; 3 weeks.	Rich, moist; sun.
Graceful Sunflower (<i>Helianthus orgyalis</i>).—One of the best hardy sunflowers. Blooms late.	Yellow; 96 inches; 4 weeks.	Any good; sun.
Maximilian's Sunflower (<i>Helianthus Maximiliana</i>).—Another graceful sunflower.	Yellow; 72 inches; 5 weeks.	Any good; sun.
Sneezeweed (<i>Helenium autumnale</i>).—Begins to bloom in August, sometimes in July.	Yellow; 60 inches; 8 weeks.	Any good; sun.

DESIRABLE ANNUAL VINES

Common and Botanical Name; Hints on Cultivation	Color, Height and Time in Bloom	Kind of Soil and Light Required
Hyalanth Bean (<i>Dolichos Lablab</i>).—Sensitive to frost. Makes good screen. Plant one foot apart.	Purple; 15 feet; 4 weeks.	Rich, light; sun.
Cup and Saucer Vine (<i>Cobæa scandens</i>).—Rapid climber. Set plants six inches apart.	Purplish, white; 15 feet; 6 weeks.	Rich, light; sun.
Allegheny Vine (<i>Adlumia cirrhosa</i>).—For covering bushes. Set eight inches apart.	Pinkish; 10 feet; 3 weeks.	Moist, rich; shade.
Ivy-Leaved Gourd (<i>Coccinea cordifolia</i>).— <i>Coccinea Indica</i> is grown for its scarlet fruit.	White; 10 feet; 4 weeks.	Light, rich; sun.
Canary-Bird Vine (<i>Tropæolum Canariense</i>).—Not showy, but quick growing. Set eight inches apart.	Canary yellow; 15 feet; 3 weeks.	Light, rich; sun.
Balloon Vine (<i>Cardiospermum Halicabum</i>).—Seed vessels like balloons. Set plants ten inches apart.	White; 10 feet; 3 weeks.	Light, rich; sun.
Balsam Pear (<i>Momordica Charantia</i>).—Plant seeds outdoors after last frost, else under glass earlier.	Yellow; 10 feet; 3 weeks.	Light, rich; sun.
Climbing Nasturtium (<i>Tropæolum majus</i>).—For close screen plant ten inches apart.	Yellow or red; 10 feet; 8 weeks.	Light, rich; sun.
Cypress Vine (<i>Ipomœa Quamoclit</i>).—Star-shaped flowers. Finely cut leaves.	Scarlet; 15 feet; 3 weeks.	Light, rich; sun.
Scarlet Runner Bean (<i>Phaseolus multiflorus</i>).—Tender perennial with tuberous roots.	Red, white; 18 feet; 4 weeks.	Light, rich; sun.
Maurandia (<i>Maurandia Barclaina</i>).—Showy leaves and trumpet-shaped flowers.	White, blue; 10 feet; 2 weeks.	Light, rich; sun.

FLOWERING SHRUBS AND HEDGE PLANTS

Names and Descriptions	Height in Feet	Flowering Time	Cultivation and Use
Spiræa (<i>Spiræa Van Houttei</i>).—The most showy of the spiræas; flowers in umbels two inches across. Handsome foliage all summer.	6	June	Plant in a conspicuous place with ample room. Cut out flowering wood in summer. Thrives anywhere.
Spiræa (<i>Spiræa, Anthony Waterer</i>).—The only shrub of its season. Flowers crimson red produced successively for six weeks. Good for edging.	3	July	Prune off old flower heads as soon as withered to induce good second crop.
Mock Orange (<i>Philadelphus coronarius</i>).—Most fragrant white large flowered shrub. Valuable for tall screen. Flowers one and one-half inches across.	12	June	Old wood should be cut out from time to time, otherwise the tree gets very ragged.
Althea or Rose of Sharon (<i>Hibiscus Syriacus</i>).—The only tall shrub of late summer. Very hardy; leaves late. White or rose flowers.	12	August	Good for hedges and screens. Must be planted very early in the autumn.
Hydrangea (<i>Hydrangea paniculata</i> , var. <i>grandiflora</i>).—Most showy of all summer shrubs. White flowers, shading into pink and persisting all winter.	6 to 15	July-August	Prune very completely in winter for quantity of flowers next year.
Golden Bell (<i>Forsythia suspensa</i>).—The most showy, early-flowering shrub. Yellow flowers before the leaves. Branches arch over and root at tips.	5 to 8	April-May	Plant against a dark background, such as evergreens, or a hillside to set off flowers.
Japan Quince (<i>Cydonia Japonica</i>).—Earliest bright scarlet flowered shrub. Useful also as a hedge. Plant as specimen. Slow growing.	4 to 8	May	Very subject to San Jose scale. Don't plant near orchards unless systematically sprayed. Stands close pruning.
Lilac (<i>Syringa vulgaris</i>).—Very fragrant lilac, white or purple flowers. Grows anywhere, even in partial shade.	8 to 15	May-June	Spray with potassium sulphide for mildew in August, September. Do not permit suckers to develop. Prune for form only.
Japanese Snowball (<i>Viburnum plicatum</i>).—Largest showy white balls of bloom, better habit than the common snowball and not so subject to plant louse.	6 to 8	May-June	Prune as little as possible. Should be planted on lawn as a specimen, or trained on wall of house.
Tartarian Honeysuckle (<i>Lonicera Tatarica</i>).—Most fragrant of all the early summer shrubs, especially at dusk. Flowers pink; several varieties red or white.	8 to 10	May-June	Plant in shrubbery where its presence is made known by the odor. Valuable as a low screen on seaside.
Weigela (<i>Diervilla florida</i>).—Showiest shrub of midsummer. Flowers pink, white, red. Best flowering shrub under big trees.	6 to 8	June	Can be planted where other shrubs fail. Free from insects and disease. Cut out old wood to the ground.
Wistaria or Wisteria (<i>W. Frutescens</i>).—Handsome hardy, slow-growing, climbing shrub. Flowers in elegant lilac-colored racemes, slightly scented.	8 to 15	All Summer	Adapted for screen or trellis.
California Privet (<i>Ligustrum ovalifolium</i>).—Fastest growing. Stands salt spray. Good soil binder. Stands severest pruning and can be trained high or low.	6 to 8	...	Set six inches deeper than in the nursery and cut back to six inches or less.
Regel's Privet (<i>Ligustrum Iota</i> , var. <i>Regelianum</i>).—Low growing, denser habit with spreading, drooping branches clothed with white tassels.	2 to 6	June	Useful as a border hedge to plantations and along roadways. Should not be planted as a protection.
Osage Orange (<i>Maclura pomifera</i>).—Grows in any soil. Makes a dense defensive hedge as far north as Massachusetts. Flowers white.	3 to 15	May	Unless regularly trimmed, the top branches will spread. Will exhaust soil on each side for some feet.
Japanese Barberry (<i>Berberis Thunbergii</i>).—Foliage down to the ground. Dense compact growth of small spiny branches making effective hedge in winter.	4	June	Does not need pruning. Red berries all winter, and foliage red until Christmas. Do not plant in wheat districts.
Honey Locust (<i>Gleditsia triacanthos</i>).—The thorniest of all. "Bull strong, horse high and pig tight." Perfectly hardy. Fast and vigorous grower. Suckers.	3 to 15	May	Plant thickly and prune severely. Mice girdle in winter. Spring trimmings must be burned. Needs strict control.
Buckthorn (<i>Rhamnus cathartica</i>).—The best strong hedge, as dense and tight as honey locust but not so high. Thorny. Never ragged. Moderate grower.	6 to 10	...	Spray with kerosene emulsion for hop louse. Old hedges that are out of condition are easily recovered by cutting back.
Trifoliolate Orange (<i>Citrus trifoliatus</i>).—Best medium height hedge for the South where it is evergreen. Deciduous in the North. Foliage yellow in fall.	Not reliably hardy north of Philadelphia. White flowers followed by small yellow fruits make it ornamental also.
Tamarix (<i>Tamarix Gallica</i>).—Unexcelled for saline and alkaline soils, growing on the salt water's edge where nothing else will.	5 to 10	...	Flowers feathery pink on old wood; on new wood in var. <i>Narbonensis</i> . Foliage small.
Japanese Briar (<i>Rosa rugosa</i>).—The only rose suitable for a hedge. White, pink and red flowers.	5 to 8	All Summer	Suited for boundary or screen.

BEST LAWN GRASSES FOR ALL PURPOSES

Common and Botanical Name	Region of Use	Lbs. per bushel cleaned seed	Sow per acre bushels alone	Conditions and Uses
Rhode Island Bent (<i>Agrostis canina</i>).	On sandy seashores.	15	13	For close, fine turf. Color very green.
Creeping Bent (<i>Agrostis alba</i> , var. <i>stolonifera</i>).	Low lying inland and dry valleys of the East.	15	3	Rapid growing, forms a strong turf, that is improved by heavy rolling or tramping.
Red Top, Fancy Red Top (<i>Agrostis alba</i> , var. <i>vulgaris</i>).	From Tennessee north.	14	4	Stands hot weather and hard usage. Fills in well with blue grass.
Beach (<i>Ammophila arenaria</i> , A. <i>arundinacea</i>).	On railway cuttings and embankments on the sea coast.	35	5-6	Dry, loose soils. Holds drifting sands and banks.
Biennial Sweet Vernal (<i>Anthoxanthum odoratum</i>).	Useful only to lend fragrance to the lawn when cut.	Used only in mixture two pounds to the acre.		Starts early in spring, and makes new root-leaves all the year after cutting.
Bermuda (<i>Capriola Dactylon</i>).	Is killed by frost; valueless north of Virginia. A weed in blue grass lawns where it dies early.	15	½	Can be used for binding banks. The best lawn grass for the South from Virginia to Florida. Withstands heat and drought. Thrives on poorest

Crested Dog's Tail (<i>Cynosurus cristatus</i>).	Valuable for shady places and under trees. Also for terraces on deep soil.	30	1	soils.
Various Leaved Fescue (<i>Festuca heterophylla</i>).	Northern States and on cold, wet soils.	15	1 ½	Same color as Kentucky blue and so mixes well with that. A good bottom grass. Not recommended alone. Prefers rich, moist soil. Does best in cold, moist soils, rich in humus and potash.
Sheep's Fescue (<i>Festuca ovina</i>).	Useful in mixtures for the Northwest and for lands on poorest sands.	16	2	This is a "bunch" or "stool" grass with very fine foliage and dense dwarf growth for any uplands.
Slender Fescue (<i>Festuca ovina</i> var. <i>tenuifolia</i>).	Dry slopes on lawns or on dry, high situations.	22	1 ½	Finer leaf than sheep's fescue and stools like that. Recommended only in special situations.
Italian Rye (<i>Lolium Italicum</i>).	Very thickly or in mixture as far south as Jacksonville, Fla.	22	2 ½	Very rapid growing and valuable for short, quick effects. Is practically an annual.
Pacey's or English Rye (<i>Lolium perenne</i> var. <i>tenue</i>).	For quick effects in the Middle and Eastern States.	28	2	Makes good verdure in four weeks. Dies out in two or three years.
Canada Blue (<i>Poa compressa</i>).	Throughout the East and North including Canada on dry sand or clay.	14	3	Flatter, more wiry stem than the Kentucky grass, also bluer color. Used in the very cheap mixtures as a substitute.
Wood Meadow (<i>Poa memorialis</i>).	Best grass for very shady places in woodland parks.	19	1 ½	Very hardy and early, resisting heat, too.
Kentucky Blue (<i>Poa pratensis</i>).	Best lawn grass north of Washington and west to the Allegheny range.	14	3	Starts early, lasts till frost, fine texture, rich green color, smooth, even growth. Three years to establish. Dislikes some soils.
Rough Stalked Meadow (<i>Poa trivialis</i>).	More shaded portions of lawns or north side of buildings.	26	4-5	Does not do well on dry land. Forms a fine turf and dense mat.
St. Augustine (<i>Stenotaphrum secundatum</i> , <i>S. Americanum</i>).	Florida and the West Indian Islands.	26	4-5	Coarse and upright leaf, but keeps green when even Bermuda grass burns out.

[157]

VI. WILD FLOWERS AND FLOWERLESS PLANTS

The beauty and inspiration of wild flowers, which lovers of Nature constantly bring to our attention, should by no means, be passed by. There are few, indeed, whose joy in living is not more than a little deepened by contact with the woods and meadows, perfumed with the scent of wild-growing flowers and blossoms, and made beautiful to the eye by a riot of colors both soothing and delightful. They are to be found under forest trees, in bushes and hedges, amidst grasses in meadows, on highways and declivities, and on rubbish heaps and in water; they crowd together, as though unwilling to be hidden from view.

Among the leading representatives of these plants, grouped according to the localities in which they are found, are sure to be the following.

FLOWERS THAT GROW IN THE WOODS

A prime favorite among the flowers of spring is the TRAILING ARBUTUS (*Epigaea repens*), a trailing plant of the Heath family, with branches six to fifteen feet long and evergreen leaves, called Mayflower in New England and Ground Laurel in the Southern States. It grows in sandy or rocky soils, especially in the shade of evergreen trees, from Canada to Texas. It is prized for its early blooming, and delicate flowers, now gathered in considerable quantities for city flower markets. In the early spring also the LUNGWORT (*Pulmonaria officinalis*) delights us with its violet and blue flowers; as does also the LIVERWORT (*Hepatica triloba*), the three-lobed leaves of which live through the winter. That familiar little favorite, the sweet-scented LILY OF THE VALLEY (*Convallaria majalis*), raises its tender string of blooms surrounded by two large leaves in May. This is followed by the sweet-scented WOODRUFF (*Asperula odorata*). In some districts the fresh leaves of the woodruff are used for making May wine; when dried they emit an agreeable scent, and are therefore frequently laid in wardrobes. Its leaves are stellate, and its small blossoms are arranged in umbels. It grows from nine to twelve inches high. Other plants found in the woods are the FORGET-ME-NOT (*Myosotis silvatica*), and the CENTAURY (*Erythraea Centaurium*). The rose-red blossoms of the latter are arranged in clusters, and its leaves have medicinal properties. Late in the year towards autumn the common LING or heather (*Calluna vulgaris*) opens its red blooms. The leaves are small, and arranged in four rows along the stem. The young heather contains a rich honey, and is consequently much sought after by all kinds of insects.

WILD FLOWERS AMONG THE HEDGES AND BUSHES

In March and April, in concealed spots, the sweet-scented VIOLET blows (*Viola odorata*), filling the air with its sweet fragrance every morning. The ANEMONE (*Anemone nemerosa*) raises its white flower, tinged with red, from the midst of three large green leaves. The WOOD-SORREL (*Oxalis acetosella*), sends out from its root graceful trifoliate leaves and white blooms traversed by violet veins. In the hedges and bushes, also, we meet with the ARUM (*Arum maculatum*), the common wake-robin or lords and ladies. On closely observing this plant, we shall find rather deep in the earth a tuberous root as large as a walnut, from which spring three or four long-stalked, bright leaves. Between the leaves a smooth stem arises six to nine inches high, which bears at its upper end the blossoms, surrounded by a greenish sheath. The arum has acrid properties, but its corn yields Portland sago or arrowroot. In the vicinity of this plant we also find the VALERIAN (*Valeriana officinalis*), the root of which possesses healing properties. It contains an oil, which is used as a remedy for cramp.

THE FLOWERS OF THE OPEN MEADOWS

The uniform green which covers the meadows all the year round is agreeably relieved by a large number of plants with colored flowers. Here blooms the sky-blue GENTIAN (*Gentiana verna*), which delights both the eye and the heart. There the beautiful blue bells of the CAMPANULA (*Campanula Rapunculus*) raise their heads, together with the violet flowers of the SCABIOUS (*Scabiosa pratensis*), and the numerous bloom-whorls of the meadow SAGE (*Salvia pratensis*). Between these can be seen the red and white heads of the meadow and white CLOVER (*Trifolia pratensis* and *T. repens*); and from a distance we can recognize the small DAISY (*Bellis perennis*), the similar but larger Dog Daisy (*Chrysanthemum leucanthemum*), the yellow MEADOW SWEET (*Tragopogon pratensis*), and the DANDELION (*Taraxacum officinale*). In these the fructification is carried out by insects; but, as the single flowers are so small that they would be overlooked by the insects, Nature has arranged many of them in the form of a small chalice or cup, which can be seen from afar, especially in those cases where the radiating petals are different in color from the sepals, like those in the dog daisies. Many meadow plants grow with their stalks and blooms high over their neighbors, as though they were the lords of the meadows.

[158]

In these the flowers are very small; but as they are united in large numbers in flat umbels, they show up well. On the dry ridges blooms the PLANTAIN (*Plantago*), which has good healing properties; and the wild THYME (*Thymus Serpyllum*), a graceful plant, which is sometimes made into tea, and is frequently placed in children's baths. The shape of its blooms shows it to be a member of the family of the labiate flowers, to which belongs also the meadow sage.

FLOWERS OF THE WOODED PASTURES

Another large natural family of plants, the milkworts, have a pretty representative in the meadows in the CUCKOO-FLOWER (*Cardamine pratensis*). Its leaves are pennate, and the lilac-colored flowers contain four large and two short stamens; the fruit is a pod. Upon woody pastures we also often find the ORCHIS (*Orchis Morio*). From the two oval tubers a stem arises enclosed in sheath-like leaves. At the top of the stem are the curiously formed flowers, which are fructified by insects in a very peculiar and striking manner. The somewhat unattractive SOUR-SORREL (*Rumex Acetosa*), Fig. 13, is well known, and its soft stem and juicy leaves are sometimes eaten by children. The leaves are arrow-shaped; the small flowers are reddish in color.

WILD FLOWERS ON HIGHWAYS AND WASTE LAND

Here we meet, besides old acquaintances from the meadows, the GROUNDSEL (*Senecio vulgaris*) and the CHICKWEED (*Stellaria media*), both valued as birds' food, and common everywhere; the SHEPARD'S POUCH (*Capsella Bursa pastoris*), easily recognized by its almost three-cornered little pods, and blooming, like the groundsel, nearly all the year round; the white, spotted, and purple BLIND-NETTLES (*Lamium album*, *L. maculatum*, and *L. purpureum*), and the ORIGANUM (*Origanum vulgare*), are labiate flowers, which are diligently visited by insects for their honey. Here, too, are the bristly, blue-flowered ADDER-WORT (*Echium vulgare*); the round-leaved MALLOW (*Malva rotundifolia*); the BURDOCK (*Lappa major*), the blossoms of which cling to the clothes so readily; the common NETTLES (*Urtica*); and the TANSY.

FLOWERS IN CULTIVATED FIELDS

Several plants grow amid the corn which are really ornamental with their bright flowers. A very pretty example is the larkspur (*Delphinium Consolida*), a small graceful little plant, with numerous blue spur-like flowers. Near the latter we also find the blue CORNFLOWER (*Centaurea Cyanus*), which is so frequently plucked by children and woven into wreaths.

The CAMOMILE (*Matricaria Chamomilla*), is recognized by its strong odor. It has a small chalice with white petals, and is an important medicinal plant. The CORN-CKOCKLE (*Agrostemma Githago*) and the red POPPY (*Papaver Rhoeas*) are also seen; and at the time when the wind sweeps over the field of stubble the latter is adorned with the wild PANSY (*Viola tricolor*), the leaves and flowers of which have healing properties, and are collected for medicinal uses.

THE GREAT GROUPS OF CRYPTOGAMS OR FLOWERLESS PLANTS

The Cryptogams are plants without true, or without visible flowers; to these belong the shave grasses, the ferns, the mosses, the algæ, the lichens, and the fungi.

The HORSE-TAIL (*Equisetum arvense*), frequently grows in damp, sandy fields. The spring stem of the plant is simple and reddish in color, and bears fruit called spores in an upright ear.

The WALL RUE (*Asplenium Ruta muraria*), belongs to the family of ferns. It grows everywhere on walls, and has a short root, three-cornered leaves, and along both sides of the middle ribs of the leaves the fruit lies in rows.

The COMMON FERN (*Polypodium vulgare*), grows on walls and rocks. It has a creeping stem, and beautiful serrated leaves, bearing on their underside the somewhat large fruit glands which contain the spores. Other familiar ferns are the WORM FERN (*Aspidium Filix mas*), and the EAGLE FERN (*Pteris Aquilina*), from three to five feet high.

The COMMON HAIR MOSS (*Polytrichum commune*), grows in all the woods and in wet fields. The stem is upright; the small leaves are pointed and serrated at their edges. The spores develop in a quadrangular sheath, which is surrounded by a cell. The mosses play an important part in the economy of Nature; they retain in the woods a quantity of the water which falls as rain, and thus preserve the lands from being flooded, store up moisture for the plants, and also influence the climatic conditions of a country. The so-called PEAT-MOSS (*Sphagnum*) enters largely into the composition of peat.

The REINDEER MOSS (*Cladonia rangiferina*), is a much-branched little plant of a greyish color. The small fruit corpuscles are at the ends of the branches. The reindeer moss is common in the pine woods of northern Europe.

The TOAD'S-STOOL (*Agricus muscarius*), grows in the woods in autumn. The blood-red cap has numerous white excrescences on its surface. It is very poisonous and ill-smelling, and has a bitter taste. It is often used as a poison for flies, but is also dangerous to men and animals.

The MUSHROOM (*Agricus campestris*), is common from May to October in fields, gardens, and meadows. It has lately also been cultivated in cellars and greenhouses. It is a favorite article of food, and one of the most useful of the edible fungi.

[159]

CAMPHOR TREE (*Cinnamomum camphora*), one of the most beautiful of all trees, grows in China and Japan, more especially in the island of Formosa. It has also been planted in Ceylon and Florida. The wood of the tree is valued by the cabinet maker, but its chief value is in the solid, essential oil, called *gum camphor*, extracted from it by a process of distillation. When pure, camphor is a white, soft semi-transparent body, with a peculiarly strong aromatic odor, and a bitter, burning taste. It is used extensively in making celluloid and smokeless powder, in medicine and as a protection against insects. Nine-tenths of the world's supply of raw material is exported from Formosa. Its production is a monopoly of the Japanese government.

VII. TREES OF THE FOREST

[160]

The forest trees are divided into two groups: Trees Bearing Foliage, and Trees with Aciculous Leaves. The former lose their leaves in autumn; the stiff linear leaves of the latter, on the contrary, live throughout the winter, with the exception of those of the larch tree.

Alder (*Alnus*), trees native to the North Temperate and Arctic zones and to the Andes into Chili. The Black Alder grows near the brooks. The male blossoms stand in long, cylindrical catkins; the female blossoms in small, roundish catkins. The fruit is found in small cones. The alder tree blossoms in April and May. It may reach seventy feet in height and nine in girth, but seldom exceeds forty in height. The bark of the shoots is used in tanning and dyeing leather red, brown, yellow, or, with coppers, black. The wood is durable under water, and is said by Virgil to have been the first wood used by man for boats. It was used for piles at Ravenna and for the Rialto at Venice, and is still so employed in Holland. Its chief use is for gunpowder-charcoal. For this purpose shoots five or six years old, or about four inches across, are employed.

Ash (*Fraxinus*), a valuable timber-tree belonging to the olive tribe. It has smooth, olive-grey bark, black buds, opposite pinnate leaves of from seven to fifteen leaflets, flowers without calyx or corolla, and an oblong-winged fruit. Its wood is more flexible than that of any other European tree, and is used for walking-sticks, spade-handles, the spokes and felloes of wheels, etc. There are about twelve species native to North America. The best known are: **COMMON ASH**, a large tree one hundred to one hundred and fifty feet high, growing wild in southern Europe and northern Asia. **WHITE ASH**, a large tree forty-five to ninety feet high; Nova Scotia to Florida, westward to Minnesota and Texas. **GREEN ASH**, forty to fifty feet high, Vermont to Florida, intermittently to Utah and Arizona. **RED ASH**, a small tree, rarely more than forty feet high, growing in moist soil from New Brunswick to South Dakota, Florida, Alabama and Missouri. **BLUE ASH**, fifty to seventy-five feet high, Ontario, Minnesota, and Michigan to Alabama, west to Iowa and Arkansas. **BLACK** or **HOOP ASH**, a large tree, seventy to eighty feet high, Newfoundland to Manitoba, south to Virginia and Arkansas.

Aspen or Trembling Poplar (*Populus tremula*), has a greenish-grey bark. Its leaves have long stalks, and tremble at the slightest current of air. The **AMERICAN ASPEN** called **QUAKING ASPEN** or **QUAKING ASP**, is one of the most widely distributed trees of North America, growing from Alaska and Newfoundland to lower California. A slender tree with light green bark, maximum height 100 feet. Wood soft, light, and largely used for manufacture of wood pulp. The **EUROPEAN ASPEN** is a quick growing tree, fifty to eighty feet high. The wood is soft and porous, and is used in turnery and in interior finish for houses.

Beech (*Fagus*), a genus containing about sixteen species. The trees have smooth, silver-grey trunks, egg-shaped leaves like leather, and blossoms at the base of the leaves. The beechnuts are three-cornered; they grow in couples in a wooden capsule. The beech trees attain a height of from sixty to ninety feet, and blossom in April and May. The **AMERICAN BEECH** is the only North American species. It is a beautiful tree seventy to eighty and sometimes one hundred feet high, and is one of the most widely distributed trees of eastern North America. The wood is tough, close grained, and is largely used in the manufacture of tool handles, chairs and for fuel. The **COMMON BEECH**, forming pure forests in many parts of Europe, is a large tree one hundred to one hundred and twenty feet high. The wood is dark colored, solid, and very durable under water and is much used in cabinet making, for weirs, and for fuel. The bark is sometimes used in tanning. The nuts are used for the manufacture of beech oil.

Birch (*Betula*), is known by all on account of its chalk-white bark, and its fine, pendent leaves. The male and female blossoms of this tree also grow separate on the same plant. Its seeds are small and plumed, whereby they are particularly adapted for being sown by the aid of the wind. There are about thirteen species in North America. **COMMON BIRCH**, abounding in northern Europe, is a beautiful tree sixty to seventy feet high. The bark is used in medicine and dyeing, and it yields the birch tar employed in the preparation of Russia leather. **RED** or **RIVER BIRCH** grows in the United States from Massachusetts to Iowa and Kansas, south to Florida and Texas. It is a slender tree, seventy to ninety feet high, which produces a hard, valuable timber. **CHERRY BLACK** or **SWEET BIRCH** is a large tree, sometimes eighty feet high. Wood fine grained and valuable for making furniture. The bark yields an oil identical with the oil of wintergreen. It grows from Newfoundland to western Ontario, Florida, and Tennessee. **YELLOW BIRCH**, a large tree, maximum height one hundred feet, is used in shipbuilding. It grows from Newfoundland to Manitoba, south to Carolina and Tennessee. **PAPER** or **CANOE BIRCH**, a large tree, maximum height eighty feet, is of a beautiful white color, and the bark is capable of division into thin sheets, used for making canoes, baskets, and ornaments. Found in Newfoundland to Alaska, northern Pennsylvania, Michigan, and Washington.

Buttonwood. See **Plane Tree**.

Cedar (*Cedrus*), the popular name of a variety of trees, mostly agreeing in having a reddish-brown aromatic wood. The coniferous genus includes only four forms, all native to the Old World, the most noted of which are the Cedars of Lebanon, frequently mentioned in the Bible. It has its needle-like leaves fascicled, like the larches; but unlike those trees, evergreen, so that they remain on the tree for several years after the dwarf-shoot has elongated. Its cones are erect, with broad, thin-edged scales which ultimately fall away from the axis, as in the firs. The **WHITE CEDAR** of the United States is more nearly a cypress, and the so-called **RED CEDAR** is a juniper. The wood of the latter is used in making lead-pencils. The species native to the West Indies, yields the wood known as Honduras, Jamaica, or Barbadoes cedar, used for cigar boxes.

Chestnut (*Castanea vulgaris*), is a fine tree that may reach a large size, and has deeply furrowed bark and large, glossy, serrate but simple leaves in tufts, which turn yellow in autumn. Its flowers are in long pendulous catkins. The dark brown nuts are surmounted by the remains of the perianth, being "inferior" fruits. In a wild state two or three kernels or seeds, separated by a membrane, are contained in each nut; but the Lyons marron, the most valued cultivated race, contains only one. The tree is native from Portugal to the Caspian and in Algeria, and is represented by allied forms in Japan and temperate North America, flourishing in the Alps and Pyrenees at 2,500 to 2,800 feet above sea-level. Its timber resembles oak, but is softer and more brittle.

[161]

HOW WE MAY KNOW THE TREES OF THE FOREST

THE OAK

Massive strength is the chief characteristic of the oak, and it was the broad-based trunk of an oak that suggested the design for the first great lighthouse. The branches twist about in zig-zag fashion, and the thick bark is deeply furrowed.

THE BIRCH

We have only to glance at the birch to realize that its name "the lady of the woods" is well deserved. Its chief characteristic is slender gracefulness, and we cannot mistake the silvery white bark, quite unlike any other tree.

Cork Oak or Cork Tree (*Quercus suber*), is a species of oak, native of southern Europe and northern Africa, the spongy bark of which is the common cork of commerce. It ranges from twenty to forty feet in height, attains a diameter of five feet, and sometimes lives three hundred to five hundred years, producing crops of bark for one hundred and fifty years.

[162]

Cypress (*Cupressus*), is an evergreen tree of the pine family, with small, imbricated leaves and globular cones, comprising about twelve species, in northern regions of the world. The COMMON CYPRESS of Europe is famous for its durable wood and is believed to be the cedar or gopher wood of the Bible. The MONTEREY CYPRESS, a beautiful tree sometimes one hundred and fifty feet high and eight or ten feet in diameter, grows near the sea in California and three others occur on the Pacific Coast. The so-called CYPRESS or WHITE CEDAR of the Eastern States, and the BALD CYPRESS of southern swamps, valued for timber, are distant varieties of cypress.

Dogwood (*Cornus*), is a shrub or small tree, the wood of which is exceedingly hard and is used for many purposes. The astringent bark and sometimes the leaves are used in medicine. There are about eighteen species in the United States. The FLOWERING DOGWOOD is a small tree, native of the Eastern States. It has showy white petal-like bracts surrounding its clusters of small flowers.

Ebony (*Ebenaceae*), is chiefly a species of tropical trees. The hard, dark colored heartwood of these is the source of most of the ebony of commerce. Those of India, Ceylon, and other tropical countries, furnish the best quality.

Elm (*Ulmus*). There are about six species which are native to the United States. They attain a height of forty-five to ninety feet, and blossom before their leaves appear, in March and April. The AMERICAN WHITE ELM is a large tree ninety to one hundred feet high, growing from Newfoundland to Florida and Texas. The wood is tough, strong, and largely used for wheel hubs, in cooperage, and for shipbuilding. It is a fine street and park tree. The CORK ELM is a tree seventy to ninety feet high, growing from Quebec and Vermont westward to Nebraska and Tennessee. The wood is considered the best of American elms, and is much used for agricultural implements and bridge timbers. The SLIPPERY, or RED ELM is a tree sixty to seventy feet high, growing from Ontario to Florida, westward to Nebraska and Texas. The wood is durable in contact with the soil and is much used for fence posts and railway ties. The mucilaginous inner bark is used in medicine.

Eucalyptus, a genus of *Myrtaceae*, contains about two hundred lofty trees occurring chiefly in Australia and the Malayan Archipelago. Many reach a height of one hundred and fifty feet and a girth of twenty-five feet, and they frequently become hollow. The species are of great economic value, yielding oils, kinos, and useful timber, while the well-known oil of eucalyptus is obtained from the blue-gum tree.

Fir (*Abies*), a genus of the Pine family containing about twenty-five species, natives of the cooler portions of the north temperate zone. The SILVER FIR, is a common tree in central Europe, and is common to the mountainous forests of Germany. It reaches ninety to one hundred and thirty feet in height, and has a smooth, light silver-grey bark, and needle-shaped leaves, which, although they stand singly and in a spiral form round the branches, are yet distinctly turned towards two sides, and are serrated at their points. The large, conical fruits stand like tapers upright on the branches, and decay upon the tree; whilst their spindles remain standing. The wood of the white fir tree is much valued. It is used as timber, and in particular for making masts; it is also useful for making all kinds of carved work, and for the manufacture of musical instruments. It is also the source of the Strassburg turpentine. The BALSAM FIR is a tree fifty to eighty feet high, growing from Virginia northward. Canada balsam is made from the sap. The WHITE FIR or GREAT SILVER FIR is a large tree, often three hundred feet high and ten feet in diameter, growing from British Columbia to lower California. The wood is soft and extensively used for cooperage and boxes. The RED FIR is a large tree one hundred and fifty to two hundred feet high, found in the same regions as the white fir. It is often planted in Europe as an ornamental tree. The MEXICAN FIR is a magnificent silver-leaved tree one hundred and fifty feet high.

Gum. The name given to several trees in America and Australia: (a) The BLACK-GUM, one of the largest trees of the Southern States, bearing a small blue fruit, the favorite food of the opossum. Most of the large trees become hollow. (b) A tree of the genus *Eucalyptus*. See *Eucalyptus*. (3) The SWEET GUM tree of the United States, a large and beautiful tree with pointedly lobed leaves and woody, burlike fruit. It exudes an aromatic juice. The wood is now extensively used in cabinet work and interior finish.

Hemlock Tree (*Tsuga*), is a genus of the Pine family containing about four species which are native to North America. The COMMON HEMLOCK is a large tree sometimes attaining a height of one hundred and ten feet, and growing from Nova Scotia to Alabama and west to Wisconsin and Minnesota. The wood is light and soft and is extensively used in building. The bark is largely used in tanning and hemlock oil is distilled from the branches and leaves. There are many cultivated varieties which are very ornamental. The CAROLINA HEMLOCK is a tree attaining a maximum height of eighty feet, and growing in Virginia, North Carolina, and Georgia.

Hickory (*Carya*), is represented by ten species, exclusively of North America. Their timber is very heavy, strong, and tough, and is much used in the manufacture of agricultural implements, carriages, and hoops for casks. The fruit is a hardshelled nut, which in some species has an excellent flavor. The SHAGBARK or SHELLBARK HICKORY is a large tree, sometimes one hundred and twenty feet high, growing in rich soils from Ontario and Minnesota south to Florida, Kansas and Texas. The nuts form an important article of commerce, though less used than the pecan. The WHITEHEART HICKORY or MOCKERNUT is a large tree seventy-five to one hundred feet high, growing from Ontario to Florida, occasionally to Missouri and Texas. It has a thick-shelled, edible nut. The PIGNUT HICKORY, a tree seventy-five to one hundred and sometimes one hundred and twenty feet high, ranges from Ontario to Florida, westward to Nebraska and Texas. See also *PECAN*.

Horse-Chestnut (*Aesculus*), is rarely found in forests, but frequently in pleasure-gardens. This beautiful tree, of sixty feet and over, has large leaves, and splendid yellow-and-red colored blossoms forming large pods. The brown chestnuts are enveloped by a prickly cover, which bursts open in the autumn. The OHIO or FETID BUCKEYE, reaching a height of about fifty feet, grows from Pennsylvania to Alabama, west to Michigan and Oklahoma. The wood is used for making artificial limbs and wooden ware. The SWEET or BIG BUCKEYE is a large tree eighty to ninety feet high, growing from Pennsylvania to Georgia, west to Iowa and Texas, and often planted as an ornamental tree. The CALIFORNIA BUCKEYE is a small tree thirty to forty feet high, native of California, and sparingly planted for ornament.

Judas Tree (*Cercis siliquastrum*), is a beautiful leguminous tree, growing wild from Japan to the shores of the Mediterranean, with smooth kidney-shaped leaves, glaucous above, and pink or red flowers, which spring from both old and young wood before the appearance of the leaves. From its appearance at this season the tree shares with the elder the sinister reputation of having formed the gallows of Judas Iscariot.

BARK, CELLS, HEART AND RINGS OF THE TREE

Scaly Bark of Willow

Membranous Bark of Birch

Fibrous Bark of Honeysuckle

Fissured Bark of Oak

The Structure of a Young Twig of Oak, showing the layer of cells (A) which increases the girth of the twig as it grows into a branch

- Juniper Tree** (*Juniperus communis*), is rarely seen as a tree, but appears usually as a low shrub. Its awl-shaped, pointed leaves stand always by threes of the same height on the young shoots. The male blossom catkins are short-stalked, and stand singly in the axils of the bracts; the fruit is a black berry. These berries are employed for medicinal purposes. The so-called WHITE CEDAR of the Eastern States and the BERMUDA CEDAR, much prized for timber, are junipers.
- Larch** (*Larix Europæa*), has leaves which grow in clusters, and drop during the Autumn. Its bark is rough and cracked; its red-blossom catkins stand at the side of the yellow catkins. Its egg-shaped little cones have backward bent stalks. The larch tree attains a height of from forty-five to sixty feet, and is found in forests everywhere. The AMERICAN LARCH or TAMARACK is a slender tree fifty to sixty feet high, growing from Virginia to Hudson Bay. It is often planted as an ornamental tree and the wood is highly valued for shipbuilding and for telegraph poles.
- Linden or Lime** (*Tilia*), is the emblem of intense feeling. It has been from time immemorial the favorite of the Germans. Below the large linden trees the judicial proceedings, the fairs, and national games formerly took place in Germany, and to this day men and women like to sit under the village linden tree, and talk of the good old times. They do not blossom before June and July. The blossom is five-leaved, and contains many stamens and one pistil. The fruit is a little nut. The AMERICAN LINDEN or BASSWOOD is a large tree seventy to one hundred and twenty-five feet high, growing from New Brunswick to Georgia, west to Nebraska and Texas. The wood is extensively used for making cheap furniture and paper pulp. The SOUTHERN BASSWOOD or WHITEWOOD is a small tree forty to fifty feet high growing from Long Island to Florida, west to Texas. The WHITE BASSWOOD or BEE TREE is a forest tree forty-five to seventy feet high, Pennsylvania to Florida, west to Illinois and Tennessee.
- Locust** is a name applied to various trees of the Pea family. The AMERICAN LOCUST TREE or the False Acacia is seventy to eighty feet high, growing from Pennsylvania to Georgia. It is widely naturalized in most states east to the Rocky Mountains. The wood is compact and hard and is extensively used for shipbuilding and all purposes where great strength and toughness are required.
- Mahogany** (*Swietenia Mahagoni*), is a native of Mexico, Central America, and the West Indies, and yields one of the most generally used of cabinet woods. The leaves resemble those of the ash; the flowers are clustered and small, with their parts in whorls of five, and ten united stamens; and the fruit is a pear-shaped, woody capsule with winged seeds. The wood is a rich reddish-brown, often richly mottled, uniform in grain, susceptible of the highest polish, and very durable. In Mexico the timber is sometimes in thirty-foot lengths and forty-eight inches square. Mahogany is commonly divided into SPANISH, the darker, heavier and more figured, from San Domingo and Cuba, and HONDURAS, lighter, softer, and plainer, from the mainland. It is employed in carving, turning, veneering and cabinet-making, and for solid furniture, easily holding first rank among cabinet woods.
- Maple** (*Acer*). This genus of trees contains nearly one hundred species, natives of north temperate regions, especially North America and eastern Asia. The SUGAR MAPLE is ninety to one hundred and twenty feet high, and grows from Newfoundland to Georgia, west to eastern Nebraska and Kansas. The wood is extensively used in cabinet work and interior finish. Large quantities of sugar and syrup are made from the sap. The SILVER or SOFT MAPLE is found from New Brunswick to Florida, west to Ontario, Nebraska and Oklahoma. It is often planted as a shade tree. The SCARLET or RED MAPLE grows in swamps and low ground from New Brunswick to Manitoba, south to Florida and Texas. The close-grained wood is largely used for furniture, and in turnery. The OREGON MAPLE grows from Alaska to California. It is often planted as an ornamental tree.
- Mesquite** (*Prosopis*), is a genus of trees containing about sixteen species, natives of America, Asia, and Africa, three of which grow in the United States. It varies from a straggling shrub to a widely-branched tree fifty feet high and occurs from central Texas to eastern California, and southward to Chile and Argentina. The very heavy wood is used for fuel and fence posts, while the pods and leaves are much eaten by stock. The SCREWPOD MESQUITE is twenty-five to thirty feet high and valuable in arid regions.
- Oak** (*Quercus*), is most numerous in temperate climates, though some are tropical; fully fifty species occur in the United States, with many intermediate forms or hybrids. The Oak is a true giant among forest trees. Its trunk often attains a circumference of thirty feet. Its bark is smooth in the young trees and rough in the old oaks. The strong, widely extended boughs are pronged and knotty; the crown is large, with a sinuate outline. The blossoms are within long pendent catkins and appear in the month of May. The bark and the acorns, which are contained in pretty little cups, are medicinal. Along the stems and the boughs mosses and lichens grow exuberantly. In the galls of the leaves and branches different gall insects live. The horn beetles suck the sap of the oaks, and the acorns form the food of squirrels and other rodents. The EUROPEAN OAK, the most important Old World timber oak, is sparingly planted in the United States. The WHITE OAK, the most valuable American timber oak, occurs from Texas to Minnesota and eastward. With similar range, but less valuable for timber, are BUR OAK or MOSSY CUP OAK, the SCARLET OAK and the RED OAK. The COW OAK or BASKET OAK and the YELLOW or CHESTNUT OAK produce edible acorns. The bark of the QUERCITRON is used in tanning, as a yellow dye, and in medicine. The LIVE OAK, once famous for ship-building, is a sturdy species with entire evergreen leaves occurring in the Southern States, Cuba and the Pacific States.
- Osage Orange or Bow Wood** (*Maclura pomifera*), is a native of the southwestern United States. It attains a height of twenty to sixty feet, and is extensively planted for hedges, while the wood, of orange color and of great hardness, is valuable for fence posts, mallet heads, and to some extent in cabinet work.
- Pine** (*Pinus*), comprises a genus of about eighty species, nearly two-thirds of which occur in the northern part of the western hemisphere. The WHITE PINE, a tree seventy-five to one hundred feet high, is one of the most important timber trees of North America. Its range is from Newfoundland to Minnesota, south to Georgia. The wood is soft, straight grained, and is much used for building and cabinet work. The YELLOW PINE of LONG-LEAVED PINE sometimes attains a height of one hundred feet, and grows in sandy soil from Virginia to Florida and Texas. The wood is heavier and stronger than that of any other pine, and is used in all kinds of building. The tree is the chief source of turpentine, tar, resin, etc. The WESTERN YELLOW PINE or BULL PINE is sometimes one hundred and fifty to two hundred and fifty feet high and five to eight feet in diameter. It is found from the Rocky Mountains to the Pacific coast and is one of the most important lumber trees of the West. The SUGAR PINE of Oregon and California attains a height of one hundred and fifty to three hundred feet and a diameter of more than ten feet. The timber is strong, straight grained, and is much used for a finishing lumber and cabinet work.
- Palm Family** (*Palmeaceae*), is a very distinct natural family of trees and shrubs, chiefly tropical and subtropical, embracing about one thousand species which are second in economic importance only to the cereal grasses. The Palm Trees have generally straight, scaly trunks without boughs, and many species attain a considerable height. Their large fan-shaped leaves grow near the top, and form a beautiful crown. The numerous blossoms stand in long panicles. The palm trees represent the only riches of many tribes of mankind in the tropics, providing them with food, drink, dress, and building materials for their dwellings. The most valued are the coconut, date and sago palm trees. The large nuts of the first named are the well-known coconuts.
- Plane Tree** (*Platanus*), a genus of six or seven species, is a native of the north temperate zone. The SYCAMORE, PLANE TREE, or BUTTONWOOD reaches a height of one hundred and thirty feet with a trunk diameter of fourteen feet. It is found from Quebec to Georgia, west to Manitoba and Kansas. The wood is a favorite material for tobacco boxes and butcher blocks and is largely used for furniture. Other species in the United States are the CALIFORNIA SYCAMORE and the ARIZONA SYCAMORE, both large trees.
- Poplar** (*Populus*), a hardy genus of about twenty trees, native to temperate and cold regions. Half of the species occur in the United States, all of soft wood and rapid growth. The COTTON-WOOD, common along streams from the Rocky Mountains eastward, sometimes attaining one hundred and fifty feet in height and a diameter of seven feet, is much planted for ornament. The BALSAM POPLAR, sometimes one hundred feet high, occurs northward and in Siberia. The EUROPEAN WHITE POPLAR and BLACK POPLAR, much-planted ornamentals, have become naturalized in the Eastern States. The LOMBARDY POPLAR, with very upright boughs, frequently grows along the roadside in Asia, Europe and America.
- Redwood**. See [Sequoia](#).
- Sandalwood** (*Santalum album*), is a small tree, native of India and the Indian Archipelago. It produces a compact, fine-grained wood which is used for making small ornamental articles and possesses a remarkable fragrance which persists long after it has become thoroughly seasoned.
- Sassafras** is a genus containing but two known species, one in North America and the other in China. The SASSAFRAS or AGUE TREE, is eighty to ninety feet high, is found from Canada to Florida, west to Kansas and Texas. Oil of sassafras, used for flavoring confectionery, is distilled from the roots, and the bark is frequently employed as a household medicine and beverage.
- Sequoia**, a genus of trees named after a remarkable Cherokee Indian (otherwise George Guess), who gave his tribe a written alphabet of eighty-six characters, and died in New Mexico in 1845. There are only two living species, both natives of Western North America, the Big or Mammoth Tree and the California Redwood. The Big Tree is a native of the Sierra Nevada, and reaches over one thousand years of age, four hundred and fifty feet in height, and one hundred and twelve feet in circumference. The Redwood has a wider range in latitude as a wild tree, and reaches three hundred feet in height. It has a shaggy, reddish bark and very dark foliage. Its wood is of good texture, but monotonous in grain. It is used in cabinet work and interiors.
- Spruce** (*Picea*), a genus of about eighteen species, native of the Northern Hemisphere. The WHITE SPRUCE is a slender tree fifty to one hundred and fifty feet high, found from New York to British Columbia, north to Newfoundland, Hudson Bay and Alaska. The wood is light and soft and is largely used for construction and for paper pulp. The BLACK SPRUCE is twenty to thirty and very rarely one hundred feet high; grows from Newfoundland and Hudson Bay and Alberta south to North Carolina, Michigan and Minnesota. It is largely used for wood pulp and paper. The RED SPRUCE, seventy to eighty feet high, grows from Nova Scotia to Virginia, and is largely manufactured into lumber. The TIDELAND or SITKA SPRUCE is a large tree usually one hundred feet, sometimes two hundred feet high, occurring abundantly from northern California to Alaska. Its valuable timber is used for all kinds of building purposes. The NORWAY SPRUCE is largely planted in the Eastern States as an ornamental tree.
- Sycamore**. Only certain trees of the genus *Ficus*, mostly natives of Asia and Africa, are properly called sycamores. The EGYPTIAN SYCAMORE, supposed to be the sycamore of the Bible, is a large spreading tree often planted for shade in Egypt and western Asia. In northern Europe this name is also given to the species of maple, and in the United States to the AMERICAN PLANE TREE. See [PLANE TREE](#).
- Upas** (*Antiaris toxicaria*). A tree found in the Philippine Islands and tropical Asia. The fiber of the bark is sometimes made into cloth and the juice of the roots is used by the Malays for poisoning their arrows. This tree figures in both religion and mythology.
- Walnut** (*Juglans*), a genus of about ten species, mostly natives of North America and Asia. The BLACK WALNUT is sometimes one hundred to one hundred and twenty-five feet high, growing from Ontario to Florida, west to Nebraska and Texas. The dark brown wood is largely used for cabinet making and gunstocks. The WHITE WALNUT or BUTTERNUT resembles the black walnut, but is seldom over one hundred feet high. The wood is used in the interior finish of houses and for furniture. The CALIFORNIA WALNUT, a tree sometimes sixty-five feet high, is often cultivated in California for shade and as a stock on which to graft the English Walnut. The ENGLISH WALNUT is sixty to ninety feet high, native of Persia, and has long been cultivated for its edible nuts.
- Willow** (*Salix*), a genus of over one hundred and fifty species, mostly of cool, northern regions, fully one-half occurring within the United States. The leaves are egg-shaped and wrinkled; the blossoms yellow and greenish. They possess great quantities of honey, and attract, therefore, all kinds of insects, especially bees. The WEEPING WILLOW is much planted for ornament. The EUROPEAN OSIER is cultivated for its twigs. Of the native species, the shrubby SHINING WILLOW, the BLACK WILLOW, is sometimes forty feet high, and the HEART-LEAVED WILLOW are among the best known.
- Yew** (*Taxus*), a genus of some six trees and shrubs, are widely distributed in the northern hemisphere, three species occurring in the United States. The AMERICAN YEW is a low, straggling shrub seldom over five feet high growing in woods from Newfoundland to Manitoba and south to Virginia and Iowa. The FLORIDA YEW is a bushy tree rarely twenty-five feet high. The CALIFORNIA YEW is a tree forty to fifty feet high occurring from British Columbia to California, sometimes cultivated in gardens in Europe. The hard wood is used for fence posts. The EUROPEAN YEW is a native of Europe and Siberia reaching a height of forty feet.

VIII. FIBER AND COMMERCIAL PLANTS

The cultivation of the fiber-yielding plants and the manufacture of their products into textiles, ropes, cordage, and matting are among the most important industries of the world, and afford employment directly and indirectly to many millions of people. The industries, moreover, are of great antiquity, for we have definite evidence from the Lake Dwellings of Switzerland that flax was cultivated and used as a textile during the Stone Age, and the occurrence of linen cloth in the tombs of Egypt and constant references to the same material in the earliest books of the Bible are well known to everyone. How and when mankind first became aware of the possibilities of vegetable fibers as materials for clothing it is not easy to say, but it is not improbable that he first employed the fibers to supply his need for string cordage, especially in his hunting expeditions, and that gradually the idea of weaving the strings to form a fabric occurred to him. The apparatus employed must have been of extreme simplicity and the finished product crude according to modern ideas; but that thousands of years ago textiles of superlative quality, rivaling anything that can be produced to-day, were manufactured by Eastern races is a matter of history and observation.

Annotto, Anatto or Arnatto. The red substance imported under this name consists of the aggregated seed pellicles of *Bixa Orellana*. The coloring matter is best extracted by alcohol, as it is not very soluble in water. It is the source of coloring for dairy products, being the standard butter and cheese color in the United States, England and Holland. Has also a limited use as a dye in calico printing. It was anciently used by natives of Brazil, Central America, and West Indies to stain their bodies red, and by Mexicans in painting. Cultivation prehistoric in tropical America. Now naturalized in India.

Bamboo (*Bambusa*) grows in the tropics of Asia, Africa and America. The plants are in reality merely gigantic grasses. The stems are hollow and contain only a light pith, but they are jointed and at the nodes strong partitions stretch across the inside. They grow in clumps, and may reach a height of one hundred and twenty feet and a thickness of ten inches. Some species flower only once, some every year, and others at longer intervals.

The Bamboo is noted for its great economic importance, and serves a variety of useful purposes. The young shoots of some species are cut when tender and eaten like asparagus; the seeds also are sometimes used as food, and for making beer; some species exude a saccharine juice at the nodes which is of domestic value.

The hard stems are converted into bows, arrows, quivers, lance-shafts, masts of vessels, bed-posts, walking-sticks, poles of palanquins, rustic bridges, bee-hives, water-pipes, gutters, furniture, ladders, domestic utensils and agricultural implements. Split up finely they afford a most durable material for weaving into mats, baskets, window-blinds, ropes and even sails of boats. Perhaps the greatest use to which they are put is in building, for in India, China, Japan, Assam, Malay, and other countries of the East, houses are frequently constructed solely of this material.

Betel-nut (*Areca Catechu*), a palm cultivated in tropical Asia. The seed or nut resembles a nutmeg in size and in color. Pieces of this nut are rolled up with a little lime in leaves of *Piper Betel*, the Betel-pepper, and chewed by the natives. The pellet is hot, acrid, aromatic and astringent, tinges the saliva red, and stains the teeth. Its charcoal is

used as toothpowder.

Cultivated extensively in the East Indies, where the consumption of leaves by chewing with the areca nut is enormous. Narcotic stimulant.

Cinchona, a genus of evergreen trees, includes thirty-six species, about a dozen of which are utilized. They are natives of the Andes, growing mostly between five thousand and eight thousand feet above the sea-level. It is the source of quinine, the most important drug in tropical medicine, and widely used throughout the world. Its cultivation is becoming quite extensive.

The bark introduced into Europe in 1639 by the Countess of Cinchon, whence the name. Now extensively cultivated in India, Japan, Ceylon and Jamaica.

Cotton (*Gossypium herbaceum*) is one of the most important cultivated shrubs. It is an annual and grows from two to four feet in height, with stalks branching extensively. At the bottom of the stalk the limbs are longest, and at the top they are light and short.

The flowers are white, or pale yellow, or cream-colored the first day. They darken and redden on the second day, and fall to the ground on the third or fourth day, leaving a tiny boll developed in the calyx. This boll develops and enlarges until maturity, when it is somewhat like a hen's egg, both in size and shape. This boll is the house of the seed and lint—the products of commerce. In it are from three to five apartments or cells (often more than five in improved types), which hold the lint from its earliest formation until it is picked in the fall. The bolls of the cotton plant mature all the way from the last of August until frost attacks them. When matured, the fibrous wool, known as seed cotton, is gathered, ginned, and baled. When separated from the seed the lint becomes the cotton of commerce.

The chief commercial types of cotton are American upland, sea island, Egyptian, India, Brazilian and Peruvian. These differ in the length of the individual fibers (staple). The quality is indicated by the grading under such names as fine, good, good fair, fully fair, middling fair, good middling, middling, etc. Sea island cotton has the longest staple and is used for the finest qualities of yarn and fabrics. Egyptian cotton also has a long staple. Large amounts are imported into the United States.

Cotton is next to corn the most valuable farm crop of the United States. Nearly three-fourths of all the cotton produced annually in the world is grown in the south Atlantic and gulf states. The remainder comes mostly from India, Egypt, China, Brazil, and Asiatic Russia. A comparatively small percentage of the crop is sea island cotton from the coast of Georgia and from islands in the West Indies. The area of cotton production is spreading in the United States as well as in foreign countries.

Cotton fiber is spun into yarn and made into thread, muslin, calico and hundreds of other cotton or part cotton fabrics. Mercerized yarn is prepared by treatment with strong caustic alkali. Cotton linters are used in cheap yarns, cotton batting, mattresses, and the manufacture of celluloid and artificial silk.

Cotton seeds are subjected to heavy pressure in machines in order to extract the oil. The oil-cake is a valuable cattle food and the hulls are used for fuel or for paper making.

Cottonseed oil is used for table purposes, for packing sardines, for cooking, making soap, candles, etc.

The greatest centers of cotton manufacture are in England, New England, the Carolinas and Georgia. Germany, Russia, India and Japan are among the important manufacturing nations.

Modern cotton mills are of immense size. The bales are opened, the cotton cleaned, carded, and twisted into slivers, rovings, and finally into yarn. Raw cotton, cotton yarn and cotton fabrics are all important in trade. About half the crop of the United States is exported in bales to be manufactured in the mills of other countries.

England has an enormous foreign trade in cotton fabrics. The United States exports chiefly unbleached muslin, more of which goes to China than to any other country.

It is certain that cotton was in use in India three thousand years ago, and in Egypt more than two thousand years ago. It was well known to the ancient civilizations of Mexico, Peru, Central America and the West Indies. When the European voyagers, Columbus, Pizarro, and Cortez, visited for the first time these ancient civilizations, the manufacture of cotton was in a flourishing condition, and the quality and beauty of the cotton goods of a high order.

Flax (*Linum usitatissimum*) has been cultivated for centuries. Along the upright stalk, of eighteen to twenty inches high, small narrow leaves grow; the blossoms appear in July and August, and are light blue.

Flax is grown for fiber in Russia, Belgium, Italy, France, Holland, Ireland and Egypt. Little flax fiber is produced in the United States. Plants for fiber production are straight stemmed, while the varieties grown for seed have many branches. Flax seeds are produced in Russia, India, Argentina and the United States. Plants harvested for fiber are pulled up by the root in order to obtain the greatest possible length. The fiber is separated from the stalk of the plant by retting, a process of partial decay, breaking and scutching to remove the woody parts and hackling or combing. In the best grades of flax most of this work is done by hand.

Flax or linen fiber and linseed oil are the chief products of the plant. Tow is a by-product in making linen and flax yarns and fabrics.

Linseed oil is used in paints, varnishes, printer's ink, oilcloth and linoleum. Linseed oil-cake is a valuable cattle food. Flax seeds find limited use in medicine.

Flax yarns are used in making rope, twine, bagging and coarse, unbleached fabrics. Linen yarns are made into products of the better grade, including fine linens, cambrics, laces, etc.

Linen is bleached by exposure to the sun and by treatment with a dilute solution of chloride of lime. Linen rags are the stock for the best qualities of paper.

The United States imports flax fiber mainly from Europe, as well as large quantities of linens, laces, etc. Some flax seeds are imported and large amounts of linseed oil-cake are sent to Europe.

Guaava (*Psidium Guayava*), small trees of tropical America belonging to the Myrtle family. The fruits vary very much in size, shape and color, the most valued being the *white guava*, with pear-shaped, yellow or whitish fruits the size of a hen's egg. The inferior *red guava* which is more apple-shaped, is also used in preparing guava-jelly and guava-cheese, which preserves, owing to the perishable character of the fruit, are the only forms in which the fruit is imported. The tree has been naturalized in the East, and is commonly grown from Mexico to Peru at date of Spanish discovery. Since widely diffused in East and West India Islands, India, and China. Recently established in Florida and California.

Hemp (*Cannabis sativa*) is cultivated in many countries. It is about three feet in height, has finger-like leaves and the fruit has the form of a little nut. The home of the hemp is the East Indies. The stalks are dried in the sun, then steeped in water or upon wet (moist) meadows, and again exposed to the sun, when the woody parts are stripped off. The remaining fibers are manufactured into cables, ropes, sail-cloth, linen and paper.

Other hems of different botanical origin and having quite different qualities are called by such names as manila hemp, sisal hemp, tampico hemp, Mauritius hemp, sunn hemp, bowstring hemp, etc. Strictly speaking, none of these is true hemp.

It is cultivated in Russia, the warm countries of Asia, the shores of the Mediterranean, Kentucky, Missouri, Illinois and California. Russia produces more hemp fiber than all the rest of the world. Russia and Italy are the largest exporters.

As with other cordage fibers of this character, the long, combed fibers are called line and the short strands, tow. The commercial fiber is longer, coarser and less strong than flax. It can not be bleached perfectly white, although used in so-called coarse linens. Russian, Italian and Kentucky, as applied to hemp, denote the country of origin. Italian hemp is the finest, Kentucky the strongest.

Hemp oil is pressed from the seeds. It is used in paints, varnishes and soap. The oil-cake is a cattle food.

Hop (*Humulus lupulus*), sometimes grows wild in hedges and bushes, and is also frequently cultivated. Its stalk, which leans to the right, is eighteen to twenty-four feet high; its petiole leaves are heart-shaped, with three to five lobes. The blossoms of its stems form panicles; the female cones stand either singly in the axils of the leaves or in clusters. In these cones a yellow, bitter resin, the hop-powder or lupulin, is secreted, which yields the wort for beer, and is also used by chemists. Hops are cultivated in almost all parts of Europe, especially in England, Germany and Austria. In the United States, California, Oregon, Washington, New York and Wisconsin produce the largest crops.

Hops are added to the malt, liquor, or wort before fermentation and give a bitter flavor to malt liquors. Hops are not exported on a large enough scale to be an important item in commerce.

Jute is an East Indian plant whose fibers are strong, coarse, dark in color and sometimes twelve feet long. The fibers are largely employed in the manufacture of coarse bagging and sacking called gunny cloth. Gunny cloth, ginger, sugar, cotton, rice, gums, etc., are shipped are made of it. Jute is also largely mixed with silk, as it has a gloss that can scarcely be distinguished from silk when woven with it. Attempts have been made to manufacture paper out of jute, but it is difficult to bleach it white, and only a coarse kind of brown paper is obtained.

Licorice (*Glycyrrhiza*) is a plant having long, pliant, sweet roots, and generally creeping rootstocks; pinnate leaves of many leaflets, and terminating in an odd one; and whitish, violet-colored flowers in spikes, racemes, or heads. The roots of licorice depend for the valuable properties on a substance called *Glycyrrhizine*, allied to sugar, yellow, transparent, uncrystallizable, soluble in both water and alcohol, and forming compounds both with acids and with bases. They are a well-known article of materia medica, and were used by the ancients as in modern times, being emollient, demulcent, very useful in catarrh and irritations of the mucous membrane. It is a native of the south of Europe and of many parts of Asia, as far as China. It is cultivated in many countries of Europe. The only American species grows in the plains of the Missouri.

Ramie is the bast fiber from a plant (*Boehmeria nivea*), commonly called China grass, or rhea, although fibers from other plants sometimes receive these names. It is usually strong and silky in appearance but difficult to clean and bleach.

It is used largely in China for weaving grass cloth, or Canton linen. The fiber is very difficult to "de-gum." Many experiments have been made to find a satisfactory process.

It is now used in making fabrics which resemble linen, laces, underwear, plushes, etc.

Raphia, a strong and useful fiber is obtained from the leaves of *Raphia Ruffia*, a palm cultivated in Madagascar, Mauritius, and neighboring islands, and of the Jupati palm, of Brazil. Madagascar raphia is the only important grade. A similar soft fiber used locally is produced in West Africa.

It is exported in considerable amounts from Madagascar and used by gardeners for tying plants; and also for making mats and basketry and in kindergartens.

Rattan is the stem of a species of climbing palm, natives of Asia, though some occur in Australia and in Africa. They have slender, reed-like but solid stems, seldom more than one or two inches in diameter, which grow to great lengths, clambering up among the branches of trees by means of the hooked prickles on the stalks of their leaves. The Indian and Malayan species are the source of the largely-imported rattan canes, used for the seats of chairs, and, in their native countries, for cables and a variety of other purposes.

Sisal (henequen or sisal hemp) is a hard, strong fiber from the leaves of a century plant (*Agave rigida*). It is cultivated in Yucatan and the Bahamas. Plantations of henequen, or maguey, have been established in Cuba, Hawaii, India, German and British East Africa and the Philippines. The home of the agave plants is Mexico and Central America and this part of the world produces most of these fibers.

On modern plantations machines have superseded the primitive hand methods of cleaning the fiber. Sisal is the chief product of Yucatan and its greatest export. The bulk of the production is used in the United States in making rope, twine and sacking. All of the other agave fibers are of less commercial importance than sisal or henequen.

The fiber of this species is especially valuable for ship cables, as it has been found to resist the action of sea-water better than most other materials.

Tobacco Plant (*Nicotiana tabacum*) is three to four feet in height; its leaves longish and lance-shaped; its corolla pink; its fruit is a capsule, with many seeds. It is indigenous to America. Its leaves are either used for chewing, for smoking, or for snuff. It belongs to the poisonous plants, and contains no nutritious substance; its flavor and odor are disagreeable; nevertheless it furnishes much enjoyment to a large portion of mankind.

More tobacco is raised in the United States than in any other country and Kentucky raises more than any other state. India is the second largest producer. In Europe it is cultivated in Austria-Hungary, Russia, Germany, Netherlands, France, Belgium and Turkey. Cuba, Porto Rico, Mexico, Central and South America, China, Java, Sumatra, Philippines, Ceylon, Syria and Cape Colony are important producers.

Commercial grades are named from the locality of production as Havana, Sumatra, Mexican, Turkish, Virginia, etc. Certain grades are appropriate for use as cigar wrappers and others for fillers and are so named in the trade.

The United States exports over half of the tobacco raised, chiefly to England in the form of leaf tobacco. Few cigars are exported, but cigarettes and plug tobacco go to the East Indies, China and Australia.

IX. POISONOUS PLANTS

A number of plants contain so powerful a poison that we should take especial care to avoid them. As the danger may be better avoided by a general knowledge of these plants, a detailed description of them is highly desirable. Many of them are also important medicinal plants; and we should therefore by no means regret the existence of these poisonous growths; for, if we apply them to their proper uses, they serve to supply us with valuable medical aids.

Darnell (*Lolium temulentum*) is from eighteen to thirty-six inches high, and often found in cornfields. Its seeds contain a poison, which is narcotic and stupefying.

Deadly Nightshade (*Atropa Belladonna*) is common in the woods. The sappy stem is from three to six feet high; the egg-shaped leaves are covered with down; the brownish-red blossoms are arranged solitary in the axils of the leaves. The bright black berry is as large as a cherry. The nightshade is our most dangerous poisonous plant, and there is little hope for children who have eaten of its berries. From the fresh leaves atropine is prepared, which is a very powerful remedy in certain diseases of the eye.

Black Hellebore (*Helleborus niger*) blooms in December, January and February, and is a native of the mountainous woods of South Germany and Austria. The black root, which is white inside, is poisonous.

Fool's Parsley or Dog's Parsley (*Aethusa Cynapium*) is a common weed, growing in gardens, fields, and also on rubbish. It is easily mistaken for parsley. As it is very poisonous, it is well to remember that it can be easily recognized by three long pendent floral leaves on solitary umbels; the leaves are odorless, and only when crushed emit a faint, garlic-like scent.

Hellebore (*H. viridis* and *H. foetidus*) is also rightly described as a poisonous plant. One species is used for killing lice and vermin on cattle, horses, and other live stock.

Henbane (*Hyoscyamus niger*) grows on rubbish and waste ground. The entire plant is covered with sticky hairs, and has a repulsive odor. The stem is about thirteen inches high; the longish leaves are widely serrated; the flowers are pale yellow, streaked with dark-violet veins; the fruit is a capsule, which opens with a spring lid. The henbane is also a dangerous, poisonous plant, but its leaves and seeds supply an important medicine.

Herb-Paris (*Paris quadrifolia*) grows in hedges and shady woods. On its upright stem there are four oval leaves. It has never more than one blossom, consisting of greenish-yellow petals, eight stamens, and one pistil. Its fruit is a dark blue, round berry, which ripens in July and August. The latter when eaten causes diarrhoea, convulsions and other disturbances.

Marsh Crow's-Foot (*Ranunculus sceleratus*) grows in ditches and marshes. The upright branching stem is from twelve to eighteen inches high; the leaves are divided in the shape of a hand, and the blossoms are small and yellow. The marsh crow's-foot contains very poisonous juices, which cause blisters and ulcers to rise on the skin, and when

[167]

[168]

[169]

taken inwardly nearly always cause death. The other species of crow's-foot found in meadows, fields, woods, etc., are also more or less poisonous.

Meadow Saffron (*Colchicum autumnale*) is a bulbous plant, which blooms in dry meadows in September and October. The flesh-colored blossoms appear in the autumn, and leaves are thrown up in the following spring; between the leaves are large capsules, each containing numerous seeds. The seeds and the bulbous root contain poison, and the former are used in medicine.

Mezereon (*Daphne Mezereum*) grows solitary in the woods. It is a tough plant, from one to three feet high; the lanceolate leaves are arranged in tufts at the end of the shoots; the rose-colored blossoms appear before the leaves, and are generally situated in clusters of three on the branches; the fruit is a red stone-fruit. The whole plant is poisonous; a medicine is prepared from the bark.

Purple Foxglove (*Digitalis purpurea*) is a common wild flower, and grows to a height of fifty inches. The longish leaves are felt-like, and the large purple flowers stand in a cluster; the fruit is a capsule. The purple foxglove is poisonous, and its leaves are used in medicine.

Spotted Hemlock (*Conium maculatum*) grows upon rubbish, hedges, fences, and highways. The stem is three to six feet high, marked with blue and bluish-red spots; the leaves are tripinnate; the white blossoms also stand in flat umbels. The leaves when bruised emit a very peculiar mouse-like odor which is very noticeable on hot summer days. The root, especially, is poisonous, and when eaten causes the most fatal consequences. Hemlock is a powerful sedative, and is used medicinally.

Thorn Apple (*Datura Stamonium*) originally came from the East Indies, but is now widely spread, growing on rubbish and in gardens. Never more than a few plants are found. Its forked stem is from eighteen inches to three feet high; the petiole leaves are widely serrated; the large blossoms are a pure white; the fruit resembles the horse chestnut, and contains numerous black seeds. The thorn apple has a very repulsive odor, a disagreeable flavor, and is poisonous in all parts. The leaves and seeds are used in medicines.

Water Hemlock (*Cicuta virosa*), is very common in many localities on the banks of streams, ditches, and in flooded fields; in other localities it is rare. The thick, fleshy root is hollow, and divided in the interior into sections; the upright stem is hollow and smooth; the leaves are tripinnate; the small white blossoms are arranged in umbels of ten or more rays. The poison is chiefly contained in the red root, which, when eaten by children, who mistake it for an edible root, nearly always causes death, unless medical aid is immediately at hand. The other parts of the plant also contain a poison, which is so strong that its odor alone will produce headache and giddiness.

Wolf's-Bane or Monk's-Hood (*Aconitum Lycotonum*) is a rare plant from eighteen inches to three feet high; the leaves are shaped like a hand, with three, five or seven lobes. The blossom is yellow. The wolf's-bane contains a virulent poison, especially in the root and in the seeds. This description also applies to the *Aconitum Napellus*, which is grown as an ornamental plant in gardens; its tubers are used medicinally.

X. SOME WONDERS OF PLANT LIFE

We usually think of plants as quite harmless things, almost wholly at the mercy of the animal creation. This, however, is only one side of the story, for quite a number of plants have a very cunning plan whereby they entrap flies and other insects. The ingenuity with which these plants lure their victims on to death is simply amazing. Everything is done to tempt the creature to visit the death traps of the plants, and, on the other hand, no means are spared to make an escape impossible.

THE MOST CRUEL PLANT IN THE WORLD

One of the most singular instances of this is to be seen in a little plant which is only found growing in the bogs of the Carolinas. This has been rather cynically called the Venus Fly Trap (*Dionaea muscipula*), a fanciful name which hides its cruel practices. Few plants have adopted a more certain plan than the *Dionaea*. Every leaf which the plant produces is the most perfect device for the securing of prey that could be imagined.

The mechanical construction of this remarkable vegetable trap is somewhat on the following lines. The leaf is borne at the end of a curiously broad stalk, and is divided into two lobes; these are joined together by a hinge-like arrangement. The outside borders of the lobes are fringed with from a dozen to twenty long teeth. When fully expanded the leaf lies back on the moss amid which the plant grows.

If we examine the inside surface of the lobes we shall see that these are in the middle colored a rosy red. Just at this point will be discovered three hairs arranged in triangular fashion.

It is interesting to consider the actual manner in which the plant carries out its fly-catching.

As is well known, bright colors have a great attraction for insects. In this case it is apparently the red areas on the lobes of the leaves which possess such an attraction for insects of all kinds. Possibly they secrete a sweet substance, but this is not definitely known. All goes on well as long as the creatures avoid doing one thing; unhappily, this they are almost certain to do sooner or later. Nothing happens unless the insect brushes up against one of the hairs previously mentioned as being on the surface of the lobes. The succeeding happenings are disastrous for the fly.

With really astonishing rapidity the sides of the leaf snap together so that the spines on the borders of the lobes meet. Thus, in a very brief time a most perfect little cage is devised from which any sort of escape is absolutely impossible. During the next half hour the sides draw in still closer, so that the spines overlap. At this stage the leaf pours out a copious discharge of digestive fluid, which enables the plant to make use of the nutritious element in the fly.

CRUEL PLANTS THAT ENTRAP AND KILL ANIMALS

The light streaming through the transparent spaces induces the prisoner to waste its strength in a vain effort to escape through them.

Once below the inside edge, escape is almost impossible. Pitchers have been found almost full of flies and other insects.

Absorbed in the delights of feasting on the nectar of the *Nepenthes*, the insect wanders with fatal ease down the fluted rim.

The fruits of the *Martynia* fasten themselves to passing animals that sometimes get the hooks caught in their mouths and die a dreadful death.

After an interval of several days the leaf of the *Dionaea* opens and allows the hard carcass of the fly to roll away. The plant is then ready for another meal, and unable to realize the fate which is in store for it, another fly falls a victim. Quite often the Venus Fly Trap is able to capture large insects.

THE STRANGE HABITS OF THE NEPENTHES

Scattered over the tropics of the old world there is a remarkable group of plants known as *Nepenthes*. Many of these are of a climbing habit, rooting in bark crevices where a little moist soil may have collected. To augment their food supply they have produced pitchers, which in some species are of great size. Indeed, in one kind of receptacles will hold as much as two quarts of water. In all cases these pitchers have a thick, corrugated rim, and it is this which plays a big part both in the luring and the capturing of the insects. On this rim, as well as on the lid of the pitcher, there are honey secreting glands, and these, of course, make the strongest appeal to hungry insects.

Absorbed in the delights of the feast, the insect wanders with fatal ease down the fluted rim. Once below the inside edge of this, escape is almost impossible, for the border is adorned with sharp, teeth-like processes, all pointing downward to the pit of destruction. Moreover, the inside walls of the pitcher are specially smoothed with a wax-like secretion, which makes climbing up a very difficult feat. Even insects with wings seem to find a great difficulty in making good their escape.

The pitchers of the *Nepenthes* are usually about half filled with fluid; this is not entirely collected rain or dew, but is largely formed by a definite secretion of the plant. Into this fluid the exhausted insect tumbles sooner or later, there to end miserably among a mass of drowning victims. It has been definitely proved that this fluid is an acid secretion—not unlike the digestive juices of an animal—which enables the plant to extract the nutriment it needs from the bodies of its victims.

THE NEPENTHES CATCH EVEN MICE AND BIRDS

It is in connection with the fluid contained in the pitchers of the *Nepenthes* that these plants catch much larger prey than insects. In the tropics it is not always an easy matter for birds and other small animals to secure a drink readily. The half-filled pitchers entice many a small creature to creep over the fluted rim in order to secure a draught of the fluid, which is not unpleasant to the taste. Now and again the venturesome visitor loses his hold and tumbles into the pitcher. Even in the case of mice and small birds the pitcher proves a veritable death-trap. The slippery sides are almost insurmountable, while the sharp hooks round the rim still further check an escape. Sooner or later the victim falls back into the fluid and is drowned. Strange as it may appear, after such a capture the plant grows vigorously, for the decaying body of its victim is rich in just the food material of which it stands in need.

THE DEATH PITCHER OF THE SARRACENIAS

[170]

[171]

A very singular group of plants, the Sarracenias, are quite common in the bogs of North America. These are of an elegant shape, and may be as much as one foot or two feet in height. Nearly always they are highly colored, and altogether so attractive do they appear that insects of all kinds simply crowd to them. On arrival at the lip of the pitcher, the insects find a feast of honey spread out for their delectation. With almost devilish ingenuity this becomes sweeter and more plentiful the farther down into the pitcher one traverses. At a certain point, however, the nectar ceases, and the insect thinks that he will retrace his steps. But although it has been easy enough to go down, it is almost impossible to get back, for the surface of the inside of the pitcher is thickly covered with sharp bristles, all pointing downward.

Some flying insects may escape, but even these do not find it easy, as witness the fact that the plant often catches a large number of winged creatures. In the lower part of the Sarracenia pitcher a fluid is secreted, and it is into this that the creatures ultimately fall, and, of course, perish. How successful are the Sarracenias in their insect-catching may be gathered from the fact that pitchers have been discovered well nigh full of flies and other small creatures.

A PLANT WITH PRISON WINDOWS

The California *Darlingtonia* seems to have been specially devised for the securing of winged creatures. The plant is most singular in appearance, and the upper part of the pitchers bear a remarkable resemblance to the head of a snake. Part of the hood and also the two protruding leaves are gaily colored in crimson. It should also be noted that the upper portion of the hood is adorned with transparent patches, like so many little windows. Now, the only opening into the pitcher of the *Darlingtonia* is quite a small hole on the under side of the hood. As in the case of the other pitcher plants, the orifice of this hole is freely supplied with honey, and this extends well into the interior of the receptacle.

Owing to the attraction of the little windows, which have been already mentioned, the flies do not attempt to get out of the hole to the extent which might be supposed. The light streaming through the transparent spaces seems to convince the insects that in that direction lies the path to freedom. At all times it is possible to see perhaps a dozen flies bobbing against the windows in a vain endeavor to escape. Finally, wearied to death by their hopeless endeavors to escape, the insects fall down into the lower part of the pitcher and become suffocated by the fluid it contains.

A N AUSTRALIAN PLANT WITH TWO KINDS OF LEAVES

A curious little Australian plant which has adopted a very similar plan of fly catching to that to be seen in the *Nepenthes* is the *Cephalotus*. One singular feature about this Australian pitcher plant is that it produces quite ordinary leaves in addition to the highly specialized fly-catching ones.

P LANTS THAT KILL EVEN THE POWERFUL LION

The *Martynias* of South America produce fruits with hooks sometimes five or six inches in length, which get imbedded into the flesh of animals. The African Grapple-plants (*Harpagophyton procumbens*) are even worse in the amount of suffering which they cause; thousands of antelopes, goats, and other creatures are lamed by them every season. The seed vessel of this plant is provided with a large number of curved hooks by which it attaches itself to the coats or hoofs of animals and is thus transported from place to place. It has been known to choke and cause the death of lions.

[172]

The pretty little parachute-like device of the Dandelion seed which helps to waft it over a wide area. It often rises to a height of thirty feet, and is wafted many miles away.

The Willow Herb produces an enormous number of flying fruits. These often sail away in masses and are carried for a great distance over the countryside, to take root in a new location.

The seed of the Sycamore is provided with a long wing. These wings revolve quickly when the heavy seed is falling, prevent a rapid decent, and help to scatter them.

The head of a seeding Dandelion. Observe the enlarged view of one of the parachutes above.

When the fruits of the Coltsfoot are ripe the smallest puff of air disperses the seed far and wide.

HOW PLANTS TRAVEL

Many plants provide their seeds with an apparatus which forms a singularly effective flying machine. Some of these are among the most beautiful and ingenious contrivances in the plant world.

NATURE'S AVIATORS AND SEED-SOWERS

By far the commonest method of ensuring a wide distribution of a seed is that in which the object is attached to some light, feathery substance which prevents a speedy falling. Of this there is no better instance than the common dandelion, which at seed time produces the handsome "clock" so prized by the children.

Here each seed is attached to a feathery process which plays the part of a parachute. On a dry day, when the dandelion heads are parting with their fruits, we may see how well the scheme works. Each puff of wind releases a few of the seeds, and these, unlike the ordinary parachute with a load, are so light that they rise upwards on the air currents.

Curiously enough, the fruits seem to travel farther when the breezes are light, and a very rough wind blows them back to earth, where they may catch in the grass or become damaged. Thus, like the airman, the dandelion seed stands the best chance of a safe journey when the weather is not too boisterous.

A very similar arrangement is to be seen in the case of the goat's-beard fruit and that of the coltsfoot, which, by reason of its flying device, secures a very wide distribution.

[173]

THE WILLOW ALSO PRODUCES FLYING SEEDS

After flowering the Willow Herb develops long, pod-like processes. During damp and stormy weather these pods remain tightly closed. On a day when the air is dry and the breezes are light, the sides of the case split open and reveal a prodigious number of perfect flying machines. The seed itself weighs a mere trifle, and to this is attached a beautiful arrangement of feathery hairs. The whole thing is so well adapted for an aerial voyage that it mounts rapidly upward on the faintest puff of air. It should be here explained that by experiment it has been shown that the air currents tend to move upward. So light are some of these flying fruits that they often rise to an immense height. It is not an uncommon thing for them to be found on mountains thousands of feet above sea-level.

Of course, many foreign seeds have remarkable flying appendages. That of the South African *Stapelia* has a vast mass of fluffy hairs which will support it on quite a long aerial voyage. In the case of the cotton plant man has turned to good account the hairs by which the seed flies.

SEEDS OF THE SYCAMORE A DIFFERENT TYPE OF FLYING MACHINE

In a large number of cases the conveyance of the seeds to a distant point is accomplished by the adoption of the screw-propeller principle. An excellent example of this is to be seen in the fruits of the sycamore. Here the actual seed is large and heavy, but it is attached to a wing-like expansion. When the fruit falls from the tree the wing revolves with great rapidity, very much on the lines of a propeller blade. This has the effect of controlling the rate of fall, so that the whole contrivance is carried to some distance before the seed is actually brought to earth.

PLANT TRAVELERS ON LAND

Some kinds of touring plants send out long trailing stems to search for fresh rooting places. A little Alpine saxifrage is curious in this respect, for the plant will traverse over many feet of barren rock to reach a suitable position. Directly the shoot touches the soil, a new plant is formed, and as this grows up, the connection between it and the parent is severed. A kind of lily has an even more singular way of traveling about. Here, after the plant has flowered, buds arise on the stems which bore the blossoms. Eventually they take root in fresh positions. This plant if left alone would rapidly cover many yards with its offspring, and this without setting a single seed.

A strange group of plants are those which actually break themselves in pieces in order to pursue their journeys abroad. A plant belonging to the Houseleek order (*Sempervivum soboliferum*) is remarkable in this respect. The species naturally finds its home in the crevices of rocks, and at a certain stage in its development numerous little ball-like offshoots are produced. In the early days these are kept at home by the stems by means of which they are attached to the parent plant. Eventually these attachments shrivel up and the offshoots go rolling away over the rocks often much helped in their journey by the wind. A considerable distance may be traversed before a little ball finds a resting-place in some niche.

HOW THE CACTUS PROTECTS ITS FLOWERS

HOW THE PLANTS DEFEND THEMSELVES

[174]

It is well-known to every intelligent observer that plants are menaced by a host of enemies. Though the plant cannot take up the aggressive to any extent, the weapons which it employs in its own defense are of an exceedingly efficient nature. In their way they are quite as effective as anything that animals employ in their battle for existence.

Among the commonest defenses of the plant are spines, thorns and prickles. In the sloe (*Prunus spinosa*), for example, the spines are modified branches; in gorse (*Ulex Europæus*) they are branches and leaves; and in cacti the green parts are thickened stems and the spines reduced leaves; while in holly (*Ilex aquifolium*) the prickly leaves answer the purpose of spines. The stinging hairs of the nettle which exude an irritating acid when touched are a familiar example of protection against vegetarian animals.

The way in which seeds are protected by spines is well illustrated in the case of the Sweet Chestnut. Here it would be a very knowing animal that could open one of the cases before they split naturally with the ripening of the seed.

HOW THE CACTUS DEFENDS ITS LIFE

There are few plants so well armed as the Cactus, the evident design of which is to conserve its moisture. This is accomplished in several ways. Of course, the very shapes of the plants are all in their favor. Being either round, globular, or cylindrical, they offer a limited surface to the dry air inconceivably less than a plant of the same size bearing a quantity of leaves. The thick skins, too, play a big part in keeping in the moisture, and many kinds of cacti, such as that known as Old Man's Beard, are covered with dense masses of hair.

Many of these succulent desert plants grow to a great size. Thus the Giant Cactus sends up a tall column, often with only a very few branches, which may be eighty or even one hundred feet in height.

Curiously enough, some cacti produce the most beautiful flowers, blossoms without rival in the whole world. The various kinds bear flowers of every conceivable shade except blue, and the blooms are often of an immense size. It is not unusual for the blossoms to measure eighteen inches, or even two feet, across.

Living as they do in arid regions, cacti are peculiarly liable to be attacked by thirsty animals. Now, a common mode of defense is the covering of the plant with sharp spines. These spines are so arranged that they completely shield the juicy stem from any possibility of attack, it is said that on occasion Mexican ponies will try to knock a cactus to pieces with their heels when they are thirsty. More often than not the animals suffer cruelly for their temerity by being severely pricked.

In much the same way the Aloes and Agaves are protected, so that a hedge of these plants when placed round a field, is better than the most perfect barbed wire fence.

THE AMERICAN AGAVE, OR "CENTURY PLANT"

This plant is remarkable for its beauty, and grows to a height of twenty to thirty-five feet. It was long popularly supposed to bloom only once in a century; hence the name. Though this is a mistaken idea, the vegetative growth of the plant is many years. The plant produces flowering stems, sometimes several feet in height, ultimately terminating in a large panicle of flowers and dying of the effort. A single plant may produce five thousand flowers, so that the ground beneath is wet with the honey distilled by them. The fiber of the leaves was used by the ancient Mexicans for paper parchment, and is now largely exported for that purpose and for cordage.

THE CURIOUS MISTLETOE, A ROBBER PLANT OR PARASITE

The mistletoe is one of the most interesting of the parasite plants. It grows on various trees, and is celebrated on account of the religious purposes to which it was consecrated by the ancient Celtic nations of Europe. It is a small shrub, with oblong, somewhat leathery leaves, and small yellowish-green flowers, the whole forming a pendent bush, covered in winter with small white berries, which contain a glutinous substance. It is common enough on certain species of trees, such as apple and pear trees, hawthorn, maple, lime, and other similar trees, but is very seldom found on the oak. Its roots penetrate into the substance of the tree on which it grows, and though it may live for forty years, it finally kills the branch supporting it.

In days of old the mistletoe was looked upon with awe as a mysterious and wonderful plant. The ancient Druids held it sacred, and cut it down with a golden sickle with all sorts of strange, mystic rites. It was the symbol of peace and friendship; and that is why we hang it up at Christmas time, and when two people meet under its green leaves, they are expected to "kiss and be friends."

A PLANT THAT GROWS IN SNOW

Strangest of all the plants is the Soldanelles, a small species which exists on the lower slopes of the Alps. When the flower stems are in their most active state of growth they release a considerable amount of heat. In this way they will bore a course up through a thick coating of ice and snow to the light and air above, when by some means the plant is aware that the spring has arrived. There seems to be something more wonderful in this than can be explained by mere mechanical causes. Indeed, the sympathy of the plant with its surroundings is surely one of those mysteries which are as inscrutable as life itself.

THE PRIMARY USE OF LIQUID RUBBER TO PLANTS

The grubs of many beetles live in wood, upon which they feed. This probably gives a clue to the primary use of the important commercial substances india-rubber and guttapercha, which are the dried sticky juices of various shrubs and trees growing in hot climates. Beetles of the wood-boring kind, which seek to pierce and lay eggs in such plants, are liable to be snarled and killed by the viscid fluids which ooze out.

Arums, and various other plants, ward off the attacks of snails and slugs in a rather curious way. The outer parts of their stems and leafstalks contain bundles of excessively sharp crystals (*raphides*), composed of oxalate of lime. These pierce the soft mouths of snails and slugs like so many needles, conveying a lesson which usually needs no repetition.

STRANGE LIFE HABITS OF UNUSUAL PLANTS

[175]

The Giant Cactus of the American Desert

These plants are little more than succulent stems covered with a thick skin which retains the moisture of the juicy shoot.

The Century Plant

The Century Plant is a native of Mexico, and is remarkable for the long intervals between the blooming periods—once erroneously thought to be 100 years.

CHRISTMAS ROSE IN WINTER

In defiance of the weather a few plants elect to come into bloom right in the middle of winter. The most striking of these is the Christmas Rose, or Hellebore. The flowers of this plant are protected by the encircling sepals, and are fully able to hold their own until the approach of a more favorable season.

SCIENTIFIC TERMS USED IN BOTANY
Completely Classified, Illustrated and Exemplified

ROOTS.

Kinds.—(1.) PRIMARY, growing from root-end of embryo.

(a.) SIMPLE.—*Conical*, ; *napiform*, ; *fusiform*, .

(b.) MULTIPLE.—*Moniliform*, necklace-like. *Fasciculated*, tufted, thick and fleshy. *Tubercular*, having small tubers. *Fibrous*, threadlike.

(2.) SECONDARY, growing from stems.

Underground, starting from stem below ground. *Aerial*, starting from stem above ground.

STEM.

Parts.— *n*, *Node*, part to which the leaf is fastened.

i, *Internode*, portion between nodes.

a, *Axil*, the angle between leaf and stem, upper side.

Class.—*Exogenous*, outside-growing (Maple, Elm).

Endogenous, inside-growing (Corn-stalk, Timothy).

Situation.—(1.) *Above ground*, usually leaf-bearing.

(2.) *Under ground*, scale-bearing.

Stems above Ground.

Character.—*Herbaceous*, soft, not woody (Four-o'clock).

Suffrutescent, slightly shrubby (Toad-flax).

Suffruticous, shrubby at base (Trailing Arbutus).

Fruticous, shrubby (Currant-bushes).

Arborescent, tree-like (Flowering Dogwood).

Arboreous, tree (Elm).

Direction of Growth.—*Repent*, prostrate and rooting from the under surface (Partridge-berry).

Procumbent, prostrate, but not rooting (Purslane).

Decumbent, prostrate, except at the extremity (Poor Man's Weather-glass).

Assurgent, ascending obliquely.

Erect, upright (Indian Corn).

Scandent, climbing with tendrils or rootlets (Grape, English Ivy).

Voluble, twining (Morning-glory).

Declinate, declined or bent downwards (Blackberry).

Diffuse, loosely-spreading (Red Currant).

Forms of Branches.—*Sucker*, a branch of subterranean origin that finally rises out of the ground. The Raspberry multiplies in this way.

Offset,  a short, prostrate-rooting branch with a tuft of leaves at the end (Houseleek).

Runner,  a long, prostrate-rooting branch with tuft of leaves (Strawberry).

Stolon,  a branch that curves downward and takes root. The Currant multiplies in this way.

Tendril,  a thread-like coiling branch used for climbing.

Spine or Thorn,  a hard, sharp-pointed branch.

Stems under Ground.

Kinds.—*Rhizoma or Rootstock*,  a perennial, horizontal stem, partially or wholly subterranean (Calamus).

Tuber,  an enlarged stem with eyes (White-potato).

Bulb,  a bud, usually subterranean with fleshy scales (Onion, Lily).

Corm,  a solid bulb (Indian Turnip).

LEAVES.

Parts.—  *b*, *Blade*, the expanded portion.

p, *Petiole*, the stem.

s, *Stipules*, leaf-like appendages at base of petiole.

Kinds.—(1.) **SIMPLE**,  having but one blade.

Sessile,  without petiole.

Petiolate,  with petiole.

Stipulate,  with stipules.

Cirrhous,  with tendril.

(2.) **COMPOUND**,  having more than one blade.

(a.) *Pinnate*,  with leaflets arranged along a common petiole.

Abruptly pinnate,  with even number of leaflets.

Odd-pinnate,  having an odd leaflet.

Unipinnate,  divided but once.

Bipinnate,  divided twice.

Tripinnate,  divided three times.

(b.) *Palmate*,  leaflets diverging from one point.

Unipalmate,  divided but once.

Bipalmate,  divided twice.

Tripalmate,  divided three times.

Framework.—*Midrib*, the central vein.

Ribs,  strong veins branching from near the base of midrib.

Veins, the branching framework.

Veinlets,  small veins.

Venation.—*Parallel*,  with simple veins running parallel from base to apex.

Feather,  with lateral veins branching at regular intervals from midrib.

Radiate,  with strong veins branching from apex of petiole.

Reticulate,  with veins and veinlets that unite and separate in the form of network.

Form.—(a.) **BROADEST AT THE MIDDLE.**—*Peltate*, ; *orbicular*, ; *oval*, ; *elliptical*, ; *oblong*, ; *linear*, ; *acerose*,

 (Pine).

(b.) BROADEST AT BASE.—*Deltoid*, ; *ovate*, ; *lanceolate*, ; *subulate*, ; *cordate*, ; *reniform*, ; *hastate*, ; *sagittate*, .

(c.) BROADEST AT THE APEX.—*Obovate*, ; *oblanceolate*, ; *spatulate*, ; *cuneate*, ; *obcordate*, ; *lyrate*, ; *runcinate*, .

Bases.—*Auriculate*, ; *oblique*, ; *tapering*, ; *abrupt*, ; *clasping*, ; *perfoliate*, ; *connate*, ; *decurrent*, .

Apexes.—*Obcordate*, ; *emarginate*, ; *retuse*, ; *truncate*, ; *obtuse*, ; *acute*, ; *acuminate*, ; *mucronate*, ; *cuspidate*, ; *aristate*, .

Margins.—*Entire*, ; *repand*, ; *sinuate*, ; *crenate*, ; *dentate*, ; *serrate*, ; *incised*, ; *lacinate*, ; *palmately-lobed*, ; *palmately-cleft*, ; *palmately-parted*, ; *palmately-divided*, ; *pinnately-lobed*, ; *pinnately-cleft*, ; *pinnately-parted*, ; *pinnately-divided*, .

Surface.—(a.) WITHOUT HAIRS.—*Glabrous*, smooth.
 (b.) SOFT HAIRS.—*Pilous*, few, short; *hirsute*, few, long; *pubescent*, dense, short; *villous*, dense, long; *sericeous*, silky; *lanuginous*, woolly; *toméntous*, matted like felt; *flóccous*, fleecy tufts.
 (c.) STIFF HAIRS.—*Scâbrous*, minute, hard points; *hispid*, few, short points; *sétous*, bristly; *spinous*, having spines.

Color.—*Glaucous*, covered with whitish powder.
Canéscent, grayish-white with fine pubescence.
Incânous, hoary-white.
Punctate, having transparent dots.
Hyaline, nearly transparent.

Texture.—*Succulent*, fleshy; *coriaceous*, leather-like; *scarious*, dry; *rígous*, wrinkled.
Phyllotaxis, arrangement on the stem.—*Alternate*, ; *opposite*, ; *whorled* (verticillate),  near the ground; *radical*, ; *cauline*, on the stem; *rosulate*,  clustered; *fasciculate*,  in bundles.

Vernation, arrangement in the bud.
Induplicate,  folded crosswise (Tulip-tree).
Conduplicate,  folded along midrib (Oak).
Plicate,  folded like a fan (Red-currant).
Circinate,  rolled lengthwise (Fern).
Convolute,  rolled edgewise (Cherry).
Involute,  both edges rolled inward (Apple).
Revolute,  both edges rolled outward (Willow).
Equitant,  astraddle (Iris).
Obvolute,  half equitant (Jerusalem Sage).
Triquêtrous,  triangular equitant (Sedges).

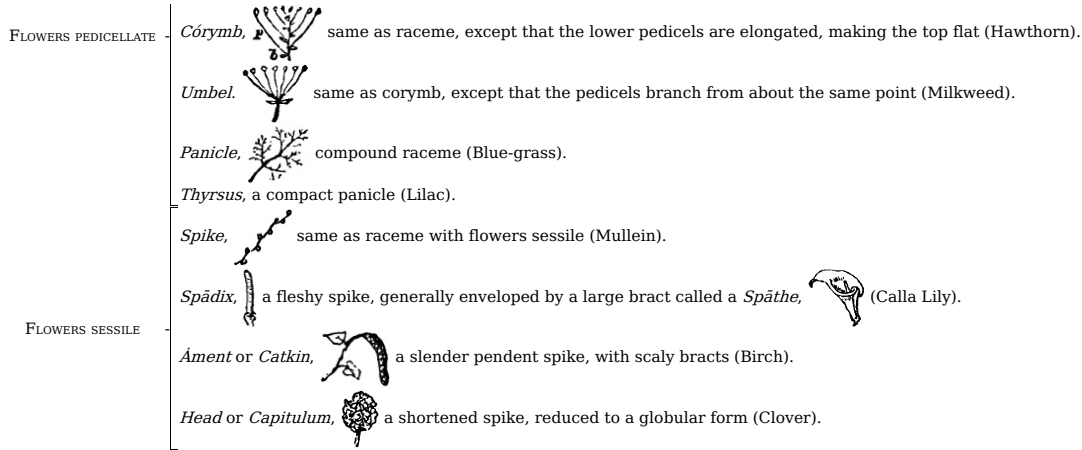

Duration.—*Fugacious*, falling very early.
Deciduous, falling at the close of the season.
Persistent, remaining through the winter.

INFLORESCENCE.

Parts.—*Flower*,  the blossom.
Peduncle,  the stem of a solitary flower or the main stem of a flower-cluster.
Scape,  a peduncle that grows from the ground.
Pedicel,  p, the stem of each flower of a flower-cluster.
Bracts, b, small floral leaves.
Involucre,  a cluster of bracts.
Kinds.—(1.) SOLITARY, single, alone.
Terminal, at the summit of the stem.
Axillary,  in the axils of the leaves.

(2.) CLUSTERED, several flowers collected in a bunch.
 (a.) INDEFINITE OR INDETERMINATE, flowering from axillary buds. Inflorescence centripetal.

Racême,  flowers arranged along the axis; pedicels about equal in length (Currant).

(b.) DEFINITE OR DETERMINATE, flowers all terminal. Inflorescence centrifugal.

Cyme,  flat-topped or rounded inflorescence (Elder).

Fascicle, a compact cyme (Sweet-William).

Glomerule, a cyme condensed into a head (Mint).

Verticillaster,  two opposite glomerules joined (Motherwort).

Scorpioid,  a one-sided and coiled cyme (Forget-me-not).

FLOWER. 

Parts.—*Receptacle*, the part upon which the several organs of the flower are inserted.

Calyx,  the exterior floral envelope.

Corolla,  the interior floral envelope. The calyx and corolla constitute the *protecting organs*, sometimes called *perianth*.

Stamens,  the fertilizing organs.

Pistils,  the seed-bearing organs. The stamens and pistils constitute the *essential organs*.

Kinds.—*Symmetrical*,  same number in each set of organs; *unsymmetrical*, different number.

Complete,  all the sets present; *incomplete*, some sets wanting.

Regular,  sepals and petals uniform; *irregular*,  sepals or petals unlike.

Perfect, stamens and pistils both present; *imperfect*, one set absent.

Staminate, with stamens only; *pistillate*, with pistils only; *neutral*, with neither.

Monœcious, staminate and pistillate on same plant; *diœcious*, on different plants.

Dichlamydeous, having calyx and corolla; *monochlamydeous*, having calyx only; *achlamydeous*, having neither.

Di,  *tri*, *tetrá*, *pentá-merous*,  two, three, four, or five parts in each set.

Sessile, without peduncle; *pedunculate*,  with peduncle.

DEVIATIONS FROM THE NORMAL OR PATTERN FLOWER ARISE FROM
Augmentation, increase of floral circles (Water Lily).

Cherisis, increase of organs by division. The Bleeding-heart shows the *collateral cherisis* of stamens, and the Catchfly  shows the *transverse cherisis* of corolla.

Anteposition, parts opposite instead of alternate (Grape).

Cohesion,  union of parts of the same set (corolla of Morning-glory).

Adnation, union of different sets. In the Cherry the stamens and corolla are inserted upon the calyx.

Irregularity, parts of the same set unequally developed (Violet, Pea).

Suppression, non-development of some parts. In the mints some of the stamens are suppressed or wanting.

CALYX.

Parts.—*Sepals*,  the divisions of the calyx.

Tube, the united portion of a gamosepalous calyx.

Teeth or *lobes*, the distinct or divided portions of a gamosepalous calyx.

Throat, the orifice or summit of the tube.

Pappus,  in Compositæ, the calyx border consisting of scales, teeth, bristles, or slender hairs.

Cohesion.—*Gamosepalous* or *Monosepalous*,  sepals partially or wholly grown together.

Truncate,  without lobes.

Toothed,  lobes small.

Lobed,  parted about one fourth.

Cleft,  parted about one half.

Parted,  separated nearly to the base.

Polysepalous,  separated to the base.

Adnation.—*Inferior*,  calyx free from ovary.

Half-inferior,  calyx adherent to the ovary half-way.

Superior,  calyx adherent to the ovary.

Form.—See under **COROLLA**.

Æstivation.—See under **COROLLA**.

COROLLA.

Parts.—*Petals*,  the divisions of the Corolla.

Lamina, the expanded portion of the petal.

Claw,  the stem portion of the petal.

Spur,  ; s, the hollow portion of certain corollas.

Crown,  a small projection from certain petals (Catchfly).

Cohesion.—*Gamopetalous* or *Monopetalous*,  petals partially or wholly grown together.

Truncate,  toothed, lobed,  cleft, parted.

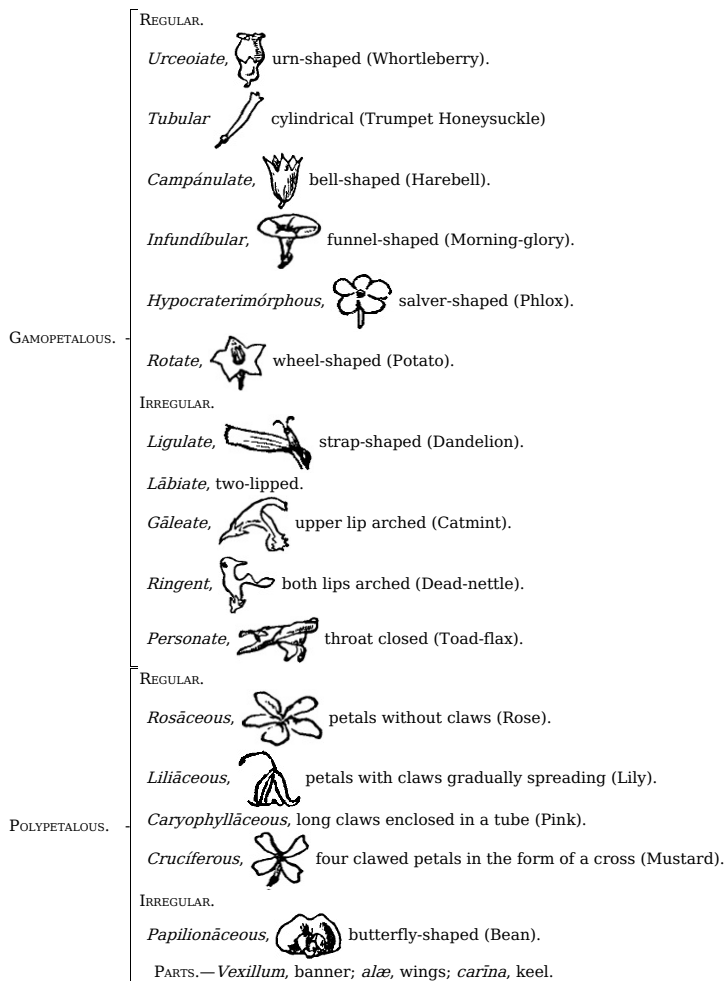

Polypetalous,  petals separate.

Adnation.—*Hypógynous*,  corolla attached under the pistil (*gynia*, pistil).

Perígynous,  corolla attached to the calyx. It is thus around the pistil.

Epígynous,  corolla attached to the ovary. It is thus upon the ovary which is a part of the pistil.

Form.—**GAMOPETALOUS** and **POLYPETALOUS**.

Æstivation, the arrangement of the floral organs in the bud.

Valvular,  pieces met by their margins (Lilac).

Induplicate,  margins turned inward (sepals of Clematis).

Reduplicate,  margins turned outward (sepal of Hollyhock).

Convolute, or *contorted*,  each piece overlaps its neighbor in one direction (Geranium).

Imbricated,  one or more petals wholly outside.

Quincúncial,  five petals, two without and two within and the remaining one with one edge outside and the other inside.

Triquétrous,  three petals, one without and one within, and the remaining one with one edge outside and the other inside.

Véxillary,  having one large petal enclosing the others (Pea).

Plicate,  the folding of gamopétalous flowers.

Supervolute,  with folds turned obliquely in the same direction (Morning-glory).

STAMENS (ANDRŒCIUM).

Parts.— *Anther*, the enlarged and essential portion.

Filament, the stem holding the anther.

Pollen, the fertilizing powder found in the anther.

Kinds.—*Sessile*,  anther without filament.

Sterile, filament without anther.

Connivent,  converging.

Exserted,  protruding out of corolla.

Included, entirely within the corolla.

Didýnamous,  four in number, two long and two short.

Tetrádýnanious,  six in number, four long and two short.

Cohesion.—*Syngenesious*,  united by their anthers.

Monodelphous, united by their filaments into one set.

Diadelphous, united into two sets.

Polyadelphous, united into many sets.

Adnation.—*Hypógynous*,  borne on the receptacle.

Perígynous,  borne on the calyx.

Epipétalous, borne on the corolla.

Alternate,  with the lobes.

Opposite, in front of the lobes.

Epigynous, borne on the ovary at its summit.

Gynándrous, borne on the style (Orchid).

FILAMENT.

Kinds.—*Filiform*, *subulate*, *dilated*, *petaloid*, *bidentate*.

ANTHER.

Parts.—*Lobes* (*thecæ*) and *connective*.

Adnation.—*Innate*,  anther firm on summit of filament.

Adnate,  anther attached by its whole length to filament.

Extrórse, facing the petals.

Intrórse, facing the pistils.

Versatile,  attached near the middle.

Dehiscence.—*Longitudinal*,  opening lengthwise.

Transverse,  opening crosswise.

Porous,  opening by terminal holes.

Valved,  opening by valves or doors.

PISTILS (GYNŒCIUM).

Parts.— *Stigma*, the rough end to which the pollen adheres.

Style, the stem holding the stigma.

Ovary, the enlarged portion containing the ovules.

Cohesion.—*Simple*,  having but one cell, placenta style and stigma.

Multiple,  a collection of simple pistils (Blackberry).

Compound,  simple pistils grown together, each called a *carpel*.

STIGMA.

Kinds.—*Sessile*, stigma on ovary: no style.
Globose, globular (Four-o'clock).

Capitate,  broad and flat.

Lobed, rounded.
Feathered, like a feather (Grasses).
Linear, thread-like (Corn).

STYLE.

Kinds.—*Basal*, attached to base of ovary (Forget-me-not).
Lateral, attached to side of ovary (Strawberry).

Terminal,  attached to top of ovary.

OVARY.

Parts.—*Placentæ*, the parts to which the ovules are attached.

Dissepiments,  partitions.

Cells, cavities in which the ovules are arranged.
Ovules, unfertilized seeds.

Adnation.—*Inferior*,  calyx adherent to ovary, same as superior calyx.

Superior,  calyx free from ovary, same as inferior calyx.

Placentation.—*Free-central*,  ovules attached to a central column in a one-celled ovary (Pink).

Axillary,  ovules attached to a central column in a compound ovary.

Parietal,  ovules attached to the outer walls of the ovary.

OVULE. 

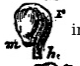

Parts.—*Nucleus*, *n*, the essential part in which the embryo is formed.

Primine, *p*, the exterior coat.
Secundine, *s*, the interior coat.
Micropyle, *m*, the opening of the ovary coats.
Funiculus, the stem to which the ovule is attached.
Hilum, *h*, the point of attachment on the ovule.
Chalāza, *c*, the place where the coverings and nucleus join
Rhāphe, *r*, the connection between the hilum and the chalaza.

N. B.—Through the funiculus, the rhaphe, and the chalaza the ovule receives its nourishment from the placenta. Through the micropyle it receives the tubular prolongation of the pollen.

Kinds.—*Orthótropous*,  straight; no change in direction of parts (Buckwheat).

Campylótropous,  curved; the micropyle brought near the chalaza (Bean).

Anátropous,  inverted; the micropyle brought near the hilum, pointing to the placenta. Rhaphe the whole length of the ovule (Magnolia).

Amphítropous,  half inverted; short rhaphe (Mallow).

Direction of Ovary.—*Erect*, ; *ascending*, ; *horizontal*, ; *pendulous*, ; *suspended*, .

FRUIT.

Parts.—*Seed*, the part containing the embryo.

Pericarp, the covering of the seeds, including the ovary and all adnate parts. The parts of the pericarp are *epicarp*, or outer coat; *mesocarp*, or middle coat; and *endocarp*, or inner coat.

Dehiscence.—*Septicidal*,  opening of the partitions.

Loculicidal,  opening at the dorsal suture.

Septifragal,  valves falling away from partitions.

Circumscissile,  opening by a circular horizontal line.

Kinds.—*Simple*, *aggregate*, *accessory*, *multiple*.

(1.) SIMPLE FRUITS.—*Fleshy*, *Stone*, *Dry* (formed by a single pistil).

(a.) FLESHY FRUITS.—Indehiscent (with two or more seeds).

Seeds immersed in a pulpy mass. $\left\{ \begin{array}{l} \textit{Berry}$, rind membranous (Grape).
 $\textit{Hesperidium}$, rind leathery, separable (Orange).
 $\textit{Pépo}$, rind hard (Cucumber).

Seeds in cells.—*Pome*, succulent calyx (Apple).

(b.) STONE FRUITS.—Indehiscent; one-celled; endocarp hard.

Drupe, three-coated; stone-cell entire (Peach).

Tryma, two-coated; stone-cell two-parted (Walnut).

Etærio, an aggregation of drupes (Raspberry).

(c.) DRY FRUITS.—Indehiscent, usually one seed with one coat.

Achênium,  coat separable from seed (Dandelion).

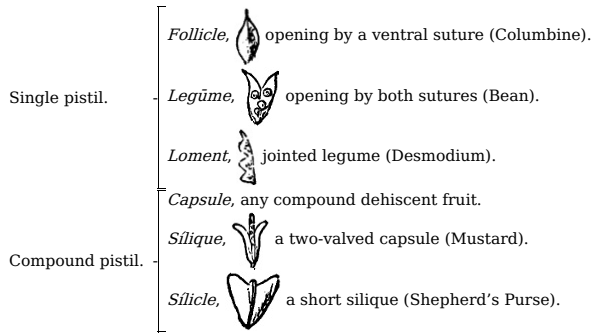

Utricle, coat inflated (Goosefoot).

Caryopsis, coat inseparable (Wheat).

Glans, invested with a cūpule,  (Acorn).

Samāra,  having winged appendages (Maple).

(c¹.) DRY FRUITS.—Dehiscent.

Pyxis,  circumscissile dehiscence (Purslane).

(2.) AGGREGATE FRUITS, . A cluster of carpels on one receptacle taken as a whole (Raspberry).

(3.) ACCESSORY OR ANTHOCARPOUS FRUITS.—Those of which the most conspicuous portion, although appearing like a pericarp in some cases, does not belong to the pistil (Rose-hip).

(4.) MULTIPLE OR COLLECTIVE FRUITS.—Those which result from the aggregation of several flowers into one mass (Pine-apple, Mulberry).

Strōbile or *Cone*, a scaly multiple fruit, resulting from the ripening of some kinds of catkins (Hop, Conifers).
Gábalus, a closed cone (Juniper-berry, Red Cedar).

Parts.—*Integuments*, seed-coats. *Nucleus*, part containing the embryo.

(1.) PARTS OF INTEGUMENTS:

Testa (episperm), the outer or proper seed-coat.

Tegmen (endopleura), the inner coat, sometimes wanting.

Funiculus Hilum (h), *Chalāza (c)*, *Rhāphe (r)*, are the same as in ovule.

Aril, covering exterior to the integuments (not in the ovule) (May-apple, Water-lily).

Coma,  a tuft of hairs on certain seeds (Silkweed).

This is to be distinguished from pappus, which is a tuft on the fruit (Achenium).

(2.) PARTS OF NUCLEUS: 

Embryo (e), the initial plantlet.

Radicle (r),  the rudimentary stem or first internode.

Cotylēdon (c), the seed leaf at the primary node.

Plūmule (p), the growing points above the cotyledons.

Albūmen (a),  the food for the plantlet's first growth, stored outside the embryo.

Kinds.—(1.) GENERAL FORM: *Orthotropous*, ; *campylotropous*, ; *anatropous*, ; *amphitropous*,  same as in ovule.

(2.) FORM OF COVERING:

Conformed, adhering closely to nucleus.

Cellular, loose (Pyrola).

Winged,  having expanded appendages (Catalpa).

Woolly, covered closely with fibers (Cotton).

Cōmose,  with coma at the end (Willow Herb).

(3.) TEXTURE OF ALBUMEN:

Farinaceous, mealy (Wheat).

Oily, mealy but mixed with oil (Poppy).

Mucilāginous, like mucilage (Morning-glory).

Ruminated, wrinkled (Papaw).

(4.) NUMBER OF COTYLEDONS:

Monocotylēdonous,  (Corn).

Dicotylēdonous,  (Bean).

Polycotylēdonous,  (Pine).

(5.) POSITION AND ARRANGEMENT OF EMBRYO:

Eccentric,  embryo on one side of albumen (Indian Corn).

Peripheric,  curved around albumen (Four-o'clock).

Accumbent,  applied to the cotyledons when the radicle is bent and lies along their edge (Water-cress).

Incumbent,  applied to the cotyledons when the radicle rests against the back of one of them (Shepherd's Purse).

Conduplicate,  applied to cotyledons that are incumbent and so folded as to embrace the radicle (Mustard).

(6.) THE DIRECTION OF THE EMBRYO AS RESPECTS THE PERICARP.

Ascending, pointing to the apex.

Descending, pointing to the base.

Centripetal, pointing to the axis.

Centrifugal, pointing to the sides.

The living plants may be divided into two grand divisions—Flowering Plants and Flowerless Plants—with five main subdivisions, according to the complexity and structure of their reproductive organs, or seed structure. The scientific names of these groups are the *Thallophyta*, the *Bryophyta*, the *Pteridophyta*, the *Gymnosperms*, and the *Angiosperms*.

Each of the five main groups is divided into a number of lesser subdivisions, sometimes called *phyla*, orders, each of which is composed of several families.

Most systematic botanists begin the study of plants with the lowest forms of plants and proceed to the highest. In the following classification, however, the usual order has been *reversed* because of its greater interest for a large majority of readers; the highest division is placed first and the lowest last.

In the earlier days of the science of botany nearly every botanist's energies were devoted to this branch which we now call *systematic botany*. There are now named and described close on a quarter of a million of living species of plants altogether, including the lower and often nearly invisible forms, and of this vast number about one hundred and thirty thousand belong to the highest group of all—the Angiosperms. With nearly a quarter of a million described forms to deal with the value of such keys will be recognized.

SUB-KINGDOM I.—Flowering Plants (*Phanerogams*), or Spermophytæ.

(1) *Angiosperms* (*anj' i-o-sperms*)—Plants producing protected seeds.

The greatest group, the *Angiosperms*, with over a hundred and thirty thousand species, contains nearly all the plants that yield crops of economic importance to man, or that decorate his gardens, or that feed his sheep or cattle. They have netted-veined leaves. When this group is further examined, there are found to be two well marked divisions—Monocotyledons and Dicotyledons. The first has embryos with only one cotyledon or "seed leaf," the second has embryos with two. The Angiosperms include over one hundred and thirty thousand species, divided among sixty-two orders, only the most important families of which can be given here.

ORDER I.—**Ranunculaceæ**: Herbs or small shrubs; about thirty genera.

Anemone (windflower): Perennial herb. Dry copses. Massachusetts to New Jersey and west to Colorado.

Anemone (rose anemone): Open woods. Canada to Georgia and west through Mississippi Valley.

Caltha (cowslip, marsh marigold): Perennial herb. United States and Canada.

Clematis (virgin's bower): Perennial. United States and Canada.

Ranunculus (buttercup, crowfoot): Herb, annual or perennial. Canada, United States and Europe.

Thalictrum (meadow rue): Perennial herb. United States and Canada.

ORDER II.—**Berberidaceæ**: Shrubs or perennial herbs; nineteen genera.

Berberis (barberry): Fruit, a sour berry. Found in Europe, naturalized in New England.

Podophyllum (May apple, mandrake): Perennial herb. Fruit, a berry. Found: Eastern North America; a species in Himalaya Mountains.

ORDER III.—**Papaveraceæ**: Annual or perennial herbs with milky or colored juice; about twenty-four genera.

Papaver (poppy): Geographical home on southern edge of North Temperate Zone, spreading north and south. Great opium districts are the valley of Ganges, Asiatic Turkey, Persia, Egypt, Asia Minor, China. From India, fourteen million pounds annually. Persia and Turkey, seventy-one million pounds.

ORDER IV.—**Cruciferae**: Herbs; about one hundred and seventy-two genera.

Brassica (turnip, mustard, cabbage, cauliflower, rape): United States, Europe, India, Syria and Russia.

Capsella (shepherd's purse): Naturalized in United States; from Europe.

Cochlearia (horseradish): Perennial. Root. Middle and southern edges of North Temperate Zone, from Great Britain to Asia and northeastern America.

Isatis (wood): Biennial. Throughout Europe. Cultivated in Azores and Canary Isles.

Nasturtium (watercress): Europe and northern Asia. Cultivated in Palestine, Hindustan, Japan.

ORDER V.—**Capparidaceæ**: Herbs, shrubs, trees; twenty-three genera.

Capparis (caper): Small shrub. Southern France and Mediterranean countries, Sicily, Malta.

ORDER VI.—**Violaceæ**: Herbs; twenty-one genera.

Viola (violet): Perennial. Canada; United States, west to Colorado; throughout Europe, some parts of China, Japan, India.

ORDER VII.—**Biximæ**: Shrubs; 29 genera.

Bixa (arnotto): Tropical America. Cultivated in southern Europe, Burma, Philippine Islands, Hindustan.

ORDER VIII.—**Teurstromiaceæ**: Shrubs and small trees; thirty-two genera.

Thea (tea): Shrub. China. Cultivated between parallels of 25° and 35° throughout Asia. In Kangra, Gurhwal, Assam, Cachar, Sylhet, Chittagong, Darjeeling, Chota, Nagpur, Hindustan, Japan, Australia, Jamaica, Brazil, North America.

ORDER IX.—**Malvaceæ**: Herbs, shrubs.

Gossypium (cotton): Tropical and sub-tropical. East Indies, China, Asiatic Islands, Greece, islands in eastern Mediterranean, Asia Minor, northern and western Africa, Australia, West Indies, southern United States, Venezuela, British Guiana, Brazil.

ORDER X.—**Sterculeaceæ**: Trees and shrubs.

Theobroma (cocoa): Tropical and sub-tropical. Brazil and north of Brazil, West Indies, Mexico. Cultivated in Philippine Islands, southern Europe, India.

ORDER XI.—**Tiliaceæ**: Trees and shrubs; 40 genera.

Corchorus (yellow jute): Southern belt of North Temperate Zone and Tropics. Cultivated in southern and western Asia, Grecian Archipelago, central and northern Africa.

ORDER XII.—**Linaceæ**: Shrubs and herbs; 94 genera.

Linum (flax): Herb. Widely distributed. Hindustan, southern Egypt, throughout Europe, southern and middle Russia, northeastern America.

Erythroxylon (coca): Shrub. Tropical and sub-tropical. Bolivia, Peru, Ecuador, Colombia, northern Brazil.

ORDER XIII.—**Zygophyllaceæ**: Trees, shrubs, herbs; seventeen genera.

Guaiacum (lignum-vitæ): Tree. Tropical and sub-tropical. Exclusively American; native to West Indies.

ORDER XIV.—**Rutaceæ**: Small trees and shrubs; eighty-three genera.

Citrus (orange, lemon, shaddock): In all regions of no frost. India. Cultivated in Persia, Syria, southern Europe, northern Africa, Spain, China, Japan, Sicily, Australia, Brazil, West Indies, Florida, southern California, Azores.

ORDER XV.—**Meliaceæ**: Trees; thirty-seven genera.

Swietenia (mahogany): Large tree. Tropical and sub-tropical. West Indies, Bahamas, Central America, southern Florida. Cultivated in southern British India.

ORDER XVI.—**Iliciniæ**: Trees and shrubs; three genera.

Ilex (Paraguay tea): Small tree. Paraguay. In Parana, ten million pounds produced annually.

ORDER XVII.—**Rhamnaceæ**: Trees and shrubs; thirty-seven genera.

Ceanothus (New Jersey tea): Shrub. Eastern North America.

Rhamnus (buckthorn): Shrubs, small trees. Southern Persia and southern Levant countries. Grows as far north as England.

ORDER XVIII.—**Ampelidæ**: Woody vine; few genera.

Vitis (grape): Zone from 21° N. latitude to 48°. British Isles and Portugal, east to Persia. Middle Atlantic States to California. Cultivated in Australia.

ORDER XIX.—**Sapindaceæ**: Trees and shrubs; seventy-three genera.

Acer (maple): Tree. Not south of 38° N. latitude, except in high mountains in northern United States and southern British America.

ORDER XX.—**Anacardeaceæ**: Trees and shrubs; forty-six genera.

Anacardium (cashew nut): Tropics of Asia and America, Jamaica.

Rhus (sumach): North America, Canada to Gulf States; Arkansas, Levant, and western Europe, Syria. Cultivated in Sicily, Italy, Turkey, Spain, Portugal.

ORDER XXI.—**Leguminosæ**: Herbs, shrubs, trees; four hundred genera.

Acacia (gum arabic): Shrubs and small trees. Tropical and sub-tropical, but widely distributed. Australia, Africa, Asia, America.

Arachis (peanut): Sub-tropical. Southern United States, southern and central Virginia, the Carolinas and Tennessee.

Astragalus (gum tragacanth): Small shrub or herb. Sub-tropical. Persia, Greece, east Mediterranean Islands, Syria.

Cassia (senna): Tropical and sub-tropical. Widely distributed.

Cæsalpinia (Brazil wood): Trees. Brazil.

Dalbergia (rosewood): Trees and vines. Brazil and southern Asia.

Glycyrrhiza (licorice): Small shrub and herb. Italy and southern Europe, southern England. Cultivated in Spain and Portugal.

Hæmatoxylon (logwood): Small tree. Yucatan, Guatemala, Honduras, Isthmus of Panama, West Indies. Cultivated in Burma.

Indigofera (indigo): Shrub. India, Java, East Indies, north Africa, West Indies, Central Asia.

Lens (lentil): Annual. Syria, Egypt, southern and central Europe, Hindustan.

Phaseolus (bean): Annual herb. Tropics and Temperate Zones to forty-fifth parallels.

Pisum (pea): Annual herb. Central and southern Europe, Egypt, Syria, Japan, India, China.

Tamarindus (tamarind): Tree. Tropical and sub-tropical. Africa. Cultivated in Arabia, southern India, Ceylon, Java, Philippines, northern Australia, Pacific Isles, South America.

ORDER XXII.—**Rosaceæ**: Trees, shrubs, herbs; seventy-one genera.

Fragaria (strawberry): Herb. Widely distributed, even to Kamchatka and Alaska.

Prunus (plum): Tree. Temperate Zone, south of 60°. Europe, western Asia. Cultivated in northeast America.

Prunus (cherry): Tree. North Africa, Holland, Portugal. Cultivated in southeastern Africa, America, Belgium, England.

Prunus (apricot): Tree. Armenia, Persia, China, Japan, California.

Prunus (peach): Tree. Southern half of North Temperate Zone in Asia, Europe, America, New Jersey, Pennsylvania, Delaware, Maryland.

Pyrus (apple): Tree. England, France, Germany, Netherlands, Prussia, Poland, United States, south Australia.

Pyrus (pear): Tree. China, Syria, Persia, central and northern Europe, Belgium, France, Great Britain. Cultivated in North America.

Pyrus (quince): Tree. Northern Persia, east and west. Cultivated in northeastern America, Portugal.

Rubus (black raspberry and raspberry): Shrub. Temperate Zone, between 30° and 50° latitude. In North America, Europe north to sixtieth parallel, south to northern parts of Africa, Asia Minor, and eastward into India; also in British Isles.

ORDER XXIII.—**Saxifragaceæ**: Shrubs, herbs; seventy-three genera.

Ribes (currant): Shrub. Lapland and southern Europe; also in the New World, northern United States to south and middle Canada.

Ribes (gooseberry): Shrub. France, England, Germany and northeastern Russia, Siberia.

ORDER XXIV.—**Combretaceæ**: Shrubs, trees; seven genera.

Terminalia (myrobalano): Large trees. Tropical India, along southern fringes of Ghaut Mountains, and in Burma.

ORDER XXV.—**Myrtaceæ**: Trees; seventy-six genera.

Bertholletia (Brazil nut): Large tree. Tropical South America, Panama.

Eugenia (cloves): Molucca Islands. Cultivated in Brazil, West Indies.

Eugenia (allspice): Jamaica.

Myrtus (myrtle): Tropical and sub-tropical. Southeastern Italy. Cultivated in all Mediterranean countries.

ORDER XXVI.—**Lythraceæ**: Tropical trees; thirty genera.

Punica (pomegranate): Persia. Cultivated in Syria, Asia Minor, Levant, southern Europe, China, Japan, South and North America.

ORDER XXVII.—**Cucurbitaceæ**: Herbs; sixty-eight genera.

Citrullus (watermelon): Herbaceous vine. Africa. Cultivated in southern Europe and southern and middle North America.

Cucumis (cucumber): Northeastern India. Cultivated in Levant, southern Asia, southern Europe, Africa, southern Russia, United States.

Cucumis (muskmelon): British India, Baluchistan, West Africa, Guinea, banks of Niger. Cultivated in Mediterranean States, India, China, Japan, middle and southern United States.

Cucurbita (squash): Annual. Europe and western Asia. Cultivated in Pacific Islands, southern Asia, Africa.

Cucurbita (pumpkin): Warm climates.

ORDER XXVIII.—**Umbelliferae**: Herbs; one hundred and fifty-two genera.

Apium (celery): Biennial. Great Britain, western Europe, Mediterranean shores, Peloponnesus, Caucasus, Palestine, South America, and western coast of North America to southern California.

Coriandrum (coriander): Annual. Tartary. Cultivated in Hindustan, Burma, middle, southern and western Europe, North America.

Carum (parsley): Biennial. Mediterranean countries and Asia Minor. Cultivated in Japan, England, and northeastern America.

Carum (caraway seed): Lapland to Siberia. Cultivated in Great Britain and Continent south of 60°, North Africa, Hindustan, Burma, northeastern America.

Cuminum (cumin): Northern Africa, middle and southern Europe, Syria, Hindustan, Bombay, Burma.

Daucus (carrot): Biennial. Herb. All over Europe south of 60°, especially in France, Germany, northern Africa, southwestern Asia, China, Japan. Cultivated in North America.

Foeniculum (fennel): Biennial. Levant. Cultivated in Hindustan, Atlantic States, France, Germany, Great Britain, southern Europe.

Pinipinella (anise): Perennial. Egypt, Syria, Malta, Spain, southern Germany, Hindustan, Japan.

Pencedanum (parsnip): Biennial. Europe, southern Greece. Cultivated in Asia and North America.

Ferula (asafetida): Middle and western Asia.

ORDER XXIX.—**Rubiaceae**: Trees, shrubs, herbs; three hundred and thirty-seven genera, including madder, coffee, tea, etc., according to most authorities.

Cephaelis (ipecauanha): Shrub. Tropical and sub-tropical. Bolivia, Colombia. Cultivated in West Indies, Hindustan, India, America.

Cinchona (Peruvian bark): Trees. Tropical Andes. Cultivated in Ceylon, Jamaica.

Coffea (coffee): Shrub. Persia. Cultivated in Arabia, East Indies, Mexico, Brazil, Guatemala, Cuba, British West Indies, Santo Domingo, Java, Padang, Sumatra, Macassar, Ceylon, British India, Manila.

Rubia (madder): Perennial. West Asia, Mediterranean countries.

ORDER XXXVII.—**Borraginaceae**: Herbs; sixty-eight genera.

Symphytum (comfrey): Perennial herb. Peloponnesus and Greek islands. Cultivated in middle Europe and older parts of the United States.

ORDER XXXVIII.—**Convolvulaceae**: Herb; thirty-two genera.

Ipomoea (sweet potato): Perennial. Asia and America. Cultivated in southern United States, Carolinas, Virginia, Maryland, Delaware, southern New Jersey, southern Spain, Italy.

ORDER XXXIX.—**Solanaceae**: Herb; sixty-six genera.

Atropa (deadly nightshade): Europe, western Asia. Cultivated in North America.

Capsicum (red pepper, cayenne pepper): Annual. South America, southern Asia. Cultivated in southern Europe and in United States, West Indies, middle Africa, southern Asia.

Lycopersicum (tomato): Annual. South and Central America. Cultivated in Italy, southern France, Spain, Greece, northern Africa, Islands of southern Asia, England (under glass), Virginia, Carolinas.

Nicotiana (tobacco): Santo Domingo, South Atlantic States of United States of America. Cultivated in Virginia, Kentucky, Carolinas, Venezuela, Cuba, Brazil, Connecticut, Pennsylvania, Holland, Flanders, France, Alsace, Hungary, European Turkey, China, Japan, southern Africa, Australia.

Solanum (potato): Chile. Cultivated wherever cereals flourish.

ORDER XL.—**Pedaliaceae**: Herb; ten genera.

Sesamum (sesame): Sunda Islands. Cultivated in India, western Asia, southern Europe, northern Africa, America.

ORDER XLI.—**Verbenaceae**: Tree; fifty genera.

Tectona (teak): Tropical. East Indies, Burma, Philippines.

ORDER XLII.—**Labiateae**: Herb; one hundred and thirty-six genera.

Lavandula (lavender): Greece and Grecian Isles. Cultivated in Hindustan, Atlantic States of North America, Levant.

Marrubium (hoarhound): Perennial. Levant, Peloponnesus, etc. Cultivated all over Europe, and in Temperate Zone in Asia, and Atlantic States in North America.

Mentha (pennyroyal): England, Hindustan, Japan, Persia, India, Egypt. In a belt from eastern side of Mississippi Valley to Japan.

Mentha (spearmint): England, etc., as above.

Nepita (catnip): Perennial or annual. Europe, western Asia, Levant, North America.

Origanum (marjoram): Levant, Mediterranean countries, Europe, as far north as fiftieth parallel. Sweet marjoram, native in Greece.

Rosmarinus (rosemary): Evergreen. Southern Europe, Greek islands in the Peloponnesus. Cultivated in western Europe, Japan, Egypt, Hindustan, Asia.

Salvia (sage): Mediterranean countries. Cultivated in middle-southern Europe, British Isles, North America, British India.

Thymus (sweet thyme): Perennial. Spain, southern Europe, Mediterranean States, mountains of Greece, and islands of Archipelago, British Isles, southern Siberia.

ORDER XLIII.—**Chenopodiaceae**: Herb; eighty genera.

Beta (beet): Europe and western Asia. Cultivated in Europe, west Africa, temperate British India, North America.

Spinacia (spinach): Annual. Persia. Cultivated in middle of North Temperate Zone, from Hindustan to western shores and islands of Europe, eastern United States of North America, South Pacific Islands. [185]

ORDER XLIV.—**Polygonaceae**: Herb; thirty genera.

Fagopyrum (buckwheat): Central Asia and Tartary, Russia. Cultivated in Canada, northern United States, northern and central Europe.

Rheum (rhubarb): Perennial. Tartary. Cultivated as far north as fiftieth parallel, China, especially in provinces of Shensi, Kansu, and Szechuen.

ORDER XLV.—**Piperaceae**: Shrub; eight genera.

Piper (pepper): Southern Asia. Cultivated in southern India, Java, Sumatra, and Malabar.

ORDER XLVI.—**Myristicaceae**: Trees, shrubs; one genus.

Myristica (nutmeg): Molucca Islands. Cultivated in Sumatra, Island of Bourbon, Mauritius, Madagascar, West Indies.

ORDER XLVII.—**Lauraceae**: Tree; thirty-four genera.

Cinnamomum (cinnamon): East India Archipelago. Cultivated in Ceylon, West Indies, South America, Pacific Isles.

Cinnamomum (camphor): Trees. Japan, Formosa, China, Borneo. The camphor gum of commerce was introduced into Europe by the Arabs.

ORDER XLVIII.—**Santalaceae**: Herbs, shrubs, trees; twenty-eight genera.

Santalum (sandalwood): Trees. East Indies, Asia, Malaysia, Pacific Islands, India, China.

ORDER XLIX.—**Euphorbiaceae**: Herbs, shrubs, trees; one hundred and ninety-five genera.

Buxus (box): Evergreen, shrub, and small trees. Southern Europe, western Asia, Syria, Persia, and south of Black Sea. Cultivated in middle States of North America and Virginia.

Croton (croton-oil plant): Cultivated in southeastern Hindustan and East India Islands.

Hevea (caoutchouc): Large tree. South America. Cultivated in southern Asia, middle Africa, northern Australia.

Manihot (tapioca): Tropical and sub-tropical South America. Cultivated in southern Asia and western Africa.

Ricinus (castor-oil plant): Annual. Southern Asia, eastern Africa. Cultivated in Japan, Bengal, eastern and northern Africa, southern Europe and United States, especially Kansas.

ORDER L.—**Urticaceae**: Trees, shrubs, herbs; one hundred and eight genera.

Cannabis (hemp): Annual. Chinese Tartary, northern India, southwestern Siberia. Cultivated in China, Japan, Persia, Hindustan, Egypt, southern Africa, Russia, European states, Canada, United States.

Ficus (fig): Tree. Subtropical. Western Asia. Cultivated through Mediterranean countries west to Canary Isles.

Humulus (hop): Perennial herb. Middle Europe, Siberia, Levant, Asia Minor, Japan, North America, foot-hills of Rocky Mountains, and along upper Arkansas River, Missouri and Mississippi Rivers, Lake Winnipeg, North Atlantic States. Cultivated in Egypt.

Morus (mulberry): Tree. Cultivated in western New England, southern upper Canada, Dakotas, Kansas and the South. White mulberry is a native of China and Japan. Cultivated in Italy, Greece, Asia Minor, Armenia.

Ulmus (elm): Tree. From Mediterranean countries to the middle of European Russia, from southern banks of St. Lawrence River to Gulf of Mexico, and westerly to foot-hills of Rocky Mountains.

ORDER LI.—**Juglandaceae**: Trees; five genera.

Juglans (butternut): Northeastern North Africa. Cultivated in middle Europe and England.

Juglans (walnut): Northwestern New York and southward to Gulf of Mexico and westward beyond Mississippi River. Cultivated in eastern middle States and southern New England, England and southern Europe.

Hicoria (hickory nut): North and middle States of North America from Atlantic to Mississippi River, and cultivated in corresponding latitude in Europe.

Hicoria (pecan nut): Southern North America. Cultivated in Prussia and England.

ORDER LII.—**Cupuliferæ**: Trees; ten genera.

Castanea (chestnut): Eastern coast of North America, west to eastern Kentucky and Tennessee. Cultivated in middle and southern England, middle and southern Europe, northern Africa, Levant, and southern and eastern Asia.

Corylus (hazelnut): Levant. Cultivated between 35° and 55° latitude in Northern Hemisphere, eastern parts of Western Hemisphere, and western Old World.

Fagus (beech): Temperate Zones up to 60° north latitude, south to 50°.

Quercus (oak): Temperate Zones above 35°, and in a zone between 30° and 60° around the globe.

ORDER LIII.—**Salicaceae**: Shrubs, trees; numerous genera.

Salix (weeping willow): Western and southern Asia. Cultivated in southern England.

Salix (curled willow): England. Cultivated in eastern United States.

ANGIOSPERMS (LEAVES PARALLEL-VEINED)

ORDER LIV.—**Orchidaceae**: Woody vine; three hundred and thirty-four genera.

Vanilla (climbs over lofty trees): Tropical and sub-tropical southern Mexico, coast of Vera Cruz. Cultivated in Guatemala, Mauritius, Bourbon, Madagascar, Java.

ORDER LV.—**Zingiberaceae**: Herbs; thirty-six genera.

Curcuma (turmeric): Farther India and Asiatic isles, southern Asia and Malay Peninsula. Cultivated in Hindustan, Cochin-China, southern India, Bengal, Java, Pacific Isles.

Elettaria (cardamom): Perennial. Tropical Asia. Cultivated in southern India, Madras, Allepy, Ceylon.

Maranta (arrowroot): Tropical America, Florida.

Musa (banana): Asia. Cultivated in Indian Archipelago, China, Cochin-China, Hindustan, Australia, Pacific Islands, Madagascar, western Africa, Sicily, southern Spain, Mexico, Central America, Colombia, Peru, northern Brazil, Guiana, West Indies, southern Florida, and Louisiana.

Musa (manila): Philippines. Cultivated in India and southern Asia.

Zingiber (ginger): Sub-tropical. Southern Asia. Cultivated on western coast of Africa, in the West Indies, and southern slopes of Himalayas.

ORDER LVI.—**Bromeliaceae**: Herbs; twenty-seven genera.

Ananassa (pineapple): Perennial root. Tropical. Bahama Islands. Cultivated in South America, Florida, southern shores of Europe, East Africa, Pacific Isles, India.

ORDER LVII.—**Iridaceae**: Herbs; fifty-seven genera.

Crocus (saffron): Throughout southern parts of North Temperate Zone.

ORDER LVIII.—**Dioscoreaceae**: Shrubs; eight genera.

Dioscorea (yam): Tropical and sub-tropical Africa.

Dioscorea (Chinese yam): America, Asia, Malaysia. Cultivated in Japan, East Indies, Siam.

ORDER LIX.—**Liliaceae**: Herbs; one hundred and eighty-seven genera.

Asparagus: Perennial herb. Japan, Levant. Cultivated in England, Holland, central Europe, Mediterranean countries, sandy places of Poland, southern Russia, Hindustan, North America.

Aloe: Southern Asia, Arabia, southern Africa. Cultivated in southern Europe, northern Africa, British West Indies.

ORDER LX.—**Palmæ**: Shrubs and small and large trees; one hundred and thirty-seven genera.

Areca (betelnut): Sunda Isles, Philippines, Cochin-China, Sumatra, southern India.

Cocos (cocoanut): East India Archipelago, Arabia, Persia, Malay. Cultivated in eastern Africa, western America, Brazil, West Indies, islands of Central America.

Metroxylon (sago palm): Malacca, southern China. Cultivated in Eastern Archipelago.

Phoenix (date palm): Between 15° and 30° north latitude, from Atlantic Coast to the River Indus; Sahara oases. Cultivated in Acre, Palmyra, Jaffa.

ORDER LXI.—**Gramineæ**: Herbs; one thousand two hundred and ninety-eight genera.

Avena (oats): West central Asia, east central Europe. Cultivated in Scotland, Ireland, Norway, Canada, United States.

Hordeum (barley): Annual. Temperate western Asia. Cultivated in northern Russia, Siberia, etc.

Oryza (rice): Southern Asia. Cultivated in India, China, Japan, East Indies, Africa, southern Europe, Hungary, South America, southern United States.

Setaria (millet): China, Japan, India. Cultivated wherever oats and rye are, except in United States.

Saccharum (sugar-cane): Perennial. Cochin-China. Cultivated in West Indies, Brazil, Mexico, Louisiana, Mississippi, Missouri, Mauritius, southern India, Pacific Islands, northern Australia.

Sorghum (broom corn): Annual. Middle Africa. Cultivated in southern India, northern Africa, southern and middle Europe, throughout United States.

Secale (rye): Southern Russia and north of Black and Caspian Seas. Cultivated in northern Germany, Poland, Sweden, Norway, Russia, western Europe, United States.

Triticum (wheat): Cultivated in western Asia, western America, southern Russia, central and western Europe, southern Italy, Turkey, Syria, northern and southern Africa, Brazil, Chile, Australia. Great wheat-growing regions are southwestern plains of Russia and central plain of North America, and in southern California, northern India, England.

Zea (Indian corn or maize): America. Cultivated in United States, upper Canada, South America, Mexico, southern Europe, Africa, western Asia.

ORDER LXII.—**Coniferæ**: Shrubs, trees; thirty-two genera.

Abies (fir): Northeastern North America, Quebec, New Brunswick, Nova Scotia, middle States, western Wisconsin. Cultivated in England.

Chamæcyparis (cypress): Evergreen, cypress. Cultivated between 30° and 42° N. latitude in both hemispheres, Carolinas, Georgia, Florida.

Lumpinus (cedar): Trees and shrubs. Middle and western Europe, northern Asia, North America.

Larix (larch): Mountains of middle Europe, north of New York to Pacific Ocean.

(2) *Gymnosperms* (*jīm 'gō-sperms*).—Plants producing naked seeds (*i. e.*, seeds not inclosed in an ovary), as the common pine and hemlock.

This second division of flowering plants (*phanerogams*) includes four living groups: (a) Coniferæ, including all evergreen trees, such as pine, fir, redwood (*Sequoia*), etc.; (b) Cycadaceæ, trees such as cypress, palmetto, etc.; (c) Gnetaceæ; (d) Ginkgo. There are about five hundred living species.

ORDER LX.—

ORDER LXX.—

SUB-KINGDOM II.—Flowerless Plants, or Cryptogamia (*krīp 'tō-gā 'mī-ā*).

(3) *Pteridophyta* (*tēr-i-dōf 'ī-ta*).

This group does not include over five thousand species altogether. All its members have a well-marked differentiation into leaves and stems, some with large leaves like the Bracken fern and some with small leaves like the Club-moss. All are provided with well-differentiated wood and phloem, which are arranged in bundles in the stem. All the members, also, have a well-marked alternation of generations, but it differs from that of the bryophytes, for the leafy plant which is conspicuous is the spore-producing generation, while the sexual generation is a very small and inconspicuous little structure, as simple as an alga except for its sexual organs. To this cohort belong all the ferns, all the Equisetums, or Horsetails, and the Club-mosses and Selaginellas.

(4) *Bryophyta* (*brī-ōfī 'tā*).

The *Bryophyta* form a much smaller group, reported to have about sixteen thousand species. Some of these appear, as do the mosses, to have true leaves, but their apparent leaves are not really like those of the higher plants. They have no true wood or vessels. They have a definite alternation of generations, but the spore-producing generation grows on to the "leafy" sexual generation, and is generally, but wrongly, called its "fruit capsule." To this group belong the Mosses and Liverworts.

(5) *Thallophytes* (*thāl-ō-fītz*).

The *Thallophytes* have the largest number of species after the Angiosperms, and number about eighty thousand species all told. They are all comparatively simple in structure and have no differentiation into stems and roots. The Thallophytes include the algæ, the large fungi, the toadstools, and all the parasitic and disease producing forms of plants.

ALGÆ are divided into FLORIDÆ, the Red Seaweeds, and the orders *Dictyotæ*, *Oösporeæ*, *Zoösporeæ*, *Conjugatæ*, *Diatomaceæ*, and *Cryptophyceæ*.

FUNGI include the molds, mildews, mushrooms, puffballs, etc., which are variously grouped into several sub-classes and many orders. The *Lichenes* or Lichens are now considered to be of a mixed nature, each plant partly a Fungus and partly an Alga.

THE ANIMAL KINGDOM

SCIENTIFIC CLASSIFICATION OF ANIMALS. MAMMALS: The Monkey Tribe; Animals of Prey; Hoofed Animals; Gnawing Animals; Thick-skinned Animals; Toothless Animals; Pouched Animals; Flying Mammals; The Seal Family; Whales. BIRDS: Song Birds; Birds of Prey; Game Birds; Running Birds; Wading Birds; Swimming Birds. CROCODILES AND OTHER REPTILES. FROGS AND OTHER AMPHIBIA. FISHES. LOBSTERS AND CRABS. INSECTS: Beetles, Butterflies and Moths; Ants; Bees and Wasps; Spiders; Grasshoppers and Locusts; Flies and Mosquitoes. SIMPLE MARINE ANIMALS: Starfish; Jellyfish; Corals; Sponges; Protozoa. DOMESTICATED ANIMALS: Domesticated Mammals; Domesticated Birds; Domesticated Fish and Insects. DICTIONARY OF SCIENTIFIC TERMS.

Of all the sciences, Zoology is the most extensive. It is estimated that over two million species of living creatures exist in the world. Between the elephant and the whale, the giants of animal creation, and the mite that is just discernible with the human eye, there are myriads of creatures differing in size, form and habit.

WHY AND HOW ANIMALS ARE CLASSIFIED

It is highly desirable, therefore, to have before us a bird's-eye view of the Animal Kingdom even if it is only occasionally brought into actual use by the average reader. Classification, it should be understood, is only a process of comparison for the purpose of enabling us to determine the exact place of each animal in the plan of Nature. In other words it is simply a scientific method of naming the various animals from the relation of their resemblances.

We are chiefly indebted to the great Swedish scientist Linnæus for the scientific method of naming animals. For his purpose, Linnæus used the Latin as the universal language of science. For example, he named the dog in his classification *Canis familiaris*, using a generic word and a specific word—just as they are used in the name of George Washington. In scientific classification, however, these names have become abstract terms, and they represent certain grades or degrees of resemblance which are spoken of as species, genera, families, orders, classes, and so on.

SCIENTIFIC CLASSIFICATION OF THE DOG

In this way we determine the exact place of each animal. The dog belongs to the kingdom *Animalia*, sub-kingdom *Metazoa*, class *Mammalia*, order *Carnivora*, family *Canidæ*, genus *Canis*, species *Familiaris*, variety *Hound* (possibly) and its individual name, perhaps, is "Rover."

The important thing is that the reader should have a picture of the actual animal representing each class in his mind's eye. He should master the distinctions between the *great groups*, or classes, before proceeding to a more minute classification.

TABULAR VIEW OF REPRESENTATIVE ANIMAL TYPES

The present day classification of animal life falls into two great divisions: (1) *Protozoa*, representing those composed of a single cell; and (2) *Metazoa*, those whose bodies are composed of many cells. The Protozoa, so far as known, form a single division or branch of the animal kingdom, and the Metazoa comprise various higher branches. In the following table the divisions are given from the highest forms to the lowest, rather than in the reverse order frequently given, and sets out the chief characteristic and animal examples of each division.

ANIMAL KINGDOM (*Kingdom Animalia*)

SUB-KINGDOM METAZOA (Gr. *meta*, after; *zoon*, animal).—Animals with cellular tissues, true eggs, and blastoderm. The group comprises all animals except the Protozoa.

CLASS I. **Mammalia** (Lat., *mamma*, breast).—Animals which suckle their young, bringing them into the world alive. *Examples*: man, monkey, ox, elephant and whale.

ORDER I. **Primates** (Lat., *primus*, first).

Sub-Order I.

Bimana (Lat., *bis*, twice; *manus*, a hand).—Two-handed animals. *Example*: man.

Sub-Order II.

Quadrumana (Lat., *quatuor*, four; *manus*, a hand).—Four-handed animals. *Example*: the monkey.

ORDER II. **Chiroptera** (Gr., *cheir*, a hand; *pteron*, a wing).—Hand-winged animals. *Example*: the bat.

ORDER III. **Insectivora** (Lat., *insecta*, insects; *voro*, "I devour").—Insect-eaters. *Examples*: the hedgehog and mole.

ORDER IV. **Carnivora** (Lat., *caro*, *carnis*, flesh).—Flesh-eaters. *Examples*: lion, tiger, fox and weasel.

ORDER V. **Rodentia** (Lat. *rodere*, to gnaw).—Gnawing animals. *Examples*: rat, rabbit and beaver.

ORDER VI. **Ungulata** (Lat., *ungula*, nail, claw or hoof).—Hoofed animals.

Sub-Order I.

Hyracoidea (Gr., *hyrax*, shrew-mouse).—*Example*: Syrian hyrax.

Sub-Order II.

Proboscidea (Lat., from the Gr., *proboskis*, an elephant's trunk; literally a front-feeder), proboscis-bearers. *Example*: elephant.

Sub-Order III.

Perissodactyla (Gr., *perisos*, superfluous; *daktulos*, finger or toe), odd-toed animals. *Examples*: tapir, rhinoceros, horse, ass, and zebra.

Sub-Order IV.

Artiodactyla (Gr., *artios*, equal; *daktulos*, finger or toe), equal-toed animals.

GROUP I. **Pecora** (Lat., plural of *pecus*, cattle) or Ruminantia (Lat., *rumen*, a paunch).—Ruminating or cud-chewing animals. *Examples*: ox, sheep, goat, antelope, deer and giraffe.

GROUP II. **Tragulina** (Gr., *tragos*, goat), or Deerlets. *Example*: kanchil.

GROUP III. **Tylopada** (Gr., *tylos*, a knob or swelling, and *pous*, *podos*, a foot).—Ruminants with digits encased in cutaneous pads. *Example*: camel.

GROUP IV. **Suina** (Lat., *sus*, a pig).—Swine-like animals. *Examples*: swine, peccary and hippopotamus.

ORDER VII. **Sirenia** (Lat., *siren*, a sea nymph).—Sea-cows. *Examples*: manatee and dugong.

ORDER VIII. **Cetacea** (Gr., *ketos*, a whale), animals of the whale kind. *Examples*: whale and dolphin.

ORDER IX. **Edentata** (Lat., *edentatus*, toothless).—Toothless animals. *Examples*: sloth, anteater and armadillo.

ORDER X. **Marsupialia** (Lat., *marsupium*, a pouch).—Pouched animals. *Examples*: kangaroo and opossum.

ORDER XI. **Monotremata** (Gr., *monos*, single; *trema*, orifice).—Egg-laying mammals. *Examples*: duckbill or water mole.

CLASS II. **Aves** (Lat., *avis*, a bird).—Birds, animals produced from eggs by the application of heat, usually supplied by the body of the mother bird in close contact with them. They are always clothed with feathers, which are a part of their special construction for flight. *Examples*: eagle, swan, ostrich and lark.

ORDER I. **Birds of Prey** (*Raptores*).—Sharp, curved beak and talons; strong legs; three toes front, one behind. *Examples*: vultures, falcons, secretary birds, owls.

ORDER II. **Perching Birds** (*Insectores*).—Short, slender, legs; three toes front, one behind. *Examples*: swallows, trogons, kingfishers, humming-birds, warblers, thrushes, crows, starlings, finches, hornbills, birds of paradise.

ORDER III. **Climbing Birds** (*Scansores*).—Toes paired; beak usually hooked. *Examples*: toucans, parrots, woodpeckers, cuckoos.

ORDER IV. **Doves and Pigeons** (*Columbæ*).—Legs weak; wings long and pointed. *Examples*: doves, pigeons.

ORDER V. **Game Birds** (*Gallinæ*).—Legs stout, short; beak stout, arched. *Examples*: pheasants, grouse, partridge, turkey, peacock, guinea, prairie chicken, domestic chickens.

ORDER VI. **Ostrich Family** (*Cursores*).—No keel or breast bone; rudimentary wings; stout legs. *Examples*: ostrich, cassowary, bustard.

ORDER VII. **Wading Birds** (*Grallatores*).—Legs and neck long; knee free from body. *Examples*: cranes, herons, snipes, plovers, storks, flamingo.

ORDER VIII. **Swimming Birds** (*Natatores*).—Web-footed. *Examples*: swans, ducks, geese, pelicans, petrels, auks, penguins, gulls, cormorants.

CLASS III. **Reptilia** (Lat., *repto*, "I creep").—Reptiles, cold-blooded animals, protected by scales and not infrequently by hard, bony plates. They are mostly oviparous, but developed from the eggs more or less casually by the heat of the sun. "Reptile" is not an apt name, for there are many members of the class that do not creep. *Examples*: crocodile, lizard, tortoise and snake.

ORDER I. **Serpents** (*Orphidia*).—Body long, cylindrical, scaly, usually limbless; numerous vertebrae and ribs; no eyelids. Lower jaw loosely united in front. *Examples*: rattlesnakes, vipers, boas, pythons, cobras, copperheads, water snakes.

ORDER II. **Lizards** (*Lacertilia*).—Body with long tail; usually four limbs; scaly; bones of the jaw firm. *Examples*: striped and green lizards, horned toads, chameleons, iguana.

ORDER III. **Tortoises and Turtles** (*Chelonia*).—Horny and bony shell within which the head and limbs can be drawn; no teeth; eyelids; four legs. *Examples*: turtles, tortoise, gophers, terrapins.

ORDER IV. **Crocodiles and Alligators** (*Crocodylia*).—Covered with scales and bony plates, teeth in sockets; heart with four cavities; eyelids and ear lids. *Examples*: Crocodile and alligator.

CLASS IV. **Batrachia** (Gr., *batrachos*, a frog), or Amphibia (Gr., *amphibios*, having a double life).—Animals that can exist for a considerable time on dry land or in water. They are oviparous, hatched by the heat of the sun from eggs, covered with a soft, glutinous membrane, which the mother had laid in the water, and develop through tadpole stages. In the early period of their existence they are fishlike in their structure, breathing by means of gills and a two-chambered heart; in the later stages of their development they acquire lungs and a heart of three chambers. A true amphibian possesses at once both lungs and gills. *Examples*: frog, toad, newt and salamander.

CLASS V. **Pisces** (Lat., *piscis*, a fish).—Fishes, oviparous animals covered with scales, which form an important part of their special organization for life in the water. Their gills, acting as lungs, extract air from the water instead of from the atmosphere.

ORDER I. **Sharks and Rays** (*Elasmobranchii*).—Shagreen skin; gills fixed and uncovered; cartilaginous skeleton.

ORDER II. **Ganoïds** (*Ganoïdes*).—Enamelled plates or scales; gills free; skeleton partly cartilaginous. *Examples*: garpikes, mud-fish, lung-fish.

ORDER III. **Bony or Fin Fishes** (*Teleostei*).—Skeleton bony; scales; fins; usually four pairs of gills; mostly oviparous. *Examples*: bass, perch and ten thousand other kinds.

CLASS V. **Arthropoda** (Gr., *arthron*, joint; *pous*, foot).—Metazoa, with definite number of segments; jointed legs; distinct feet and hard, external skeleton.

ORDER I. **Crustacea** (Lat., *crusta*, a crust or shell).—Water-breathing; having gills and more than eight jointed legs; four antennae. *Examples*: fairy-shrimp, water-fleas, goose barnacle, acorn barnacle, opossum-shrimp, prawn, lobster, crayfish, cancer-crab, rock-crab, pill-bug, sand-hopper.

ORDER II. **Arachnida** (Gr., *arachne*, spider).—Eight legs; air-breathing. *Examples*: garden-spider, tarantula, bird-spider, trap-door spider, mite, tick, king-crab or horseshoe crab.

ORDER III. **Insecta** (Lat., *insectum*, cut in, owing to the grooves surrounding the body).—Distinct head, thorax and abdomen; air-breathing. *Examples*: fishmoth, springtail, cockroach, grasshopper, cricket, katydid, locust, dragon-fly, caddis-fly, may-fly, white ants or termites, ant-lion, water-boatman, water-bug, back-swimmer, chinch-bug, squash-bug, lice, plant-lice, scale-insect, gnat, mosquito, flea, house-fly, stage-beetle, wood-beetle, water-beetle, potato-beetle, ladybug, firefly, moth, butterfly, ants, honey-bees and bumblebees, wasps, hornets, yellow-jackets, centipedes.

CLASS VII. **Mollusca** (Lat., *mollis*, soft).—Soft-bodied, unjointed Metazoa, with muscular skin ("mantle"), generally protected by a calcareous shell; two or three-chambered heart; three main pairs of nerve-ganglia. *Examples*: Clams, oysters, snails, cuttlefish, devil-fish, nautilus.

CLASS VIII. **Echinodermata** (Gr., *echinos*, a hedgehog; *derma*, skin).—Radiated Metazoa, with distinct alimentary canal and well developed nervous system; body-walls secreting calcareous plates; parts in multiple of five. *Examples*: starfish, sea urchins, sea cucumbers, sea lilies, serpent or brittle stars, basket stars.

CLASS IX. **Worms** (Lat., *vermes*).—Bilateral Metazoa, with no jointed legs, nor primitive stripe. *Examples*: earth worm, leech, tube worm, tape worm, bristle worms, vinegar eel, rotifers.

CLASS X. **Cœlenterata** (animals with combined body and stomach cavity).—Radiated Metazoa, with distinct digestive cavity, tentacles and netting thread-cells. *Examples*: jellyfish, sea-anemones, coral polyps.

CLASS XI. **Porifera** (Lat., *porus*, pore; *fero*, to carry).—Sponges, Metazoa, with numerous ingoing openings, one or few outgoing orifices, a skeleton, independent cells. *Example*: sponges.

SUB-KINGDOM PROTOZOA (Gr., *protos*, first; *zoon*, animal).—One-celled animals of microscopic size. Simplest forms of animal life. *Examples*: amœba, bell animalcule (*vorticella*), euglena.

[191]

ANIMALS IN CLASSIFIED GROUPS

THE MAMMALS (*Mammalia*)

Mammals constitute the highest class of animal creation, and include Man. They have a hard, bony skeleton and a vertebral column or backbone; warm red blood flows in their veins; they breathe by means of lungs, and suckle their young, which they bring forth alive. Their bodies are generally covered with hair. More than three thousand species of mammals are known.

THE MONKEY TRIBE (*Quadrumana*)

Monkeys are animals whose four feet are hand-like, and hence their scientific name, *Quadrumana*, which means four-handed. They are distinguished from the other animals by their docility, and, more especially, by their power of imitation. It is evident at the first glance that they are nearer related to man than any other animal.

The monkeys have long, loosely hanging arms, with elongated, claw-like fingers; their feet resemble hands. They swing themselves with ease from branch to branch and from tree to tree; they are good climbers, and bring down fruit from the topmost branches. But notwithstanding the aptitude of their hands for climbing, the latter cannot equal the dexterity of the human hand, which is justly described as the tool of all tools.

Monkeys differ outwardly from man in many respects: their foreheads are low, and almost disappear under the overhanging hair; their ears are directed upwards; their nose is exceedingly flat and scarcely projects; their teeth resemble those of the animals of prey; their chin is receding; their entire skin is hairy, except in a few places; and their movements are, in most instances, only possible with the assistance of their long arms.

The intellectual qualities of monkeys are not of very high order. In this attribute, they are surpassed by the dog, the horse, and the elephant. There is especially no trace of those qualities of fidelity and gratitude which we so highly value in the animals last mentioned.

All of the American monkeys are true monkeys, but in the old world there is no line between ape, baboon, gibbon, macaque and monkey. Most of the American species (the marmosets excepted) have one more molar tooth on each side of each jaw than does man, but the forms of the eastern continent are like man in that respect, as they are in having nails rather than claws on at least some of the fingers and toes. Many of the new world species have prehensile tails, but this never occurs in the others, the tail exhibiting a tendency to be reduced, at last disappearing in the man-like apes.

The American apes have the nostrils widely separated and opening sidewise, while in the others they open in front and downward as in man.

Monkeys are extremely interesting because of their caricature of man. Some make most interesting pets, and others are disagreeable, in looks, temper, and habits. Most of them are vegetarians for most of their diet, but they are fond of eggs and young birds, as well as insects. None stray far out of the tropics and only one enters Europe at Gibraltar.

There are over one hundred various kinds of monkeys, only a few of which it will be necessary to describe with more detail.

Baboon (*Cynocephalus babuin*).—The Greek name, signifying "dog's-head," is very appropriate to the baboons, for they resemble a dog both in the shape of the head and in the hairy covering of the skin, and even in the tone of the voice.

They are very powerful animals, with protruding jaws like those of a bull-dog. Their jaws, supplied with immense incisor teeth, would do honor to any beast of prey, and their whole expression is fierce and malicious. Their limbs are strikingly short in comparison with those of the monkeys mentioned above. The baboons are found in Africa and the East Indies, and live chiefly in rocky and hilly regions, avoiding the woods as far as possible.

Their food consists of all kinds of plants, fruits, herbs, grasses, bulbs, etc., and also of small animals, especially snails, insects, and spiders. The structure of their body prevents them from walking upright, and their whole behavior, whether at rest or when running and jumping, exhibits a malicious disposition. Notwithstanding the fierceness of their nature, they may be tamed and made obedient when young; but their innate malicious nature reappears in old age. They are then no longer obedient, but again grin, scratch and bite.

Chimpanzee (*Simia troglodytes*) attains to the same height as the orang-outan; its body is covered with dark hair, and its hairless face is of a leathery yellow. It lives in forests, and is social and much livelier than the orang-outan, but it is also extraordinarily fierce. It builds hut-like constructions in the trees. The chimpanzee cannot live longer than a few years in our climate.

Dooc (*Semnopithecus nemæus*).—The dooc, or variegated monkey, is a native of Cochin-China. Its tail is almost as long as its body. From its variegated external appearance this monkey might be called a clown; its jacket is grey; its breeches, head-band, and gloves are black, its stockings brownish red; its sleeves, beard, loins, and tail white; its face yellow; and its necktie brownish red.

It is timid and shy, and at the sight of man quickly makes off into the recesses of the forest. It does not live long in captivity.

Galago (*G. senegalensis*).—They vary from the size of a rabbit to that of a rat, are covered with thick, soft, woolly fur, have somewhat bushy tails longer than the body, and hind-legs longer and stronger than the arms. The head is round like a cat's; the eyes are large with oval pupils contracting in daylight to vertical slits; the ears are naked and very big, expanded during activity, but rolled together when the animal rests. The digits are strong and well adapted for grasping the branches; all bear nails except the second on the hind-foot, which is clawed. The galago proper is a pretty animal with woolly fur, grayish fawn above, whitish beneath. It seems to be distributed throughout tropical Africa, and is known in Senegal as "the gum animal" from its frequent habitat in mimosa or gum-acacia forests.

Gorilla (*Simia gorilla*) is the largest of the monkeys, growing to a height of six feet. Its grey, sparkling eyes are deeply sunk, and the powerful bony forehead gives the face an expression of wild ferocity. The mouth is wide, and the lips are sharply cut, without any red at the edges; the jaws are extremely powerful, and are armed with strong incisor teeth. The eyes stand wide apart, and the nose is more prominent and the head better formed than is the case with the other monkeys.

Howling Monkey (*Mycetes niger*).—The coat of the male is black, that of the female rather brown. Their tails are what are known as prehensile tails, and are of great service to them when climbing. The howling monkeys are found in South America. They live chiefly in the dense, damp woods, and along the banks of rivers. Every morning and evening their dismal howling fills the hearer with horror. They sit or lie about in the trees, and sometimes hang from the boughs by means of their prehensile tails. Their faces have a serious expression, and are surrounded by long beards. Their dismal chorus is begun by one of the old monkeys, and the whole company afterwards join in, the concert often lasting several hours.

The Indians hunt the howling monkey and eat its flesh; but it very often escapes the hunter, even after having been mortally wounded; for while in the act of falling down from the tree it will twist its tail around a bough, and remain there suspended long after death.

Mandrill (*C. mormon*).—This monkey has a repulsive appearance. The high puffed-up cheeks are blue with red lines, the nose a fiery red, the hair of the head greyish green, and the whiskers lemon yellow. It is as malicious and violent as it is rapacious, and is found on the west coast of Africa. It is much feared on account of its strength. As it feeds chiefly on plants, it frequently does a great deal of damage; troops of these animals are said to have invaded the inhabited districts on the coast.

The mandrill does not fear man, and is never to be frightened by a gun-shot; the smallest trifle suffices to put it in a most violent rage. The natives very rarely dare to enter the forests in which the mandrills are known to live.

Marmoset (*Hapale Jacchus*).—One of the few monkeys that can with truthfulness be termed pretty is the Marmoset. There are several species, and all are beautiful, with the gentle, engaging manners. Only seven or eight inches long, or about as big as a full-grown rat, the thick, soft fur and the long, bushy tail, a foot in length, give it the aspect of a considerably larger animal. The color of the coat is a peculiarly rich brown, which appears quite ruddy when the hairs are blown aside. The tail, which is not prehensile, is light grey, ringed with black, and there is a prominent tuft of white hair on either side of the head, standing out before the ears. The Marmoset has claws instead of nails except on its great toe. Its voice is a low, gentle whistle, quickly repeated when alarmed. It is common in many parts of South America. Its chief food consists of fruit, but it is very fond of insects.

GALAGO (Page 192)

HEDGEHOG (Page 195)

Orang-Outan (*Simia satyrus*).—The orang-outan is found in the islands of Borneo and Sumatra. It attains to a height of four and a half feet. The face and the inside of its hands are hairless, and are of a bluish-grey tint; but the other parts of its body are covered more or less thickly with hair, generally of a rusty-brown color. Its hands reach almost to the ground.

[194]

When at liberty it feeds on plants only, and especially on tree-fruits. Hard shelled-fruit, as big as a human head, which a man could only open with an axe, the orang-outan tears asunder with its hands. It is by no means so lively as the monkeys, and sits for hours at a time in a melancholy mood on the bough of a tree, exhibiting only the natural fierceness of its class when attacked.

In youth it is sociable, and lives with others of its kind, but when old it leads a more solitary life; the old males are especially fond of solitude. With increasing age the orang-outans scarcely ever climb the trees. On the ground, however, they move with difficulty, and their gait is awkward and clumsy. They build a kind of nest in the thick branches nineteen or twenty feet above the ground. Their attachment to their young is very touching.

Wanderoo (*Macacus silenus*).—A remarkable species which the Ceylonese call Black Monkey, on account of the color of its long fur. On the top of its head the hair is particularly long, falling on either side of its face like the full-dress wig of a judge. It also possesses a long grey beard, so that it has quite a venerable aspect. Unlike the other macaques, it has a tuft of hair on the end of its tail, much like that of a lion. The wanderoo is furnished with cheek pouches of considerable size; and probably the rapidity with which it feeds is due to the fact that it is storing away a portion of its food for future use. The animal stands about thirty inches high, weighs as much as eighty pounds, and is possessed of considerable muscular power.

THE ANIMALS OF PREY

The animals of prey proper are very powerful, and some of them are even dangerous to man; they feed on the flesh of other animals. The Insectivora, or insect eaters, are, on the contrary, small; they feed chiefly on insects and worms, and are therefore useful. Of these several groups are distinguished: the cat-like, hyaena-like, dog-like, marten-like, and bear-like animals of prey.

Badger (*Meles taxus*).—The compact body of the badger is covered with blackish fur, with white stripes at the neck and head. It lives in forests, near fields and vineyards, where it digs burrows, with about six to eight passages leading to a kettle-shaped chamber, which lies from four to six feet under the surface. It sleeps in the daytime and during the winter, but at night it goes out on its predatory excursions. Its food consists of insects, worms, snails, frogs, snakes, birds' eggs, young hares; nor does it despise fruit, roots, and honey. The badger is very wary, and defends itself with great courage in its burrow. It is hunted chiefly for its fur; its flesh is rarely eaten. Paint brushes are made from its hair.

Bear, Brown (*Ursus arctos*), also called the common or European bear, has a shaggy light or dark brown fur. It is only about five feet long, and attains a weight of five hundred to six hundred pounds. Its home is in the temperate regions of Europe and Asia. Although not so strong as the polar bear, it is not to be despised as an adversary. It is the king of the northern forests. When attacked it will place itself in an erect position, and try to tear its enemy with strokes of its paws. In the fables of animals it is represented as an awkward, foolish simpleton, who is always brought to shame and disgrace by the cunning of the fox. It can easily be tamed, and nearly everybody has seen its clown-like performances. Its habitation is in caverns or hollow trees. Its flesh is eaten, and its fur used like that of the polar bear.

Bear, Polar (*Ursus maritimus*).—Its fur is quite white. Its body attains eight feet in length, and weighs from fifteen hundred to sixteen hundred pounds. It inhabits the most northern parts of Europe, Asia and America. Its movements are equally quick on water and land; and it is a terrible animal of prey, attacking even man with the greatest fury. It pursues its predatory excursions on the numerous islands of the northern polar regions, and its chief food is fish and seals. Sometimes it will come into more southern latitudes, when it causes terrible havoc among the herds, and only with the greatest difficulty can this strong and fearless animal be killed. The polar bear has its home in the regions of everlasting snow, and can only obtain the necessities of life by means of never-ceasing activity. It often uses a sheet of ice as a raft to transport itself to spots where it can obtain its prey. Its flesh is eaten; its fat is used for food and fuel, and its fur for carpets and rugs.

Caracal (*Felis* or *Lynx caracal*), a species of lynx found in the warmer parts of Asia and throughout the whole of Africa. It is larger than a fox, about the same height, but much more powerful; of a uniform deep chestnut color, except two spots near each eye, the under parts of the body, and inner parts of the legs, which are white, and tufts of long black hair which terminate the ears. The young forms are spotted. The ears are about three inches in length. The caracal is powerful enough to tear a hound to pieces.

Fox (*Canis vulpes*).—The common fox, also called red fox, has thick, soft fur, which is, on its upper parts, a light rust red, and on its lower parts whitish. Its body attains a length of thirty inches. Its long tail is bushy, and ends in a white tip.

[195]

The fox is a common inhabitant of the whole of Europe, and of the northern parts of Asia, America, and Africa. It inhabits forests and woods, where it lives with its mate in caverns. In rapacity it is nearly equal to the wolf; but it can master its cupidity and wait for better opportunities if danger should threaten. No animal is the subject of so many fables. "Master Reynard" is always the cunning rogue, who outwits his adversaries. Only on behalf of their young will the male as well as the female fox risk their lives; intense love will then overcome every fear and precaution.

The fox hunts hares, fowls, geese, and ducks, and even fish; but it always destroys a great number of mice, whereby the injury done by it is partly equalized. Its cover has always several exits. If found to be rather deep, it was not constructed by the fox, but by a badger, which either left its burrow willingly or was driven out by the new tenant. The fox is hunted in different ways.

Hedgehog (*Erinaceus Europæus*).—The hedgehog is likewise an inhabitant of the underground world, for it lives in holes below the roots of trees, and under heaps of stones. Its body, with the exception of its belly, is covered with sharp spines, and its feet are short and strong. It begins to hunt for its prey in the darkness of the night. Should it be disturbed it will suddenly roll itself up into a ball, its sharp spines projecting in all directions. In this condition no dog can get at it; but, if water is poured on it, it will unroll again. Its spines are also of great service to it in other ways; for when rolled up it can let itself down the steepest precipices, and fall from walls ten feet high, without sustaining the smallest injury.

The hedgehog may also be called a useful animal; for it destroys mice, rats, and vermin of all kinds, and will even feed on vipers, as poison does not effect it. Its flesh is eaten in some countries.

Hyena (*Hyaena maculata*).—This whitish-grey and white-spotted animal attains a length of four feet, and has its home in Southern and Eastern Africa. It has a repulsive appearance, and emits a very disagreeable odor. Hyenas remain hidden during the daytime; in the evening and during the night they go out in quest of prey. They are great cowards, and sometimes encircle human habitations in troops, and fall on their sleeping prey. Hyenas force their way even into villages, clear off the decayed animal matter, and dig the corpses out of their shallow graves. The HYENA DOG (*Canis pictus*) does not belong to the hyenas proper, but to the dog-like animals of prey. It inhabits the central and southern parts of Africa, and is very dangerous to the antelopes and the herds of sheep; it also attacks cattle.

Ichneumon (*Herpestes ichneumon*).—This animal is also called Pharaoh's rat. It inhabits Africa, and was considered a holy animal by the ancient Egyptians. The color of its hair is greenish-grey, somewhat darker on the head and back. Its snout is rather short; its tail ends in a tuft. It feeds on rats, mice, toads, frogs, and snakes, birds' eggs, and the eggs of crocodiles.

Jackal (*Canis aureus*).—Very similar in appearance to the fox, the hair of the jackal is of a dark rusty yellow, whitish on its lower parts. It inhabits Asia and north Africa, and is also found in the south-eastern parts of Europe, in Greece, and Turkey. It makes its excursions during the night in troops. Like the hyena, the jackal prowls round the herds and human habitations, and, failing living prey, is content with carrion.

Jaguar (*Felis onca*), sometimes called the American tiger, has reddish-yellow fur, spotted with black. It inhabits South America, from Paraguay to Mexico, and is the largest and most dangerous animal of prey in those parts of the globe. The jaguar lies in wait for all sorts of animals, and shows a great fondness for fish; but most frequently it attacks grazing animals. It does not even hesitate to spring upon man.

Leopard (*Felis pardus*).—Now generally supposed to be identical with the panther. The leopard is at home in Africa, from Algeria to Cape Colony; it is also found in Asia, from Palestine through central Asia to Manchuria. It is characterized by a peculiar gracefulness, slenderness and flexibility of form, with a very long tail, and spotted fur, the spots being arranged in numerous rows along the sides, and each spot composed of five or six small spots arranged in a circle or rosette. The general color is yellowish; the lower parts lighter; the spots darker than the general color of the fur. The leopard is extremely agile, and possesses the power of leaping and also that of climbing trees in great perfection. Deer and antelopes are its habitual prey; but it is equally ready to feed on pigs, poultry, or whatever animals may be found in the vicinity of a farm or village. The size and strength of the leopard render it dangerous to man; but it generally seems to dread and flee from man, unless assailed.

Lion (*Felis leo*).—The lion is covered with short, smooth hair, which lies close to the skin. Its fur is mostly of a uniform yellow color. A male lion measures about ten feet in

length; the female is about a foot shorter. The male has a long mane on its neck and breast. Its claws are retractile—*i. e.*, may be drawn back entirely into their sheaths. At the end of the tail is a horny point, which is surrounded by a tuft of hair.

The lion, the king of animals, inhabits the Old World, Africa and Asia and was formerly also found in Greece and Macedonia. The majesty of terror and violence accompanies its movements. Its most striking qualities are courage, pride, and circumspection. It chooses lonely spots with rocky caves for its habitation, where it passes the day in sleep.

At the beginning of twilight it rises from its couch, stretches its limbs, and gives vent to a roar which makes man and beast tremble far and wide. Then it begins to roam through the neighborhood; and woe to the animal or man who approaches too near to it! It crouches like the cat, and will sometimes spring thirty feet. The results of such an attack are terrible; for with one stroke of its paw it can kill a galloping horse, together with its rider. But it rarely attacks man.

The lion often overcomes animals larger than himself by means of his stealthy, cat-like habit of springing upon them unawares. He preys upon buffaloes, zebras, and even young elephants. Lions sometimes go in troops, being sociable rather than gregarious. The male aids in care and feeding of the young, which number from two to four, usually three, at a birth. The pupil of the lion's eye is circular when contracted, not a narrow slit, as in the cat. The papillæ of its tongue are so large that it can rapidly rasp the flesh from bones by licking them.

Lynx (*Felix lynx*).—This animal, which is widely spread, is of a reddish grey, with darker spots on its upper parts and white on its lower parts. It is frequently seen upon the Alps, the Carpathian Mountains, and in the north of Europe and Asia. Hidden in the tops of low trees, it lies in wait for the passing animals, and springs even upon horses and stags. It commits great havoc among game, and is therefore eagerly hunted. Every year about fifty thousand furs of the common lynx and its nearest relations, the desert, polar, red, pardel, and bog lynx, are sold in the markets of the world.

Marten (*Mustela martes*).—The tree marten has a yellowish-brown fur and a reddish-yellow patch across its breast. It inhabits Europe and the western parts of Asia. It is always found in forests, where it lies hidden in hollow trees. It not only causes great destruction among game, but is also a great robber of useful birds. It also hunts squirrels, which, as soon as they get sight of it, try to escape as rapidly as possible.

Related to the tree marten are the **STONE OR HOUSE MARTEN** (*M. foina*), which generally lives in the neighborhood of human habitations, and destroys poultry and eggs: the **POLE CAT** (*Putorius fætidus*), which lives in the same localities and has the same injurious habits as the house marten: the small **WEASEL** (*P. vulgaris*), is reddish brown on its upper parts, but on its lower parts whitish, and is over seven inches long. It is a useful animal, as it feeds chiefly on rats, mice, and badgers; it is also fond of eggs, which it carries under its chin: and the **ERMINE** (*P. ermineus*), the fur of which is of a dazzling white color in the winter, and is the most valued of all furs.

Mink (*Putorius*), a name applied to several carnivores in the same genus as weasel, polecat, ferret, and ermine, and with essentially similar characteristics. The body measures from twelve to eighteen inches in length, not including the bushy tail. The color of the valuable fur is chestnut-brown. The Siberian vison (*P. sibiricus*), the European vison (*P. lutreola*), and the American mink (*P. vison*) are very nearly related. They all live by rivers and lakes, feeding chiefly on fishes, frogs, mussels, and the like; though not refusing any small mammals which come in their way.

Mole (*Talpa Europea*).—The mole is one of the most interesting of the smaller animals. It inhabits meadows, fields, gardens, and forests where it finds its food. It lives in the earth, and digs out its "runs," at the same time throwing up mole-hills. The mole feeds on grubs, caterpillars, chrysalises, maggots, crickets, lizards, snakes, frogs, mice, and rats, and does not even spare its own kindred. The formation of its body, which is about six inches long, enables it to seize these different kinds of prey with ease; for it is cylindrical and wedge-like in shape, with a long, flexible snout, and very large fore paws, furnished with five strong nails. Its head is placed deep between the shoulders—no neck is visible; its eyes are very small, and covered with hair; and there are no exterior ears. Its hind paws are longer but weaker than the fore limbs, and its tail is short. Its fur consists of short, velvety hair.

The mole nearly always lives a solitary life. It is very quarrelsome and rapacious. The weasel, fox, marten, hedgehog, owl, buzzard, falcon, raven, the viper, and man all threaten its life. Against these enemies it is, however, well protected by its dark fur, by the keenness of its senses of hearing and smell, and by its rapid movements, and the ingenious architecture of its burrow. The latter is a real fortress.

CURIOUS STRUCTURE OF A MOLE HILL

It consists: (1) Of the **chief structure**, which is about two feet deep, below the roots of trees or ruined walls. This consists again of an almost spherical sitting-room (*a*), about four inches square, which is stuffed with grass and hay, from which leads a descending passage (*b*). Round the sitting-room there are two circular galleries (*c*), the upper one of which is connected with the sitting-room. (2) Of a number of runs (*d*), which are twelve to sixteen inches long, and radiate in all directions; they are connected with each other by cross passages. (3) Of the chief passage, into which all the runs open in the form of arches, and which leads to the hunting grounds. (4) Of the hunting passages, which run in all directions.

In this burrow from four to six young ones are born between the middle of April and June. The mother nurses them with the greatest tenderness, carrying them away in her mouth whenever danger threatens. But as soon as they are able to take care of themselves the parents drive them out of their home, and begin to lead a solitary life again. The mole is a very useful animal, because it destroys so many injurious insects. Although it does some harm by means of its mining operations, it is, nevertheless, more useful than destructive, and ought, therefore, not to be destroyed unless absolutely necessary.

Mongoose.—A small carnivorous animal of India, noted as a destroyer of snakes, and accordingly encouraged. It does not hesitate to attack the most venomous serpents, killing them by agility and having no protection against their poison except its hair and ability to dodge the blows. The mongoose and its near relative, the ichneumon of northern Africa, are gray and a little larger than a rat. All make interesting pets.

Ocelot (*Felis pardalis*) is a species, with several varieties, which is confined to the New World, and ranges from Arkansas in the north to Patagonia. These animals are inhabitants of forests, and very expert in climbing trees. Their prey consists in great part of birds. They are beautifully marked and colored. The coloration varies considerably, but the ground tint is always a rich red or tawny color; the head, neck, and legs being also variously spotted or barred with dark brown or black.

Otter (*Lutra vulgaris*).—On the upper parts, the fur of the otter is dark brown, while on the lower parts it is lighter brown. Its body is about thirty inches long, and its tail eight inches; between its toes there are web membranes. The otter is rather a water than a land animal. On land it is clumsy and uneasy in its movements, but in the water quick and persevering. It hunts fish, and its sharp eyes greatly assist it in this hunt. It is very seldom seen, as it is very shy and constantly hiding, mostly committing its depredations during the night. Otter hunting is, therefore, difficult; but in winter, when the snow has just fallen, and the water has been frozen over, the spots may be found where the fish otter enters the water. There it can be killed with a spear.

Puma, Cougar or Mountain Lion (*Felis concolor*).—Generally distributed in North and South America, but rare in those parts which have been long settled. It is sometimes called the American "lion," "panther" (painter), or "catamount." The fur is thick and close, dark yellowish red above, lighter on the sides, and reddish white on the belly; the muzzle, chin, throat, breast, and insides of the legs are more or less white. Young pumas have dark brown spots in three rows on the back, and scattered markings elsewhere. The long tail is covered with thick fur, and is slightly coiled. They are agile in their movements, and can leap and spring well, but swim only under compulsion. Many kinds of mammals fall victims to the pumas, and they are the more disastrous to flocks and herds because of their habit of killing many more than they devour.

Raccoon (*Procyon lotor*).—The fur of the raccoon is a yellowish-grey-black; its body is about twenty inches long, and its tail ten inches. It inhabits North America, and feeds on fruit, birds' eggs, etc. It has received its name because it is in the habit of rinsing dry and bloody-stained food before eating it, rubbing it between its fore paws. The eagerness with which it is hunted is best illustrated by the fact that every year about half a million of its furs are brought into the market. The flesh of the raccoon is eaten, and its hair is used for paint brushes.

Sable (*Martes zibellina*), a species of Marten. The feet are covered with fur, even on the soles, and the tail is rather more bushy than in the martens. The length, exclusive of the tail, is about eighteen inches. The fur is brown, grayish yellow on the throat, and small, grayish-yellow spots are scattered on the sides of the neck. The whole fur is extremely lustrous, and hence of the very highest value. The sable is a native of Siberia, widely distributed over that country, and found in its coldest regions, at least wherever forests extend. It is a very wary animal, and not easily captured. It makes its nest in a hollow tree, or sometimes, it is said, by burrowing in the ground, and lines it with moss, leaves, and grass.

Shrew (*Soricidae*), a family of insectivorous animals closely resembling, in general form and appearance, the true mice and dormice, but in reality widely differing from and not to be confused with those rodents. The shrews have the head small, muzzle long and pointed, eyes small but well developed, external ears usually small; body mouse-like, covered with hair; limbs short, nearly equal in size, the feet not adapted for digging; tail nearly naked and scaly. Along the sides of the body, or at the root of the tail, are peculiar glands, which secrete a fluid of a very strong odor. The shrews are very widely distributed, being found over North America and the whole of the eastern hemisphere except Australia.

The **DWARF-SHREW** (*S. pygmaeus*) is the size of a cockchafer; it is the smallest of the mammalia, and is so voracious that when hungry it attacks and kills its own kind.

Tiger (*Felis tigris*).—The tiger is the largest and most dangerous of all the animals of prey. It varies from a yellowish brown to a rust red in color. It has neither a mane nor a tuft to its tail. Its length amounts in all to about eight feet, of which thirty-two inches belong to the tail. It inhabits chiefly the southeastern part of Asia. The tiger displays neither courage nor pride; but cowardice, cruelty, and malice, with no trace of majesty. Its strength and rapidity are astonishing. Tigers, when driven by hunger, even enter the villages, and often force the inhabitants to retire altogether. They are especially fond of human flesh. When lying in ambush, their eyes sparkle through the darkness. Horses scent them from long distances; and fear of this terrible foe almost paralyzes them.

Wolf (*Canis lupus*).—The fur of this animal is yellowish grey with blackish spots; in its lower parts its color is lighter. It is the size of a shepherd's dog. Its whole appearance is unprepossessing; its body is lean and long; its expression malicious; its ears erect. When it cannot obtain its favorite food, game or sheep, it feeds on mice, frogs, and carrion. It sometimes attacks even horses, attempting by a bold jump to seize them by the throat and pull them down. It knows how to avoid their kicks, and also how to secure itself against the horns of oxen. It is ordinarily a coward, like the hyena; but when hungry fears nothing. It carries away sheep under the very eyes of the shepherd, and even forces its way into stables. It is cunning and sly, and knows how to make use of the best opportunities. It is as strong as it is tenacious of life; with a sheep in its mouth it runs off at a trot; sometimes a dozen bullets are not sufficient to kill it.

The wolf was formerly spread over all Europe. At the present time it is still found in great numbers in Hungary, Galicia, Russia, and Scandinavia, in the Alps and Pyrenees, the Ardennes and Bosges, and in the northern parts of America, Africa, and Asia, also in central Asia. It sometimes becomes rabid.

PRAIRIE WOLF, or **Coyote** (*Canis latrans*) has now been extirpated over large tracts in Kansas, Nebraska, etc., but it may still be found where the common wolf has disappeared, owing to its smaller size and less dangerous character.

GNAWING ANIMALS, OR RODENTS

The rodents are for the most part small animals, but their lack of size is made up by their great numbers. They have in the upper as well as in the lower jaw two chisel-like incisors, and from two to six molar teeth. The latter are separated from the incisors by a great gap. In the hares there are two little tack-like teeth behind the incisors. The incisors wear away on the inside more than on the outside, so that they are always very sharp.

The rodents feed chiefly on plants. Some of them collect food for the winter; others sleep during the whole of that period. They inhabit all parts of the globe, but are more numerous in North America than anywhere else.

Beaver (*Castor fiber*).—The true beaver is now found in only a few places in northern parts of Europe and Asia; but in North America a variety of this animal, the American beaver (*Castor Canadensis*), abounds in great numbers. It is now much hunted, as was formerly the European variety, and the number of beaver furs sold in the markets every year can be counted by thousands.

On the upper parts the fur is dark chestnut brown, while on the lower parts it is lighter; its tail is almost bare, scaly, and twelve inches long; the length of its whole body is thirty-two inches.

Beavers build lodges which contain many compartments, close to rivers and lakes. These lodges consist of branches, tree-trunks, and mud, and are divided into many different compartments. Such habitations are built in pairs, one above the other, and lead into the water. As tools they use their fore feet and their sharp teeth, by means of which they fell stems of the thickness of twelve inches. They are shy, and do not leave their homes before darkness in search of food, which consists of tender barks and

other vegetable matter. For the winter they collect large stores of provisions. As the beavers are awkward on land, they try to save themselves by jumping quickly into the water when pursued. They are then in their own element, and are good swimmers and divers. They are caught by means of nets and traps, which are placed close to their lodges. Their soft furs are valuable. Though the subject of numerous stories, the sagacity of the beaver is much exaggerated.

Chinchilla (*C. lanigera*).—A South American rodent, well known by its soft, gray fur. Two related animals form, along with the true chinchilla, a small family in the porcupine section of the Rodent order. All the three are somewhat squirrel-like animals, but have long hind legs, bushy tail, very soft fur, and complete collar bones. The chinchilla proper has a body about one foot long, and the tail measures fully six inches. They are extremely active animals, and climb among the rocks with the greatest agility. They are killed in thousands for the sake of their fur.

Dormouse (*Muscardinus avellanarius*) is a pretty little animal, about three inches in length, not including the bushy tail, which is almost as long as the body. The general color is a beautiful tawny yellow, but there is white on throat and breast. It is widely distributed and is especially fond of hazel-copses. It feeds on nuts, seeds, berries, buds, etc., grows very fat in autumn, sleeps intermittently through the winter in a round grassy nest a little above the ground. The loir or fat dormouse (*Myoxus glis*) is about twice the size of the common dormouse, and has the hairs of the tail in two rows, as in squirrels. It is ashen-gray, sometimes brownish above and white below. The favorite haunts are in oak and beech woods.

Hare (*Lepus timidus*).—Hares and rabbits are of various colors, some brown, some grey, while others are whitish; their ears are long; behind the two front teeth, in the upper jaw, are two little tack-like teeth; the small tail is black and white, and the body about sixteen inches long. The name "hare" is given to the large forms, or types and "rabbit" to the smaller. The hare is found in Europe and Western Asia. It is very timid, and a nocturnal rather than a diurnal animal; but in a quiet neighborhood it is also seen during the day. It does not leave the district in which it was born unless it is forced to do so.

Hares multiply very rapidly, for they bring forth two to five young four or five times a year, for which they construct a kind of nest. The old animals choose a somewhat hollowed-out spot as their habitation, where they are protected against the storms. As they are very fond of cultivated plants, such as clover, carrots, turnips, young corn, and the bark of young trees (especially of fruit trees), they do much damage in fields and woods.

The **Rabbit** (*Lepus cuniculus*) is widely distributed in North America, and there are numerous varieties. The Jack-rabbit of the west is the largest. The original home of these sprightly little animals was Spain and North Africa.

Lemmings (*Muodex linnus*).—These voracious little animals live in the far north of Europe, and sometimes make migrations in vast numbers, swimming across rivers and lakes, passing through towns and villages, and climbing over mountains and rocks. Troops of birds of prey follow above them, and they are followed by bears, foxes, martens, and weasels, so that their migratory flocks often disappear as rapidly as they make their appearance. They are about the size of a rat. The snowy lemming turns white in winter. [199]

Marmot (*Arctomys marmota*).—The upper parts of the marmot are brownish black, its sides yellowish grey, while its lower parts are reddish brown. It attains a length of sixteen inches, and is found in both Europe and America. In North America, they are popularly termed woodchuck or groundhogs. The marmots live together in social troops in rocky caverns and feed on plants. In the autumn the marmots move into their winter quarters. There they sleep through the whole winter, huddled together in parties of three, five, and more, and apparently lifeless. In this state they can be rolled about like balls without being awakened until Spring, when they are usually hailed as weather prophets. Marmots are easily tamed, and can be trained to perform many tricks.

Mice are the best known of the rodents, which only too often do a great deal of harm by their predatory habits. Of these the domestic mouse (*Mus musculus*), a swift and pretty little animal, which is very much attached to our larder provisions. Even the elephant, the largest among animals, fears this tiny rodent.

The domestic rat (*Mus rattus*) became known in Europe in the twelfth century, and probably emigrated from Asia. The brown rats did not appear in Europe until the eighteenth century. They are stronger than the domestic rats, which they drive away or devour. Their food generally consists in kitchen refuse of all sorts. If driven by hunger they even eat their own kind.

Porcupine (*Hystrix cristata*).—This is quite a remarkable animal. It attains the size of a badger, and inhabits South Europe, Africa, and North America. Like the hedgehog, it is provided with a peculiar muscle, which enables it to erect a coat of spines whenever danger threatens, and it is thus protected against foxes and jackals, which often share the porcupine's habitation, and would very much like to devour their fellow-lodger. In European porcupines, the spines or quills attain a length of from ten to twelve inches. Our American species has quills about three inches in length. The fore feet are supplied with sharp claws, which are very necessary to the animal for digging out its burrow. During the day the porcupines remain hidden in their burrows, but at night they go out in search of food.

Prairie Dog.—This small rodent animal of the squirrel family is found on the plains east of the rocky mountains. It resembles the marmot in appearance, and has well-developed claws on all the toes of the fore-feet; shallow cheek-pouches. The best known species is about one foot in length, and has a tail of about four inches. On the upper surface it is reddish-brown, variegated with gray. These animals live together in great societies on those portions of the prairies where the buffalo grass grows luxuriantly. Here they excavate burrows in the ground in contiguity to each other, and, when the little creatures are out, quite a busy scene is presented. The name is given on account of a resemblance between its cry and the bark of a small dog.

Rabbit. See **Hare**.

Rat. See **Mice**.

Squirrel (*Sciurus vulgaris*).—In the summer the squirrel is brownish red on the upper parts and white on the lower parts; in the winter, brown red and light grey mixed. The black, white, and spotted squirrels are rare. The tail of the squirrel is bushy and arranged in two lines of bristles; its ears are adorned with a tuft of hair. Squirrels prefer the forests of trees with pointed leaves to those with broad leaves, and are always in motion, being equally adept in climbing, running, and jumping from tree to tree. They feed on nuts, acorns, seeds of fir trees, young shoots, young birds, and birds' eggs, and do a great deal of harm. They collect large stores for the winter, which they hide in hollow trees. Their nests are globular, and made of bark and leaves; they often build on the top of an old magpie's nest. Their greatest enemy is the tree marten.

HOOFED ANIMALS (*Ungulata*)

It is impossible to overestimate the importance of this order, because all the domestic animals which are used for food belong to it.

The name *Ungulata* is derived from the Latin word *ungula*, which signifies a nail, claw, or hoof. The Ungulates, which are all vegetable feeders except the pig and the peccary, include the largest of all the mammals, save only the whale and the sea elephant.

Antelope (*Antilopidae*).—The family of antelopes is a very large one, and includes many important species. It belongs to the order of Ruminants in which the horns consist of a horny sheath, surrounding a bony process of the skull, and are permanent, not annually renewed. The body is slender and deer-like, the feet small and elegant, the tail short and tufted, the hair generally short, and the color often lively. Some species, however, have comparatively long hair; and a few which inhabit cold mountainous regions are clothed with wool mixed with longer and coarser hair, as in the chamois of the Alps, Caucasus, etc.; the Rocky Mountain goat of North America; and the chiru of the Himalayas. The females of many species, as of deer, are destitute of horns; and if they alone came under observation, it would be difficult to say to which genus they belonged. The size is very various; the guevi, or pigmy antelope of Africa (*Antelope pygmaea*), is only eight to nine inches high at the shoulders, while the largest forms measure five or six feet. Almost all the species of antelopes are peaceable, timid animals, and are distinguished by agility and fleetness. most of them are gregarious. Some inhabit plains; others are found only in the most inaccessible mountainous regions; others still, dwell in jungles and deep forests. Many, on the other hand, are water-loving forms, and frequent the banks of rivers.

North America possesses two species, found only in the western parts of the continent, the prong-horn (*Antilocapra*) and the Rocky Mountain goat (*Aplocerus*), which depart considerably from the typical character of the genus. The prong-horn sheds the horns annually like most species of deer. Europe produces only the Alpine chamois and the saiga (*A. saiga*), which inhabits the southern plains of Poland and Russia. Most species are African, and take the place of the true deer in that continent. The Springbok is goat-like in form and movement; the Gnu, with a body resembling that of a horse, but with forward-directed, hook-shaped horns; the Eland, or Cape Elk, with nearly straight backward-directed spiral horns; and the Gazelle, of north Africa, with nearly upright horns and noted for the luster of its eyes. In India is the curious Chickara, the females of which are hornless, while the males have four horns. [200]

Bison.—The name applied to two species of ox. One of these, the European bison, or aurochs, (*Bos bison* or *Bison europaeus*), is now nearly extinct, being found only in the forests of Lithuania and the Caucasus. The other, or American bison, improperly termed buffalo (*Bison americanus*), is found only in the region lying north and south between the Great Slave Lake and the Yellowstone River, and is rapidly becoming extinct in the wild state, though formerly to be met with in immense herds. The two species closely resemble each other, the American bison, however, being for the most part smaller, and with shorter and weaker hind-quarters. The bison is remarkable for the great hump or projection over its fore-shoulders, at which point the adult male is almost six feet in height; and for the long, shaggy rust-colored hair over the head, neck, and forehead of the body. In summer, from the shoulders backward, the surface is covered with a very short, fine hair, smooth and soft as velvet. The tail is short and tufted at the end. The American bison used to be much hunted for sport as well as for its flesh and skin. Its flesh is rather coarser grained than that of the domestic ox, but was considered by hunters and travelers as superior in tenderness and flavor. The hump is highly celebrated for its richness and delicacy. Their skins, especially that of the cow, dressed in the Indian fashion, with the hair on, make admirable defenses against the cold, and are known as *buffalo robes*; the wool has been manufactured into hats, and a coarse cloth. The American bison has been found to breed readily with the common ox, the issue being fertile among themselves.

Buffalo. See **Bison**.

Chamois (*Capella rupicapra*).—This European representative of the Antelope family attains the size of a goat. It is red in summer, and dark brown in the winter, the lower portion of the body being lighter, while a dark, brownish-black band reaches from the corner of the mouth to the eyes. It has small, erect horns, which are curved backwards at the tips. The chamois is found in herds, numbering from five to twenty, in the Carpathian Mountains, the Pyrenees, and the Apennines; but most frequently in the Alps of Bavaria and Styria. It feeds on the buds of Alpine herbs and trees. When pursued it will leap down the most precipitous cliffs. The peculiar flavor of the flesh of these animals, especially of the young ones, is greatly appreciated by many persons. Out of their skin, a leather is manufactured noted for its softness. The horns are utilized for handles of various kinds.

Deer (*Cervidae*) are animals of graceful form, combining much compactness and strength with slenderness of limb and fleetness. They use their horns for weapons of defense and offense; but in general they trust to flight for their safety. They have a long neck, a small head, which they carry high, large ears, and large, full eyes. Many have scent glands, usually beneath the eyes, which serve as sexual attractions. Deer are distinguished from all other ruminants by their branching horns (antlers), which in most species exist in the male only; they are solid, fall off annually, and are renewed with increase of size, and number of branches, according to the kind, until the animal has reached old age.

Deer are found in almost all parts of the globe except Australia and the south of Africa, their place in the latter region being supplied by antelopes; the greater number inhabit the warmer temperate countries, and they are chiefly found in wide plains and hills of moderate height. The flesh (venison) of most kinds of deer is highly esteemed for the table, and they have long been regarded as among the noblest objects of the chase. Only one species, the reindeer, can be said to have been fully domesticated.

Elk (*Cervus alces*).—This animal is the largest representative of the genus of stags. It is the size of a horse, and its head is adorned with large antlers. The elk inhabits the northern regions of Europe and America. It is hunted for the sake of its excellent flesh, but the hunting of this strong and swift animal is attended with many dangers. It swims across the largest rivers. The Elk of Europe is called Moose in America.

FALLOW DEER (*Cervus capreolus*).—Nearly everybody has seen this graceful animal. It attains the size of a goat. The head of the male, the roebuck, is adorned with small but strong antlers, which are shed every year at the end of autumn. The fallow deer go about in troops, and feed on grass, clover, corn, and fruit. Their young are called kids, and the female, does. They are hunted for the sake of their flesh.

RED DEER (*Cervus elaphus*) is much larger than the fallow deer, and is the grandest animal of the higher species of game. The male carries large, branching antlers, which it loses in February of each year. The antlers of the one-year-old stag are like a spear, in the second year they are fork-shaped, and in those appearing later two more prongs are added each year. The stag has a greyish-brown fur. During the day it remains in the recesses of the forests; in the evening and night it roams in herds in search of food, which consists of various grasses and herbs, and the twigs and bark of trees. It runs with great swiftness when scenting danger, and will wade, or swim rivers and lakes. [201]

OKAPI (Page 202)

ZEBRA (Page 203)

Gayal (*Bibos frontalis*), a species of ox, which is found in the mountains of Aracan, Chittagong, Tipura, and Sylhet. It is about the size of the Indian buffalo, is dark brown, and has short curved horns.

Gazelle (*Gazella Dorcas*), is a species of antelope about the size of a roebuck, but of lighter and more graceful form, with longer and more slender limbs. It is of a light tawny color, the under parts white; a broad brown band along each flank; the hair short and smooth. The face is reddish fawn-color, with white and dark stripes. The horns of the old males are nine or ten inches long, bending outward and then inward, like the sides of a lyre, also backward at the base and forward at the tips, tapering to a point, surrounded by thirteen or fourteen permanent rings, the rings near the base being closest together and most perfect. The ears are long, narrow, and pointed; the eyes very large, soft, and black; there is a tuft of hair on each knee; the tail is short, with black hairs on its upper surface only, and at its tip. The gazelle is a native of the North of Africa, and of Syria, Arabia and Persia.

Giraffe (*Camelopardalis giraffa*).—This strange looking animal has the head of the horse, the neck and hoof of the stag, the callous breast of the camel, and the spotted skin of the panther. On its forehead it has two horny excrescences. It attains a height of sixteen feet.

GIRAFFE (Page 201)

The giraffe lives in the wooded plains of central Africa, feeds on the leaves of trees, and is generally seen in small troops. Its rapidity is extraordinary; not even the Arabian horse can overtake it. It is often attacked by the lion, which lies in wait for it near the rivers and springs, where it comes to drink.

Gnu (*Catoblepas*), genus of antelopes of which the best known species has been often described as apparently made up of parts of different animals, not only of the antelope and the ox or buffalo, but even of the horse. This species (*C. Gnu*) is a native of South Africa; it has disappeared from the more settled parts of Cape Colony, but is to be seen in herds on the arid plains beyond these boundaries in company with small troops of zebras, and with flocks of ostriches. The size of the gnu is that of a large ass; the general color is yellowish-tawny. Both sexes have horns. The limbs are slender, like those of deer and antelopes. The gnu gallops with great speed. It has been usually represented as a very fierce animal, and certainly shows much ability to defend itself with its horns, when unable to escape from danger by flight; but when taken young it is easily tamed, and readily associates with oxen, accompanying them to and from the field.

[202]

Ibex or Wild Goat (*Capra ibex*).—Different species of the ibex inhabit the mountain regions of Europe and Asia. It has a greyish-yellow, long fur, and powerful horns bent obliquely backwards. It frequently attains a weight of two hundred pounds. It is a true mountain animal, and was formerly spread all over the Swiss and Tyrolean Alps, but is at present found only in limited numbers.

Markhor (*Copra falconeri*), from Tibet, Cashmere, and Afghanistan, is a strong, powerful goat, with corkscrew horns, much larger in the males, which are also distinguished by a thick mane on the neck and breast.

Musk-Ox (*Ovibos moschatus*).—The Musk-ox, or Musk-Sheep, has its home in central Asia and Arctic America. The male has in its upper jaw two incisors in the shape of tusks, and in a gland of its abdomen the well-known, strong-scented musk. In the forests of the Himalayas it is found at elevations of upwards of eight thousand five hundred feet. A full-grown animal weighs about four hundred and fifty pounds. They live in herds, and feed on mosses, leaves and underbrush.

Okapi (*Ocapia*), a giraffe-like animal discovered by Sir H. H. Johnston in the Semliki forest in central Africa. Its neck and legs are shorter than in the giraffe, ears larger and broader. The general color of the upper parts is a slightly purplish chocolate-brown; buttocks and upper parts of fore and hind legs have wavy black stripes on a buff ground. The living okapi is classed with the giraffe group.

Sambur (*Cervus aristotelis*), a species of stag abundant in the forest-land of some parts of India, Burma, and China. It stands about five feet high, is a powerful animal, and is much hunted. The color is dark brown; the antlers are rounded, and belong to a type known as Rusine.

Tahr (*Hemitragus jemlaicus*), a goat-like animal, differs from the true goats, especially in the absence of a beard. The male is generally from three to three and a half feet in height at the shoulder; the horns seldom exceed fifteen inches in length. The doe is a smaller animal. The coat is fawn brown in color, and is long on the neck, chest, and shoulders. The home of the Tahr is chiefly in the elevated forest regions of the Himalayas; and it frequents almost inaccessible spots.

Vicuna (*Auchenia vicugna*) is a species of the South American animals allied to the camels. The vicuna lives wild, and frequents the most desolate parts of the Cordillera, at great elevations, delighting in a kind of grass, the yehu, which abounds there in moist places. The small herds commonly include from six to fifteen females with one male. When the females are quietly grazing, the male stands apart, and carefully keeps guard, giving notice of danger by a kind of whistling sound, and a quick movement of foot. The soft wool is much valued for weaving.

Wild Goats.—See [Ibex](#), [Markhor](#), [Tahr](#).

[203]

Zebra (*Equus zebra*).—The true zebra is a native of South Africa; lives in troops, and is very swift and savage, and therefore difficult to tame. Its general color is creamy white, marked with black cross-stripes everywhere except the belly. The Quagga, its nearest relative, has legs and entire hind-quarters unstriped. It is hunted by the natives for the sake of its beautiful fur and its savory flesh and is also a favorite food of the lion.

PACHIDERMMS (Pachydermata) OR THICK-SKINNED ANIMALS

The animals belonging to this division are mostly of immense size, and are very thick-skinned and scantily covered with hair; they are therefore called "Pachydermata."

Elephant (*Elephas*).—There are two species of the Elephant: the African elephant and the Indian Elephant (*Elephas Indicus*). The elephant is the largest of the land animals. It has been known to live from one hundred to four hundred years, and weighs from six thousand to eight thousand pounds. Its height reaches ten feet, its length from thirteen to sixteen feet. Its thick, wrinkled skin is covered with a few bristles. The eyes are small, the ears large, and its nose is prolonged into a long, flexible trunk. In the upper jaw of the male animal are two tusks (or thrusting teeth), which are from three to six feet long, and from thirty to seventy pounds in weight; these furnish valuable ivory. The tail is long, and has at its end a tuft of coarse bristles. The elephant is a native of central Africa.

The Indian elephant lives in herds of from thirty to two hundred, and is fond of marshy districts. It feeds, in its wild state, on the leaves and twigs of trees, and is a harmless, peaceable animal, so long as it is not provoked. It does great harm to the plantations of rice, sugar, and coffee whenever it forces its way through them. Its docility and prudence are astonishing; its senses of smell and hearing are also greatly developed.

The first elephants are mentioned in the history of Alexander the Great. He brought three hundred of them from India to Babylon. At present they are little used as domestic animals, although many are still kept for that purpose in Ceylon and Burma. They are eagerly hunted for their tusks. About ten thousand are said to be killed annually.

Hippopotamus (*Hippopotamus amphibius*).—There is only one species of the hippopotamus now living—that of Africa. It is nearly as tall as the rhinoceros—viz., about five feet; but it exceeds twelve feet in length. The eyes and ears are small, its neck short and thick, and its feet clumsy. Its incisor teeth grow from twelve to eighteen inches long, and weigh from two to six pounds. It is found in all lakes and rivers, and its principal food is grass; sometimes it commits great ravages in the plantations. It is by nature peaceful, but when provoked gets into a violent rage. Some consider its flesh savory. Its skin, when cut into strips, is manufactured into whips; its teeth are worked like ivory, and are especially used for the manufacture of artificial teeth.

Rhinoceros (*Rhinoceros*).—The Indian rhinoceros and that of Java have only one horn on the nose, while the African species has two. The white rhinoceros of Africa is the largest, attaining to a length of over twelve feet, and a height of nearly six feet; but the black rhinoceros is best known. These awkward animals are enveloped in a wrinkled and bare hide, which may be compared to a coat-of-mail. They live either solitary or in small herds, in marsh and well-watered districts, and feed on grass, leaves, and roots. They only attack an enemy when provoked. Their horn is a terrible weapon. It is a bony excrescence, extremely sharp-pointed, and is used for ploughing up hard ground, or uprooting strong trees. When fighting with the elephant the rhinoceros attempts to rip up its enemy's abdomen.

Tapir (*Tapirus Americanus*).—This denizen of South America lies concealed in the recesses of the forests during the day, but in the evening and early morning it frequents the marshes and rivers, where it wallows in the mud with its young. It feeds on the branches of trees, but also ravages the fields. All are bulky beasts, recalling somewhat the swine in appearance. They have the snout prolonged into a flexible proboscis with the nostrils at the tip. Their flesh is said to be good.

Wild Pig (*Sus scrofa*) lives in herds in the well-watered forests of central and southern Europe, in central and western Asia, and in north Africa. The adult males are called boars, the females wild sows, and the young shoats. They feed on the fruits of forest trees, roots, etc., and do great damage in the fields by raking up the earth for long distances. For this reason and also for the sake of their flesh they are hunted.

TOOTHLESS ANIMALS (Edentata)

Some of the animals belonging to this division have no teeth at all, and all are without the front incisors. They are slow, stupid animals, and work only in the night-time. They are all inhabitants of Brazil with the exception of two species. Nearly all are provided with very long claws. They live in trees or in subterranean passages.

Ant-eater or Ant-bear (*Myrmecophaga jubata*) attains a length of six feet six inches, of which its long-haired, plumy tail takes twenty-eight inches. The color of its hair is blackish brown; it can project its worm-like tongue to a distance of sixteen inches. The Great Ant-eater is a native of Brazil and Guiana, and much the largest of all the species.

The ant-eater inhabits the same regions as the sloth. It feeds on ants and termites. Raking up the habitations of these insects with its sharp claws, it inserts its proboscis, and begins to work with its viscid (sticky) tongue, to which hundreds of ants remain sticking.

Armadillo (*Dasyppus peba*).—A mammal peculiar to South America, consisting of various species, belonging to a family intermediate between the sloths and ant-eaters. They are covered with a hard bony shell, divided into belts, composed of small separate plates like a coat of mail, flexible everywhere except on the forehead, shoulders, and haunches, where it is not movable. The belts are connected by a membrane, which enables the animal to roll itself up like a hedgehog. These animals burrow in the earth, where they lie during the daytime, seldom going abroad except at night. They are of different sizes; the largest, *Dasyppus gigas*, being three feet in length without the tail, and the smallest only ten inches. They subsist chiefly on fruits and roots, sometimes on insects and flesh. They are inoffensive, and their flesh is esteemed good food.

Pangolin (*Manis longicaudata*).—There are several species of these scaly ant-eaters. They are found in Africa and Asia, and are covered with dark brown scales, which are arranged one above the other like tiles. When danger approaches the pangolin does not run away, but rolls itself together into a ball like the hedge-hog.

Sloth (*Bradypus pallidus*).—The general color of the sloth is reddish grey, its abdomen lighter. It is about sixteen inches in length, and has three long claws on each foot.

It inhabits the thickets of the virgin forests of Brazil, passing its life in laziness upon the tops of trees, the leaves of which form its food. During the day it hangs down asleep from a bough, and is then only discovered with difficulty. In the same position it creeps along the boughs, and does not leave the tree until the latter is stripped of all its leaves and fruits. When it descends to the ground it is very helpless, and can neither walk nor stand. It gives the best proof of its skill when climbing, hanging down from a bough by means of one of its feet, while it seizes the fruits with the other. It sometimes pierces the large snakes of Brazil with its long claws, so that they die from loss of blood. Its attachment to its young is very touching and the mother carries them on her back from bough to bough.

POUCHED ANIMALS (Marsupialia)

The marsupials have in the abdomen a pouch, a sort of bag or purse, in which they carry about their young. In some species the hind legs are developed to an extraordinary degree, whereby they are enabled to jump great distances. Their original home is Australia; but several species are also found in America. They feed partly on plants, partly on animal matter.

Kangaroo (*Macropus giganteus*).—The fur of the kangaroo is greyish brown, somewhat lighter on the sides, while the lower parts are whitish. Its body is six feet long, and its tail nearly three feet. It inhabits Australia, and is found chiefly in New South Wales and Tasmania. It is the largest quadruped of that part of the globe. The front of its body is extremely slim in proportion to its hind quarters, and its hind legs are five times longer than the front ones. The kangaroo is a peaceful, shy, grazing animal. When startled it tries to get away from its pursuers by immense bounds. Its swiftness is so great that, at least across flat country, the fastest dog cannot equal it. But when it is brought to bay it will defend itself most pertinaciously with its sharp claws, and with powerful strokes of its tail. It will seize even large dogs with its fore feet, and tear open their breasts and abdomens, often carrying them to neighboring water to drown them. The flesh of the kangaroo is eaten; its hair makes a good fur.

Koala (*Phascolarctus cinereus*), a marsupial, restricted to eastern Australia. The toes of the fore-feet are in two opposable groups, of two or three, a characteristic not found in any other quadruped, but well adapted to grasping the branches of trees, on which the koala often hangs with its back undermost, like the sloth. There is scarcely any rudiment of a tail.

Opossum (*Didelphys virginiana*).—The American opossum is perhaps the best known and certainly not the least interesting of the pouched animals. It abounds in the warmer parts of North America, extending considerably north of Virginia. In form it is robust and in size about that of an ordinary cat. The color of its fine wholly fur ranges from white to black, and includes numerous varieties of intermixture. They have a long tail, which is almost destitute of hair, and is very useful from its prehensile nature, enabling the animal not only to hang by it, but also to climb and descend trees. They are sly and live chiefly in trees, lying up in the daytime, and at night roaming in search of their food, which consists of insects, small reptiles, birds' eggs, etc. Caught red-handed in one of its marauding excursions, or captured under any other circumstances, the slightest blow causes it immediately to feign death, even to the extent of a protruding tongue and film-covered eyes. It may be battered almost beyond recognition and will lie where it has been flung without so much as the flicker of an eyelid. The moment, however, that its captor takes attention from it, the presumably dead animal regains its feet and effects its escape. "Possuming" is a slang term that has come into use to denote the acme of human artfulness and deceit.

A wonderfully pretty species of opossum which lives in Surinam is scarcely larger than a good-sized mouse, the body measuring only six inches from the nose to the root of the tail. It has scarcely a vestige of pouch, and so, robbed of this advantage, it carries its young on its back, curling its tail over, so as to allow the little ones to twist their tails around it. With her progeny thus secured from falling the mother can pursue her way in comfort. Even some of the larger opossums adopt this method of carrying their young.

BATS AND OTHER FLYING MAMMALS

A Bat is provided with true wings, with which it is able not merely to propel itself through the air for a longer or a shorter distance, but to fly like a bird by beating the air with its anterior members. The Colugo, in common with the Flying Squirrel and the Flying Phalanger, has the skin of the flanks extended in a manner capable of sustaining the animals, very much in the manner of a parachute, in an extended leap through the air. But bats possess the power of true flight. They move through the air with ease, and in pursuit of their insect-prey wheel and double and circle about with a nimbleness that the human eye can only follow with difficulty.

The bats are strange looking animals, being half mouse, half bird; their fore limbs are very long, and between these and the hind limbs, and also generally extending to the tail, there is a delicate membrane, which enables them to fly. Their eyes are small; their large ears erect; their teeth sharp. The flight of the bats is swift and noiseless, but not enduring. They could not, like the migratory birds, fly off in the autumn towards warmer countries. Therefore in the winter they retire into clefts and crannies, where they suspend themselves by the claws of their hind feet, and sleep until the rays of the spring sun warm their benumbed limbs. Our native bats feed upon insects, and are consequently useful. In the warm summer evenings they can be seen flitting around the blossoming trees in order to catch the honey-sucking moths. They do not build any nest for their young, but the latter cling between the folds of the wings of the parent animal, and are thus carried about by her on her excursions.

The best known of the foreign kinds are the vampire bat of South America and the colugo bat. In the flying lemur, or colugo, the hairy fold of skin begins behind the throat, includes fore and hind limbs as far as the claws, and extends along the tail to the tip. The animal has been observed to swoop over a distance of seventy yards. The flying lemurs are about twenty inches in length, are natives of the Indian Archipelago, inhabit lofty trees in dense forests, and feed chiefly on leaves and fruits, though said at times to eat insects, eggs, and even small birds. They are nocturnal in their habits, and very inoffensive, scarcely attempting to bite even when seized. Their voice resembles the low cackling of a goose.

[204]

[205]

THE SEALS (*Pinnipedia*)

In the seals the five toes of the limbs have become palmate, being joined together by a web; the hind feet have a backward, horizontal direction. Their food consists of small marine animals and plants.

Seal (*Phoca vitulina*).—The habitat of the common seal is spread over a large area, but it is chiefly found in the northern seas. It is nearly six feet long, and its fur is yellowish grey, sprinkled above with dark-brown spots. It has no exterior ear. To the inhabitants of the north the seal is a most useful animal; its flesh and fat form their chief food, with its oil they illuminate the long winter nights, its sinews they use as thread, from its bones they make various domestic implements, and with its fur they cover their tents and sledges. Seals are gentle animals, and when tamed exhibit great attachment to man. When wounded they snap savagely in all directions. Seal-hunting forms one of the most important branches of commerce among seafaring nations. Over a thousand vessels leave America every year to take part in seal-hunting; and as one vessel will sometimes capture nearly two thousand seals, some idea may be obtained of the immense number of these animals which are slain annually.

Walrus (*Trichechus rosmarus*).—This animal is from eighteen to twenty-two feet long, and weighs from two thousand to three thousand pounds. It is easily recognized by the long tusks in its upper jaw, which attain a length of eighteen to twenty-four inches.

The walrus lives in the northern Polar seas, where it is sometimes met with in herds of a thousand to two thousand head. They either swim about in the water or lie basking in the sun upon ice-floes. When they are about to sleep one remains awake as sentinel. They attract whole herds to their assistance by their terrific roaring, which can be heard for several miles; in all directions their black heads, with red, dilated eyes, and gleaming tusks, emerge from the water. The walrus is hunted for its tusks, skin and oil.

[206]

ANIMALS OTHER THAN BIRDS THAT HAVE LEARNED TO FLY

FLYING-FOX WITH OUTSPREAD WINGS. ITS ANCESTORS ONCE WALKED THE EARTH LIKE OTHER MAMMALS

A FLYING FROG

It glides through air by means of the membranes uniting the toes, but is not capable of sustained flight.

SQUIRREL-LIKE PHALANGER

COMMON BAT

The bat is the only animal, outside of the birds, that can really fly in the true sense.

Sea Lion (*Otaria stelleri*).—The home of the Sea Lion is Bering Sea, and as far South as the Kurile Islands on the one side of the north Pacific and California on the other. In the latter case a rookery of sea lions is strictly preserved by the American Government, or probably long ere this the animal would have been exterminated in those waters, as it has been in many other regions after a century and a half of constant persecution.

The male sea lion, of eleven or twelve feet in length and a thousand pounds in weight, is yellowish-brown in color with shaded darker patches. There is a distinct mane upon the neck, which, with its upright posture, combines to give the creature its supposed leonine appearance. The males are fierce in aspect, and if hard pressed will turn and show fight. Old animals bellow like bulls; the younger ones bleat like sheep. They bolt their fish without mastication. The female is only about half the dimensions of the male, and is considerably lighter in color. The animal is useful only for its hide, flesh, and fat.

[207]

THE WHALES (*Cetacea*)

Under the general name of Cetacea, *i.e.*, the Whales, are classed together a wonderful group of marine Mammalia, which includes not only the true whales, but also the Dolphin, Narwhal, Porpoise, and Grampus.

Notwithstanding their marked resemblance to fishes, the Cetacea possess the most indubitable mammalian character.

In the cetacea the bodies are elongated, fish-like, devoid of hair, and run out into a powerful caudal fin. The fore limbs are in the form of fins; there are no hind limbs. The cetacea are marine animals, and their food consists wholly of water animals and plants.

The whale is an astonishing animal, and in order that it may subsist a number of apparently contradictory conditions must be reconciled. It is a warm-blooded mammal, and yet spends its life wholly in cold water. In order to dive to great depths it must be able to make its body heavier than a corresponding bulk of water, and conversely it will make it lighter in order to reach the surface. Though breathing atmospheric air through nostrils, the animal can exist at a greater depth than where the pressure of the water would force its particles into solid oak, and yet no water can reach the whales' lungs. It must be able to exist without breathing at all for at least the space of an hour. With the bones, ears, and eyes of a mammal it has to move, hear, and see as though it were a fish.

The "spouting" or "blowing" of the whale is simply an operation of purifying its blood. When the animal comes to the surface, it first expels the air in its lungs as it takes its first deep breath.

Dolphin (*Delphinus delphis*).—The dolphin is grey or greenish black on its upper parts, and white beneath. It generally attains a length of six feet, and lives in herds in all the northern seas. Hundreds of these swift animals are often seen around vessels, and amuse the passengers by their playful gambols. They feed chiefly on fish.

Greenland Whale (*Balaena mysticetus*).—This whale is greyish black on its upper parts, and white beneath. It is from forty-eight to seventy-two feet long, and weighs upwards of twenty thousand pounds. It is the largest of all living animals; a boat with six persons could enter its jaws. Its tongue is nine feet broad, eighteen feet long, and weighs about eight hundred pounds.

The whale inhabits the northern parts of the Atlantic and Pacific. It has been hunted for the sake of its blubber since the ninth century. A whale forty-eight feet long, and fourteen thousand pounds in weight, will furnish six thousand pounds of blubber, from which four thousand eight hundred pounds of oil will be obtained; there will also be over three thousand pounds of whalebone, which lies in the upper jaw in the place of teeth.

Narwhal, or Sea Unicorn (*Monodon monoceros*), allied to the dolphins and porpoises. The male has one—almost invariably the left—of the teeth or tusks in the upper jaw extraordinarily developed into a spirally furrowed horn of pure ivory from six to ten feet long. This is the longest tooth found in the Mammalia. The adult animal is from ten to sixteen feet long. It has a grey back, mottled with black, the under parts being much lighter, but also spotted. It has a blunt, short head, no dorsal fin and very small flippers, but is very active and a rapid swimmer. It is peculiar to the Arctic Ocean, though it occasionally strays as far south as the British seas. The oil is valuable and the flesh edible. The ivory is very fine, and in the castle of Rosenborg at Copenhagen is a throne of the kings of Denmark made of this substance.

Porpoise (*Phocaena communis*).—The porpoise, five, six, or seven feet in length, is common in the North Atlantic. Often off the British coasts a shoal of porpoises may be seen frolicking quite near to the shore. Passengers on board ocean-going liners are always interested in watching the sportive "black pigs," as sailors call them, race along the side of the ship. The animals are captured chiefly for their oil, and the skin can be converted into useful leather.

Rorqual (*Balaenoptera musculus*).—The common Rorqual is a typical species of the "finners," as sailors term them; the generic name means "Finned Whale," in reference to the small back fin that lies near the region of the tail. It attains an enormous size; one caught in the North Sea was ninety-five feet in length, twenty-two feet in width, and weighed over two hundred and fifty tons. Rorquals are the most widely distributed of all the larger Cetaceans; they are found nearly everywhere outside the Antarctic regions.

WHALE FISHERIES.—With the older method of whale-fishing the chief products were oil and whalebone. Recently the industry has been revolutionized, principally by Norwegians, and practically every part of the animal is used. For the new method a suitable island is selected, a cutting-up station constructed, and all whales killed are towed to the station and there drawn upon land to be dealt with. The modern whaling-vessel is a small and powerful steamer with a heavy harpoon gun mounted in the bows. The harpoon is a special kind of barbed spear. No boats are used, the steamer following the whales when sighted. By dealing with the carcass on shore all parts are now used, including the bone, blubber (or fat), the soft parts after the oil has been expressed being prepared as fertilizers. The flesh is asserted to be palatable and may ultimately be sold for food.

[208]

WHITE AMERICAN EGRETS IN A SOUTH FLORIDA CYPRESS FOREST

These are perhaps the most beautiful of the heron family and are much persecuted by the plumage hunters for the sake of the spray-like plumes which grow on their backs in the breeding season.

THE BIRDS

The birds have a hard, bony skeleton, and red, warm blood; they breathe by means of lungs, and lay eggs with hard shells. Their bodies are covered with feathers, their fore limbs are changed into wings.

HOW BIRDS COMPARE WITH MAMMALS

In some ways birds are the highest of the vertebrate animals. They represent the climax of that passage from water to land which the backbone series illustrates. Their skeleton is more modified from the general type than that of mammals; their arrangements for locomotion, breathing, and nutrition are certainly not less perfect; their body temperature, higher than that of any other animals, is an index to the intense activity of their general life; their habitual and adaptive intelligence is familiarly great, while in range of emotion and sense impressions they must be allowed the palm. It is, in fact, only when we emphasize the development of the nervous system and the closeness of connection between mother and offspring, that the mammals are seen to have a right to their pre-eminence over birds.

THE VOICE OF BIRDS

With few exceptions, birds have a vocal organ, and are able to produce more or less variable sounds. The organ is, however, wanting in the running birds, such as the ostrich, and in the American vultures. The sounds produced are almost as varied as the different kinds of birds, and an expert has little difficulty in identifying a great number of forms by their distinctive noises. It is among the so-called perchers, songsters, or Insessores, that we find song really developed and that for the most part in the males, and in highest degree at breeding-time.

HOW BIRDS ARE CLOTHED

The integument differs markedly from that of other animals in being clad with feathers. Three distinct kinds of feathers are at once distinguishable—(a) the small hair-like downy rudimentary *filoplumes*; (b) the numerous smaller contour or covering *plumes*; and (c) the large strong quill-feathers or *pennæ* on wings and tail. The ordinary feather consists of a quill at the base of a shaft up the center, and of the vane borne on the sides of the shaft. The vane consists of parallel barbs, which are linked together by small barbules. On the bare legs of many birds the feathers are replaced by horny scales, and the horny structures forming the beak and terminating the toes are very familiar.

THE BIRDS OF PREY

The birds of prey have a hooked, curved beak, at the base of which are the nostrils, surrounded by cere skin. They live chiefly upon warm-blooded animals, which they seize with their claws and tear in pieces with their beak. There are more than five hundred varieties, which are separated into day and night birds of prey.

Eagles, falcons, hawks, harriers, buzzards, and the like are adapted for the pursuit of prey not only by possession of strong, hooked beaks, powerful talons, and keen powers of vision, but also by the swiftness of their flight. Many of them—for example, falcons—are able to poise themselves, apparently motionless, in the air till some such prey as a young rabbit or small bird is discovered, and then swoop down upon the victim with almost incredible rapidity.

Condor (*Sarcorhamphus condor*).—Largest of vultures, averaging nine feet wing expanse, lives among the peaks of the Andes but descends for food. Its feet are not adapted for grasping, and it cannot truly perch nor carry objects when flying; it sleeps soundly, can be lassoed at night and kills small quadrupeds, besides feeding on carrion. The condor lays two white eggs four inches long, on bare rock, hatched in seven weeks. The young are brown and a year old before they can fly. The male is black with white ruff, has wing bars and tip of bill; wattles are present on the head and breast. The female lacks comb, wattles, and has less white. The young do not acquire full plumage for six years. The condor depends more on sight than smell in finding food.

Eagle (*Aquila*) is a name given to many birds of prey in the Falcon family. The golden eagle, the white-headed eagle, and the sea-eagles are characteristic examples. The falcon family includes over three hundred predacious birds, feeding for the most part on living animals, hunting by day, and living usually on exposed rocky places. The bill is powerful, but rather short, high at the root, and slightly curved; the partition between the nostrils is complete; the upper margin of the eye-socket projects; the head and neck are feathered; the soles of the feet bear large callosities.

Representatives of this noble genus are found in all parts of the world except the neotropical and Australian regions.

The **GOLDEN EAGLE** is a large and magnificent bird. The predominant color is dark, tawny brown, but the back of the head and neck are more tawny and look golden in the sunlight. The young birds have tails of a brighter color. The adult female measures about three feet in length; the male is rather less both in length of body and wing. The golden eagles have their homes in remote rocky regions, but often wander far in search of booty. They prey upon numerous mammals and birds, but are rarely willing to run any great risks in so doing. The nest, usually upon a rocky ledge, is large and roughly made. There are most commonly two eggs. Though a strong and majestic bird, it cannot be credited with much bravery. The occasional cry is loud and shrill, but with some hoarseness. The species is widely distributed in Europe, Asia and North America.

The crested eagles are found in parts of both hemispheres, and are in some species distinguished by tufts of feathers on the back of the head. The harrier-eagle is an Old-World bird represented in Europe, north Africa, and western Asia. The fishing eagle or fish-hawk is an almost cosmopolitan bird, with markedly piscivorous diet. The bald eagle has the tarsus feathered only halfway to toes; with white head and tail after third year. Its length is about 36 inches. The bald eagle is the emblem of the United States, feeds on fish, sometimes secured by robbing the osprey and sometimes found as carrion.

EAGLES AS EMBLEMS.—In the arms of the present German empire an eagle (with one head) sustains on its breast a shield containing the arms of Prussia. Austria has preserved the double-headed eagle of the earlier German empire. Russia assumed in 1472 the double-headed eagle under Ivan III. to signify that the czar sprang from the Greek emperors, who had borne it as a symbol since the partition of the Roman empire. A white crowned eagle in a red field was the shield of the kingdom of Poland. The arms adopted by the United States consist of a dark-brown eagle with outspread wings, having in one of its talons a bundle of arrows, in the other an olive branch, bearing on its breast a shield whose upper part is blue and under part silver, and crossed by six red vertical bars. In its beak it holds a band with the inscription *E. pluribus unum*, surmounted by thirteen stars, the original number of states.

Falcons (*Falco*) are birds of medium or small size, having short, strong beak, with a sharp hook at tip and a strong tooth on each side of upper mandible; legs short and strong, middle toe long, claws much curved and sharp, tail short and stiff, wings long and pointed. There are about fifty species, some known as hawks. True falcons, in hunting prey rise high in air above and swoop down. Hawks chase the prey near the ground. The most common falcon is dark-bluish above and white below with bars; the young are brownish above and streaked below. The largest falcon is found in the Scandinavian Mountains. Among small falcons are the sparrow-hawk of the United States and the kestrel of Europe. They feed on mice and insects. Most falcons prey upon birds, attacking some even larger than themselves. They, at one time, were trained for hunting the heron, sparrow, etc., in the sport known as falconry.

Hawks have the upper mandible not toothed, and the wings short, rounded, and concave below. They do not easily soar or glide.

HENHAWKS comprise chiefly the rough-legged hawk and the red-shouldered hawk. The first rarely, and the second never, takes chickens; they prey rather on noxious insects, mice, etc. The sharp-shinned hawk, length twelve inches, and Cooper's hawk, eighteen inches, are rufous on breast and dusky above, with dark bars on the tail. These useful buzzards last mentioned should be protected.

GOSHAWKS (*Astur palumbarius*) is found in almost all parts of Europe. It generally inhabits thick woods in the neighborhood of fields and meadows, and builds its nest on the topmost boughs of a lofty tree.

The Peacock excels all other birds in the beauty of its plumage, the colors of which are usually both gorgeous and varied. The above bird is pure white, and very rarely seen in the United States.

The Peacock excels all other birds in the beauty of its plumage, the colors of which are usually both gorgeous and varied. The above bird is pure white, and very rarely seen in the United States.

[209]

[210-211]

The ostrich is a strong runner and a swift racer. It has been known to equal the speed of a train going at the rate of sixty miles an hour. Though frequently used for driving, it is not easily managed.

The Peacock excels all other birds in the beauty of its plumage, the colors of which are usually both gorgeous and varied. The above bird is pure white, and very rarely seen in the United States.

This unsociable bird is as swift and wild as it is shy and cunning. It can be easily recognized at a distance by its long tail and short wings. When hunting for prey it flies, as a rule, along the edges of woods and thickets, and is active almost the whole of the day. Flying, resting, swimming, or running, it seizes its prey with equal dexterity. Its great swiftness and adroitness render the goshawk a formidable opponent. It appears suddenly among the unsuspecting birds, and, before they can escape, one lies bleeding under the claws of the bold robber. It follows its prey into inhabited houses, and sometimes flies through the windows.

The goshawk carries off poultry, and also steals game. It also destroys a great number of our most useful insect-devouring birds.

The osprey of fishing hawk (*Haliaeetus albicilla*) is often mistaken for the golden eagle. The latter, however, can be easily recognized by its feathered legs. The osprey is widely distributed in the United States along the Atlantic coast, and is found all over Europe. It has its nest on the summits of inaccessible rocks and cliffs. During the process of building it is a high tree, and rarely among the woods. The osprey is a voracious and dangerous robber, attacking all animals which it is able to overcome, and has been said to have killed the young of a bear, and a young man, and has been said to have killed a young man, and a young man.

The sparrow hawk (*Nisus communis*) resembles the goshawk both in form and habits, and is a true copy of its bigger cousin.

to two families. The Java owl, which ranges from the eastern Himalayas to Burma and the Java and Borneo islands, constitutes the second of these families. They have large eyes, looking forward, encircled by stiff feathers, and with a large bill, used for catching insects, birds, and small mammals. Some have a well developed feathered external ear. The long ears by which the horned owl is known, refers to the horns of feathers, developed above the eyes. Owls fly noiselessly, owing to their soft plumage. The feet are usually feathered; the outer toe is reversible, and in the Fishing Owl the toes are osprey-like. The female is larger. The size ranges from six inches in the Pygmy Owl of the tropical forests, to thirty inches in the Great Grey Owl of the northern regions. Reddish brown is predominant, but dark and light colors may be exhibited by a single brood. The eggs are spherical and pure white. Some species breed before the snow has gone, and their eggs hatch a few at a time. The Snowy Little Owl of Europe, is the symbol of learning. The Burrowing Owl lives in the burrows of prairie dogs in America, on whose young it feeds, in part while rattle-snakes associate with both as a common enemy.

The White or Barn Owl (*Strix flammea*) always lives in the neighborhood of man, building its nest in sheds, church-towers, old ruins, and also in pigeon-houses. It sleeps during the day. At night it flies through the gardens and fields, catching all kinds of mice, insects, and young birds. The nest is carelessly built, and in the spring contains from six to nine white, oval eggs.

Vultures (*Vulturinae*) are large carrion-eating birds of prey. Those of the Old World differ from those in the New in several particulars; thus, the hind toe of the former is on the level with the other toes; the partition between the nostrils is not perforated as in American vultures; and they carry food to their young in their claws and not in their beaks. The chief of the American vultures are the Condor, Turkey Buzzard, Carrion-crow, or Black Vulture, or King Vulture, which haunts jungles from Mexico to Paraguay, and is white, with the long tail and wing-feathers black, the head lemon and scarlet. Examples of the Old World vultures are the Bearded Vulture or Lammergeyer (*Gypaetus barbatus*), the largest bird of prey of Europe. It was formerly often seen in the Alps and Pyrenees; but is now, at least in the Swiss and Bavarian Alps, almost exterminated. It is a bold and dangerous robber, not only waylaying hares and roes, but also sheep and chamois; children even, have been attacked by this bird.

The Egyptian or White Vultures are known as Pharaoh's Chickens. The crested Black Vulture ranges from China through North Africa. It builds large nests in trees on mountain-tops, where it rears a single young. The Griffon is black, with white tail and wing feathers. Vultures find their food by sight.

THE CLIMBING BIRDS

The toes of the climbing birds are arranged opposite each other in pairs; one of the back toes is, in many of these birds, so flexible that it can be easily turned forward. The claws are long, strong, and hooked, thus these birds can easily hold on firmly, even in a perpendicular position. Most of them frequent the woods, and live upon insects and fruit.

Cuckoo (*Caculus canorus*) is as large as a pigeon. It has a gently-curved, deeply-cleft beak, long, pointed wings, and wedge-shaped, pointed tail. The outer toe can be directed forward as well as backward. American cuckoos hatch their own eggs. The Old World cuckoos are especially marked by the habit of leaving their eggs to be hatched by other birds. The spotted cuckoo of northern Europe lays four eggs in a nest, usually that of a crow. A small South African cuckoo, size of a sparrow is brilliantly colored. Australia has the large channel billed cuckoo, with its immense beak. The road-runner or chapparral cock of the desert plateaus of western United States feeds mainly on grasshoppers. In the West Indies and adjacent states is found the Ani, with high bill, and peculiar in that several females unite in building one nest, where all co-operate in hatching their eggs.

The cuckoo, with its never-weared song, is the joyful harbinger of spring, and is heard with delight by old and young. It lives chiefly upon hairy caterpillars; and, as it is always feeding, we can justly include the cuckoo among the useful birds.

Parrots (*Psittacae*) are near relatives of the cockatoos, paroquets, macaws, lories, nestors, etc. The true parrots have the upper mandible toothed, and longer than high, and a short, rounded tail. These birds combine with the beauty of their plumage a nature of great docility, and have the faculty of imitating the human voice in a degree not possessed by other birds. They are found chiefly in Africa, from whence we get the gray parrot, the best talker. South America, which is particularly rich in species, furnishes the well-known green parrot; and North America is the home of a single species, the Carolina parrot. The parrots are forest birds, and are adepts at climbing, using for that purpose both the feet and the bill. Their food consists of seeds and fruits. They make their nests in holes, and lay white eggs, as is commonly the case where the eggs are concealed.

The parrots may be called the monkeys among the birds; for, like the monkeys, they seek their food while climbing, but are awkward and clumsy when on the ground. Their imitative qualities and docility, their obstinacy and slyness, and their disagreeable voice and gregarious habits, all serve to remind us of the monkeys.

Toucan (*Rhamphastus toco*), a bird of the American tropics, is related to the woodpeckers and parrots. It belongs to the most curious of the animal forms, as its immense beak is treble the length of its head. The tongue is horny, slender, and brush-like; the considerable tail is hinged next the pelvis, so that it can be thrown over the back when resting and where the bill lies also during sleep. Toucans are omnivorous, but prefer fruit, live in flocks in forests, and nest in hollow trees. There are over fifty species, in size from that of a robin to a crow, and colored from green to black, variegated with red, yellow and white. The largest is two feet long, with bill eight inches long and three inches high.

Woodpecker (*Picidae*) includes any of three hundred birds which have climbing feet, stiff tail feathers and which bore into trees for grubs on which they feed, though some of them are fond of fruit and other vegetable food. Most of the species have barbed and pointed tongues with which they spear the larvae, but in some the tongue is smeared with a sticky substance, secreted by glands in the throat. There are no woodpeckers in Australia or Madagascar, but they occur in all other parts of the world. The prevailing color of the plumage is green—dark olive on the upper, pale green on the under parts; the crown and back of the head are bright crimson.

Of the numerous American species the flickers, the South American ground-flickers, which live chiefly on termites, and the great ivory-billed woodpecker may be specially noted. The last-named species, which inhabits the dense forests of the southern States, is one of the handsomest of the group, and was once called the prince of woodpeckers.

The woodpeckers lead a solitary life. Their presence is generally known by the noise they make while pecking; holding fast to a tree, they hack at it with their long, sharp beaks, so that splinters and chips fly in all directions. The woodpecker excavates a hole in the rotten tree, in order therein to build its nest.

THE SINGING BIRDS

Not all the birds belonging to this class are veritable songsters; but nearly all of them have in the throat an organ of song, consisting of five or six pairs of muscles, by means of which they can produce a variety of notes. They are mostly small, prettily colored birds, which chiefly inhabit the Temperate Zones, and make themselves very useful by devouring the insects, worms, and seeds of weeds in the fields, gardens, and woods. They delight us with their song; but their song is also the reason why some of

them are kept in captivity.

Birds of Paradise (*Paradisea apoda*), though song birds of some ability, are more particularly notable for their gorgeous plumage. They are natives of New Guinea and Australia, and are very closely allied to the crow family, both in their habits and voice. The Great Bird of Paradise is the largest of the species, measuring about one and one-half feet in length; the others are comparatively small. The adult males are in beauty unsurpassed even by humming-birds. Tufts of bright feathers spring from beneath the wings, from the tail, or from the head, back, or shoulders. Trains, fans, and exquisitely delicate tress-like decorations occur abundantly, and the gracefulness of the plumage is enhanced by the brilliant color and metallic luster. The females are plain, sober-colored birds, and it is only with maturity that the males acquire that brilliancy of plumage which they exhibit to such advantage in their courtships. The true birds of paradise feed on fruits and insects, and are practically omnivorous. Their mode of life is more or less gregarious. Their song consists of a series of loud, shrill notes.

Blackbird (*Turdus merula*), is a member of the thrush family. The plumage of the male is quite black, and the beak yellow; the female is dark brown above, and greyish brown on the under parts, with a brown beak. It is shy, solitary, nests in March, and has two broods during the season. The nest is plastered inside with mud; four or six blue eggs, speckled with black, are laid. The bird feeds mainly on insects. It is a mocking bird, but not so good a songster as the song-thrush. In confinement it can be taught.

[213]

The American Crow-blackbird or Purple Grackle is restricted to the region east of the Rockies, the Blue-headed Grackle is confined west of the Mississippi, while the Rusty Grackle pervades the whole continent.

The Red-winged Blackbird breeds in Mexico and North America south of the Barron Grounds; winters in southern half of United States and south to Costa Rica.

The blackbird is frequently an inhabitant of the woods; but in the winter it comes into the gardens of the villages and towns. It is very fond of fruit, and thus often ravages the orchards and strawberry gardens.

Bobolink (*Dolichonyx oryzivorus*), resembles a sparrow, but its tail feathers are acute. Length seven inches. It breeds from Ohio northeast to Nova Scotia, north to Manitoba, and northwest to British Columbia; winters in South America.

Few species show such striking contrasts in the color of the sexes, and few have songs more unique and whimsical. In its northern home the bird is loved for its beauty and its rich melody; in the South it earns deserved hatred by its destructiveness. Bobolinks reach the southeastern coast of the United States the last half of April just as rice is sprouting and at once begin to pull up and devour the sprouting kernels. Soon they move on to their northern breeding grounds, where they feed upon insects, weed seeds, and a little grain. When the young are well on the wing, they gather in flocks with the parent birds and gradually move southward, being then generally known as reed birds. They reach the rice fields of the Carolinas about August 20, when the rice is in the milk. Then until the birds depart for South America planters and birds fight for the crop, and in spite of constant watchfulness and innumerable devices for scaring the birds a loss of ten per cent of the rice is the usual result.

Canary (*Fringilla*) is a beautiful but very common cage-bird, much esteemed for its musical powers. It is native to the region about the Canary Islands. Its color is grayish brown and dusky green, but the numerous artificial breeds show varieties of yellow and black markings, crests, etc. Naturally monogamous, the male sings best to win the love of the female. She incubates the eggs, he feeds the young. Six eggs are produced four times a year. Canaries cross readily with allied species. They have been domesticated for nearly four centuries.

Distinct varieties have been produced by scientific selective breeding, and these reproduce their distinctive characteristics, and "like breeds like" so long as the varieties are not crossed. The hardest are the Norwich; the largest are Lancashire Coppies; the most costly and delicate are Belgians. Lizards, London Fancies, Yorkshires, Scotch Fancies, and Cinnamons practically complete the list.

Catbird (*Mimus Carolinensis*) is a species of Thrush common in eastern United States, so called from its peculiar note. It is very dark colored, about nine inches long, and nests in low bushes early in May. It breeds throughout the United States west to New Mexico, Utah, Oregon and Washington, and in southern Canada; winters from the Gulf States to Panama. The bird has a fine song, unfortunately marred by occasional cat calls. With habits similar to those of the mocking bird and a song almost as varied, the catbird has never secured a similar place in popular favor. Half of its food consists of fruit, and the cultivated crops most often injured are cherries, strawberries, raspberries, and blackberries. Beetles, ants, crickets, and grasshoppers are the most important element of its animal food. The bird is known to attack a few pests, as cutworms, leaf beetles, clover-root curculio, and the periodical cicada, but the good it does in this way probably does not pay for the fruit it steals.

Chickadee (*Penthestes atricapillus*).—The Chickadees are among the most popular birds that we have, owing to their uniform good nature even in the coldest weather, and their confiding disposition. They are common about farms and even on the outskirts of large cities they will come to feasts prepared for them on the window sill with their clear "phe-be," "chick-a-dee-dee-dee" or "dee-dee-dee," and several scolding or chucking notes. They nest in hollow stumps at any elevation from the ground but usually near the ground, and most often in birch stubs. Their eggs are white, sparingly speckled with reddish brown. They range and breed in the northern half of the United States and northward. The Carolina Chickadee (*Parus carolinensis*) is smaller and with no white edges to the wing feathers, and is found in southeastern United States, breeding north to Virginia and Ohio.

Crossbills (*Loxia*) are the most highly developed members of the Finch family, characterized by having the tips of the upper and lower bills crossing so as to facilitate extraction of seeds. Males are reddish, females brownish olive in general coloration. The crossbill lives chiefly in the pine plantations, where it feeds for the most part on the seeds of the pine, cleverly opening the cones with its pointed beak. It hatches in all seasons of the year.

Finch (*Fringilla*) is a name applied to many birds but generally used with some affix, as in the familiar names bullfinch, chaffinch, and goldfinch. A finch is usually small, has a hard, conical beak, and generally lives upon seeds. The distribution is almost world-wide, excepting Australia. The buntings and the weaver-finches of the Ethiopian and Australian regions are usually kept distinct.

Some, as Canary (see [Canary](#)) and Bullfinch make fine songsters in confinement. The Chaffinch is the typical Finch of Europe. In America the Purple Finch has a flush of red in male; the female is olive brown, streaked below, the tail feathers soft and rounded; length without tail, three and one-half inches. The Goldfinch has acute bill, yellow on bases and edges of quills, male rich yellow, length three inches without tail; also called Thistle-bird and Yellow-bird. The Lark-finch of the prairies has tail three inches long, and is much streaked with black, white, and chestnut. In the spring the males are usually seen on, or heard from, tree tops in orchards or parks, giving forth their glad carols. They are especially musical in spring when the snow is just leaving the ground and the air is bracing.

[214]

The nest consists of strips of bark, twigs, rootlets and grasses, placed at any height in evergreens or orchard trees. The eggs resemble, somewhat, large specimens of those of the Chipping Sparrow. They are three or four in number and are greenish blue with strong blackish specks.

Grosbeaks are finches with beaks extraordinarily stout, forming a continuous curve with the top of the head. The Cardinal Grosbeak is known as the Winter Redbird. In eastern United States are also the Blue, Rose-breasted, and Pine Grosbeaks, all beautifully colored and fine singers. The Rose-breasted Grosbeak breeds from Kansas, Ohio, Georgia (mountains), and New Jersey, north to southern Canada; winters from Mexico to South America. This beautiful grosbeak is noted for its clear, melodious notes, which are poured forth in generous measure. The rosebreast sings even at midday during summer, when the intense heat has silenced almost every other songster. Its beautiful plumage and sweet song are not its sole claim on our favor, for few birds are more beneficial to agriculture. The rosebreast eats some green peas and does some damage to fruit. But this mischief is much more than balanced by the destruction of insect pests. The bird is so fond of the Colorado potato beetle that it has earned the name of "potato-bug bird." It vigorously attacks cucumber beetles, many of the scale insects, spring and fall cankerworms, orchard and forest tent caterpillars, tussock, gipsy, and brown-tail moths, plum curculio, army worm, and chinch bug. In fact, not one of our birds has a better record.

Jays (*Cyanocitta*) are brightly colored, noisy birds, near relatives of the crow and are represented by numerous species distributed throughout the northern hemisphere. Probably the best known is the Blue Jay, one of the most beautiful birds that we have, but, unfortunately, one with a very bad reputation. Blue Jays often rob other birds of their eggs and young as well as food and nesting material. They are very active birds and are always engaged in gathering food, usually acorns or other nuts, and hiding them away for future use.

These Green Jays are very beautiful, but, like all the other members of the family, they are merciless in their treatment of smaller birds. During the summer their diet consists of raw eggs with young birds "on the side," or vice versa; later they live upon nuts, berries, insects; in fact, anything that is edible. They are fairly common in the Lower Rio Grande Valley in southern Texas.

Lark (*Alauda arvensis*).—This familiar songster, is well known as the symbol of poets and the victim of epicures. It is included among a type of birds which comprizes over one hundred species, widely distributed in Europe, Asia, Africa, with spreading stragglers in Australia and North America. The plumage is usually sandy brown, the color of the ground; the lower legs bear scales, behind and before; the hind claw is very long and straight; the bill is strong and conical. The skylark measures about seven inches in length; the males and females are alike in plumage; the food consists of insects, worms, and seeds. It nests in April, making a structure of dry grass in a hollow in the ground, usually among growing grass or cereals. The eggs (three to five) are dull gray, mottled with olive brown; two broods are usually reared in the season.

The MEADOWLARKS (*Sturnella magna*) our familiar friends of the hillside and meadow; their clear, life-like whistle is often heard, while they are perched on a fence-post or tree-top, as well as their spattering alarm note when they fly up before us as we cross the field. In North America they range east of the Plains and north to southern Canada; and winter from Massachusetts and Illinois southward.

The Western Meadowlark has the yellow on the throat extended on the sides; its song is much more brilliant and varied than the eastern bird. It is found from the Plains to the Pacific. The Florida Meadowlark is smaller and darker than the common HORNED LARK (*Otocoris alpestris*). This variety is only found in the United States in winter. During the mating season they have a sweet song that is uttered on the wing, like that of the Bobolink.

Mockingbird (*Mimus polyglottos*). This is the great vocalist of the South, and by many is considered to be the most versatile singer in America. It is found in gardens, pastures and open woods. All its habits are similar to our Catbird, and like that species, it is given to imitating the notes of other birds. Its song is an indescribable medley, sometimes very sweet and pleasing, at others, harsh and unmusical. Its general colors are gray and white.

Usually the nest is built in impenetrable thickets or hedges, or again in more open situation in the garden; made of twigs and rootlets, lined with black rootlets; the four or five eggs are bluish green with blotches of reddish brown.

It ranges throughout the southern United States, breeding north to New Jersey (and casually farther) and Ohio; and winters in the South Atlantic and Gulf States. The Western Mockingbird is found in southwestern United States, north to Oklahoma and California.

Nightingale (*Daulias luscinia*).—The common nightingale is well known as the finest of songsters. It is rather larger than the hedge-sparrow, with about the same proportionate length of wings and tail. It is of a rich russet-brown color above, shading into reddish chestnut on the tail-coverts and tail; the lower part grayish-white; bill, legs, and feet brown. The sexes are alike in plumage. It is a native of many parts of Europe and Asia, and of the north of Africa, and is a bird of passage, extending its summer migrations on the continent of Europe as far north as Sweden. It frequents thickets and hedges and damp meadows near streams, and feeds very much on worms, beetles, insects, ants' eggs, caterpillars, and other insect larvæ. The male bird sings by day as well as by night, but at night its song is most noticeable and characteristic. The variety, loudness and richness of its notes are equally extraordinary; and its long, quivering strains are full of plaintiveness as well as of passionate ecstasy. The ancient Romans paid more for a nightingale than they paid for a slave.

[215]

Orioles (*Oriolidae*) are confined entirely to the Old World and are characteristic of the Oriental and Ethiopian regions. The birds called "Orioles" in the United States belong to an entirely different family, the *Icteridae*. The members of the family are generally of a bright yellow or golden color, which is well set off by the black of the wings.

Twenty-four species are enumerated, the best known being the GOLDEN ORIOLE. The adult male is about nine inches long. Its general color is a rich, golden yellow; the bill is dull orange-red; a black streak reaches from its base to the eye; the iris is blood-red; the wings are black, marked here and there with yellow, and a patch of yellow forms a conspicuous wing-spot; the two middle feathers of the tail are black, inclining to olive at the base, the very tips yellow, the base half of the others black, the other half yellow; legs, feet and claws dark brown. The female is less yellow than the male, and the under parts are streaked with gray. In central and southern Europe it is common in summer in certain localities; it is abundant in Persia, and ranges through central Asia as far as to Irkutsk. It winters in South Africa. Its food consists of insects and their larvæ, especially green caterpillars, and fruits such as currants, cherries and mulberries. The song of the male is short, loud, clear, and flute-like; he has also a mewing call-note, and a harsh alarm-note. The nest is unlike that of any other European bird; it is placed in, and suspended from, a fork in a horizontal branch, sometimes of an oak, usually of a pine, in a shady grove or thick wood, and is made of bark, wool and grass.

The BALTIMORE ORIOLES (*Icterus galbula*) range in color through orange, black, yellow and gray. They are sociable birds and seem to like the company of mankind, for their nests are, from choice, built as near as possible to houses, often being where they can be reached from windows. As they use a great deal of string in the construction of their nests, children often get amusement by placing bright-colored pieces of yarn where the birds will get them, and watch them weave them into their homes. Their song is a clear, querulous, varied whistle or warble; the call, a plaintive whistle. The Baltimore Oriole is found east of the Rockies, breeding north to New Brunswick and Manitoba. They winter in Central America.

Robin (*Planesticus migratorius*).—These well-known birds are very abundant in the northern half of the United States, being found most commonly about farms and dwellings in the country, and also in cities if they are not persecuted too severely by English Sparrows.

The male has a black head and bright reddish brown breast; the female, a gray head and much paler breast; the young, intermediate between the two and with a reddish brown breast spotted with black.

The song of the Robin is a loud, cheery carol, "cheerily-cheerup, cheerily-cheerup," often long continued. The nest is a coarse but substantial structure of mud and grass, placed on horizontal boughs or in forks at any height, or in any odd place about dwellings; the four or five eggs are bluish green. Robins range throughout eastern North America, breeding from the middle of the United States northward. They winter throughout the same region. The Southern Robin is a paler form found in the Carolinas and Georgia.

Sparrows (*Fringillidae*) are small plain-colored birds, with narrow palates, small conical bills, and streaked plumage. The English Sparrow (*Passer domesticus*) was introduced into United States in 1853, and has since spread to a remarkable extent, in cities, driving off other birds. The white-throated sparrow, an American form, is really a bunting. Other American sparrows have little in common with the English Sparrow. All American sparrows wear the characteristic brown streaked plumage of the group, and include the small chestnut-capped chipping sparrow of gardens, the song sparrow, the little active seashore sparrow, and the large handsome fox sparrow.

SONG SPARROW (*Melospiza melodia*).—This is probably the best known, most abundant and most widely distributed of all our birds. They are quite hardy and many of them winter in the northern states, but the majority go farther south, returning to their summer homes about the first of March. They may be found anywhere where there are bushes, vines or hedges, and very often about houses, even in large cities.

Their song is very pleasing and musical, strongly resembling brilliant measures from that of the Canary.

The nest of grass is either on the ground or in bushes, and contains three to five bluish-white eggs, profusely spotted with brown. The Song Sparrow breeds from Virginia and Missouri north to southern Canada. It winters from Massachusetts and Ohio southward. Many local races are found west of the Rockies, but only one east of them. Dakota Song Sparrow is found in the vicinity of Turtle Mountains, North Dakota; it is lighter above and brighter below.

Swallows (*Hirundinidae*) are birds with long pointed wings, small feet, short, broad bill, and ten tail feathers. About one hundred species are known, almost universal in

Pelican (*Pelecanus onocrotalus*) is a native of southeast Europe, Asia and Africa. It is the largest of all swimming birds, and is found on the lakes and rivers of the continents mentioned. There are a number of species, chiefly tropical. The birds have a tail of twenty-four soft feathers, and a long bill, beneath the mandible of which is a distensible pouch for carrying fish. The Pelican of North America goes north into temperate regions in summer, at its breeding time.

Penguin.—The most remarkable peculiarity of these birds is the flattened wing, which is clad with flat, scale-like feathers; the whole limb, unfit for flight, is admirably suited for swimming. The feathers of the penguin—instead of being disposed in feather-tracts, separated by intervals (*apteria*) upon which no feathers grow, as is the case with all other birds, not excepting even the ostrich and cassowary—form a continuous covering to the body. The penguins are entirely confined to the Antarctic and to the south temperate regions—Patagonia, Cape of Good Hope, Australia and New Zealand. In some situations they are extremely abundant, and make their nests in a common area. The nest is little more than a hole in the sand in which the female deposits a single egg. The stupidity of these birds is perhaps due to the inaccessibility of the rocks and shores where so great a number live and breed; having been comparatively little interfered with by man, they show no terror at the sight of him. The plumage of the neck is valued by furriers for collars and tippets; and large numbers of "Johnnies," as the sailors call them, are slaughtered annually.

Swans.—See **Domesticated Animals**.

THE RUNNING BIRDS (*Cursores*)

This group is characterized by a considerable sized body, long neck, flat back, powerful legs and strong, two or three-toed running feet. The bones are heavy; the wings are stunted, and useless for flying; and the plumage is scanty on the head, neck, legs and abdomen.

Cassowary (*Casuarus*).—A bird of ostrich affinities, living in New Guinea, and other Malay Islands, and Northern Australia. They have rudimentary wings, live in dense forests, head protected by horny helmet, have blue, red and yellow wattles, three-toed feet, the inner toe with powerful claw, used as weapon, eat large quantities of miscellaneous articles, including indigestible ones; and can be tamed. Their cry is a loud croak. Their eggs, five in number, are laid in August and September, in nests on ground, covered in brush. The young are brownish, but gradually become blacker. The helmet is not full-grown until the fifth year.

Emu (*Dromæus*) is closely akin to the cassowary family. There are two species, both Australian—the Common Emu and the Spotted Emu. They differ from the cassowaries in several marked features—e.g., the head and neck are feathered except on cheeks and throat, there is no "helmet," nor are there wattles on the neck, the bill is broad, and the claws of the three toes are almost of equal length. The emu is a large bird, standing about six feet in height. The plumage is like that of the cassowary; the color is predominantly dull brown, darker on the head, neck and middle line of the back, lighter beneath. The naked parts of head and neck are grayish blue, the bill and feet brownish. The young are striped with black. The wings are of course rudimentary, but the legs serve the bird well both in running and kicking. Timid and peaceful in character, the emu trusts to its speed for safety. It is valued on account of its beef-like flesh, abundant oil, and edible eggs, but is unfortunately being destroyed with too great carelessness.

Ostrich.—See **Domesticated Animals**.

Rhea, also called Nandu and American Ostrich is a South American bird, which form a somewhat isolated group, though nearer to the ostrich than to any other bird. They are incapable of flight, but the wings are rather better developed than in the ostrich. As in the ostrich and the apteryx, the feathers have no aftershaft, and the color of the eggs is white. The male bird incubates. Three species have been described.

GAME BIRDS (*Gallinæ*)

The members of this order are ground-birds, with strong, blunt-clawed feet adapted for scratching up the ground in search of food. The beak is nearly always shorter than the head, and has projecting edges; the wings are generally short, and rounded off; the legs are armored with callosities. All these birds build their nests on the ground, and their young are nest fledglings, leaving the nest on the same day. A number of our domesticated fowl belong to this group.

Bobwhite (*Colinus virginianus*) is known everywhere by the clear whistle that suggests its name. It is loved by every dweller in the country and is better known to more hunters in the United States than any other game bird. It is no less appreciated on the table than in the field, and in many states has unquestionably been hunted too closely. Half the food of this quail consists of weed seeds, almost a fourth of grain, and about a tenth of wild fruits. Although thus eating grain, the bird gets most of it from stubble. It feeds freely upon Colorado potato beetles, chinch bugs, cucumber beetles, wireworms, billbugs, clover-leaf weevils, cotton-boll weevils army worms, bollworms, cutworms, and Rocky Mountain locusts.

Chicken or Fowl.—See **Domesticated Animals**.

Grouse is a name applied to many game-birds, including quail and partridges. They are well known to be large, plump, somewhat heavy birds, usually short-tailed, and with beautifully variegated plumage, which must often be protective. The largest American grouse, however, is the Cock of the Plains or Sage Cock. The Ruffed Grouse (*Bonasa umbellus*) is distinguished from other grouse by the broad black band near tip of tail. It is found in the northern two-thirds of the United States and in the forested parts of Canada. The Ruffed Grouse is famed as the finest game bird of the northern woods. It is usually wild and wary and well understands the attacks of hunters. Wild fruits, mast, and browse make up the bulk of the vegetable food of this species; and it is very fond of hazelnuts, beechnuts, chestnuts, and acorns and eats practically all kinds of wild berries and other fruits.

Guinea.—See **Domesticated Animals**.

Partridges (*Tetraonidæ*).—The most common of the Old World is the Gray Partridge. The Snow Pheasants of the heights of the Himalayas may exceed six pounds in weight. The Gray Partridge of India is not palatable as food, but, being very pugnacious, is kept for fighting; the male has two spurs on each foot. There are upward of fifty species of American partridges, among which are the Mountain Quail of California, the **Bobwhite** (which see), while the Ruffed Grouse is called Partridge in the North and Pheasant in the South. It is shy, forest-loving; the male makes a drumming sound by vibrating its wings. Its tarsus is feathered half way, the head crested, and plumage variegated.

Peacock.—See **Domesticated Animals**.

Pheasants (*Phasianidæ*).—About forty species of pheasants inhabit southeastern Asia. They are brilliantly colored and have long tails and crests. The males generally are pugnacious; the male of the Blood Pheasant, dwelling on the heights of the Himalayas, has four or five spurs on each foot.

The pheasant exhibits a remarkable readiness to hybridize with other like birds. The Ring-necked Pheasant is a native of the forests of India and China. It is distinguished by a white ring almost surrounding the neck, and is of smaller size than the common pheasant, somewhat different in markings, and has a shorter tail. It is the common pheasant of the Celestial Empire. Among other species of pheasant may be mentioned Diard's pheasant, a native of Japan; Soemmering's Pheasant, also from Japan, one of the most beautiful pheasants known, but terribly pugnacious; and Reeve's Pheasant, a native of the north of China, in which white is the prevailing color, and the tail is of extraordinary length.

Of somewhat different type are the Golden Pheasant and the Silver Pheasant, both natives of China. The Golden Pheasant is one of the most splendid of the tribe. It has a fine crest, and a ruff of orange and black, capable of being erected at pleasure. The tail is very long. The Silver Pheasant is one of the largest and most powerful of the tribe. The Impeyan Pheasant is a native of the East Indies, and known as the "bird of gold."

Ptarmigan (*Lagopus*), a bird nearly allied to the true grouse, differs chiefly in having the toes as well as the legs thickly clothed with short feathers. They are natives of the northern parts of the world, of elevated or of arctic regions. With the exception of the Red Grouse, the species change color on the approach of winter, assuming a white or nearly white plumage. All are esteemed as food.

The Common Ptarmigan is now resident in the Lofoden Island, in Scandinavia, on the Ural and the Altai ranges, etc., and also on the Alps and the Pyrenees. The winter plumage is pure white, except a black band above the eyes of the male, and some black on the under feathers of the tail. In both sexes the wings are always white, but have dark shafts to their quills. In summer the males are predominantly grayish brown above, with blackish head, shoulders, and breast, with white belly, with black tail-feathers tipped with white. In the female a tawny color predominates. In autumn, again the plumage is different, with numerous streaks of slate gray on the upper parts. The white winter plumage is doubtless protective amid the snow, and may be the result of the cold; the summer plumage is not less harmonious with the surroundings.

Turkey.—See **Domesticated Animals**.

Quail.—See **Partridges** and **Bobwhite**.

THE REPTILES (*Reptilia*)

LIZARDS, CHAMELEONS, SNAKES, CROCODILES, TORTOISES AND TURTLES

The reptiles are vertebrates which are supplied with a horny or bony skin; they have red, cold blood, breathe by means of lungs, and generally lay eggs; many of them have no feet. When limbs are present, however, they do not raise the body far off the ground, for the elbows and knees are turned outward. Some reptiles pass the winter in sleep.

TORTOISES AND TURTLES (*Chelonia*)

These animals have a wide body, which is enclosed between the arched shell of the back and the flat shell of the stomach. There are land, sea, and river tortoises. In some the head and legs can be retracted inside the shell. Over the outside of the case are horny plates which, in the hawkbill turtle are of value, as they afford the tortoise shell used for combs, etc. Turtles never have teeth, the edges of the jaws being covered with horny material. Most of the species are carnivorous. The largest species are the marine leather-backs of the tropics, which occasionally drift north to New England, and the giant species occurring on the Galapagos Islands, off the west coast of South America, and on some islands in the Indian Ocean.

Land Tortoises have a high arched shell under which the head and feet can be retracted. The feet have separate toes, and are adapted for walking. They are strictly herbivorous. Examples of this family are the large and strong Gopher-tortoises of the Carolinas, which burrow in the earth, the massive Amazon Tortoise, used for food by the natives, the Galapagos Tortoise, and the small Garden Tortoise.

Mud Tortoise (*Emys lutaria*) is frequently seen in Italy and the south of France. It inhabits lakes and slow-flowing waters, and feeds upon small fish, spawn, frogs, water insects, etc. It lays its eggs in a hole, which it digs in the bank. Its flesh is edible. Small specimens are frequently kept in aquariums, and fed with meat, bread, lettuce leaves, etc.

Sea Turtles have flat shells between which the flipper-like feet and huge head cannot be retracted. There are no nails or separate toes, and the fore feet are much the larger. The Green Turtle (*Chelone midas*) is much esteemed as food, with its eggs. It lives in or near the Gulf Stream, feeds on the roots of eelgrass, comes ashore at night, during May, and lays nearly one hundred eggs, which hatch in six weeks; the laying is usually repeated several times every two weeks, near the first nest. This Turtle may attain a weight of over eight hundred pounds. The Logger-head Turtle, so-called from its huge head and neck, ranges from Brazil to Massachusetts, attains a weight half that of the Green Turtle, and feeds on fish, crustacea, conchs, etc.

The Hawk's Bill (*Eretmochelys*) has pointed plates that supply the "tortoise shell" of commerce. A large specimen may yield as much as eight pounds of the "shell." The beautiful mottled color and semi-transparent characters of this material are well known. Its manufacture is carried on in the East, a fine tortoise-shell being exported from Celebes to China.

Snapping Turtle is a large voracious turtle, common in North America along stagnant waters and along the southern Mississippi where it sometimes reaches the weight of thirty pounds. It lives on fishes, frogs, and shells, and occasionally water-fowl. It has great strength of jaw and snaps when it bites. When fattened, its flesh is often esteemed as a delicacy. It is sometimes known as the Alligator-terrapin or Alligator Turtle.

Terrapin is the popular name of many species of fresh-water and tidal-water tortoises, native to tropical and the warmer temperate countries. About twenty fresh-water species are found in the United States. But the terrapin *par excellence* is the Diamond-back Salt-water Terrapin, highly prized as a delicacy for the table. It is caught in salt marshes along the coast from New England to Texas, the finest being those of the Massachusetts and the northern coasts.

Crocodiles are cruel, but in one way they serve us, by eating the dead bodies of animals which float down the rivers. But for the crocodiles these bodies might poison the water. Here we see the crocodile and the little bird called the zizac, which picks the food from between the crocodile's teeth.

CROCODILES AND ALLIGATORS (*Crocodylia*)

These inhabitants of the rivers and estuaries of tropical regions are somewhat lizard-like in appearance, but in structure they are in many ways much more specialized. They have a scaly, tough skin on the back, four powerful feet, and a long tail. They live chiefly in the water, and only go to the banks to bask in the sun. The jaws are armed with powerful interlocking teeth, which constitute a deadly trap. The valvular nostrils are so situated that the animal can drift along with most of its body submerged, and at the same time breathe quite easily.

Alligator (*Alligator mississippiensis*) is found in the southern states of North America. It is as voracious as it is bloodthirsty. Should it perceive an unfortunate mammal drinking or browsing on the edge of the bank, it sinks below the surface, and rapidly swims toward the victim by strokes of its powerful, flattened tail. Then comes a sudden snap, aided, perhaps, by a lash of the tail; should the attempt prove successful, the prey is held under water till it is drowned, if too large to be forthwith swallowed. No bullet will pierce the hide on its back. It deposits its eggs in a kind of nest, which it builds with grass and mud on the banks, and defends with great fierceness. It deposits about one hundred eggs in this nest. The alligator is captured in various ways, but there is danger in hunting it.

Crocodile (*Procaelia*) is found in both hemispheres, but especially in Africa; they swarm on the Upper Nile. The crocodile of the Nile is a well-known species, not now found farther north than Thebes, but occurring abundantly farther south and east. Some two or three score of eggs, with delicate, rough, limy shells, about the size of those of geese, are laid in sandy cavities in the bank. The crocodile is now hunted for the perfume of its musk-glands, and also for its skin and fat.

The alligators have a covering of horny plates, and terrible jaws and teeth. These teeth are frequently renewed, new ones forming in place of those worn out. Alligators are, in this respect, more fortunate than human beings. In America alligators are protected part of the year, because they kill things which damage the crops.

LIZARDS (*Lacertilia*)

These may perhaps be described as the most average of existing reptiles, and have a very wide distribution. Examination of a lizard or its skeleton enables us to grasp very clearly some of the average characters of reptiles, such as the sprawling limbs and long tail. Some of the tropical lizards are of very considerable size, attaining a length of as much as six feet, as in the iguanas of America, some of which are esteemed as food. These are among the climbing members of the order, other examples being the geckoes and chameleons, both of which are animals of small size.

Chameleons are proverbial for the way in which they rapidly change color if placed among fresh surroundings, so as to harmonize with them. This variable general coloration is protective, because it makes the chameleon invisible to its foes, and also aggressive, as the insect prey of the little lizard are thereby lulled into a sense of false security. The digits are bound together into two groups, and a tongs-like grasping organ of great efficiency is thus constituted. The chameleon is also notable for the relatively enormous distance to which it can suddenly shoot out its sticky club-shaped tongue, for the purpose of seizing insects or other small creatures.

Flying Dragon (*Draco volans*) is found on trees in the island of Java. It generally frequents the trees along the banks of great rivers, in the leaves of which are numerous insects, upon which the flying dragon feeds. As it is as green as the leaves of the trees, it can only be recognized by an experienced eye. It is hunted for its delicate flesh, and also for the eggs, which are found deposited, often fifteen to twenty at a time, in a hollow in the ground.

Gecko (*Hemidactylus maculatus*) is a native of the East Indies and China. At dawn these reptiles creep out of their holes, and with dilated eyes look around for prey. As soon as they catch sight of it, the clumsy creatures spring upon it from a distance of four to six inches, with all the violence and rapidity of an animal of prey. Sucking pads on the feet of the gecko enable it to cling firmly to the most slippery surface, and to crawl about without slipping; its claws, which are sharp and retractile, are also useful to this reptile.

Iguana (*Iguana tuberculata*) is found in the East Indies and in South America. It lives in trees along the banks of rivers, feeding upon the insects. Its usual color is dark olive green. Its flesh is considered a delicacy, being tender and very much like that of a chicken. The eggs, of which the female deposits from four to six dozen at a time, are also eaten.

SNAKES OR SERPENTS

have elongated bodies, covered with plates or scales, and no feet. Many kinds have no poisonous fangs in the upper jaw. Serpents reproduce their species from eggs, and feed upon living animals; those found in colder regions sleep through the winter.

HOW THE SNAKE TRAVELS

The vertebrae are very numerous. With the exception of the most anterior (atlas), all bear ribs, which are very freely movable and are the snake's main organs of locomotion. Snakes are capable of moving with great swiftness. The body undulates from side to side—not up and down—in a wriggling or writhing fashion. The extremely flexible backbone permits of this, but to guard against dislocation the vertebrae are connected by extra locking-joints, which only permit a certain amount of play. It is, however, comparatively easy to break the back of a snake by a sharp blow with a stick or whip.

MOUTH AND SENSE ORGANS OF SNAKES

Snakes are typically carnivorous, and many of them are furnished with powerful poison fangs. The tongue is forked, can be rapidly protruded and retracted, and is an efficient sense organ. Upon it and the well-developed nostrils the snakes largely depend, for neither sight nor hearing is very acute. There are no eyelids, the eyes being covered over by a transparent convex scale. The whole skin is covered with scales, which are folds of the epidermis, continuous with one another. In consequence, when the snake casts its coat—which occurs several times in the year—it casts it in one piece, this being a complete replica of the snake.

THE ORGANS OF CIRCULATION

The heart is four-chambered, as in mammals and birds, and not three-chambered, as in other reptiles and amphibia. The pure and impure blood do not, therefore, mix inside the heart; but as such blending takes place outside, owing to imperfect separation of the great vessels, the net result is much the same as in the lizards.

HOW SNAKES SECRETE POISONS

In venomous serpents some of the glands opening into the mouth secrete a poisonous fluid, which is introduced into the blood of a bitten victim. The largest amount of specialization is found among the vipers, where the teeth are reduced to a pair of hollow "fangs" in the front of the upper jaw, and there are two large poison-glands, one on either side of the head, giving it a characteristic resemblance to the ace of spades. In a state of rest, when the mouth is shut, the poison-fangs are pressed against the roof of the mouth, with their tips directed backwards. But when the snake opens its mouth and "strikes," the fangs are rotated forward so that their sharp tips can be brought into action. The poison flows into the upper end of the tooth-canal and, in vipers, enters the wound by a small hole on the side of the tip. Were it at the end a blockage might result. We have, in fact, an anticipation of the device used in the construction of the needles employed with hypodermic syringe.

WHY SNAKES ARE COLORED

Snakes, like lizards, are very commonly colored in such a way that they may harmonize with their surroundings. A good many poisonous forms, on the other hand, advertise their dangerous properties by brilliant hues and striking patterns. Such "warning coloration" is seen, for example, in the coral snakes of tropical America, which are marked with broad red rings, alternating with others of whitish tint, shading into black at the front and back of each ring. These coral snakes serve as models which certain harmless forms unconsciously mimic, thus securing a certain amount of immunity from attack by sailing under false colors.

SOME SNAKES THAT WARN

In the American rattlesnakes, at each periodical casting of the skin or slough, a little knob remains at the end of the tail. A series of these loosely united together make up the "rattle," used for the production of warning sounds. The "hissing" of a snake has the same purpose. Venomous snakes also commonly assume a warning attitude, raising the front part of the body from the ground and, in some cases, as illustrated by the cobra, inflating a kind of hood—in this particular instance bringing a black, spectacle-shaped mark into prominence.

But in these and other animals it must not be supposed that the "warning" is for the benefit of the prey, but may be taken as a hint to aggressive birds and mammals that discretion is the better part of valor. The success of this device is shown by the terror with which all monkeys regard serpents.

THE ART OF SNAKE CHARMING

This art has been practised from very ancient times in Africa and the East, and often remains from generation to generation the profession of a family. It is sometimes practised for alleged useful purposes, since the "charmers" are often employed to clear a house of its unwelcome snake visitors. For the most part, however, it is, like conjuring, a form of popular amusement. In India it is practised by several distinct classes of men, who vary in the methods and success of their art. The charmers usually take good care to play with snakes whose fangs or even poison-glands have been carefully removed, or even to use those which are not venomous at all. The frequent use of a musical pipe, and the way in which the snakes seem to respond to the sounds, are facts interesting to naturalists, who believe that at least many snakes are very deaf. The charmers sometimes manifest a fearlessly confident dexterity in handling intact venomous snakes.

THE WISDOM OF THE SERPENT

In correlation with the presence of a well-developed brain, snakes may be regarded as the most intelligent of reptiles, though the idea of their "wisdom" probably took origin in their stealthy ways, and the curious "fascinating" powers already mentioned. They are among the numerous animals that have been the objects of superstitious worship.

AMERICAN AND OTHER SNAKES

The group of North American snakes include a large number of Colubrine snakes and about a score of pit-vipers or rattlesnakes. Among the Colubrine forms are the water-snakes, the black snakes and coachwhip snakes of the genus *Coluber*, the pine-snakes, the king-snakes, the ring-necked snakes and so on. Besides the rattlesnakes proper, there are the related copperheads and moccasins. Outside these two families there are the boa-like and venomous coral-snakes, and the harlequin snake.

There are no snakes in Ireland, nor are they represented in most oceanic islands such as New Zealand and Iceland. The pythons and boas are distinctly tropical snakes: the pythons in Africa, India, Malaya, Australia; the boas in tropical America. Among the most important venomous snakes of India are the following: the cobra, the Hamadryas, the Krait, the Sankni, and the sea-snakes.

AMPHIBIANS (*Amphibia*)

FROGS, NEWTS, SALAMANDERS AND TOADS

The amphibians hold a middle position between the reptiles and fishes. The name, Amphibia, means "double-lived" or living on both land and water. The larvæ, after leaving the eggs, live in the water like fishes; they gradually accustom themselves to live in the air, and when their metamorphosis is complete they breathe by means of lungs.

They have red, cold blood, and are enveloped in a smooth, often slippery, skin. Some have tails, like the newt and salamander, and others are tailless, like the frog and toad.

Frog (*Rana temporaria*) is familiar all over America, and is found in the early spring in all our ponds, ditches, and lakes, in which also large quantities of frog's eggs can be seen. When fully developed, frogs have a short, tailless body, a large head, and four legs, the toes being frequently joined together by a membrane.

They deposit their eggs (*a*) in the water, either in masses or in strings. The larvæ (called tadpoles) have a long, flattened tail (*c*); they have no legs, and breathe through gills (*b*), and are therefore very different from the fully developed frog. The gills gradually disappear, and lungs are developed; the fore legs make their appearance, the hind pair developing first (*d* and *e*); the tail gradually diminishes, and finally disappears (*f*). The change, is then complete, and the young frog leaves the water to begin its life upon land. The common frog leaves the water immediately after spawning, and makes itself very useful by destroying numerous injurious insects and snails.

In this country the commoner species of frogs embrace the BULL FROG (*R. catesbiana*), which is the largest, sometimes being eight inches long. Its sonorous bass notes are familiar to the ear, and to the eye it presents a greenish appearance, brightest on the head; with faint spots on the back and blotches on the legs. It occurs from Kansas eastwards, and its hind-legs fried are considered a delicacy.

The SPRING FROG (*R. clamata*) is widespread, about three inches in length, green and black spotted above and white below.

The common GREEN FROG (*R. virescens*) has irregular black blotches, and is paler beneath. Both average about three inches in length.

[224]

DEVELOPMENT OF THE FROG—FROM THE EGG TO THE FULL-GROWN ANIMAL
(See Page 223).

The PICKEREL FROG (*R. palustris*) is light brown in color, with two rows of large oblong blotches of dark brown on the back and spots elsewhere. It is smaller in size and less aquatic than most other kinds.

The WOOD-FROG or TREE-FROG (*R. sylvatica*) is more closely related in structure to the toads than to the frogs proper. The tree-frogs show various interesting adaptations to their arboreal life. The last joint of each toe bears a claw, on which is supported a disc or sucker by means of which the animals can cling to a perfectly perpendicular surface. Most of them also exhibit in a greater or less degree the power of color-change, where the color varies from a dark brown to a lichen-like gray or a brilliant green.

Newts are separated from the lizards on account of their changes while young. Like the frogs, they are first tadpoles, and do not assume their perfect shape until six weeks after their exclusion from the eggs. The common Newt is a beautiful inhabitant of the ponds, ditches, and still waters.

The male newt is distinguished by a beautiful crimson tipped wavy crest of loose skin, that extends along the whole course of the back and tail, and which, together with the rich orange-colored belly, makes it a most beautiful creature. The female has a singular habit of laying her eggs upon long leaves of water-plants, and actually tying them in the leaf by a regular knot.

Salamander (*Salamandra maculata*) is a nocturnal animal, and found in woods and hedges under decayed leaves and similar matter. Their bodies are longer and similar to the lizard. Most of the species lay eggs, usually in the water. From these the gilled young hatch out. They are carnivorous or insectivorous. In the adult stage, some are aquatic, but more live on the earth burrowing beneath the soil or under stones, seeking their prey at night. None are poisonous, except that they have glands in the skin which secrete an acrid juice. Our largest species is the mud puppy (*Necturus*) of the Mississippi basin; the largest living species is the giant salamander of Japan, three feet in length.

Toad (*Bufo*).—Toads are distinguished from frogs by the absence of teeth, by the roughness of the skin, by peculiarities in the breastbone, and by the shorter hind-legs.

The common toad is a shy, nocturnal animal, hiding during the day in dark, damp places, crawling about at night in search of insects, grubs, slugs, worms, and the like. Its appearance is familiar—a dirty brownish-gray color, a warty skin, a flat head, swollen parotid glands above the ears, bright jewel-like eyes with a transverse pupil, slightly webbed toes. They are heavier and clumsier than frogs, and cannot leap nearly so far. During the winter they live in the mud or in holes. In spring they pair, and the females lay in the water-pools their numerous eggs in strings about three or four feet in length. The tadpoles are smaller and darker than those of frogs, and do not accomplish their transformation into toads until autumn.

Toads are widely distributed over most parts of the continents, but are most abundant in tropical regions. The common toad of North America ranges everywhere east of the Rocky Mountains. In the Southern States another very similar species is numerous, and other species are found in the West. The largest toad of tropical America measures eight inches in length.

The LAUGHING TOAD (*Bombinator igneus*) is the smallest of the toads, with a yellow spotted belly.

[225]

THE ARCHER FISH
is one of the strangest of all fishes in its habits. It shoots down flies and other small creatures from the bank by means of a series of well-aimed "bullets" of water, which it ejects in rapid succession.

THE FISHES (*Pisces*)

The fishes are the last class of the vertebrated animals, and have cold, red blood. The elongated body generally tapers off to the tail; the head and neck are large; the limbs are called fins, and are such as to make efficient paddles. They are usually one or more fins in the middle line of the back and one or two in a corresponding position beneath the tail (anal fins); while the tip of the tail is terminated by a caudal fin, the chief organ of swimming. All of the fins are supported by a skeleton of rays, either horny or spinous in character.

There are but two chambers to the heart, and the occurrence of a swim bladder, an organ for regulating or recognition of the depth of the water in which the fish is, is very frequent. Externally fish have a defensive armor of scales or bony plates embedded in the skin. They breathe throughout life by means of gills, which are delicate folds or filaments connected with openings (gill slits) in the sides of the throat. The fishes live in water, and reproduce their species by eggs.

There are several great groups of fishes, distinguished by the presence of a cartilage or bony skeleton, by having the gill slits free or under a gill cover, by characteristics of the skull, presence or absence of air bladder, and by peculiarities of the digestive tract and nervous system.

(1) The bony, or true fishes (*Teleostei*), which include all the most familiar freshwater and marine forms; (2) the Cartilaginous fishes (*Elasmobranchii*), including sharks, dog-fish, bays and skates; (3) the heavily-armed fishes (*Ganoidei*), like the sturgeons and bony pike; and (4) the double-breathers (*Dipnoi*), of rare occurrence.

THE BONY FISHES (*Teleostei*)

These have a bony skeleton, and a well-defined vertebra, or backbone; their bodies are mostly covered with scales.

Alewife (*Alosa tyrannus*), a fish of the same genus with the Shad, which, at the beginning of summer, appears in great numbers on the east coast of North America, and enters the rivers to spawn. It appears in Chesapeake Bay in March, on the coasts of New York and New England in April, and on those of the British provinces about May 1. It abounds in the bay of Fundy, but is more rare in the gulf of St. Lawrence; and the bay of Miramichi appears to be its northern limit. Its length is not more than twelve inches. The alewife is called spring herring in some places, and gaspereau by the French Canadians.

Bass (*Labrax*) is a member of the perch family. The shape is salmon-like. The color is without the zebra-like bars of the perch, and shades off from dusky blue above to silvery white beneath.

The Striped Bass or Rock-fish of the United States (*L. lineatus*) very nearly resembles the common bass, but attains a larger size. It is one of the most important of American food fishes, and sometimes weighs fifty pounds. It is caught from July to September. The name Stone Bass is given to various forms. A Yellow Bass is found in the Lower Mississippi valley, and the Fresh-water Bass is an imported fish found in the streams of eastern New York and the other middle states.

Bluefish (*Temnodon* or *Pomatomus saltator*).—A fish common on the eastern coasts of America, allied to the mackerel. The only known species is abundant on the east coast of North America. The upper parts are of a bluish color, the lower parts whitish, a large black spot at the base of the pectoral fins. The mouth is crowded with teeth, the jaws are furnished with large ones. The bluefish preys on other fishes, such as the menhaden and mackerel, the shoals of which it pursues. It sometimes attains a length of three, or even five feet, and a weight of fourteen pounds. It is often caught by trolling, as it bites readily at an object drawn swiftly through the water. It is much esteemed for the table.

[226]

Bullhead.—In the United States the name is given to some species of catfish or horned pout; in England to a smaller fish, allied to our miller's thumb, but belonging to a different group from the catfish.

Carp. See page 256.

Cod (*Gadus*), a genus of bony fishes in the soft-rayed order. This is probably the most important food fish and is taken in enormous numbers on the coasts of Europe and of eastern North America. It occurs in the northern Pacific as well. It feeds upon other fishes as well as on shellfish, and large specimens weigh over one hundred pounds. Allied to the cod are the haddock, pollack, hake and cusk.

Eel (*Anguilla vulgaris*) has elongated form, and has become proverbial on account of its slipperiness and tenacity of life. In the rivers and lakes only female fish are found; the males keep to the open sea. The former go down to the sea in the autumn; but in the following spring the young female fish swim up the rivers in immense numbers, while the young males remain in the sea. During the day the eel conceals itself in the mud, but at night it exhibits its voracious qualities by swallowing numerous fish, water insects, crabs, mussels, and worms. Its firm, delicate flesh is much esteemed.

Flounder (*Pleuronectes flesus*), a common species of flat-fish, of wide distribution in shallow waters in north temperate countries. It is the Scotch "fluke," and the Swedish "flundra," and differs but a little from the plaice and dab, two of the commonest neighbor-species. Like other flat-fishes, the flounder is asymmetrical, and swims or rests on one side, almost always the left, the eye of which is in early youth, brought round to the upturned surface. It measures about one foot in length, and about a third as much between the dorsal and the ventral edge, without including the fringing fins.

Of the two dozen related species, the plaice, the dab, the smear-dab, and the craig-fluke are the commonest.

Flying-fish.—Various fishes which have the power of sustaining themselves for a time in the air by means of their large pectoral fins. Generally, however, the name is limited to the species of the genus *Exocoetus*, which belongs to the family of mackerel-pikes. These can pass through the air to a considerable distance, sometimes as much as two hundred yards, to escape from the attacks of other fishes, especially the dolphin. They are most common between the tropics.

Goldfish. See page 256.

Haddock (*Gadus aeglefinus*) is a fish of the same genus as the cod, and much resembling it in general appearance; but distinguished by a notched tail and a white line along the side. In habits the two are much alike, being voracious, eating anything edible, but largely clams and the like.

Halibut (*Hippoglossus vulgaris*), the largest of all the flat-fish and in form more elongated than the flounder or the turbot. The halibut, though esteemed for the table, is not to be compared in quality with the turbot; its flesh is white and firm, dry and of little flavor. It attains a great size; specimens have been caught weighing at least five hundred pounds, and one caught in Iceland was little short of twenty feet long.

Herring (*Clupea harengus*) belongs to the order of bony fishes and is spread over the whole North Atlantic. It is of great economic importance, and occurs in large schools, swimming through the sea with open mouths, scooping up the minute life for food. Immense numbers are taken both here and abroad, the annual catch for Europe and America being estimated at a billion and a half pounds. The young are also taken in vast quantities and are preserved as American sardines. With us most of the adults are smoked and dried.

Mackerel (*Scamber*), a genus of fishes which also includes the tunny, bonito, and sucking fishes. It is an important food fish occurring in the North Atlantic and characterized by its slender shape, the series of little finlets on the tail and the deeply notched caudal or tail fin. It is taken both by hooks and by seines. Some are eaten in the fresh condition and some are salted. It goes in large schools. Allied is the Spanish mackerel of our southern waters and the large horse mackerel which is more common in the Mediterranean, where it is called the tunny.

Perch (*Perca*).—Spiny-finned fishes, well represented by the Fresh-water Perch (*P. fluviatilis*), which is widely distributed in lakes, ponds, and rivers in Europe, Northern Asia, North America and Britain. It is of a greenish-brown color above and golden yellow on the under parts, with six or seven indistinct dark bands on the back. In length it measures about eighteen inches, and its height is about a third of this. It sometimes weighs from three to five pounds, and a prize of nine pounds has been recorded.

Porgy.—A food fish on the eastern coast from Cape Cod south, known also as scup. It should not be confounded with the pogy or menhaden, one of the herrings, which is taken extensively for oil.

Pollack (*Gadus pollachius*), a fish, belonging to the cod genus. It is about the size of the coal-fish, is active in habit, and is frequently caught. The lower jaw projects beyond the upper, and there is no barbel. It has commercial value in the English Channel and off the coasts of Newfoundland. Allied species, which promise a valuable future, abound from Puget Sound to Alaska on the Pacific coast.

Salmon (*Salmo*), a genus of well-known fish which inhabits both salt and fresh waters, and ranks among the food-fishes. It generally attains a length of from three to four feet, and an average weight of from twelve to thirty pounds, but these limits are frequently exceeded. The adult fish is a steel-blue on the back and head, becoming lighter on the sides and belly.

It usually continues in the shallows of its native stream for two years after hatching, and during this period it attains a length of eight inches. When the season of its migration arrives, the fins have become darker and the fish has assumed a silvery hue. It is now known as a *smolt* or *salmon fry*. The smolts now congregate into shoals and proceed seaward. On reaching the estuary they remain in its brackish water for a short time and then make for the open sea. Leaving its native river as a fish weighing, it may be, not more than two ounces, the smolt, after three months' absence, may return to fresh water as a *grilse*, weighing four or five pounds. In the grilse stage, the fish is capable of depositing eggs. After spawning in the fresh water the grilse again seeks the sea in the autumn, and when its second stay in the ocean is over it returns after a few months' absence as the adult salmon, weighing from eight to ten pounds. The salmon returns as a rule to the river in which it passed its earlier existence. The fertility of the fish is enormous.

Salmon are caught by the rod, and by means of nets, the fishings being regulated by law. There are important fisheries in some European and North American rivers. In Europe the fish is found between the latitudes of forty-five and seventy-five degrees, in North America in corresponding latitudes. The flesh when fresh is of a bright orange color, and is of highest flavor when taken from the sea-feeding fish. In the waters of northwestern America are several salmon belonging to a distinct genus, including the quinnat or king-salmon, blue-back salmon or redfish, silver salmon, dog salmon, and humpback salmon. The quinnat has an average weight of twenty-two pounds, but sometimes reaches one hundred pounds. Both it and the blue-back salmon are caught in immense numbers in the Columbia, Sacramento, and Frazer rivers (especially in spring), and are preserved by canning.

Sardine, or Pilchard (*Clupea pilchardus*) is an important fish closely related to the herring and sprat. In size it grows from ten to fourteen inches; in color it is bluish-green above, whitish underneath and on its sides. It is entirely marine in habit, and its eggs float on the surface of the sea, unlike those of the herring, which are attached to objects at the bottom. The young, before it has attained maturity, is known as the sardine, and as such forms a valuable fishery; the full-grown pilchard is used as an article of diet as well as for bait. The method of capture is usually by drift-net. It is most abundant off the coasts of Portugal, and in the English Channel and the Mediterranean.

Shad is a migratory fish of great food value. It ascends all of the rivers of the eastern coast of the United States every spring to lay its eggs. It is closely related to the herring, but is much larger, and were it not so full of bones it would stand very near the head of food fishes.

Smelt (*Osmerus*) is a genus of the Salmon family, characterized by strong fang-like teeth, and by rather large scales, which readily fall off. The form is very trout-like, but rather more slender; the tail is larger in proportion, and more forked. The back is whitish, tinged with green; the upper part of the sides shows bluish tints, the lower part of the sides and the belly are of a bright silvery color. The smelt has a peculiar, cucumber-like smell, and a delicious flavor, on account of which it is highly esteemed for the table.

Sole (*Solea*) is a fish oval in shape, the outline of the snout being semi-circular, and projecting somewhat beyond the mouth. The Common Sole (*S. vulgaris*) is a fish of high value in European markets. It lives in European seas from the Mediterranean to the north of Denmark, and is rarely caught on the American side of the Atlantic Ocean, although numerous closely allied kinds abound.

Sword-fish (*Xiphiidae*) are abundantly represented in tropical and subtropical seas. They are among the largest bony fishes, sometimes measuring twelve to fifteen feet in length. The sword, which may be over three feet long, is formed from a compressed prolongation of the upper jaw, and is often strong enough to stab whales fatally, or less advantageously to pierce the bottom of a ship or the planks of a boat. Sword-fish are said to attack whales and other cetacea, and also boats and canoes, and even large vessels.

Trout, a name applied to various members of the Salmon family. The Common or Brown Trout (*Salmo fario*) varies greatly in appearance, not only with individuals but at different seasons, and this variability has led some authorities to distinguish a number of subspecies.

At midsummer an adult trout is usually brownish or olive in color, with pure white on the belly and gold on the flanks, while the back varies from olive or pale brown to nearly black. The dorsal fin and sides are spotted with black and often also with scarlet. The scales are circular, thin and minute. When the spawning season begins in autumn all the color disappears and the body becomes slimy to the touch. The head of the male is larger than that of the female, and the lower jaw bears a cartilaginous knob. It feeds on a large variety of food, different kinds appealing in turn. It is by cunning imitations of some prevailing fly that the fisherman makes his most cherished captures.

The artificial hatching of trout is now carried on extensively, and lakes and streams can be stocked or replenished with fish if they are not too polluted.

The Bull Trout or Sea Trout (*S. eriox*) most resembles the salmon in appearance and habits, though thicker in proportion to its length, and with larger and more numerous dark spots on the gill-covers and scales.

The Salmon or White Trout (*S. trutta*) is a more elegant fish, and its flesh is much more delicate in flavor. The habits of both are similar.

The Rainbow Trout (*Salmo irideus*) of America has been introduced into many parts of the world; in New Zealand, especially in Lake Taupo, it attains the greatest size, many tons being caught yearly.

Whitefish (*Coregonus clupeiformis*), the common whitefish, is the largest of all the American lake whitefish. It is very highly esteemed for food, ranking, indeed, as one of the finest table fishes. Its range extends from Lake Champlain to the Arctic Circle.

CARTILAGINOUS FISHES (*Elasmobranchii*)

These fishes have a cartilaginous, pliant, undeveloped skeleton, and are not covered with true scales. They include rays, sawfish, sharks, skates and others.

Ray, a popular name applied to many of the flat cartilaginous fishes: Thornbacks, Electric Rays, Sting-rays, Eagle-rays are representative. They lead a somewhat sedentary life at the bottom of the sea, moving sluggishly by undulations of the pectoral fins which form a large part of the flat body. Many attain a large size, sometimes measuring six feet across.

Sawfish (*Pristis*) are distinguished by the prolongation of the snout into a formidable weapon bordered on each side by sharp teeth. Some species are found off the southern coasts of North America and in the Gulf of Mexico, and in the Mediterranean and many other seas. With its saw, which is sometimes six feet in length, the sawfish slashes or rips up its prey, and its assault is often fatal to large whales.

Sharks are a group of very simple fishes, which have only a cartilage skeleton, no bone being developed anywhere in them. They have the gill openings on the side of the neck separate, and in all of the common species the mouth is on the lower side of the head instead of at the tip, as in ordinary fishes. The tail has unequal lobes, the upper lobe being much the larger. There are always four paired fins and one or more on the back. The size of the sharks varies from the smaller dogfish, about two feet long, to the great basking shark, some forty feet in length. Most of these species are very voracious, but the tales of man-eating are often exaggerated, although occasionally they may occur. Some of the largest species feed exclusively on shellfish. The flesh of several species is good to eat, but they are mostly neglected in America. The livers are very rich in oil, which commands a good price for use in dressing leather. In some species the skin has small spines and was formerly used (it was called shagreen) instead of sandpaper. Skin with larger plates is sometimes used in the manufacture of pocketbooks, etc.

Skates (*Raia batis*).—A group of fishes, closely related to the sharks, but having the body flattened from above downward, and with the anterior fins so united to the side of the head and the body that it has a rhomboid appearance and the tail seems like an inconsiderable appendage. The mouth and the gill openings are on the under surface. The animals are bottom feeders, living on clams and mussels, buried in the mud. In Europe some of the smaller species are used for food. Another has a large electric battery on either side of the head, capable of giving very strong shocks. This is called the torpedo.

ARMORED FISH (*Ganoidei*)

These include, among others, the Bony Pike and the Sturgeons.

Bony Pike or Garfish.—A remarkable genus of fishes inhabiting North American lakes and rivers, and one of the few living forms that now represent the order of ganoid fishes so largely developed in previous geological epochs. The body is covered with smooth, enameled scales, so hard that it is impossible to pierce them with a spear. The common garfish attains a length of five feet, and is easily distinguished by the great length of its jaws.

Sturgeon (*Acipenser*).—These large, sluggish fishes, some reach a length of over ten feet, and live on worms, crustacea, and mollusks. The body is long and narrow with five rows of bony shields. There are many species of sturgeon, all confined to the northern hemisphere. They live in the sea and great lakes, and ascend the great rivers. All supply valuable commodities, for which they are regularly captured on a large scale. These commodities are their flesh, which is palatable and wholesome, their roe (caviare), and their air-bladders, from which isinglass is made.

The most important sturgeon-fishery in Europe is that of the Volga and the Caspian Sea. The flesh of the fish is salted, and caviare and isinglass made on a large scale from the roes and air-bladder.

THE STERLET (*A. ruthenus*) is a much smaller species, which is common in the Black and Caspian Seas, and ascends the Danube as far as Vienna. It is one of the principal objects of the sturgeon fishery on the Volga.

In America sturgeon flesh is eaten fresh, and caviare is made both in Georgia and in San Francisco; but there is no great fishery in any particular district, and the manufacture of isinglass does not receive much attention. The sturgeon of the great lakes (*A. rubicundus*) and the Shovel-nose of the Mississippi valley are the chief American species.

LUNG-FISHES OR DOUBLE-BREATHERS (*Dipnoi*)

are at present represented by three fresh-water types, the insignificant remnant of a group that was once dominant in the sea, and would have become entirely extinct if some of its members had not taken to live in the waters of the land. These types are the eel-shaped mud-fishes of West Africa (*Protopterus*) and South America (*Lepidosiren*), and a Queensland form (*Ceratodus*). In all these the swim-bladder has been converted into a regular lung, which returns purified blood to the heart. The African form lives in streams which are liable to dry up, and were it not for the possession of a kind of lung capable of breathing air, it would perish during the dry season, whereas it remains embedded in the mud in a torpid state till the rains return.

The Queensland lung-fish lives under somewhat different conditions, for its native rivers do not entirely dry up, but are reduced to a series of deep holes connected by mere

[227]

[228]

[229]

trickles of water. These holes become so foul from decaying vegetation and dead fish that the possession of a lung is a vital matter, and if the *ceratodus* were not able to come to the surface and breathe air it would probably succumb.

THE MOLLUSCS (*Mollusca*)

SNAILS, CUTTLEFISHES, SQUIDS, OCTOPUS, TUSK SHELLS, BIVALVE MOLLUSCS, OYSTERS

The Molluscs have no limbs. The body is surrounded by a membraneous sac, from the secretions of which in many species a chalky shell is formed. The organs of circulation, digestion, and respiration are well developed. The under side of the body is thickened into a fleshy "foot," by which locomotion is effected, and there is a well-marked head.

The Molluscs are divided into five classes: (1) Snails and Slugs (*Gastropoda*); (2) Cuttlefishes (*Cephalopoda*); (3) Tusk Shells (*Scaphopoda*); (4) Bivalves (*Lamellibranchia*); (5) Mail Shells (*Protomollusca*).

Argonaut (*Argonauta*) belongs to the two-gilled cuttle-fishes, and are distinguished by the females possessing a single-chambered external shell not organically connected with the body of the animal. The males have no shell and are of much smaller size than the females. The shell is fragile, translucent, and boat-like in shape; it serves as the receptacle of the eggs of the female, which sits in it with the respiratory tube or "funnel" turned toward the carina or "keel." This famed mollusk swims only by ejecting water from its funnel, and it can crawl in a reversed position, carrying its shell over its back like a snail. The argonaut, or *paper-nautilus*, must be carefully distinguished from the *pearly-nautilus* or *nautilus* proper.

Cuttlefish.—One of the mollusks in which there are ten arms around the mouth. The internal shell is calcified and is used as a supply of lime for cage birds. They have also an ink bag, the secretion of which furnishes the pigment sepia. Cuttle-fish are an important article of food in southern Europe.

Octopus.—A mollusk with a rounded body, and a small head bearing a pair of well-developed eyes, the mouth surrounded by eight long arms, each arm bearing numbers of suckers by which the animals hold their prey. Inside the mouth is a pair of jaws, shaped much like those of a parrot. Most of the species are small, possibly averaging a weight of five pounds, but some on the Pacific coast spread nearly twenty-eight feet. The octopus is eaten extensively in the Mediterranean countries.

Oyster.—Possibly the most valuable of all of the mollusks. There are various species in all parts of the world, but the best is the American species, which now occurs from Cape Cod to the Gulf of Mexico. Formerly it extended to the coast of Maine, and even now there are scattered beds in the Gulf of St. Lawrence. The oyster grows in shallow water, fastening its shell to some rock or shell, and in this way large beds are formed. They are also planted; that is, the young are taken and placed in favorable situations for rapid growth.

The oyster contains but comparatively little nourishment, though eaten extensively. The European oyster is smaller than ours and has a coppery taste.

Allied to the true oysters are the PEARL OYSTERS, especially abundant around Ceylon. These have the interior of the shell lined with mother-of-pearl, and when foreign particles get between body and shell they are covered with the same substance, thus forming the pearls used for adornment. These oysters are obtained by diving; the animal matter is allowed to rot, leaving the pearls behind. The shell is also of value, furnishing material for knife handles, buttons, etc., though most of our pearl buttons are now made from the shells of fresh-water mussels from the Mississippi valley.

Scallop (*Pecten*), a well-known bivalve, one of those with a single muscle closing the shell. The valves are fan-shaped, the left often more or less flat, the right more markedly arched; both are marked with sinuous radiating ridges, to which the name pecten (*Lat.* "a comb") refers. The hinge-line is without teeth, and is extended laterally in two ears. The small finger-shaped foot is usually marked with bright orange or red color. The scallops are widely distributed in all seas, at depths of three to forty fathoms.

Snails.—A common name used for any mollusk with a coiled shell. In the narrower meaning it includes only those forms which occur on land. These land-dwelling forms have a slight shell, into which the whole body can be retracted. They feed exclusively on vegetation, which they rasp by means of a long ribbon, just inside the mouth, the surface of which is covered with thousands of minute teeth, so that the whole is a flexible file. The animal creeps about on a broad sole, and has four tentacles on the head, one pair of them bearing the simple eyes at the tip. Snails do considerable damage where they are numerous. One species is eaten by many in Europe, especially in France and Italy. Over ten thousand species are known.

The shells of sea snails are often of great beauty, and large sums have been given by collectors for specimens of unusual elegance or rarity, fifty pounds having been paid for a single example of a species of cone shell (*Conus*). The helmet shells (*Cassisi*) are made up of differently colored layers, and on account of their beauty have been largely employed for the carving of cameos.

Squid.—A mollusk nearly related to the cuttlefish. It has a barrel-shaped body, with a head in front bearing ten pairs of tapering tentacles, each with numerous suckers. On the side of the head is a well-developed eye. Squid live largely on small fishes which they catch with the tentacles, biting them with a pair of parrot-like jaws. They are largely used as bait in fishing, and to a limited extent as food. The average length is a foot or two, but in the seas around Newfoundland and Japan giants are occasionally found with bodies a dozen feet in length and tentacles adding thirty feet to this.

Tusk Shells are a small group of burrowing marine forms, in which the body is covered by a long, curved shell resembling a tusk in shape. There is a small hole at its tip, through which the water which has been used in breathing makes its exit. An imperfectly developed head and a rasping organ are present, and burrowing is effected by a long foot with a three-lobed end. The food consists of small organisms, which are apparently secured by the agency of a bunch of filaments with thickened sticky tips that can be protruded from the mouth of the shell. In some respects these animals are intermediate in structure between typical sea snails and bivalve molluscs.

JOINTED-LIMBED ANIMALS (*Arthropoda*)

CRABS AND LOBSTERS, SCORPIONS AND SPIDERS, INSECTS AND GRASSHOPPERS

This great division of the animal kingdom includes far more numerous species than any other, and is abundantly represented in both salt and fresh water, on the land and in the air. It consequently includes both *air-breathers* and *gill-breathers*: the former, typical land insects; and the latter, chiefly crustaceans.

CRABS AND THEIR ALLIES (*Crustacea*)

The Crustaceans breathe by means of gills, and their bodies consist of rings. They have two pairs of feelers and two pairs of jaws, to which are mostly joined one or more pairs of jaw feet. All the remaining rings of the body may have a pair of limbs each. The head bears two pairs of feelers. Crustaceans commonly hatch out as free-swimming larvæ, like the adult in form.

This large class of jointed-limbed animals includes lobsters, prawns, shrimps, crabs, and other familiar forms, the great bulk of which are aquatic, though the wood-lice have become adapted to a life on land.

A GROUP OF CRUSTACEANS
1. Common Lobster. 2. Thornback Crab. 3. Land Crab. 4. Hermit Crab.
5. Barnacle. 6. Scorpion. 7. Antarctic Trilobite.

Crab.—In this class of Crustaceans the abdomen is small and folded under the anterior part of the body. Over two thousand species are known, differing greatly in size, shape, and in other respects. The great majority are marine, but there are a few which spend their entire life on land, only going to the water once a year to lay their eggs. The largest is the great spider crab of Japan, whose legs may stretch out a dozen feet. One species on the Atlantic coast is taken at molting time in great numbers and forms the favorite soft-shell crab of the table. The hermit crabs have the abdomen soft, and to protect this vulnerable part, they insert it in the shell of some dead snail, and carry this about with them wherever they go.

Barnacle.—A family of marine crustacean animals enveloped by a mantle and shell, composed of five principal valves and several smaller pieces, joined together by a membrane attached to their circumference. They are furnished with a long, flexible, fleshy stalk, provided with muscles, by which they attach themselves to ships' bottoms, submerged timber, etc. They feed on small marine animals, brought within their reach by the water and secured by their tentacula. Some of the larger species are edible.

Crayfish.—Small, fresh-water crustaceans, which resemble the lobsters in appearance. They usually live in burrows in the banks or bottoms of streams and feed on decaying animal matter. In Europe they form a considerable element in the food supply and are bred in ponds. A large number of species occur in the United States, and are always to be found in the larger markets.

Lobster.—The most important of the crustaceans. One species occurs on our east coast, another on the coast of northern Europe. The body is divided into two regions, the anterior bearing, besides the parts used in taking food, a pair of large pincers and four pairs of walking feet. At the front of the head are two pairs of feelers, which are sensory, and a pair of eyes on the ends of short stalks. The lobsters are fond of decaying fish and are among the scavengers of the sea. They are caught in large traps, called lobster pots, made out of lath and baited with decaying fish. The annual catch on the New England coast is estimated at about thirty million pounds, the average weight of a lobster being between two and three pounds. Farther south on our east coast, in California and the Mediterranean a different animal is called lobster.

Prawn.—Crustaceans nearly allied to shrimps and lobsters, but not exclusively marine. They vary in size from a couple of inches to over a foot in some tropical forms. Many of them are semi-transparent, and exhibit very fine colors. On the approach of night they change to a beautiful blue, but the meaning of this "sunset" coloration is not fully understood. Some of the deep-sea prawns are blind; others possess enormous eyes, and many emit a phosphorescent light. They may be caught in putting nets or in osier baskets, like those used for trapping lobsters. They are esteemed for eating even more highly than the shrimp.

Shrimps.—Small crustaceans allied to the lobster, most of them inhabitants of the sea. In many countries they form an important part of the diet, but with us they are little used with the exception of one or two southern species which are used as a basis for shrimp salad. Shrimps are very abundant off our coast and could be made an important fishery.

SCORPIONS AND SPIDERS

In this class of insects the head and thorax are joined together in one mass, on which they have two pairs of jaws, and four pairs of legs.

Scorpions.—These spider-like animals have four pairs of legs and a pair of large pincers, as well as a small pair on the anterior half of the body; while the hinder portion consists of at first a broad region, followed by a narrower one, the whole terminated with a sting, with which a poison gland is connected. The animal strikes by bending the end of this tail over the back. Its sting is very painful, but rarely if ever is it fatal. Scorpions occur as far north as Nebraska, but are more common in the tropics. They bring forth living young and care for their brood for a while.

Spiders have jointed bodies and legs. The bodies are divided into two regions, the anterior of these bearing four pairs of legs and two smaller pairs of appendages. The most anterior of these are the poison claws. They have a poison gland in the base, while the end of the claw tapers to a point. The front of the head has from six to eight simple eyes. The hinder half of the body, the abdomen, is without appendages, save for two or three pairs of very small projections, the spinnerets. Each of these has numbers of openings at the tip, through which a fluid is forced at will. This hardens immediately it comes in contact with the air and furnishes the silk of which the spider's web is woven. Fine as it is, this silk is really a cable, being made of numbers of finer threads, one for each opening in the spinnerets. They use the silk for making webs, for cocoons for the eggs, nests, and in some cases for parachutes for flying. Each species makes its own type of web.

[230]

[231]

Spiders breathe by means of sacks—so-called lungs—on the lower side of the abdomen.

Our common house spider is the same as that of Europe; the largest species we see is the one found occasionally in banana bunches.

The TARANTULA has the greatest reputation for the unfounded belief that its bite causes madness which can be cured only by music. So far as is known there is only one species which can cause serious effects by biting man, and even these cases are not sufficiently authenticated.

The BIRD CATCHING SPIDER is a gigantic spider native to Surinam and elsewhere. It preys upon insects and small birds, which it hunts for and pounces upon. It is about two inches long, very hairy, and almost black; its feet when spread out occupy a surface of nearly a foot in diameter.

HUNTER-SPIDERS. A great many of this species construct no webs, but use their silk merely for lining their dwellings—which are commonly underground—or the construction of protective investments for the eggs. Such forms simply stalk their prey, seizing the victims, when near enough, by a sudden spring. One such type is the tarantula spider described above.

WATER SPIDERS are found in ponds and ditches in this country. They hunt down small crustaceans but do not construct a web. For the protection of the eggs a thimble-shaped nest is woven, moored by threads to stems or leaves, and smeared externally with liquid silk to make it watertight. The nest is filled with air brought down from the surface of the pond in successive bubbles adhering to the hairy body of the spider.

THE INSECTS (*Insecta*)

This ubiquitous class includes more species than all the other groups of land animals put together. The bodies consist of a series of rings, divided into three sections: the head, the thorax, and the abdomen. There is an external covering that serves as a protection. The head possesses a pair of antennae, two large compound eyes (and sometimes several simple eyes as well), and three pairs of jaws, differing greatly in character according to the habits. The thorax bears three pairs of legs, and in most cases two pairs of wings, while the abdomen is entirely or practically limbless. The air-tubes make up an exceedingly complex system, and open to the exterior by a limited number of air-holes.

All insects undergo a series of changes (metamorphoses). From the egg first comes the larva (caterpillar, maggot); from the larva after several changes of the outer skin, the pupa is developed; from which, after a longer or shorter period of repose, the perfect insect emerges. In some, such as the dragon flies, the whole course of metamorphosis, or change, is not gone through; for in the dragon flies the larva which comes from the egg resembles the full-grown insect, only it is without wings; but later, without entering the pupa stage, it develops into the perfect insect. There are altogether about two hundred thousand various kinds of insects.

The simplest way of classification is into the following nine orders, though specialists recognize a much larger number: (1) Wingless insects (*Aptera*); (2) Straight-winged Insects (*Orthoptera*); (3) Bugs (*Hemiptera*); (4) Fringe-winged Insects (*Thysanoptera*); (5) Net-winged Insects (*Neuroptera*); (6) Beetles (*Coleoptera*); (7) Moths and Butterflies (*Lepidoptera*); (8) Flies (*Diptera*); (9) Membrane-winged Insects (*Hymenoptera*).

Beetles (*Coleoptera*).—These include an enormous host of insects. Their horny investment is particularly thick, and they possess strong biting jaws, though these differ in some respects from those described for the cockroach and its allies. The third pair, for instance are much more intimately fused together into a lower lip. The fore wings are modified into hard wing-covers, while the hind wings are membranous, as in straight-winged insects (cockroaches, grasshoppers, and the like). But there is one marked difference between the two orders in regard to these organs. The hind wings of the latter fold up along a set of longitudinal pleats when they are tucked away under their covers, but in a beetle they are relatively long, and require a transverse fold as well.

The life history of beetles exhibits a well-marked metamorphosis. From the egg a grub hatches out, which, after a time, passes into a motionless pupa stage, and ultimately the investment of this splits open so that the perfect insect may emerge.

Beetles vary in size from a mere point to the bulk of a man's fist, the largest, the elephant beetle of South America, being four inches long. The so-called "black beetles" of kitchens and cellars are not properly beetles at all, but cockroaches.

The most interesting are the following:

BOMBARDIER BEETLE (*Brachinus crepitans*). This insect is preyed upon by larger beetles of its own family; but when chased, the bombardier ejects an acid fluid from glands situated at the tip of its tail. This acid immediately vaporizes on contact with the atmosphere, and looks like a tiny puff of smoke, while at the same time a distinct report is heard, reminding one of a miniature cannon. The discharge can be repeated several times in rapid succession, and prove very serviceable in keeping the enemy at bay until the little artilleryman is able to find shelter beneath a stone, or in a crevice of the soil.

Cantharis, a genus of blister-beetles, represented by the Spanish fly of Southern Europe. The insects are shaken with gloved hands from the branches of trees (ash, privet, lilac, elder, etc.), the gathering in the south of France taking place in May; they are usually killed in a hot vinegar solution and carefully dried. To retain their medicinal properties they must be kept in stoppered bottles. The blistering principle, or cantharidine, is so powerful that those who gather the insects are apt to suffer, and one-hundredth of a grain, placed on the lip, will raise blisters.

Firefly (*Elater*).—Some fireflies give forth a steady light, and these may be distinguished as fireflies proper from the glow-worms and "lightning-bugs," which flash light intermittently.

The most brilliant fireflies are a species most at home in tropical America. One form—*Pyrophorus noctilucus*—common in the West Indies and Brazil, attains a length of about one and one-half inches, and has a dark, rusty-brown color. On the upper surface of the first rings of the thorax are two yellowish oval spots, which are brilliantly luminous during the nocturnal activity of the beetle, while on the first ring of the abdomen a still brighter organ is situated. Even the eggs are luminous, and excised portions placed in a damp chamber remain functional for two or three days. The pounded debris of the insect is also luminous. The luminous organs are special modifications of the epidermic cells, which are disposed in two layers, of which the outer alone is luminous, while the inner contains masses of waste products, and is riddled by air tubes. The luminosity depends on a process of oxidation; the oxygen is supplied by the tracheae, and the brilliancy varies with the breathing process of the insect. On the sleeping or entirely passive insect a soft light may be observed; the real light is only exhibited during active respiration, and may be exaggerated experimentally by blowing in an extra supply of oxygen. Experiments seem to show that the fireflies utilize their phosphorescence to guide their steps.

SOME PICTURED MARVELS OF INSECT LIFE

A MOTHER EARWIG PROTECTING HER FAMILY (See page 237)

CONTEST BETWEEN TWO MALE STAG-BEETLES FOR A MATE (See Page 234)

THE SEVEN SPOTTED LADY-BUG (See Page 234)

THE VICTORIOUS HERCULES BEETLE HAVING VANQUISHED HIS RIVALS IN COURTSHIP CARRIES OFF HIS MATE IN THIS FASHION. (See Page 234)

THE ENGLISH CRICKET whose familiar chirp we have all heard in the late autumn (See Page 237)

THE BOMBARDIER BEETLE is an expert artilleryman, and when pursued by an enemy is able successfully to resist the chase. (See Page 232)

Glow-worms (*Lampyrides*) are to be distinguished from the fireflies. They are nocturnal in habit, and represented by about five hundred species, widely distributed, especially in warm countries. America is very rich in "lightning-bugs," such as *Photuris pennsylvanicus*, and other species.

The luminous organs consist, like those of the fireflies, of fatty-looking cells round which there is a plentiful supply of tracheae, affording the necessary oxygen for the rapid production of phosphorescence.

Professor Emery gives a most entertaining account of his observations on the love-lights of *Luciola italica*, which he studied in the meadows around Bologna, Italy. By catching females and imprisoning them in glass tubes in the meadows he satisfied himself that sight, not smell, was all important. When the females caught sight of the flashes of an approaching male, in spite of their tantalizing situation, they allowed their splendor to shine forth. The most noteworthy difference is that the luminous rhythm of the male is more rapid and the flashes briefer, while that of the female is more prolonged, at longer intervals, and more tremulous. The attracted males dance round about the female, who, after having captivated one suitor, proceeds to signal other rivals, till she is finally surrounded by a circle of devotees.

Ladybird or Ladybug (*Coccinella*) is a pretty little beetle, generally of a brilliant red or yellow color, with black, red, white or yellow spots. The form is nearly hemispherical, the under-surface flat, the thorax and head small, the antennae and legs short. When handled they emit a yellowish fluid, with a disagreeable smell. Adults and larvae feed chiefly on plant lice, and are thus most useful to hop-growers and other agriculturists. Ladybirds occasionally occur in immense numbers, and from ignorance of their usefulness have sometimes been regarded with superstitious dread.

Colorado Beetle (*Chrysomela*) is a North American beetle which commits fearful ravages among potatoes. It is an oval insect, of an orange color, with black spots and lines. The antennæ are club-shaped. The larvæ and adults live on the potato-plant, and have sometimes quite destroyed the crop in certain parts of the United States. They pass the winter underground, and emerge from their hiding-places in the beginning of May. The female lays many hundreds of eggs in groups of twelve to twenty on the under side of potato leaves. The larvæ, which emerge in about a week, are reddish and afterwards orange. They grow up quickly and produce a second generation, which may again produce a third in the same summer. Their rate of multiplication is therefore very rapid. The surest remedy in case of attack is said to be a preparation of arsenic known as "Paris Green."

Scarabæus (*Ateuchus sacer*), one of the dung-beetles well known for the zeal with which they unite in rolling balls of dung to their holes. The dung serves as food, and a beetle having secured a ball seems to gnaw at it continuously—sometimes for a fortnight—until the supply is exhausted. Sometimes an egg is laid in the ball, and the parents unite in rolling this to a place of safety. There are numerous American species.

By the Egyptians the scarabæus was venerated during its life, and often embalmed after death. Entomologists have recognized four distinct species sculptured on the Egyptian monuments, and gems of various kinds of stones were often fashioned in their image.

Stag-beetles (*Lucanus*) are nearly allied to the scarabæes. The males are remarkable for the large size of their mandibles, the branching of which has suggested stags' antlers. The common stag-beetle is a large formidable-looking insect, the males being fully two inches long, and able to give a sharp bite with their strong mandibles. It flies about in the evening in the middle of summer, chiefly frequenting oak-woods.

These insects habitually are well known to fight for possession of a coveted mate. For this purpose the mandibles of the male are enormously developed, and frequently there occurs a most amusing tussle, one beetle striving to gain the side of his lady-love, the other balking him. Eventually one suitor admits defeat by turning tail and making off, while the victor marches in triumph to the fair cause of all the trouble, and begins to court her.

The huge Hercules Beetle of South America has been seen to carry off his mate bodily in this way. Other tropical beetles have specially developed forelegs for grasping their spouse, should she prove coy and attempt playfully to run away.

Water-beetles (*Ditiscus marginalis*) are carnivorous types which have become adapted to life in freshwater, although the adults have not lost the power of flight. In our native great water-beetle the large hind legs are fringed with bristles, and serve as oars, while air can be stored under the wing-covers. There is only a partial metamorphosis.

Weevil is a popular name for a large number of beetles, marked by a beak or proboscis, generally used by both sexes as a boring organ. Among ten thousand described species are the American species *Trichobaris trinotata*, a small black weevil which destroys potatoes, and *Conotrachelus nenuphar*, which lays its eggs in various fruits and is a great pest, and the *Entimus imperialis*, the diamond-beetle with very brilliant scales.

Wire-worms are the grubs of skip-jack or click beetles, perhaps the most injurious of farm pests. They are called wire-worms "from their likeness in toughness and shape to a piece of wire;" they are yellowish in color, from one-quarter to one-half an inch in length, with three pairs of legs, and a suctorial appendage below the tail. The eggs are laid near the roots of plants, in the ground or in the axils of leaves; the grub remains for several years (three to five) as such, burrowing in the ground during the frost of winter, but at other times hardly ceasing from voracious attacks on the roots and underground stems of all sorts of crops. Dressing of lime, salt, nitrate of soda, etc., have been recommended as remedies.

THE LIFE HISTORY OF A BEAUTIFUL BUTTERFLY ITS STORY IS VERY SIMILAR TO THAT OF THE SILKWORM

In these photographs the transformations of a butterfly are shown: the butterfly's eggs (highly magnified) laid upon a leaf; the newly hatched caterpillar; and a caterpillar which has finished its growth and has spun a silken pad, to which as a chrysalis it may cling. The chrysalis is also shown, and the newly emerged butterfly waiting for its wings to expand fully and harden. All the figures are enlarged.

BUTTERFLIES AND MOTHS (*Lepidoptera*)

These are among the highest orders of insects. For beauty and variety of coloration they are quite unrivaled, and their attractive appearance is primarily due to the fact that the four wings are covered with overlapping scales of different kinds. The mouth parts are specialized to constitute a suctorial organ, which is made up of the second jaws, while the first and third jaws are greatly reduced. Each second jaw has become a half-tube, and the two are hooked together to make up a proboscis, sometimes of great length, which can be separated into its halves.

HOW BUTTERFLIES DEVELOP

The life-history exhibits a very typical and familiar metamorphosis. From the egg, which is often very beautifully sculptured, a larva known as a caterpillar hatches out, possessing not only the three pairs of jointed legs characteristic of the class, but also a varying number of unjointed pro-legs terminating in suckers. After feeding voraciously for some time by means of its powerful biting first jaws, and undergoing a number of moults, the caterpillar passes into the motionless pupa stage, here called a chrysalis, which may or may not be invested in a protective cocoon. The skin of the chrysalis ultimately splits, and the perfect insect makes it way out.

HOW TO DISTINGUISH BUTTERFLIES FROM MOTHS

Butterflies are typically distinguished from moths by the club-shaped thickenings at the ends of their antennæ, and by the fact that when settling, the wings are folded together over the back. In moths the antennæ may be of various form, but very rarely club-shaped, and the rest-position of the wings is horizontal or sloping downward, while in some instances they may be more or less wrapped round the body.

WHY BUTTERFLIES AND MOTHS HAVE BEAUTIFUL COLORS

Some butterflies are dingy, others uniform, but in contrast to moths the majority are beautifully colored. This is especially the case with tropical forms. How the colors are variegated and contrasted in spots and bands, how the hues are embellished by metallic shimmer, every one knows; what exactly the color means is, however, still obscure. A few general facts may be first noticed: (1) The color is in many cases subject to variation—it cannot be said to be absolutely constant for a species; (2) in some instances, at any rate, it is influenced by external conditions, for different forms at different periods of the year, is known in many kinds; (3) sometimes the color and markings, especially of the under surface of the wings, are obviously of use for the protection of the resting butterfly; (4) in some cases this protective adaptation is so pronounced as to deserve to be called mimicry; (5) in many cases the coloring is in direct connection with the physical constitution of the species, and is usually most marked in the males.

CHIEF CLASSES OF BUTTERFLIES

Of the families representing more than five thousand species, the chief are the following:

- (1) *Nymphalidæ*, the largest, containing between four and five thousand species. They have a relatively simple type of coloration, and are interesting because of their disposition to mimic other species. They are distasteful to birds. They include the red admiral, the tortoise-shells, the peacock, and so on, as well as the fritillaries and the purple emperor. In it are also included the remarkable leaf butterflies in which the under surface, in shape, color and markings, closely resemble a dead leaf, while the upper surface is brightly colored. On alighting only the under surface is visible.
- (2) The *Erycinidæ* is represented by the Duke of Burgundy fritillary.
- (3) The *Lycænidæ* include the "blues," so commonly seen flitting near the ground along muddy roads, so called from the color of the upper surface, but many are also copper, white and yellow.
- (4) The *Pieridæ* include the white cabbage butterflies. They are remarkable for the prevalence of white, yellow, and orange colors, and for the fact that these tints are due to uric acid, or derivatives of this substance, stored in the wings as a pigment.
- (5) The *Papilionidæ*, or swallow-tails, contain perhaps the most beautiful forms. The females are strikingly different from the males, and though larger, do not display the same beauty of coloration. The members of the family are widely distributed.
- (6) The family *Hesperidæ*, or skippers, includes insects very different from other butterflies, both in structure and habits. The adults have in many cases a very rapid but jerky method of flight, and the larvæ in their habits resemble moths rather than butterflies.

Moths (*Heterocera*).—The antennæ of moths are bristly, gradually lessening from base to tip; when sitting the wings are turned down; and its flight is nocturnal. What the owl is among birds, the moth is among insects: it is a night-insect, carrying on its pursuits, and exercising all its activity amid the gloom of darkness. So numerous is the variety of moths, that there are upward of five hundred species.

The giant Owl-Moth of Brazil (*Thysania agrippina*) measures nearly a foot across from tip to tip of expanded wings, while the smallest are hardly visible to unaided eyes. The larvæ or caterpillars feed mostly on living plants, and in this connection are very familiar; others of these ravaging forms ruin clothes, furs, and the like. Almost the only directly useful form is the silk-moth.

Silkworm Moth. See under **Domesticated Animals.**

STRAIGHT-WINGED INSECTS (*Orthoptera*)

The fore wings are either parchment-like or membranous; the hind wings always membranous. The wings cover the body horizontally, and do not meet in a straight line or ridge, as they do in the beetles. This order of insects undergoes only a partial metamorphosis, being produced from eggs in a wingless condition. The Cicadas, however, are an exception, as they live in the ground frequently for years in the larva state. In this order are included the locust, cricket, grasshopper, cockroach, scale insect, plant-lice, and many kinds of bugs.

Crickets (*Gryllus*) are akin to grasshoppers. They have long feelers, a rasping organ on the wing-covers of the males, wings closely folded lengthwise, but often along with the wing-covers degenerate, great powers of leaping, and a retiring, more or less subterranean habit of life. Many of the species are wingless, and it is the males only which make a chirping sound. They are widely distributed, and all are herbivorous. The field cricket, house cricket and the common mole-cricket, are well-known representatives of the family.

Earwigs (*Forficula*) have two pairs of wings, very dissimilar, the anterior pair being short and horny, the posterior pair folded longitudinally and transversely; the mouth parts are well developed and suited for biting; the antennae are thread-like; there is no true metamorphosis in the life-history. The common earwig is best known for the pincer-like organ at the end of the abdomen.

Earwigs avoid the light, and do most of their work in the dark. They feed, as gardeners well know, on petals and other parts of flowers, on fruit, seeds and leaves, nor is animal debris refused. They are usually and readily caught in artificial shelters provided for their destruction.

The eggs of the common species are laid in spring, fifteen to twenty, in some convenient cavity. These are carefully watched, and even after the birth of the young earwigs, the mother still tends them as a hen does her chicks.

Grasshopper, a name given to numerous insects forming the locust family. They usually live among vegetation, in woods and thickets or in the open field. Most of them feed on flies and caterpillars, in catching which they use their powerful fore-legs, but many affect plants, and some combine both diets.

In the grasshopper the head is placed vertically; the slender antennae are longer than the body; there are hemispherical eyes, but rarely eye-spots; wings and wing-covers are generally present. The right (and occasionally also the left) wing-cover of the male bears a clear, round membrane stretched on a ring, which produces the well-known "chirp" when set in vibration.

The females have a long egg-positor. The eggs are laid by means of it either in the earth or in some dry stem. From these, in spring, larvæ are developed, which are virtually like the adults, but molt at least six times before they become full-grown.

Katydid, a name applied to numerous American insects, nearly related to grasshoppers. They frequent trees, shrubbery, and grass, and are well concealed in the foliage by their green color. In their general habit, *e. g.* in the song to which the syllables "kat-y-did" refer, and in the egg-laying accomplished by the long egg-positors of the female, these lively insects resemble grasshoppers.

Locusts (*Acrididae*) are large, ground-loving insects, of world-wide distribution, famous for their voracious vegetarian appetite. In size they vary from one-quarter inch to five inches in length. They have strong hind-legs with great leaping powers, large heads with formidable mouth-organs, shorter antennæ and robuster bodies than grasshoppers. Both winged and wingless forms occur, the former with strong powers of flight. The females have strong egg-positors by which they bore holes for their eggs. The numerous eggs are laid in holes drilled in the ground; the young when hatched generally resemble the parents except in the absence of wings. From the first they are gregarious, and excessively voracious except during their repeated molts; they devour all green things, and even one another, and are often forced by stress of hunger and excessive multiplication to migrate in great swarms.

Their ravages sometimes cause widespread famine and ruin. One of the most famous and destructive forms is the Rocky Mountain Locust (*Caloptenus spretus*); the most abundant migratory species of the East, so often mentioned in the Scriptures, is *Pachytylus migratorius*.

On the left is shown a Leaf Insect which, having given up the habit of flight, has yet retained its likeness to the leaves upon which it feeds to protect itself from its enemies. On the right is shown a grasshopper depositing her eggs in a nest under the ground. (See above).

ANTS, BEES AND WASPS (*Hymenoptera*)

These membrane-winged insects are the most intelligent of their kind. They are readily recognized by the presence of four transparent wings traversed by a comparatively small number of veins, the hinder ones being much smaller than the others, to which they are in many instances attached during flight by means of a row of minute hooks. The posterior end of the body in the female is commonly provided with a piercing apparatus, which may either serve for boring holes, in which eggs are laid, in which case it is called an "ovipositor," or may have been modified into a poisoned sting, useful for offense and defense. The black and yellow or black and red bands of wasps and bees are "warning colors," indicating their stinging powers.

The larvæ either resemble caterpillars or are pale, helpless maggots, devoid of limbs, for the welfare of which more or less elaborate provisions are made by the mother insect. Later on a pupa stage is reached, from which the winged adult ultimately emerges. The highest members of the order live in communities comprising several casts.

Ants (*Formicidae*).—These familiar and intelligent diminutive creatures are perhaps the most interesting of all insects, owing to the extraordinary way in which they have become adapted to a great variety of modes of life. All are social, and a community typically consists of males, females, workers (of one or more kinds), and, it may be, soldiers. The first two are generally provided with wings, though those of the females are soon shed, but exceptions to this occur, and some species may have both winged and wingless individuals of one sex or the other. The first pair of jaws (mandibles) are well or even excessively developed, and possess unusually free powers of movement in accordance with the varied functions they have to perform. In many cases the females (including the workers) are provided with a sting.

Ants hatch out as helpless, limbless larvæ, which have to be fed and carefully attended, either by the fertile females or the workers, as the case may be. Feeding is rather a curious affair, for the nurse possesses a sort of pouch (crop) connected with her gullet, and this is used as a store from which nutriment can be squeezed up into the mouth. Adults can feed one another in the same way, as also the little beetles and other insects which are often found as guests in their communities.

WANDERING ANTS OF THE TROPICS

These ants are of highly carnivorous habits, and move about in large armies, devouring everything of animal nature that comes in their way. The fact that they are blind, or practically so, does not seem to interfere with their devastations. Some of the forms are common in the hotter parts of South America, while others, the "driver" ants, are well known in Africa, where criminals, it is said, are sometimes tied up in their path, to perish miserably, if speedily.

SLAVE-HOLDING ANTS AND THEIR SLAVES

Some ants press weaker species of their kind into unmerited captivity. In one familiar instance the relatively large oppressor (*Polyergus rufescens*) is of reddish color and well endowed in the matter of jaws, while the enslaved species (*Formica fusca*) is small and dark. Regular slave raids are made from time to time, when, after stubborn resistance, the pupæ and older larvæ of the weaker form are carried away to lead a life of bondage, to which, indeed, they take very kindly. This kind of social economy has indeed become an absolute necessity to the slavers, which have quite lost the power of feeding their own young, while some such species cannot feed themselves.

A most extraordinary state of things occurs in the case of a small kind of ant (*Anergates*) which possesses no workers of its own, but lives within the communities of another species (*Tetramorium cæspitosum*) entirely made up of workers.

Some ants, such as the little black species (*Lasius niger*) common in gardens, use as part of their food a sweet fluid that exudes from plant lice (*aphides*), and keep these insects as we keep kine. The captives are fed, sheltered, and jealously guarded. Fenced enclosures are constructed for them on plants in the vicinity of the nest, with which they are connected by covered roads. During winter the fragile eggs of the plant lice are taken underground and sedulously cared for.

THE HARVESTER ANTS OF EUROPE, NORTH AFRICA AND NORTH AMERICA

A number of ants are known that construct extensive underground dwellings, in which they store seeds of various kinds. Some of the American species (*Pogonomyrmex*) may be even said to winnow their grain, for they carefully strip off the husks and deposit these on rubbish-heaps outside the nest.

Some of the seed-storing ants almost deserve the name of maltsters on account of the way they deal with their harvest. The human method of making malt is to allow the barley grains to germinate to a certain extent until the contained starch is converted into malt-sugar, when the process is arrested by scalding. In similar fashion ants permit germination to go on to a certain point, and then kill the seedlings by biting away the little shoots and roots. In this way a supply of the sweet food they love is secured.

Among the most interesting of ants are leaf-cutting forms (*Atta*) native to tropical America. They are associated in huge communities occupying complex underground dwellings, the sides of which are marked by mounds that may measure as much as forty yards round. The chief food consists of a kind of fungus (*Rozites gongylophora*), cultivated on bits of leaf, and treated in such a way that little white elevations are produced. It is these that the ants desire.

The chief duty of one set of workers is to collect the pieces of leaf required. To facilitate their operations, roads, largely underground, are constructed, which lead to suitable trees, and may be as much as twenty yards long, or more. Curved pieces of leaf are bitten out and carried back to the nest, where they are handed over to another set of workers, by them to be reduced to smaller fragments and made into mushroom beds.

WHERE AND HOW THE HOMES OF ANTS ARE BUILT

Ants live in dwellings of the most varied kind, many being underground. In a large number of species ant-hills are constructed of various loose materials, our common native wood-ant (*Formica rufa*) being a good example of this. An Asiatic ant (*Oecophylla*) constructs a summer-house of leaves in a curious fashion. The larva possesses silk-glands from which a sticky fluid exudes, hardening quickly on exposure to the air. Advantage of this is taken by the workers, for they hold larvæ in their jaws, and employ them as living gum-bottles, while the leaf-edges to be cemented are held in position by other workers.

Some South American ants construct hanging nests in trees, by which protection against floods is secured. Other ants in the same part of the world make curious homes which well deserve the name of "hanging gardens," for they are mainly constructed of living plants, some of which have never been found in any other situation. The plants are cultivated and tended by the ants with which they are associated. The soldiers of certain ants (*Colobopsis*), which tunnel out homes in the wood of trees, play the part of living front doors. Every entrance to the nest is guarded by one of these hall-porters, its huge head not only exactly filling the aperture, but closely resembling the adjacent bark in appearance. If this curious door be touched by a bit of stick or a feather, it remains shut, but is immediately opened when stroked by the antennæ of a worker.

CURIOUS ANT GUESTS AND ASSOCIATES

Not only may ants of two or more kinds be associated together in the same dwelling, but a nest may also be tenanted by peculiar species of beetles (and other insects), spiders, mites, or other creatures. Many of these, especially the beetles, are fed and cared for by the ants, some of them for the sake of a substance which exudes from their bodies; others, perhaps, to serve as pets. The beetle-grubs are looked after as well as the adults; at least in the case of certain blind species.

On the other hand, certain ant-beetles not only steal food from the ants, but also devour their young. There can be no doubt that these curious associations are very ancient ones, for many species of beetles are found nowhere else. A kind of bristle-tail that lives in ants' nests is a thief pure and simple. It has been seen to steal the drops of honey being passed from the mouth of one worker to another, afterwards retreating at full speed.

The common red ant (*Myrmica rubra*) shelters and feeds a curious kind of blind mite, which lives on the bodies of its hosts. By stroking its entertainers with its legs it makes known its need of nutriment, and such requests are never refused. Not improbably some return may be made for these good offices.

One of the Indian ants (*Sima rufo-nigra*) lives on the bark of trees with a species of wasp (*Rhinopsis ruficornis*) and a kind of spider (*Salticus*), both of which closely resemble it in appearance. The three associates appear to be good friends, while wasp and ant sometimes engage in a friendly wrestle.

[238]

[239]

AN ANT AT ITS MORNING TOILET

A remarkable observation made by a student of insect life while examining ants under the microscope.

HOW ANTS COMMUNICATE WITH ONE ANOTHER

The complex life of an ants' nest is a striking instance of order among apparent disorder. Each of the innumerable individuals discharges its special tasks without hesitation, unless unusual circumstances prove a hindrance. It would seem, therefore, that there must be some means by which any one can convey information to others. When two meet they frequently stroke one another with their feelers, and this perhaps serves the purpose of language.

THEIR REMARKABLE HABITS OF CLEANLINESS

Some wonderful facts are recorded concerning matters of personal cleanliness among ants, and has shown incidentally that these insects perform amazing feats of acrobatic skill without the least effort, and quite as matters of course. For example, an ant will often hang from a grass stem by the claws of one leg, while it combs its antennæ, cleanses its five remaining feet, or bends its head upwards to lick its abdomen and furbish the joints of its armor. Indeed, thanks partly to the wonderful flexibility of its "waist," and still more to the tenacity of its muscles, an ant is able to assume and maintain almost any position that the need or fancy of the moment may prompt.

Many stingless ants, when fighting, first bite their adversary with their jaws, and then bringing the tip of the abdomen beneath the body, squirt formic acid into the wound. [240]

Bees.—See *Domesticated Animals*.

Bumble-bees.—These common bees are large, somewhat clumsy-looking insects which live in communities including workers or imperfect females as well as ordinary members of the two sexes. The nests are constructed in holes in the ground or other sheltered places, and the establishment of a community is due in the first instance to the labors of a queen in early summer. She makes a number of waxen cells, stores them with honey and pollen, and afterwards feeds the larvæ when they have devoured these provisions. From the first (and several other), batches of larvæ workers are chiefly produced, which undertake the constructive and nursing work, until at last the queen has nothing to do but lay eggs. Males and other queens are reared from some of the eggs laid in late summer and early autumn.

Wasps, like bees, are either solitary or social, and it is only in the latter that workers exist. Solitary wasps construct small nests of clay and little stones, or else make burrows. They possess the curious habit of storing up immature—for example, caterpillars—or mature insects, or even spiders, for the benefit of their larvæ when these hatch out. The kind of victim depends upon the species of the wasp concerned, but in any case it is killed or paralysed by stinging.

Social wasps somewhat resemble social bees in their habits, but their building material, instead of being wax, is a kind of paper made of chewed wood mixed up with saliva. In some instances the nest is suspended from a bush or tree, and is provided with a kind of overhanging roof by which rain is drained off.

In our commonest species, an underground site is chosen, and a series of combs constructed from above downward, the whole being enclosed in several layers of wasp paper. Adjacent combs are held together by little pillars. The young are at first fed upon fruit-juice, nectar, and other vegetable matter, for which a more stimulating diet of chewed insects is afterwards substituted.

The **HORNET** (*Vespa crabro*) is a social wasp which commonly nests in hollow trees or constructs elaborate nests out of wood fibers, suspended from boughs. The females have formidable retractile stings. The hornet is represented in the United States by the white-faced hornet (*V. maculata*), also a large species.

FLIES (*Diptera*)

There are some thirty or forty thousand species of flies known, while no other order has so many individuals as this. This enormous assemblage of insects, most of which are small or even minute, includes many species that have earned an undesirable reputation as bloodsuckers and pests. Except in fleas and a few others, such as sheep-ticks, there are two membranous front wings, the hinder pair serving as sensory structures. The mouthparts of the female are very often piercing and sucking organs of great efficiency, the first and second jaws being in the form of slender lancets protected above and below by the upper and under lip respectively.

But in other types, such as the house-fly (*Musca domestica*), the jaws are modified into a proboscis used for sucking juices, and devoid of powers of perforation.

THEIR UNCLEANLY AND DEATH-CARRYING HABITS

This fly lays its eggs in manure or other refuse, these hatching out, passing through all their stages and emerging as perfect insects in a few days. Their uncleanly habits make the house flies most efficient agents in the carriage of different diseases, especially typhoid fever and others which attack the digestive tract. Flies are therefore not merely a nuisance to be deplored, but a positive danger to mankind. Among other flies are the carrion flies, black flies, the gnats and the mosquitoes, all troublesome to man, while others attack various plants.

THE LARGE VORACIOUS FLEAS

Of these the breeze-flies or gad-flies possess powerful piercing mouth-parts, with which they torment both stock and human beings. A well-known species is the long brown clegg (*Hæmatopota pluvialis*), often met with in woods. In some tropical kinds the jaws are of enormous length.

Robber-flies are voracious and insatiable forms which prey upon other insects, even wasps and tiger-beetles being among their victims.

Hover-flies are swift and elegant insects which have already been mentioned in connection with flowers. Some of them closely resemble bees in appearance.

The dreaded tsetse fly (*Glossina morsitans*), so fatal to horses in parts of South Africa, belongs here. Germs of the fly-sickness (*Nagana*) are introduced into the blood of the victims, Tsetse flies of other species are responsible for "sleeping sickness," which makes parts of tropical Africa uninhabitable.

THE PESTIFEROUS MOSQUITOS AND GNATS

These are particularly notable for the blood-sucking propensities of the female. Some tropical mosquitoes disseminate the germs of such diseases as malarial fever. Wholesale destruction of the early stages, by pouring petroleum on the surface of the stagnant water in which they live, has been employed with conspicuous success at Havana and in the Panama Canal zone as a preventive measure against yellow fever and malaria.

Midges are very minute gnats, of which the aquatic larvæ are known as blood-worms.

THE WINGLESS FLEAS AND OTHER PESTS

Fleas are wingless members of the order, and their agility fully compensates for the loss of the power of flight. There are many species, infesting different mammals and birds. The females of the tiny sand-fleas, or chiggers (*Sarcopsylla penetrans*), of America deposit their eggs in the feet of human beings (or other animals), and unless the painful swellings thus brought about are carefully treated they are apt to fester dangerously.

STRANGE ANIMAL FORMS FOUND IN THE SEA

BRANCHING CORAL (Page 243)

**STARFISHES AND SEA-URCHINS (Echinoderms)
HEDGEHOG SKINNED ANIMALS OF THE SEA. SEA-LILIES, STAR
FISHES, BRITTLE STARS, SEA URCHINS, AND SEA CUCUMBERS**

Echinoderms, or hedgehog-skinned animals differ from all the forms so far considered in the nature of their symmetry. Instead of being two-sided, with a well-marked distinction between right and left and front and back (bilateral symmetry), they resemble a star or regular flower in shape. The skin is hardened by the deposition of salts of lime, and the body is often covered with spines, as more particularly in sea urchins.

Five existing subdivisions are recognized: (1) Sea-lilies and feather-stars (*Crinoidea*); (2) Starfishes (*Asteroidea*); (3) Brittle Stars (*Ophiuroidea*); (4) Sea urchins (*Echinoidea*); and (5) Sea-cucumbers (*Holothuroidea*). All are marine.

Sea Cucumbers are sort of second cousins to the sea urchins and rather more distantly related to the starfish. As the name indicates, they are shaped like a cucumber, and hundreds of little feet on the side heighten the resemblance, as they recall the spines on the vegetable. Inside they have a coiled intestine, usually filled with mud and the contained vegetable and other debris. With us no use is made of the animals, but they are taken in great numbers in the South Seas, and sent to China, where, as trepang, they form an ingredient in soups.

Sea-lilies are deep-sea animals, once numerous and flourishing, but now comparatively rare, and only to be obtained by dredging in the deeper parts of the ocean. They are fixed by a long, jointed stalk bearing circlets of sensitive threads and terminating in a cup, in the center of which the mouth is situated. Radiating from the edges of the cup are five branching, feather-like arms, all of which are grooved above, the grooves uniting, and finally converging to the mouth. They are beset with cilia, and minute organisms are conducted inward along them to serve as food.

Sea Urchins are radiated animals which are usually shaped like a flattened sphere. They have a mouth, surrounded by five chisel-shaped jaws at one pole, while the whole outer surface is covered with slender, movable spines. Between the spines are numbers of slender, flexible, tubular feet, which pull the body along, while the spines act more like true feet. The animals feed mostly on seaweeds. They have no economic value with us, but in Europe the eggs of some species are eaten, forming part of the *frutti di mare* of every Italian seaport.

Starfishes.—Starfishes are among the most familiar objects of the seashore, and the commonest kinds, such as the five-finger (*Asterias rubens*) and the comb-star (*Astropecten aurantiacus*) possess five radiating arms. The mouth is in the center of the under side, and leads into a capacious stomach, of which the first part can be protruded from the body to surround such prey as mussels and oysters.

A starfish crawls slowly by means of numerous tube-feet, which are lodged in five grooves radiating from the mouth, and make up a part of the water-vascular system, so called because it is full of sea-water. At the end of each arm is an unpaired tube-foot acting as a feeler, while on its under side there is an orange-red eye-spot.

The water-vascular system assists in breathing. It was probably first evolved in the interests of respiration, and this is its chief use in the sea-lily. Some of the spines are formed of little, two-bladed pincers, which clean the surface of the body.

Starfishes are remarkable for their powers of restoring lost parts. A detached arm can grow a fresh disc and another four arms.

**ANIMALS THAT APPROACH THE SIMPLEST FORMS OF LIFE
WORMS, LEECHES, SEA-ANEMONES, CORAL-POLYPS, JELLY-FISHES, SPONGES**

Several groups of the lower animals are collectively known as Worms, though most of these groups are but remotely related. Ringed worms are elongated creatures in which the body is made up of a considerable number of rings or segments, most of which are, on the whole, much alike. There is often a well-marked head, but no distinct thorax and abdomen, as in an insect or crayfish. Two subdivisions are recognized: (a) Bristle-worms (*Chaetopoda*) and (b) Leeches (*Discophora*).

Bristle-worms include a host of marine worms, together with some that live in fresh water, and also the earthworms. Their average characters are best understood by examining one of the commonest shore-worms, known as the sea-centipede (*Nereis*). Here the segments are very clearly seen, and almost every one of them bears a pair of unjointed conical foot-stumps, used for crawling.

Imbedded in the foot-stumps of the sea-centipede are bundles of strong bristles, which give a hold on the underlying surface and prevent slipping. The head-region is fairly distinct, and bears a number of feelers of various kinds, as well as four simple eyes. Sea-centipedes and many of their allies are highly carnivorous, and seize their prey by means of a pair of horny jaws which can be protruded at will.

Earthworms are found in all parts of the world, though naturally they do not thrive in arid tracts; and their effect upon the fertility and drainage of the soil can hardly be calculated. Burrowing into the ground, they cast up the earth they have swallowed, and so pursue a constant and thorough system of ploughing. Though eyeless, they evade the light and only come out of their burrows at dusk, often remaining, even then, with their tails in the holes and their bodies working round and round.

Darwin long since demonstrated, the earthworm is one of the farmers' best friends. Its burrows drain and aerate the soil, while the earth which has passed through its body is finely divided and constantly being brought to the surface from lower levels.

Not far from the front end of an earthworm a thickening will be seen, often erroneously supposed to be the result of injury. From it exudes a fluid which hardens into the egg-cases.

Leeches live in the sea, fresh water, or even in damp, tropical forests. The flattened body of the leech is divided by grooves into a number of narrow parts, several of which go to make up a segment. Foot-stumps and bristles are entirely absent, and progression is effected by means of suckers, one at each end. They effect a looping movement, but the animal can also swim by undulations of its body. The freshwater leech is a bloodsucking parasite. The mouth is situated in the middle of the front sucker, which serves to fix the animal to its victim. Three saw-edged jaws are then brought into play, a three-rayed cut being made, and a fluid poured out which prevents the blood from clotting. Digestion is slow, and the food is stored in a large crop, drawn out into numerous pairs of pouches. The head possesses eye-spots, but no feelers.

ANIMALS LIKE PLANTS (*Cœlenterata*) of which sea-anemones, corals, and jelly-fishes are examples, are distinguished by the ray-like symmetry of starfishes and their kind, though here, as a rule, it is more perfect. In structure they are much simpler, than any of the animals so far considered. For such a creature is to all intents and purposes simply a stomach, the wall of which is made up of two layers of cells, one (*ectoderm*) external, and the other (*endoderm*) internal. In higher animals a third layer (*mesoderm*) is interposed.

Sea Anemones are common between tides and lower on all coasts. They are cylindrical animals, with a mouth surrounded by tentacles at one end. Inside there is a single cavity which serves as a stomach and whose branches run to all parts of the body, thus distributing the food like a blood vessel. The colors, especially in the tropics, are variable, and often gorgeous.

Coral-polyps are closely related to sea-anemones, but differ from them by secreting a hard, limy skeleton in the base of the body. They are either simple or compound. The well-known mushroom coral may be taken as an example of the former. Its skeleton is a shallow cup, exhibiting numerous radiating plates. If we look at the upper surface of such a coral in the living state we shall see a mouth surrounded by circlets of tentacles, much as in a sea-anemone.

A compound coral consists of a number of individuals, relatively small in size, connected together by a common flesh, and formed by the budding or splitting of a single original polyp, the results of the process remaining united.

Many corals branch, while others form compact masses, as in the kind above described, and also in the brain coral, where the boundaries between the individuals are not clearly marked.

Corals are widely distributed, some living even in cold latitudes, and others on the floor of the deep sea. Coral reefs, however, made up of the skeletons of such animals, are only found in the warmer parts of the ocean, where the water is clear, particularly favorable conditions being afforded by the Pacific and Indian Oceans. (See also *Coral Reefs* and *Islands*).

Jelly-fish (*Medusæ*).—All agree in having a more or less bell or umbrella shaped body, with a proboscis hanging down in the place of the handle of the umbrella or the tongue of the bell. The mouth is at the end of the handle and leads into a stomach which divides and sends out branches, like the ribs of the umbrella, to the margin. The common name is due to its gelatinous consistency. Most of the species start in life as buds from attached animals, which later separate and henceforth lead a free existence, swimming by opening and closing the bell.

SPONGES (*Porifera*) are animals of peculiar structure, which resemble zoophytes in many respects, but possess neither tentacles nor thread-cells. Some are simple, but most of them are compound. A simple sponge may be compared to a cup or vase with a wall perforated by numerous small holes, through which currents of sea-water stream into the central cavity, to make their exit by the main opening. They are set up by ciliary action.

Venus Flower-basket.—In the majority of cases the skeleton of a sponge is mostly or entirely made up of sharp needles of lime or flint, which may be welded together, as in this form. Often the opening of the vase is provided with a convex perforated covering. Another elegant form is the Glassrope Sponge native to the Japanese seas. It is rooted in the mud by a bundle of long, glassy spicules, which are slightly twisted.

Most sponges are marine, and, despite their fixed habit and apparent helplessness, are pretty free from the attacks of most other creatures, partly because of the innumerable sharp spicules they contain, and partly because their taste and smell are unpleasant. These deterrent qualities are often associated with bright warning colors, generally red, yellow or orange.

Most of us little realize that the sponges we see or use daily are in reality dead animals.

CROSS-SECTION OF LIVING SPONGE

THE SPONGE IN ACTION

The arrows show how the water enters by the small pores, to pass out by the large openings. Food is thus brought to the cells which line the channels. At the right the currents of water are seen passing from the outer openings, as seen under a powerful microscope.

[242]

[243]

[244]

THE BORDER-LINE BETWEEN ANIMAL AND PLANT LIFE

On the left are represented highly magnified animal skeletons of a class of Protozoa called Radiolarians. Most of them are under one-twenty-fifth of an inch in size. Millions upon millions of these little shells are found upon the floors of the ocean, and upon its shores. They are marvels of form and color—so wonderful, indeed, that man with all his skill cannot imitate them. When alive they consist of but a single cell, and live in colonies with the plant forms, called *algæ*, pictured on the right. The *algæ* are also single-celled, and of rare beauty of form, and the strange association of the simplest of animal forms with the simplest of *plant* forms has up to the present time proved the supreme enigma of science.

PROTOZOA OR SIMPLEST FORMS OF ANIMAL LIFE ANIMALCULES, AMOEBA, RADIOLARIA, FLAGELLATES, CILIATES

ANIMALCULES (*Protozoa*)

In botany we find that the lowest plants are mostly of a microscopic size, and unicellular—that is, consisting of a single cell or structural unit, essentially a fragment of living matter (protoplasm), part of which is specialized into a nucleus. The lowest animals are also unicellular, and the popular term “animalcule”—a little animal—has reference to their diminutive size. One of the simplest known cases is afforded by the

Amoeba (*Gr.* “change”), a name given to a number of the simplest animals or protozoa. The simplest form which the observer will meet is a naked lump of jelly-like protoplasm constantly flowing into new shapes.

Ray Animalcules (*Radiolaria*) are forms which resemble the members of the last group in some respects, but are more complex in structure, with shells composed of a latticework of flinty matter. These shells cover large tracts of the floor of the deeper parts of the ocean (limy shells dissolve before getting so far), and make up “radiolarian oozes,” such as Barbadoes earth.

Flagellates are immensely numerous animalcules with a body of definite shape covered by a membrane. Swimming is effected by a slender thread of flagellum (Latin for whiplash) of living substance, which executes whip-like movements. They are common in ponds and ditches, where it often makes up a green scum. A mouth is situated at the base of the flagellum, and at this end there is also a red eye-spot. Some flagellates bear more than one flagellum, many are fixed, and the colonial condition is common. The exceedingly minute animalcules which swarm in putrid fluids and are vaguely known as “monads” belong to this group.

Ciliates like flagellates, are invested in a firm membrane, and therefore of definite form. Instead of flagella, they possess cilia, short threads of living substance which are associated in large numbers, and alternately bend and straighten in a rhythmic fashion, bringing about locomotion in free species, or setting up currents in the water in fixed ones.

Despite their apparent insignificance, certain animalcules, by virtue of their almost imperishable skeletons, are among the most important agencies which have built up the crust of the earth. The surface of the sea is largely inhabited by Radiolarians and Foraminifera, the former preponderating in cold, the latter in temperate and tropical waters. As they die, their skeletons sink to the bottom and form mud or ooze, which through time and pressure becomes consolidated into rock.

[245]

It is generally believed that sheep were the very first of all domesticated animals. Doubtless because they supplied him with food and clothing and by reason of their gentleness, they were selected by man as his first animal associate.

DOMESTICATED ANIMALS

DOMESTICATED MAMMALS: Alpaca, Ass, Camel, Cat, Cattle, Dog, Elephant, Gayal, Goat, Guinea Pig, Horse, Llama, Rabbit, Reindeer, Sheep, Swine, Yak, Zebu.
DOMESTICATED FISH: Carp, Goldfish. **DOMESTICATED BIRDS:** Canary, Chickens or Fowls, Duck, Guinea, Goose, Ostrich, Parrot, Peacock, Pigeon, Swan, Turkey.
DOMESTICATED INSECTS: Bee, Cochineal, Silkworm Moth.

Domestic animals are those kept for the use or companionship of man. When studied in their relation to the animal kingdom as a whole it is readily seen that they belong to the highest groups of animals; but the actual process of original domestication is unknown to us. It is also very evident that the origin of some of the domesticated groups themselves is very obscure. In general it may be said that only when a yellowish breed has been produced by human interference may we call the result domestication.

CLASSES TO WHICH THE DOMESTIC ANIMALS BELONG

Among the highest class of animals—the Mammals—familiar illustrations are dogs and cats, horses and asses, cattle, elephants, camels, and the like. Birds include the domesticated pigeons, fowls, ducks, ostrich, peacock, canary, and others. Among fishes, goldfish and carp belong to the domestic class; while the honey bee and the silkworm moth belong to the lowest domestic group—the insects.

WHERE ANIMALS WERE FIRST DOMESTICATED

The original home of fully three-fourths of our domestic animals was the continent of Asia, where, also, the first home of man himself is placed. It seems quite probable that nearly all of these animals were first held as captives by the early peoples for food supply, and that their other uses developed later. As the races spread to the continent of Europe and thence over the habitable world, their animal servants spread with them, and others were added, adapted to varying climatic and other conditions. Our own continent—North America—has added only the turkey and the cochineal insect, while South America has contributed the alpaca, llama, and guinea-pig. No new domestic animals have been developed during the last two thousand years; and the natural conclusion is that all must have come into use at various stages from the very earliest period of man down to the time of the Christian Era.

[246]

RESULTS OF DOMESTICATION ON ANIMALS

Many animals have been greatly changed in form, size and habits by domestication, especially the dog, sheep, pig, donkey, pigeon and chicken, so that a great variety of breeds and strains have been developed. Many kinds of dogs are incapable of existence apart from human care. The donkey does not run wild, and chickens are never found at a great distance from human habitations. Others, though much varied in form and size, are still capable of independent existence, such as the horse, goat, ox, cat, and goose, but a group like the cheetah, water buffalo, and swan are only partially domesticated, and little changed by association with man.

DOMESTICATED MAMMALS

Alpaca (*Auchenia Paco*), an animal of the same genus with the llama, belongs to the Camel family, is the half-domesticated form of the wild vicuna. It is remarkable for the length and fineness of the wool, which is of a silken texture, and of an uncommonly lustrous, almost metallic appearance. The alpaca is smaller than the llama, and, in form, somewhat resembles the sheep, but has a longer neck and more elegant head. It carries its long neck erect; its motions are free and active, its ordinary pace a rapid, bounding canter. The eyes are very large and beautiful. The wool, if regularly shorn, is supposed to grow about six or eight inches in a year; but if allowed to remain upon the animal for several years, attains a much greater length, sometimes even thirty inches, and not unfrequently twenty. Its color varies; it is often yellowish brown; sometimes gray, or approaching to white; sometimes almost black.

The alpaca is a native of the Andes, from the equator to Tierra del Fuego, but is most frequent on the highest mountains of Peru and Chile, almost on the borders of perpetual snow, congregating in flocks of one or two hundred. The Peruvians keep vast flocks of them for the sake of the silky luster and fineness of their wool, which furnishes material for the best of fabrics.

The alpaca does not acclimatize in other regions of the world, and all attempts to introduce and establish it as a wool-bearing animal in Europe and the United States have failed.

Ass (*Equus asinus*), a species of the horse genus, supposed to have sprung from the wild variety (*Asinus tæniopus*) found in Abyssinia. It differs from the horse in having short hair at the root of the tail and a long tuft at the end, in the absence of warts on the hind-legs, and in the persistence of stripes, except in albinos. The upright mane, the long ears, the cross stripe on the shoulders, and the dark bands on the back are also characteristic. The domestication took place at an early date, probably before that of the horse. It was brought to Mexico and South America by the Spaniards.

In Arabia, Syria, Egypt, Spain, Kentucky, and elsewhere asses are well cared for, and the breed has been considerably varied and improved. The stupidity for which the animal has for long been proverbially reproached seems largely the result of human influence.

The **MULE** is a hybrid bred between mare and male ass; while the **hinny** is the rarer result of hybridism between horse and female ass. The mule is much nearer in temper and appearance to the ass than to the horse; the hinny in some points resembles the horse more, as it neighs, while the mule brays like the ass. The ass is admirably adapted for a beast of burden, being remarkable for endurance, hardiness, and docility under kind treatment. It varies greatly in size, from dwarf forms only twenty to thirty inches high in the West Indies to fine Spanish and American breeds sixteen hands high.

The **BURRO**, used almost exclusively as a pack animal by miners and prospectors in the mountain regions of the western states, is a small form.

Banteng (*Bos sondaicus*), a species of ox, a native of Java and Borneo, which, in color, shape, horns, and absence of dewlap, bears some resemblance in appearance and ferocity to the gaur (*Bos gaurus*) of India. It is black, with white legs; the hair is short and sleek; the limbs slender; the muzzle sharp; the back rises into a high arch immediately behind the neck.

Camel (*camelus*), called by the Arabs the "ship of the desert" is a misshapen animal of the even-toed group. In this family, the upper lip is hairy and deeply cleft; the neck is very long; the feet (with two toes) are not enhoofed, but provided with callous soles; and the stomach has three compartments. The family includes the camels proper and the various forms of alpaca.

The camels are well known for their large size, for their dorsal humps, for their callosities on knees, breast, etc., for the common sole uniting the two toes. The ears are small and rounded; the short tail bears a terminal switch; the hair is tangled and felted; a single young one is born; and the diet is wholly vegetarian.

One species is usually spoken of as the **DROMEDARY**. It has a single hump and a generally reddish-gray color. There are many breeds, and the dromedary is the most agile of these. Apart from its use in transit and transport, the flesh is eaten, the milk made into butter and cheese, the hair woven into fabrics of various degrees of fineness, and the skin tanned.

The other camel is known as the **Bactrian**, and is distinguished by its slightly larger size, two dorsal humps, and somewhat finer brown or reddish hair. This camel is bred in central Asia, and in its adaptability to domestication, as well as in its natural adaptation to desert life, is a most useful animal. Its frugal diet, its powers of storing water and of going long without a fresh supply, and its great strength are very familiar facts. A camel will eat almost any herbage or green thing it comes across, even dried, leafless twigs. The hair of the camel forms the wool and cotton the warp of the famous Persian camel's-hair cloth. Coarser camel's wool or hair is imported for various purposes.

The Bactrian camel can carry one thousand pounds weight or more, and the dromedary proper can cover one hundred miles in a day. The ordinary jog of a camel is about two and one-half miles an hour, but this can be kept up for many days with little food and less drink. A swift dromedary may go ten miles an hour. A thousand or more may journey in a caravan, and the amount of food carried is surprisingly small. The hump must be in good condition before starting. In the stomach-reservoirs a gallon and a half of water can be stowed away. Like some other frugal animals, the camel enjoys a long life of thirty or forty years.

In disposition the camel is peculiarly stolid, not to say stupid. Whether domestication has been too much for it, there can be no doubt that its "docility" is more the result of habitual nonchalance than any outcome of intelligent subservience. It is usually very submissive, except when habitually thwarted or ill-treated.

The camel is the most useful and important of all African domestic animals; without it commerce would be impossible across some districts which are nearly devoid of water and plants. In Australia, also, it has become valuable for interior expeditions, and camel corps have been formed by European troops in the Sudan, and are a permanent branch of the Egyptian army.

BLUE RUSSIAN

ABYSSINIAN

PERSIAN, OR ANGORA (above)
MALTESE KITTENS (below)

Cat (*Felis domestica*) is known to everybody. Its nearest relation is the **WILD CAT** (*Felis catus*), but it is not a tamed descendant of this wild cat but seems, like other domestic animals, to have come from the East. It is usually, though not with absolute certainty, regarded as the descendant of the Egyptian cat which was domesticated in Egypt thirteen centuries B. C. From Egypt the domestic cat spread through Europe, and was confined to those who could afford a high price for the pet.

THE VARIETIES OF CATS ARE DUE TO COLOR AND FUR

The varieties of domestic cat concern color and quality of fur, not differences of form, as in the case of dogs. Thus we have (1) black cats with clear yellow eyes, usually with a few white hairs, and with hints of markings in the kittens; (2) white cats, sometimes with blue eyes, and then generally deaf; (3) tabby cats, like the wild species, and perhaps the result of crossing with the same; (4) gray cats, which are rare, and differ from the tabby forms in having no black stripes, except the common ones over the forelegs; (5) tortoise-shell, fawn-colored, and mottled with black, usually females; and (6) sandy-colored, usually males. The royal Siamese cat is fawn-colored, with blue eyes and small head; the Carthusian or blue cat has long, dark, grayish-blue fur, with black lips and soles; the Angora, or Persian cat is large, fine furred, generally white, tending to yellow or gray, and possibly derived from an Asiatic species. The Malay cat, in Pegu, Siam, and Burma, has a tail only half the normal length; the Manx cat of the Isle of Man is tailless and has longer hind-legs. A fine all-blue cat comes from Russia and Iceland, and there are characteristic breeds from India, Abyssinia, and other parts of the world.

CHARACTERISTICS AND HABITS OF CATS

The domestic cat is too well known to require description. It has been known to attain a weight of twenty-three pounds and an age of eighteen years. Though thoroughly domesticated, it retains many characteristics of wildness, especially in its private hunting expeditions, nocturnal wanderings, unsocial habits, and generally self-centered, not entirely confident disposition. When turned out in the woods it usually adapts itself readily. Domestication has had a different influence on cat and on dog, and the former may be fairly said to have surrendered itself less. Its sense of smell has probably degenerated, but is still very sensitive to certain favorite odors. The great dilatibility of the pupil enables it to make the most of feeble light. The dry fur, freed from any oily matter and readily injured by water, becomes highly electric by friction, especially in dry or frosty weather.

CATS POSSESS UNUSUAL INTELLIGENCE

In cats the senses of sight, hearing, and touch are very highly developed, and the intelligence is proportionately great. That they exhibit great adroitness in catching their prey is well known, but the climax is reached in certain recorded cases where a young bird was used as a decoy for its parents, and where crumbs were scattered or scraped from beneath the snow to attract sparrows. A remarkable case is recorded of a cat which, being accidentally ignited by paraffin, ran one hundred yards and plunged into a trough of water.

SUPERSTITIONS REGARDING CATS

Cats have been objects of superstition from the earliest ages. In Egypt they were held in the highest reverence; temples were erected in their honor; sacrifices and devotions were offered to them; and it was customary for the family in whose house a cat died to shave their eyebrows. The favorite shape of Satan was said to be that of a black cat, and the animal was an object of dread instead of veneration. Many people still prophesy rainy weather from a cat washing over its ears or simply its face; and a cat-call on the housetop was formerly held to signify death.

Cattle, or Ox.—All farm animals were once called cattle, belonging to the bovine genus; nowadays this term applies only to beef and dairy animals—meat cattle. Our improved breeds are descended from the wild ox (*bos*) of Europe and Asia, and have attained their size and usefulness by care, food, and selection. The uses of cattle are familiar. Their flesh is part of the daily food of man—butter, cheese, and milk are on every table; their hides go to make leather; their hair forms part of plaster; their hoofs are used for glue; their bones for fertilizer, ornaments and buttons, and many other purposes. Cattle are primarily used, however, for meat and milk. This being the case, breeders have quite naturally chosen their animals with one or another of these purposes in mind. There have been developed consequently two classes of breeders, those that excel as milk producers or butter cows, and those that on being slaughtered dress out large quantities of the most marketable meat.

TWO GENERAL TYPES OF CATTLE

The differences between these two leading classes is one of form, type and quality, as the breeders say. A good dairy cow has a very soft, mellow skin, and fine, silky hair. Her head is narrow and long, and the distance between the eyes is noticed to be great. This indicates much nerve force, an important quality of the heavy milkers. The neck of a good dairy cow is long and thin. The shoulders are thin and lithe, and narrow at the top. The back is open, angular, and tapering toward the tail. The hips are wide apart and covered with little meat. The good cow is also thin in the region of the thigh and flank, but very deep through the stomach girth, as a result of the long, open ribs. The udder is large, attached well forward on the abdomen, and high up behind. It should be full but not fleshy. The lacteal or milk veins ought also to be large, and extend considerably toward the front legs.

REPRESENTATIVE BREEDS OF MILK PRODUCERS

The Holstein-Friesians from Holland, Jerseys, Guernseys and Alderneys from the English Channel islands, the Ayrshires from Scotland, Dutch Belted, French Canadians, and Kerry cattle, the latter from Ireland, and Brown Swiss from Switzerland, are all especially dairy cattle. The Holstein-Friesians are large and noted for their heavy production of milk and at the same time large carcasses, while, on the other hand, the Jerseys, Guernseys and Alderneys are less in size and noted for the richness of their milk rather than its great quantity. The Jersey shares popular honors in the dairy world with the Holstein-Friesian.

AYRSHIRE.—Medium size, standard weight for cows 1000 pounds, bulls 1500 pounds or more. A little smoother than Jersey or Holstein but from behind wedge shape is evident. Tips of ears notched, horns white with black tips and curve outward and upward. Body large and deep, ribs well sprung, hindquarters often heavy. Udder shows high development of form and setting. Color variable though red, white and brown in patches. Mild but active disposition. Dairy breed.

BROWN-SWISS.—Weight for cows 1200 pounds and bulls 1800 pounds. Colors shade from light to dark chestnut brown. Light tuft of hair between horns, on inside of ears, and a narrow line along back. Nose black, mouth surrounded with meal-colored band. Horns with black tips, medium size. Face dishing, large, full eye; ribs well sprung. Hoofs and tongue black, udder large, extending well up in front and rear. Teats large, well placed. Short legs. Dairy breed.

GUERNSEY.—Clean-cut, lean face, long, thin neck, backbone rising well between shoulder blades, pelvis arching and wide, rump long, abdomen large and deep, udder full in front, of large size and capacity. Teats well apart, and of good even size. Hair a shade of fawn with white markings, cream colored nose, horns amber, small, curved and not coarse. Mature cows about 1050 pounds. Bulls 1200 to 1500 pounds. Dairy breed.

SPLENDID HERDS AND FLOCKS ON AMERICAN FARMS

[249]

HOLSTEIN-FRIESIANS ON A MODERN DAIRY FARM IN IOWA

This fine breed of dairy cattle probably excels all others for the general purposes of the dairy-farm. As milk producers they outrank all other breeds as they do also in size.

A FINE FLOCK RESTING BENEATH THE TREES OF MONTANA

HOLSTEIN-FRIESIAN.—Color black and white piebald. Head broad between eyes, eyes large and bright, horns small, tapering toward tips, neck long, chest moderately deep and low, barrel long and wedge shaped, large abdomen, legs rather short and nearly straight and wide apart. Hair fine, soft and furry. Udder very capacious, extending well forward in front; teats well formed and wide apart. Dairy breed.

JERSEY.—Small head, muzzle black or dark in color surrounded by light or mealy strip of light skin and hair. Eyes prominent, bright and wide apart. Horns crumpled, small, often black tipped. Neck fine, clean and small. Legs short, fine boned and small. Body well rounded, large and deep. Skin mellow, loose, yellow, with short fine silky hair. Udder large, not pendulous. Teats medium size, placed far apart. Back straight from shoulder to tail. Movement light and graceful. Cows 800 to 1000 pounds, bulls 1200 to 1500 pounds. Dairy breeds.

REPRESENTATIVE BREEDS OF MEAT CATTLE

The beef cow presents a totally different appearance. She is square in shape, full and broad over the back and loins, possessing depth and quality particularly in these regions. The hips are evenly fleshed, the legs full and thick, the under line parallel with the straight back. The neck is full and short. The eye should be bright, the face short, the bones of fine texture the skin soft and pliable, and the flesh mellow, elastic to the touch, and rich in quality.

For meat the Short-horns (formerly called Durhams) and Herefords and their grades predominate. They are both English breeds with horns. In color the Short-horns are red and white or a mixture of these, while the Herefords are red with white faces, briskets, bellies and feet. The Aberdeen-Angus and Galloways are famous for their high qualities as beef makers, and are both of Scotch origin, black and hornless.

ABERDEEN-ANGUS.—Black color, polled heads, rotund compact type, smoothness of conformation, short legs, evenness of flesh when fat, deep, full hindquarters. Beef breed.

GALLOWAY.—Low, blocky animal, with long, soft, shaggy coat of black hair, hornless, well sprung in the ribs, resembling barrel in shape, which is evenly covered with juicy, lean flesh. Head short and wide, forehead broad, face clean, nostrils large. Eye large and prominent. Neck short, clean. Shoulders broad, joining body smoothly. Hindquarters long, wide, well filled. Rump straight, wide, carrying width of body out uniformly, well filled with flesh. Thighs broad and thick. Legs short and clean. Beef breed.

HEREFORD.—Color red and white. Head, including jaws and throat, white, white under neck, down the breast, under belly, and on legs. Bush of tail white, white strip on top of neck to top of shoulders, remainder of body red. Head short, forehead broad, eyes full, horns rather strong and of whitish yellow color, free from black tips, more or less drooping, neck short and thick. Hide heavy and loose and covered with dense soft coat of hair. Breast broad and full, free from loose dewlap. Shoulders broad on top. Ribs well sprung and extending well backward. Rump bones wide apart. Legs short, straight and set well apart. Line of back straight and level. Quarters full and well rounded. Beef breed.

SHORTHORN.—Head wide between eyes, short from eyes to nostril. Horns short, curved forward waxy white with dark tips. Neck short and fine. Back straight, level and broad and deeply covered with flesh. Thighs wide, deep and long, well filled down in the twist. Body deep, squarely built. Flanks well let down, underline nearly straight. Legs medium length. Colors pure red, pure white, a mixture of these colors, or roan. Beef breed.

The breeds considered as chiefly serving the dual-purposes of milk and beef-making are Red Polls and Devons, both English breeds, and some of the Short-horn families having the milking characteristic best developed.

RED POLLED.—Weight for bulls 1800 to 2000 pounds, cows 1300 to 1500 pounds. Color red. Nose flesh color. Switch of tail and udder white. Head medium length, wide between eyes. Poll well defined and prominent, neck of medium length, clean cut, straight from head to top of shoulder. Chest broad and deep, back long, straight and level, hips wide and well covered, legs short and straight. Udder full and flexible. Teats well placed and wide apart. Hide loose, mellow, with full coat of soft hair. Dual purpose breed.

CATTLE AS A FORM OF INDUSTRY

Cattle are the chief source of wealth in many regions. Just as the horse is pre-eminent as a labor animal, the ox stands first as the food producing animal in modern civilization. The aggregate value of cattle products,—beef, milk, butter, cheese, hides, etc., far exceeds that of any other animal.

The relative economy of milk and beef production is now more and more commanding attention. The experiment stations have demonstrated that good dairy cows produce human food in the form of milk much more economically than food products can be obtained in the form of beef, pork or mutton.

REMARKABLE EXPERIMENT IN CATTLE VALUES

At one of the Stations, for example, the entire carcass of a steer and the milk of an Holstein cow were analyzed.

The steer when killed weighed twelve hundred and fifty pounds. The cow during the year gave eighteen thousand four hundred and five pounds of milk. From the milk of the cow, and from the carcass of the steer, the following number of pounds of human food substances were obtained. Of protein five hundred and fifty-two pounds from the milk, and one hundred and seventy-two pounds from the steer; of fat six hundred and eighteen pounds from the milk and three hundred and thirty-three pounds from the steer; of sugar nine hundred and twenty pounds from the milk and none from the steer; of mineral matter one hundred and twenty-eight pounds from the milk and forty-three pounds from the steer.

The steer's body contained about fifty-six per cent of water, leaving five hundred and forty-eight pounds of dry matter, which included not only the edible, dry, lean meat and fat, but also every part of the body—horns, hide, bones, internal organs, etc. In one year the cow produced two thousand two hundred and eighteen pounds of dry matter, every part of which was wholly digestible and suitable for human food. In that time she produced enough protein to build the bodies of three steers, fat enough for nearly two steers, and mineral matter enough for the skeletons of three, besides nine hundred and twenty pounds of milk sugar, as nutritious and useful for humans as the same weight of cane-sugar like that bought at the store.

ECONOMIC VALUE OF THE DAIRY COW

These figures explain why dairy cows and not steers are kept on the valuable lands. When the cheap lands disappear, and rough food commands higher values, the beef cow will be raised as a luxury, and cattle will make their contribution to the human race largely in the form of milk, butter, and cheese. In the future more and more will the farmers

[250]

[251]

CHINESE POUCHONG

ARABIAN GAZELLE HOUND

SCOTCH COLLIE (above)

BIRD DOG OR POINTER (middle)

ENGLISH SETTER (lower)

Dog (*Canis familiaris*) is the most intelligent, affectionate, and devoted of domestic animals; in use by all peoples, and accompanying man throughout a wider range than any other animal, greatly exceeding the cat, donkey, or horse in this respect. It is very docile; its memory and its sense of localities and time are admirable. It is the constant companion of man, the protector of his house and of his herds, his helpmate in battle, a useful companion of the hunter, a draft animal, a guide, a buffoon, a postman, a comedian, and a brother of charity at St. Bernard. What creature can do more? Among its characteristic qualities, its faithfulness and gratitude are most prominent. No animal is attached to man in the same degree.

The domestication of the dog dates to primitive man, and far precedes the dawn of history, many important varieties being portrayed in the earliest sculptures. Most varieties have become so modified by domestication that they are unable to sustain themselves apart from man.

DIFFERENT BREEDS OF DOGS

Dogs vary widely in color, form and size; in adaptation to climate from the hairless forms of the tropics to the heavily fur-coated Eskimo breeds; and in size from tiny lapdogs no larger than kittens to great Danes standing three feet high at the shoulder. There are some two hundred varieties which have resulted from the intercrossing of about six leading types, namely: wolf-like dogs, greyhounds, spaniels, hounds, mastiffs, and terriers.

Among sporting dogs, the bloodhound stands pre-eminent for its majesty of appearance and beauty of color, and is distinguished for the keenness of its scenting powers. The head of the bloodhound is long and narrow, and "peaked" on the top of the skull. There is much loose skin about the head, and the eye is sunken, showing the red skin beneath it.

The greyhound is remarkable for its fleetness of foot. In addition to its beauty and elegance, it is of a very affectionate disposition. Pointers and setters are much used by sportsmen in the field, and are possessed of keen scent and cunning. The retriever, which is useful for domestic as well as sporting purposes, is sagacious, good-tempered, and intelligent. An English retriever, whether smooth or curly coated, should be black or black and tan, or black with tabby or brindled legs. Among the terriers, or vermin killers, the best-known varieties are the fox terrier, the Skye terrier, and the Irish and Airedale terriers.

Spaniels are the oldest and the most useful generally of all breeds of sporting dogs; earnest, untiring workmen in the fields, and faithful, loving, and gentle companions when the day's work is done. They are also very beautiful, and universal favorites. The leading varieties are the black spaniel, the lurcher, the Clumber, the Sussex, the Norfolk spaniels, and the Irish and English water spaniels.

Among other sporting dogs are the dachshund, which is crooked-legged, jealous, and affectionate; the basset-hound, the beagle, the otter-hound, the harrier, and the foxhound.

Among the large house dogs which are treasured as companions the most notable are the St. Bernard, the Newfoundland, and the mastiff. The St. Bernard is an extremely large and powerful fellow, a perfect giant among dogs, with a beautiful head and speaking countenance, in which sagacity is blended with nobility; and a body of great symmetry.

The Newfoundland, which is a capital swimmer, is a very large, jet-black dog, with a large and massive head, with a long, straight coat and bushy tail, and a face extremely expressive, and eyes that beam with intelligence.

The mastiff is a large dog, with a majestic-looking head, and is either fawn or brindle. The collie is a good companion, and a valuable sheep dog. The Dalmatian, which is white with black spots, is well known as a coach dog.

Among pet dogs, we have the fondled King Charles spaniel; the poodle, which is a good performer of tricks; the active little pug; and the watchful Pomeranian.

DOGS IN FOLKLORE AND MYTHOLOGY

Dogs still play an important part in folklore everywhere, whether as revenants whose intention is merely to warn or foretell, or as hell hounds of purely malignant nature. They are represented as quick to detect the presence of invisible spirits, and, in connection with this aptitude for seeing into the spirit world, they are often the outward objects through which devils and demons make their appearance, and they have often been associated with such masters of unhallowed arts as the great Cornelius Agrippa.

The Wild Huntsman with his train of hounds is one of the most widespread superstitions in Europe, and in the dim mythological histories of the early world we find many dogs of supernatural strength and courage who give material aid to the heroes in their exploits.

The American Indian, as is well known, believed in the immortality of the dog, and always looked forward to being reunited with this faithful companion in the Happy Hunting-ground beyond the grave.

Elephant.—Though the Indian Elephant has been, and still is, used as a beast of burden, it has never reached a completely domesticated state. See further under **Pachiderms**.

Gayal.—Frequently domesticated, though more often found wild.

Goat (*Capra hircus*), "the peasant's cow," is found in all parts of the globe as a domestic animal. It has a beard on its chin, and carries sharp-edged horns, which incline towards its back. The common domestic goat is a variety of the wild goat (*C. hircus*) which inhabits the Taurus and other mountains of southwestern Asia. Compared with its ancestor, the domesticated form is somewhat reduced both in general size and as regards its horns. The domestication must have taken place at a very remote period, and spread from the East, probably through Egypt, westwards.

A great number of breeds now exist. A most important variety, formed into a breed by artificial selection, is the Angora goat, where almost the whole body is enveloped in that long, silky, white hair which is so valuable. The Angora goat has been introduced into the United States, Cape Colony, and Australia. The Cashmere goat, from Tibet and Bokhara, is almost equally valuable, furnishing the white to brown hair used in making Cashmere textiles, especially the famous Cashmere shawls. It has been successfully acclimatized in France. The Rocky mountain goat is about the size of an ordinary sheep, and its general appearance is not unlike that of a sheep of the merino breed, its long, straight hair hanging down in an abundant white fleece.

Frequently goats are found wild in mountainous countries, scrambling among rocks and bushes; are extremely sure-footed, and display great strength and agility in leaping. These include the Markhor, the Alpine ibex, or Steinbock, and the Izard.

Goats are very valuable for flesh, milk, wool, and skins, particularly in warm, dry regions. The greater part of the world's goats are grown in southern Europe, northern Africa, and Syria. Goat's leather is employed for innumerable uses, some of the chief of which are glove making, shoemaking, and bookbinding. In the United States goats have never attained much importance as farm animals. They have been established in the Pacific States, however, notably in Oregon, and in Iowa and Missouri.

Guinea-pig.—Frequently domesticated as pets, but more often a game animal in the forest regions of South America.

Horse (*Equus*) is one of the noblest and most useful of animals. The horse proper is characterized by the tail with long hairs from its base; the long and flowing mane; a bare callosity on the inner surface of the hind as well as of the fore legs; and by the head and ears being smaller and the limbs longer than in the ass and other related species.

ORIGINAL HOME AND ANCESTORS OF THE HORSE

The native country of the horse seems to have been central Asia. It became early domesticated in Egypt, and is mentioned throughout the Bible. The Greeks and Romans had some covering to secure their horses' hoofs from injury. In the ninth century, horses were only shod in time of frost. Shoeing was introduced into England by William I., 1066. It is believed that the original breed of horses is extinct, and that the half-wild herds existing in many places have descended from animals once in captivity. Thus, when the horse was first introduced by the Spaniards in 1537, at Buenos Ayres, there were no wild horses in America. But individuals escaping ran wild, and, by 1580, their descendants had spread over the continent as far as the Straits of Magellan. More fossil horses have been found in the new than in the old world. The horse may have descended from a striped ancestor, stripes still sometimes remaining, especially in duns and mouse-duns.

THE VARIOUS BREEDS OF HORSES

Like other domestic animals the horse has run into various breeds. The most celebrated is the Arab horse. Great attention is given in America to the breeding of horses, and American horses have won races both in England and on the Continent.

While the increasing use of automobiles by farmers and others may have a more or less depressing effect upon the demand for some classes of horses, no machine can successfully supersede the horse in more than a part of his many uses in business, sport and pleasure. There is a prevailing tendency toward heavier horses for farm work, and draft work in cities as well.

Of the draft breeds the Percherons, of French origin, are regarded with high favor, while the Clydesdales, from Scotland, have a well merited if not equal popularity. The

English Shire and Belgian horses are also excellent types of the drafters. Cleveland Bays, one of the oldest and most popular of the English Coach breeds, are quite appropriately termed "the general utility horse," while the admirers of the German and French Coachers, as yet comparatively few in numbers in the United States, regard them as unexcelled for similar purposes. Hackneys are pre-eminently adapted to drawing any sort of vehicle at a rapid pace on the road, and French Coachers are in demand for large, stylish, high-stepping carriage teams and single drivers.

Thoroughbreds are probably the oldest and best established of all the breeds of Europe and America. They are distinctly of British production, and especially noted for endurance and speed on the race course. The term Thoroughbred, when applied to horses, is used to designate one particular breed, the running or race horse. Standard bred classes include the trotter and his immediate fellow, the pacer. They are American productions of modern times, the outgrowth of the commercial tendencies of Americans, coupled with their ardent love for tests of speed, and fast, level-headed roasters for light business and pleasure driving, used single or in pairs. The chief families of trotters are Hambletonians, the Mambrinos, the Clays, the Morgans, the Bashaws and the Pilots, all, except the Morgans, more or less related, and tracing their ancestry, directly or indirectly, to an imported English Thoroughbred sire, foaled in 1780, and known as Messenger.

Other breeds of horses, but of extremely small numbers, in America are the Suffolk Punch, for draft; Orloff trotters, and Shetland, Welsh and Exmoor ponies.

Of the smaller breeds of horses, the Shetland Pony is best known. Only seven or eight hands high (a hand equals four inches), they are as docile as they are hardy. Their coats are shaggy, and in winter become so matted as to protect the animals from the severe weather experienced in their northern home. Notwithstanding their small size, they are wonderfully strong, and are capable of exertion without fatigue.

THE NOBLE CHARACTER OF THE HORSE

The horse is not only a fiery racer, but displays all the noble characteristics of fidelity, gratitude, attachment, and compassion. It also exhibits a talent for understanding, has an almost unerring memory, and a very rare docility. With patience and kind treatment the horse can be trained to go through quite complicated feats of memory and perception. That it possesses also an accurate sense of time is clear from the facility with which it can be taught to walk, trot, and dance to music, or take part in concerted evolutions. It is very timid and cautious and suspicious of every new sight or sound; while in respect of moral qualities it is scarcely too much to say that horses are as diverse as men.

CHIEF CHARACTERISTICS OF LEADING DRAFT HORSES

BELGIAN DRAFT.—Short body set on short legs. Tendons of legs large. Head good size. Eyes small, neck short, thick and well crested. Shoulders heavily muscled. Chest deep and wide, good barrel. Hock short, broad and inclined to sag. Loins wide, short and very thick. Flank low and full. Hindquarters short, very wide, muscular. Lower thighs very wide, well muscled. Backs round and meaty. Colors, chestnut, roan, brown and bay.

CLYDESDALE.—Weight 1700 to 2000 pounds for stallions, 1500 to 1800 pounds for mares. Height sixteen to sixteen and one-half hands. Colors, bay, brown, black or chestnut, with white markings on face and legs. Head intelligent. Shoulders good, which gives a free, easy, long stride. High withers. Arm well muscled. Feathering on leg is fine, silky and long. Quarters and croup muscular. Springy, strong pastern. Front action free and snappy.

HACKNEY.—Considerable substance, very smooth, gracefully curved outlines, rather short legs, head well proportioned, full, bright eyes, well developed neck, shoulders long and sloping, well muscled. Body deep and round-ribbed. Muscular loins and quarters, strong hocks, excellent action. Colors brown, bay or chestnut, with white markings. Height fifteen and two-tenths to sixteen hands.

PERCHERON.—Height fifteen and one-quarter to sixteen and one-half hands. Weight 1500 to 2000 pounds. Colors, gray and black. Active temperament, intelligent head, deep body, wide, muscular croup, clean-cut legs, joints clean and hard; legs show abundance of quality. Good action.

SHIRE.—Conformation low, broad and stout. Heavy in build, slow in movement. Large girth, deep and strongly coupled with broad back, quarters heavily muscled, legs strong, feet large. Feathering on legs below knees and hocks. Weight 2200 pounds. Height 17 hands. Colors brown, bay or black with white markings on face and legs.

SUFFOLK PUNCH.—Low-set, short legs, deep body, muscular, durable feet. Head clean cut, with full forehead and Roman nose, neck full, with strong crest, chest deep and wide. Barrel deep, round-ribbed, and well let down on hind flank. Legs and hindquarters muscular. Height sixteen and one-half hands. Weight 2000 pounds. Color chestnut.

CHARACTERISTICS OF LEADING SADDLE AND DRIVING HORSES

AMERICAN SADDLE HORSE.—Head rather small and clean cut. Eyes wide apart, full, clear and prominent. Ears pointed. Long, upright neck, sloping shoulders. Deep chest, short, strong back. Barrel ribbed well back. Strong coupling, quarters level, strongly muscled. Pasterns long and sloping. Bones of leg broad and flat, strong tendons. Height about fifteen hands, two inches. Weight about 1000 pounds.

FRENCH COACH.—Height sixteen hands. Weight 1000 to 1400 pounds. Rather upstanding. Smooth and symmetrical, fine quality, clean cut, intelligent head, long, graceful neck, closely ribbed body, muscular quarters. Legs well set and fine. High, free knee action, regular uplifting hock action. Colors bay, brown or black.

GERMAN COACH.—Colors bay, brown or black. Height sixteen to sixteen and one-half hands. Weight 1350 to 1450 pounds. Deep, round body, well proportioned, close ribs, neck long and high set on shoulders, neat head, intelligent face. Back short and strong, smooth at coupling, plump rounded quarters, strongly muscled limbs, strong hock, good feet.

SHETLAND PONY.—Height ten hands two inches. Weight 325 to 375 pounds. Compact build, deep body, heavy muscular quarters, short legs, short broad back, deep full chest, muscular neck, small head and ears, prominent eyes, docile disposition. Colors brown, black and bay. Long shaggy coats, heavy, long mane.

STANDARD-BRED TROTTER.—Head well proportioned, clean cut, neck long and muscular, crested in stallions. Shoulders well muscled, chest low, foreleg long from elbow to knee, short from knee to fetlock. Pasterns sloping, feet moderate in size, oily in appearance. Back and loin well muscled, hind quarters and croup well muscled and smooth. No fixed colors. Height sixteen hands. Weight for mares 900 pounds, stallions 1150 pounds.

THOROUGHBRED.—Very deep, narrow chest, long legs. Refinement and clear definition of feature. Large nostrils, full, clear eyes, broad forehead, neck long and straight, sloping shoulder, muscular hindquarters, sharp withers, well marked superficial blood vessels, silky skin and hair. Colors bay, brown or chestnut, more or less white in face and limbs. Height fifteen to sixteen hands. Weight 900 to 1050 pounds.

WELSH PONY.—Good shoulders, strong back, neat head, best of legs and feet. Height twelve to thirteen hands. Colors bay or brown, gray or black. Great strength and endurance.

Llama (*Auchenia lama*), a most useful South American domesticated variety of the guanaco whose herds roam with the rheas on the plains of Patagonia, or climb on the Cordilleras. As a beast of burden the llama was in general use at the time of the Spanish conquest, and its sure-footedness and power of foraging for itself make it most valuable for transport in the rough and steep mining regions of the Andes. In many places, however, mules have to some extent replaced the llamas. The males carry a hundredweight about twelve miles in a day. The females, which are kept for breeding, are smaller and less strong than the males. The animal is larger and stouter than the allied species, the alpaca, stands about three feet high at the shoulders, and keeps its head raised.

The reader of the story of "Robinson Crusoe" will remember that a llama, with its two young ones, were his first household companions.

Rabbit.—See page 198, under [Hare](#).

Reindeer (*Rangifer tarandus*) is the only representative of the genus. It is a native of the northern parts of Europe, Asia and America, and was introduced into Iceland in 1770. It is by far the most valuable of the deer, for not only are the flesh and skin of much use, but the animal has long been domesticated in Scandinavia, especially among the Laplanders.

The wild reindeer of Lapland is almost equal in size to the stag, but there are great differences of size in different districts, the largest size being generally attained in the polar regions. The reindeer is strong, somewhat heavily built, but yet very swift. The hair is longer in winter, and is gray or brownish in color. The legs are short and thick, and the broad main hoofs spread out as the animal speeds over the snow. Besides the main hoofs, there are two accessory lateral hoofs. The head is carried horizontally, not erect as in other deer. The antlers are large and are unique in being possessed by both sexes. Moreover, they begin to appear at an early stage in life, within a few weeks after birth, and at the same time in both sexes, whereas in the other deer, in which only the males have antlers, they do not appear before nine months or more after birth.

In summer the Lapland reindeer feeds chiefly on the shoots of willow and birch, while in the winter it depends mainly on lichens such as the so-called reindeer moss.

In their natural life the reindeer are gregarious. They migrate from the mountains to the lowlands in winter, and return again in spring, a change in part dependent on the food-supply. It constitutes the chief part of the Lapp's wealth, and some possess tame herds of two thousand or more, which feed chiefly in the mountainous regions in summer and in the lower grounds in winter. The animal can maintain a speed of nine or ten miles an hour for a long time, and can easily draw a weight of two hundred pounds besides the sledge. The reindeer also yields excellent milk. In Siberia a large domestic reindeer is used for riding.

The CARIBOU, or American reindeer, is found in the northern parts of Canada, but is not domesticated.

Sheep (*Ovis aries*).—The common sheep was probably the first animal domesticated by man in western Asia—the first home of the human race and their propagation, care and improvement have always played a large part in the best husbandry of all lands. Domestication and selective breeding have greatly modified the sheep as to bodily size, length and quality of wool, presence and character of horns, and in the case of the so-called fat-tailed sheep, the tail has become enormously developed.

Sheep were introduced into Florida by the Spanish in 1565; into Virginia in 1609; into Massachusetts in 1624; into New York in 1625; into New Jersey and Delaware by the Swedes in 1634; into Pennsylvania in 1684; and into California by the Spanish missions from Mexico in 1773.

The flesh of sheep is both a staple and a delicacy, and from their wool has been fashioned clothing to meet a wider range of requirements for bodily comfort than any other fiber, animal or vegetable, has afforded. Their skins are a large factor in manufacture, arts and commerce.

The common classification of sheep is according to the characteristics of their fleeces, as "fine wools," "long wools" and "medium wools." The American Merino, the Delaine Merino, and Rambouillet belong to the first named class, or fine wools; the Leicester, Lincoln and Cotswold, to the long wools; and the Southdown, Tunis, Dorset, Shropshire, Cheviot, Suffolk, Hampshire and Oxford, to the medium wools. The fine wool breeds are reared chiefly for wool, while the others are kept for both wool and mutton. Nearly all the breeds in the United States, except the Merino, were imported from Great Britain. Wyoming, Montana, New Mexico and Idaho are foremost in sheep and wool-growing, and theirs, with those of Utah and Oregon, make nearly half of the total production in the United States.

The good-nature, gentleness, and patience of sheep have become proverbial; it is therefore not to be wondered at that they are the pets of children, and that the playful gambols and antics of the lambs amuse young and old alike.

CHARACTERISTICS OF REPRESENTATIVE WOOL BREEDS

LEICESTER.—Hornless, large size, rectangular form of body on clean legs, bare faces or carrying a very scant topknot. Head long, tapering toward muzzle, face wedge-shaped, covered with fine white hairs, eyes large and prominent, neck strong and moderately short. Breast deep, broad and full. Back broad and well fleshed. Legs of moderate length. Fleece fine, uniform, curly, with bright luster.

LINCOLN.—Large size with heavy fleece of long wavy or curly wool and moderate tuft of wool on face. Color white, head large, without horns, body deep, back wide and straight. Legs broad and set well apart. Weight for rams 250 pounds, ewes 200 pounds.

MERINO.—Distinguished by its very fine wool, usually delicately crimped. Wool generally short and dense. Grows to tips of ears and hoofs of feet. Form, when shorn, angular, shoulders narrow, back not usually so straight or strong as English breeds, legs less straight and neck more slender. Ram usually has horns. Very enduring and resistant. The American merino has three to five heavy folds on neck, and folds on arm and sides and across hips. Fleece covers entire sheep except tip of nose and hoofs. Eyes hidden by wool. Outside of fleece a dirty brown, but inside white. Ewes 80 to 100 pounds, rams 100 to 175 pounds. Delaine merinos have smoother bodies than the American, and fewer folds and wrinkles. Mature ewes 100 to 150 pounds, rams 140 to 200 pounds. Rambouillet merinos have large bodies, usually smooth and free from wrinkles, except perhaps on neck. Fleece fine and white. Rams usually have large spirally curved horns, ewes hornless. Legs long. Rams 175 to 185 pounds, ewes 140 to 160 pounds.

REPRESENTATIVE MUTTON PRODUCING BREEDS

CHEVIOT.—Medium size, hornless, face and legs white, body closely covered with wool of soft fiber and pure white. Head bold and broad. Fleece forms almost a ruff about face. Deep and large in breast, back wide and straight. Short legs set well apart, hoofs black. Mature rams 200 pounds, ewes 150 pounds.

COTSWOLD.—Large, high-standing breed with heavy fleece of long white, lustrous wool. Ample topknot often covering eyes. Bold, upright carriage. Head moderately small, face white or mixed with gray, eyes prominent, neck short, thick and strong, shoulders broad and full, back broad, breast broad and well forward, quarters long and full, mutton quite down to hock. Weight of ram 250 pounds, ewe 200 pounds.

DORSET-HORN.—Face and legs pure white, flesh-colored nose. Both sexes have horns. Eyes prominent, neck short and symmetrical, shoulders broad and full. Chest full and deep, quarters wide and full with mutton extending down to hock. Fleece medium grade, of even quality, extending over belly and well down on legs. Short, stout legs. Weight for rams 200 pounds, ewes 160 pounds.

HAMPSHIRE DOWN.—Black face, head large, well covered with wool on forehead and cheeks, nostrils wide. Ears large and drooping, eyes prominent and lustrous, legs well under outside of body, straight, almost black. Chest deep and full with breast prominent and full, back straight, quarters long and deep in thigh. Ewes prolific and heavy milkers. Weight for rams 250 pounds, ewes 185 to 195 pounds.

OXFORD DOWN.—Largest of down breeds. Nearly straight on underline. Long and coarse fleece. Very stately appearance. Color of face and legs brown, which is often flecked with gray. Ewes very prolific and heavy milkers. Not hardy under American climatic conditions. Rams 250 to 350 pounds, ewes 180 to 275 pounds.

SHROPSHIRE DOWN.—Dark brown face and legs. Broad head, short face, thick muscular neck, body somewhat barrel shaped, except that it is straight on back. Body, head and legs to knees covered with fleece of even length and quality. Weight for rams 225 pounds, ewes 175 pounds.

SOUTH DOWN.—Smallest of down breeds, but the model in form. Short, straight legs, wide apart; broad level back, thickly fleshed; long, broad hips; neck short, thick at shoulder; head small, forehead full, face short, eyes prominent, ears small. Face and legs uniform reddish brown. Hindquarters carry down very heavy; breast broad and prominent. Fleece compact, long and close wool, white and carrying some yolk. Best weight for rams 200 pounds, ewes 150 pounds.

SUFFOLK DOWN.—Large, rangy sheep, black-faced, hornless, with long, clean, black legs. Wool is of good quality and mutton is excellent. A good feeder and very prolific.

Swine, Pig or Hog (*Sus*).—There are numerous varieties of the domestic pig. Some have erect and some pendent ears, and those are most esteemed which exhibit the

greatest departure from the wild type, notably in shorter and less powerful limbs, less muscular and more rounded forms, wider ribs, and greater wealth of flesh. The domestication of the pig is remotely ancient, having been established among the Chinese for some thousands of years. It was brought to America by the early colonists. However, it is only during the last two hundred years that the pig has reached its present highly modified state of domestication, and only during the last century has selective breeding been carried on to secure rapid growth and much fat.

[256]

The Chinese breed is renowned for its fertility. Its head is short and thick, ears erect, legs very short, chine high and broad, and jowl wide, belly hanging very near to the ground. As a rule it carries a small quantity of hair. The skin is usually dark, but the flesh is delicate and white. The Neapolitan breed is entirely black, with little hair, remarkably easy to fatten, but scarcely so robust in constitution or so prolific as the Chinese pig.

Swine are most profitably reared where corn and grass most abound; hence, they are found in America in largest numbers and highest development, the United States not infrequently having upwards of fifty per cent of the world's supply. In America the industry centers in the Mississippi valley, where Indian corn is grown in greatest abundance and at least expense, particularly in the states of Iowa, Illinois, Texas, Nebraska, Missouri, Indiana, Ohio and Kansas. These swine are mostly of the four breeds of the large or "lard" type, viz.: Poland-Chinas, and Berkshires, Duroc-Jerseys and Chester Whites, the Poland-Chinas predominating.

DESCRIPTIONS OF REPRESENTATIVE BREEDS

BERKSHIRE.—Rather more than medium size. Snout of medium length, face dishd. Ears nearly erect, well carried. Jowl heavy. Neck short with considerable crest. Shoulder, back and rump of good width. Body deep. Ham thickly meated, strong constitution. Color black with a white mark on face. White on each foot and on tip of tail.

CHESHIRE.—Medium size. Body has good length. Shoulders and hams well developed. Face slightly dishd. Ear small and erect. Bone fine and of fair quality. Color white. Black spots often occur on skin.

CHESTER-WHITE.—Medium size, face straight or very slightly dishd. Ear droops and is somewhat loosely attached to head. Color white, hair in many specimens wavy or curly. Neck wide, deep and short. Jowl smooth, neat and firm. Shoulders broad, deep and full. Chest large, deep, full in girth. Sides full, smooth, deep; ham broad, full, long, wide and deep. Back broad on top, straight or slightly arched, legs short and straight. Coat fine. Weight of boars two years old 500 pounds, sows 450 pounds.

DUROC-JERSEY.—Medium size, fine bone. Snout medium length, face slightly dishd, ear drooped, jowl heavy, body wide and deep set on short legs. Ham heavily fleshed. Cherry red the popular color, but yellowish red and chestnut are often seen. Weight of boars two years old 600 pounds, sows 500 pounds.

HAMPSHIRE OR THIN-RIND SWINE.—Medium size, face straight, ear inclined forward, but does not droop. Jowl light, as is also shoulder and ham. Back of medium width. Legs of medium length and bone of good quality. Color black extremities with a white belt four to twelve inches wide encircling body and including fore-legs, which should also be white. Weight, boars two years old 450 pounds, sows 400 pounds.

LARGE YORKSHIRE.—One of the largest breeds. Snout of medium length, with little or no dish. Moderate dish in face. Jowl of good width and muscular. Ears rather large, firmly attached, fringed with fine hair. Shoulders and back of medium width. Side long. Ham lighter than that of lard type with flesh carried well round inside of thigh. Legs medium length. Bone fairly heavy, clean and flinty. Color, white.

POLAND-CHINA.—Medium size. Face slightly dishd. Jowl full and heavy. Ears fine, firmly attached; about one-third of ear droops. Neck short, thick and heavily arched on top. Shoulder heavy. Side short. Back wide. Ham very wide and deep. Legs short, bone fine. Black with six white points on face, feet and tip of tail. Weight of boars two years old 600 pounds, sows 500 pounds.

TAMWORTH.—Should have golden-red hair on a flesh-colored skin, free from black. Snout long and straight. Ear large. Jowl narrow and light. Neck and shoulder are light; back and loin of medium width, side of good length, moderately deep. Rather deficient in ham. Legs long and strong.

Yak (*Bos grunniens*), a species of ox found in Tibet, and domesticated there. The wild yak of central Asia is the largest native animal of Tibet, and is found only near the limits of perpetual snow. The domesticated yak, which forms great part of the wealth of the inhabitants of central Asia, is about the height of an American ox, which it much resembles also in body, head, and legs; but it is covered all over with a thick coat of long, silky hair, that of the lower parts of the body being very long and hanging down almost to the ground. The neck is short; the rump is low; the legs are short. Over the shoulders there is a bunch of long hair; and the tail is covered with a prodigious quantity of long, flowing hair. Its milk is very rich, and yields excellent butter and curd.

Zebu (*Bos indicus*), an ox which exists only in a domesticated state in Asia. It is characterized chiefly by its large hump, or sometimes two humps, over the withers and by a greatly developed dewlap. Its color varies from ashen grey to pure white, and white bulls, known as Brahmin bulls, are held sacred by the Hindus and allowed to wander at will. They vary greatly in size, and in India are used as beasts of burden and draft.

DOMESTICATED FISH

Carp (*Cyprinus*), constitutes a group of fishes without spines in the fins. The true carp originated in China and was introduced into Europe three hundred years ago, and much later into America. The back is blackish gray or brown, the sides yellowish brown, the belly yellow. The usual length is between one and two feet, but large forms five feet long or more have been caught.

The carp is mainly vegetarian, but also eats small animals, such as larvæ and worms. The general habit is sluggish, except at the spawning period in May and June. Their longevity is great; some are said to have lived one hundred and fifty to two hundred years. The carp is an important food fish, and is largely bred in the United States.

Goldfish, or GOLDEN CARP (*Carassius auratus*), a Chinese and Japanese fresh-water fish nearly allied to the carp but lacking barbels. In its warm native waters it is brownish, like its neighbor species, the crucian carp (*C. carassius*) while in its more familiar domesticated state it loses the black and brown pigment, becomes golden-yellow, or passes more completely into albinism to those unpigmented forms known as silver fish. The goldfish is naturalized in some rivers, and has had a wide artificial distribution throughout the world.

[257]

BUSY BIDDY AND HER BROOD OF NEW-BORN CHICKS

DOMESTICATED BIRDS

Canary.—See page 213.

Chickens (*Gallus domestica*), or Fowls, are widely distributed and almost universally raised in every rural home. Immense poultry plants have been built up in America in recent years, and the business developed to proportions of a notably distinct industry. The contributions of poultry to the nation's wealth, mostly by the hands of farmers' wives, reaches an annual total of half a billion dollars or more—an amount equal to the average value of the nation's wheat crop.

Apart from the intrinsic merits of the individual breeds, and the better understood methods of breeding and management, much progress has been due to artificial methods of hatching and rearing the young fowls. The incubator and the brooder make it possible to secure chicks at any season of the year, and thus permits the development of special branches of poultry raising, such as the production of broilers and soft roasters.

There are numerous standard varieties of chickens recognized in the United States, subdivided into four general classes, as follows: The general-purpose breeds—the American class—Plymouth Rock, the Wyandotte, and Dominique; the heavier, clumsier or meat breeds, such as the Brahma, Cochin, and Langshan; the egg breeds, as the Leghorn, Minorca, Andalusian, and Black Spanish; the ornamental breeds, as the various Bantams, and others. Some other breeds on American farms are the Rhode Island Red, Orpington, Houdan, Dorking and Hamburg.

LEADING BREEDS OF POULTRY DESCRIBED

BRAHMA.—Meat breed. Two varieties, light and dark. Show heavy leg and toe feathering, thick, close plumage. General color of light Brahma, white, with black tail and black center stripes in both hackle and saddle feathers. In dark Brahma, wings of cock crossed by heavy black bar, and entire breast, body, leg and toes black. Back, wings, body and breast of female have a basis of gray on which are distinct dark pencillings. Weight for dark cocks eleven pounds, hens eight and one-half pounds; for light cocks twelve pounds, hens nine and one-half pounds. Brown egg.

COCHIN.—Meat breed. Four varieties, buff, partridge, white, black. Peculiarity is an appearance of massiveness and fluffiness. Heavy, short feathering is piled high on back and extends wide at sides. Excessive thigh and shank feathering. Combs single, low, close on head and evenly serrated with five distinct points. Cocks weigh eleven pounds, hens eight and one-half pounds. Brown egg.

DORKING.—General purpose, meat especially. Three varieties, colored, white and silver-gray. Body long and deep. Carries abundance of flesh. Skin white. Colored largest cocks weigh nine pounds and hens seven pounds. White cocks weigh seven and one-half pounds, hens six pounds. Silver-gray variety is between these two. All have a fifth toe. Eggs of very light color.

HAMBURG.—Egg and fancy breed. Six varieties, golden spangled, silver spangled, golden penciled, silver penciled, white and black. About size of the Leghorn. White egg.

HOUDAN.—General breeding purposes. Color black and white evenly broken in alternate splotches throughout entire plumage. Head ornaments of crest and beard. White skin. Carry fifth toe on each foot. Cocks weigh seven pounds, hens six pounds. White egg.

[258]

INDIAN.—Meat breed. Two varieties, Cornish and white. Beaks and shanks yellow. Bird of strong proportions. Back and wings of cock mixture of red and black, tail and breast black. Hen's back, wings, breast and body a rich bay penciled with black. Cocks weigh nine pounds, hens six and one-half pounds. Tinted egg.

LEGHORN.—Egg production. Eight varieties, single-comb and rose-comb brown, single-comb and rose-comb white, single-comb and rose-comb buff, single-comb black and single-comb silver duck-wing. Characterized by early maturity and great activity. Large combs on the top of head. White egg.

MINORCA.—Egg breed. Three varieties, single-comb black, rose-comb black, single-comb white. Long body, carried rather upright, deep at breast with back tapering sharply toward tail, which is long and carried rather low. Comb large. Ear lobes large and pure white. Cocks of rose-comb weigh eight pounds, hens six and one-half pounds. Single-combs weigh one pound heavier. White egg.

ORPINGTON.—General purpose. Three varieties, buff, black and white. Long body, abundant plumage, white skin. Short, heavy shanks. Tendency to feathering on shanks. Cock weighs ten pounds, hen eight pounds. Egg tinted.

PLYMOUTH ROCK.—General purpose, for both meat and eggs. Three varieties, the barred, white and buff. Back and body rather long, breast broad and deep. Single combs, yellow shanks. Cocks weigh nine and one-half pounds and hens seven and one-half pounds. Brown egg.

RHODE ISLAND RED.—General purpose. Two varieties, single comb and rose-comb. Tail color black. Rhode Island red has a red surface of body plumage, with a red under color, free from slate.

Buckeye breed surface color is dark, rich garnet, and under color allows a bar of slate-color next to surface. Body of both long. Rhode Island Reds level. Buckeye body shows slight elevation in front. Weight of Rhode Island red cocks eight and one-half pounds, hens six and one-half pounds, hens six pounds. Brown egg.

WYANDOTTE.—General purpose, for both meat and eggs. Eight standard varieties, white, buff, black, silver, golden, silver penciled, partridge and Columbian. A bird of curves, back short and broad, body deep and round, breast broad and deep, with a low-set keel. Shanks short, strong and carried well apart. Colors silver, white, black, buff and mixtures. Close-fitting rose combs. Abundant fluffly, close-fitting plumage. Weight eight and one-half pounds for cocks, six and one-half pounds for hens. Brown egg.

Duck (*Anas domestica*).—The various breeds of domestic duck are all descended from the wild species. The prominent characteristics of the family are familiar: the short webbed feet, with a small hind toe; the netted scales in front of the lower leg; the bill, about as long as the head, rounded at the tip, and bearing the nostrils towards the broad root. They are aquatic birds, swimming with much agility, diving comparatively little, preferring to grub in the shallows for water-plants, worms, and small animals.

Duck raising is extensive in Europe both for flesh and eggs, which are more generally used than in the United States. In eastern Asia, notably in China, ducks are grown in enormous numbers. Duck raising has become a profitable industry in the United States, particularly since the introduction of the Pekin duck, which was introduced into the

United States from China in 1870.

THE CHIEF BREEDS RAISED IN THIS COUNTRY ARE THE FOLLOWING:

BLACK CAYUGA.—Largest solid black duck known. Mature pair weighs fifteen pounds. Body of good length.

COLORÉD MUSCOVY.—Good size, black and white in color, black predominating. Side of head and region around eyes are without feathers and are carunculated or corrugated and scarlet. Builds her nest and never scatters her eggs. Never quacks. Active on wing.

WHITE MUSCOVY.—Same as colored muscovy except that it is pure white.

INDIAN RUNNER.—Head long and flat, light fawn in color, cap and cheek markings light fawn, bill straight, green with black bean at tip, eyes hazel, neck white from head to beginning of breast markings, back, light fawn or gray, breast light fawn, body light fawn, rear half white. Shanks and feet orange-yellow. Carriage very erect. Small size.

PEKIN.—Largest white duck in existence. Specimens weigh as high as ten or twelve pounds. Head and beak long and of good size, beak orange-yellow, back, breast and body long, broad and deep, with deep keel. Creamy white.

ROUEN.—Largest and most popular of all colored market varieties. Weight nine pounds for drakes, eight pounds for ducks.

WHITE CRESTED.—Medium-sized white duck with large white crest or topknot, about two-thirds the size of Pekin, which it resembles in color and shape of body, except crest.

Goose (*Anser domesticus*).—The goose has been but slightly changed from the parent wild stock by domestication. The feet are short and completely webbed; the hind-toe is present; and the legs are placed comparatively far forward, so that the movements on land are less awkward than those of most ducks. Geese swim little, and never dive.

In general, geese spend much of their time on land, feeding on grass and other herbage, berries, seeds, and other vegetable food. Although large birds, and of bulky form, they have great powers of flight. They strike with their wings in fighting, and there is a hard, callous knob or tubercle at the bend of the wing, which in some species becomes a spur.

The domestic goose is regarded as deriving its origin from the common wild goose, but all the species seem capable of domestication.

Geese are valuable for eggs, quills, feathers, and for food. In southern Europe culture was formerly much more important, but it is still a great industry in Holland and Germany. Livers from geese artificially fattened, in districts near Strassburg, are made into the celebrated delicacy known as *pâté-de-foie-gras*. In the United States, goose raising is of minor importance. They are most extensively grown in the Southern States; Kentucky, Missouri, Texas, Tennessee, and Arkansas leading in the order named.

THE CHIEF BREEDS RAISED ARE THE FOLLOWING:

AFRICAN.—Large head with pronounced black knot and heavy gray dewlap under throat. Neck long, back broad and flat, breast full and round, body large and upright, thighs short and plump. Shanks medium length and dark orange color. Wings of good size, close fitting. General color gray. Mature gander twenty pounds, goose eighteen pounds. [259]

EMBDEN.—Color white. Square, compact body. Neck long and massive appearing, large head. Medium-size orange colored bill. Back slightly arched, breast round, deep and full. Shanks short, stout, deep, orange color, thighs strong, wings large, tail short. Eyes bright blue. Mature gander twenty pounds, goose eighteen pounds.

TOULOUSE.—Blue-gray in color, marked with brown. Head large but short, bill short and stout, neck medium long, body compact, medium length, deep, belly almost touching ground, back broad, slightly arched, breast broad and deep, wings large, strong, close fitting, tail short. Adult gander twenty pounds, goose eighteen pounds.

WHITE AND BROWN CHINESE.—Bodies plump and round, covered with coat of soft feathers and fine down. Medium size, mature specimens weighing ten to fourteen pounds. Long arch necks, with large round knob at base of beak. Short erect body and carriage.

Guinea Fowl (*Numida*) belongs to a genus of African birds in the pheasant family. The plumage is dark gray, with round spots of white, generally larger on the back and under surface. Some species are adorned on the head with a helmet or horny casque, while others have fleshy wattles on the cheeks and a tuft or top-knot on the crown.

The best known is the common guinea fowl (*N. meleagris*), also popularly known as "Comeback," from its cry, with naked head, hard callous casque, and slate-colored plumage, everywhere speckled with round white spots of various sizes. The guinea fowl is now common in the poultry-yards, although it is more adapted to warm than to cold climates. The eggs are small, and have a thick, strong shell, but are particularly esteemed. The flesh is somewhat like a pheasant's, but rather dry.

Ostrich (*Struthio*). A bird which was once included with the cassowaries, emu, rhea and apteryx in a distinct order, but which is probably better regarded as forming a separate family. Its nearest allies appear to be the rheas of South America.

An adult male may reach a height of eight feet, the neck being about three feet long. The special peculiarity is the reduction of the toes to two, these corresponding to the third and fourth of the typical foot. The foot and tarsus are both stout; the head is small, with large eyes, and short, broad, and depressed beak; the wing and tail feathers are large and soft, and have broad, equal vanes; while the long neck is practically naked. The feathers are without an aftershaft.

The true ostrich is a native of Africa. All are flightless birds, and as the wing muscles are reduced there is no keel on the breastbone. The African ostrich has but two toes, the others three. The rheas and the emus may be dismissed with mere mention, the rheas furnishing the feathers used in feather dusters. The African ostriches furnish the well-known plumes and are bred for the purpose, the export of feathers from South Africa amounting to over five million dollars a year. There are now ostrich farms in South America, California, Arizona and Florida. The eggs are laid in the sand and in nature are incubated by the heat of the sun. The plumes are cut (not pulled out) once a year.

Parrot (*Psittacus erithacus*) is a type of an important group of birds, divided into numerous families including the love-birds, macaws, cockatoos and parakeets. They are preeminently tropical birds, and arboreal in habit; some species, however, range into colder countries—*e. g.*, Patagonia and New Zealand—and some, such as the burrowing ground parrot of New Zealand, are not arboreal. They are fruit and seed eating birds, with the exception of the kea, of New Zealand, which has taken to a carnivorous diet.

As a rule, the parrots are brightly colored birds, being often, like other forest-frequenting creatures, green; there are some species, however, which are not brilliantly colored. There is occasionally a difference of color in the two sexes, which is best marked in species belonging to the genus *Eclectus*; in these the prevailing color of the female is red, and of the male green.

Their power of imitating human speech is very remarkable, and equalled by no other animal. The great age to which parrots will live has often been exaggerated, but it is at any rate certain that some species will survive for fifty years in confinement. They are highly regarded by natives of central America as household pets, where they are also used for food and the feathers for ornaments. The best talking birds lack the brilliancy of plumage possessed by many other parrots. Their chief use among civilized peoples is as an ornamental bird and household pet.

Peacock (*Pavo*) is allied to pheasants and other game-birds, and includes at least two species—the Indian and Singhalese (*P. cristatus*), and the Malayan (*P. muticus*), inhabiting Java, Borneo, and similar regions. The birds roost in trees, and eat omnivorously—worms, insects, small snakes, seeds, etc. At the pairing season rival males display the well-known beauty of their tail-coverts before their desired mates, and strut about after the fashion of many game-birds. The usual cry is a shrill "p-a-o" and strange noises are made by rattling the quills. The females lay, according to the climatic conditions, from April to October; the eggs, of a brownish color, are numerous (eight to ten), and are laid without a nest in some concealed spot. At first both sexes are alike in plumage, but after a year or so the males gradually acquire their gorgeous feathers, which are perfected about the third year. The Javan peafowl is said to be even handsomer than the familiar species. The flesh and eggs are of good quality though inferior to the domestic fowl, though they are still extensively bred in southeastern Asia for food. The range of the peacock in domestication has been greatly extended in modern times, but its use is restricted to ornamental purposes. The splendor of its plumage is unequalled by any other large bird.

Pigeon (*Columba livia*), including some three hundred species, is distributed in nearly all parts of the world. Most of the domesticated varieties are derived from the rock dove. The mountain witch of Jamaica is one of the most beautiful of birds. The largest member of the group was the dodo, a native of the islands in the Indian ocean, which became extinct before 1700, partly because it lacked the power of flight. It was somewhat larger than a turkey, with the same external appearance. [260]

In America, as in Europe there are enormous numbers of breeders who devote themselves to what are known as "fancy pigeons," by which term are meant those bred for their special points or characteristics. Of these there is a great and ever-increasing variety, many of which have several distinct colors.

The most important of the domestic pigeons are the common pigeon, the trumpeter, the ruff pigeon, the Jacobin, the Turkish pigeon, the carrier pigeon, which, on account of its great power of remembering localities, is used for carrying messages; the pouter, the tumbler, the turbit, the fantail, and the oriental pigeon. The young pigeons are highly esteemed for their delicate flavor.

The **TURTLE DOVE (*Turtur auritus*)** is frequently kept in captivity, as it is the smallest and prettiest of all the family of pigeons.

Swans (*Cygnus*) are swimming birds, closely related to the ducks and geese, with long and slender neck, bill about as long as the head, and with a soft cere. Nine species are known. The American swan (*C. americanus*) breeds in the northern parts of North America, but its winter migrations extend only to North Carolina. The trumpeter swan (*C. buccinator*) is another American species, breeding chiefly within the Arctic Circle, but of which large flocks may be seen in winter as far south as Texas. Australia produces a black swan (*C. atratus*), discovered towards the end of the eighteenth century, rather smaller than the common swan, the plumage deep black, except the primaries of the wings, which are white. The eye is red. The black-necked swan (*C. nigricollis*), perhaps the handsomest bird of the genus, is a South American species, ranging from Chile to the Falkland Islands.

Turkey (*Meleagris gallipavo*) or common turkey, is a native of North America, where it exists in two forms. The typical form ranges from southern Canada to Florida and eastern Texas, and westward to the edge of the great Plains; farther south, it is replaced by another form (*M. mexicana*), having the tail and its coverts tipped with buffy white, and inhabiting the tablelands of Mexico, and extending north to the southern border of the United States, and south to Vera Cruz. The finest tame turkeys are those of the American bronze breed, which has been created by crossing.

It is our largest domestic fowl, and much prized for food, though neither its eggs nor feathers are used to an important extent. Notwithstanding it is a stupid bird, ranking low in intelligence, the turkey is easily domesticated and the tame birds readily intermingle with the wild ones. While it needs considerable range and is inclined to wander, and therefore is not suited to small farms, it is comparatively easy to rear and stands second to the chicken in the United States, ranking above geese and ducks both in number and value. Texas reports the largest number, and is followed in order by Missouri, Illinois, Iowa and Ohio.

THE FOLLOWING ARE MUCH PRIZED BREEDS:

BLACK.—Plumage pure black. Otherwise same as above.

BOURBON RED.—A kindred variety to the buff, having deep reddish-buff plumage.

BRONZE.—Largest and hardest of all varieties for the market. Adult cock thirty-six pounds, hen twenty pounds.

BUFF.—Feathers a reddish buff, the wing flights being white.

NARRAGANSETT.—Plumage bronze and black with a mixture of white. Second in size to bronze. Cock thirty pounds, hen eighteen pounds. General color gray.

SLATE.—Plumage of a bluish slate shade. Cock twenty-seven pounds, hen eighteen pounds.

WHITE HOLLAND.—Plumage pure white throughout; has pinkish white shanks. Cocks twenty-eight pounds, hens eighteen pounds.

The Swan, on account of its graceful carriage, and beauty of form, is not only a universal favorite with children and grown-ups but has been the subject of much legend and poetry. It was sacred to Apollo, and was the bird of the Muses; and was fabulously celebrated for its melodious song, especially at the time of its death. From the latter legend we derive the expression "swan-song" which means the last effort, or production, or achievement of an individual.

DOMESTICATED INSECTS

Bee, Honey (*Apis mellifica*).—Bees form a family of insects belonging to the same order as the wasps and ants. Many kinds of bees are social, that is to say, they live in communities. As in the case of ants, various sets of members have come to discharge special functions, and the result of this division of labor has been difference of form. [261]

Her Majesty of the Hive—The worker bees attending on the queen, all with their faces turned toward her. The queen is the large bee in the center. No "swarm" is possible without the commanding presence of an accompanying queen.

As the Honey Bee visits flower after flower she collects pollen as well as nectar. The pollen is largely picked up by the hairy coat, then brushed off by the feet and pressed into the "pollen basket" on the thigh of the hind leg.

HOW A BEE HOUSEHOLD IS ORGANIZED

Thus the ordinary hive contains (1) a single queen-bee—the fertile female and mother of the next brood, (2) the males or drones, and (3) the vast majority of workers or imperfectly developed females, which only exceptionally become fertile. The working bees constitute essentially the bee community; they are recognized by their small size, reddish-brown color, and, above all, by the palettes and brushes with which the hind legs are furnished. [262]

The males, or drones, are larger and more hairy than the working bees; they emit a buzzing sound, have no palettes, and no sting. The female, or queen, has a longer body than the workers, and the wings shorter in proportion. The only part she has to play is that of laying eggs, and so she has no palettes or brushes. Only one queen lives in each hive, of which she is perfect sovereign, all the workers submissively obeying her. The number of males is scarcely one-tenth that of the working bees, and they live only about three months.

WHAT THE SWARMING OF BEES MEANS

At a certain time of the year the queen leaves the hive, accompanied by the drones, and takes what is called her "nuptial flight" through the air. About forty-eight hours after her return to the hive she begins laying her eggs, at the rate of about two hundred a day. The eggs which are destined to develop into workers are first laid, then those which are to produce males, and lastly those which give birth to females. The eggs are not long in being hatched, and the larvæ, or caterpillars, which emerge from them are tended by the workers, and fed by them on a peculiar paste, which is apparently a preparation of pollen. In five or six days the larvæ pass into the condition of pupa, or chrysalis, and in about seven or eight days after this the perfect insect is hatched.

A pound weight of bees contain about five thousand individuals, and swarms are often found to weigh eight pounds, or even more. A populous hive will thus contain from forty to fifty thousand bees. In spring, however, the number is much smaller, amounting to only a few thousand.

THE STRUCTURE OF HONEY-BEES

Many of the points in the structure of the honey-bee fit it for the performance of its complex activities. Upon the head there are two large compound eyes, used for near vision, and three small simple eyes, by which objects at a distance can be perceived. There is a well-developed sense of color, and flowers which specially lay themselves out to attract bees are mostly of blue or purple hue. Bees have also a keen sense of smell, which not only attracts them to fragrant flowers, but also helps them to detect the presence of nectar.

THE BEE'S WONDERFUL MOUTH AND LEGS

The mouth-parts of the bee are highly specialized. The powerful first jaws are used in the construction of the comb, and for a great variety of other purposes, while the second and third jaws are drawn out into a long suctorial and licking apparatus. The basal part of this constitutes a tube through which nectar or other sweet fluids can be sucked up, while its terminal portion is a sort of tongue (*ligula*) that can be inserted into the recesses of flowers. This is worked up and down so as to bring nectar within the tubular part of the apparatus. The end of the tongue is expanded into a sort of lappet for licking, and the sharp blades of the second jaws can be used for piercing certain flowers, such as orchids, which contain sweet sap. When not in action, the suctorial parts of the mouth are folded up on the under side of the head, enabling the first jaws to work freely.

HOW THE COAT IS GATHERED FOR THE HONEY-COMBS

There are marked differences between the three pairs of legs of a worker-bee. The first are provided with combs, by which the delicate antennæ are cleaned, while the third are chiefly remarkable for peculiar pollen brushes on the feet, and a depression or "pollen basket" on the outer side of the shin. The hairy feet brush pollen into the baskets, and when of a dry nature a little honey is ejected from the mouth on to the grains, so as to stick them together. Another peculiarity of the third leg is the nature of the joint between shin and foot, which constitutes a sort of pincers useful in manipulating wax.

The wax of which the cells of the honeycomb are constructed is supposed to be secreted by an organ situated in the abdomen, or belly, of the bee; but, in addition to wax, another substance much resembling it, but not identical, called propolis, is elaborated from the juices of certain plants, and employed to line the inner surface of the hive. The cells are hexagonal in shape, that is, having six equal sides—the most economical form as regards space—and are of two kinds, namely, store-cells, which are filled with honey, as a reserve store of food, and cradle-cells, in which the eggs are deposited.

WHERE THE HONEY COMES FROM

The honey of various regions is flavored by the flowers predominant in the districts where it is gathered—heather, rosemary, lavender, orange-flowers, white clover, bass-wood, lime-tree. In Scotland it is not unusual to transport the hives in the flowering season to the neighborhood of heathery tracts. The honey most famous in the ancient world was that of Mt. Hybla in Sicily, and Mt. Hymettus in Attica. Supplies are imported into Britain from various quarters; but it is to the United States and Canada that we must turn for bee-farming on the largest scale, and California, especially southern California, is the paradise of beekeepers. Some bee-keepers have from two thousand to three thousand hives; and as much as seven hundred pounds of honey has been obtained from one hive. The most improved hives, honey-extractors, artificial combs, and comb-foundations are in general use.

Silk-worm (*Bombyx mori*) lives on the Mulberry, and is bred for the fibers of the cocoon. It originally came from southern Asia, but is now extensively cultivated in China, Japan and southern Europe for the purpose of obtaining its silk. The cultivation of the silkworm is dependent almost entirely on the supply of these leaves.

HOW THE SILK WORM GROWS AND FEEDS

On the low, moist, alluvial soils of the East, slips of this tree are planted in close and continuous lines, and six to eight weeks afterwards they are six feet high, and the leaf-crop allows of six to ten broods being produced in the course of six months. In Europe it is not unusual for more than one brood to be produced, and the female lays her eggs towards the end of the summer; but they do not hatch until the following spring, when the leaves appear. In Asia, during the season, the eggs hatch eight to ten days after laying. The caterpillar feeds persistently, and rapidly grows; at the end of a month it moults, and this happens four times in all before it starts to make its cocoon. [263]

THE DEVELOPMENT OF THE SILKWORM

The female moth deposits in July three to five hundred eggs, from which the white caterpillars (a) emerge in the following spring, at the period when the white mulberry tree blooms, upon the leaves of which they feed. The caterpillars change their skins four times and are full grown in about a month. They now spin a cocoon (c), which is generally completed in three and a half days, and five days later they change into pupæ (b). The pupal stage lasts from fourteen to nineteen days. The cocoons furnish the silk, and the pupæ are generally killed on the tenth day by heat.

HOW THE DELICATE SILK FILAMENT IS PRODUCED

The silk is produced from spinnerets, two apertures in the head, the two filaments joining as they appear to form a very strong thread from five hundred to one thousand yards long. This the caterpillar wraps round its body until it is completely covered, and then it passes into the chrysalis state. Unless the grey moth is wanted for egg-laying, the chrysalis is killed by putting the cocoon in a hot oven, for if allowed to appear it cuts through some of the more valuable parts of the silk.

WINDING THE SILK FROM THE COCOONS

The next process is to wind as much as possible off the cocoons into hanks. In Europe and in some Oriental towns this is done with improved machinery in factories called filatures. It is usually begun when the cocoons are fresh. Each operator has before her a basin of hot water, the temperature of which is regulated by a steam-pipe or a fire, and overhead is a reel turning slowly. After removing the outside flossy covering, the operator places the cocoons in the basin, with the result that the hot water softens the natural gum that is in the silk, and allows it to be wound off. The filaments are passed through several glass eyes, and crossed, and thus become glued together into a thread which is called "singles," and when further prepared is known as "thrown silk." The singles are reeled into large hanks being called a "moss," and each bundle a "book."

In this form, Asiatic silk is imported into Europe and the United States. The quantity of such silk obtained from one cocoon is very small—seldom up to a thousand yards, generally not more than five hundred yards. The remainder of the cocoon is either too flossy or too entangled to be wound. This waste portion forms the material from which spun silk is prepared. Five to six hundred cocoons weigh two pounds, and twenty pounds of cocoons yield two pounds of spun silk. The eggs of the silkworm were first brought to Europe by two Christian monks in 555 A. D., who took them in hollow sticks to Constantinople, whence the cultivation of the silkworm rapidly spread to other parts.

SCIENTIFIC TERMS CONCERNING ANIMALS

Abdomen (*ăb-dō' mēn*).—In mammals, that portion of the body-cavity which is separated from the thorax or chest by the diaphragm. In insects the third or last portion.

Ametabolic (*ă-mēt' a-bōl' ik*).—Referring to insects and other animals which do not undergo a metamorphosis, or change of form.

Amoeba (*ă-mē' hă*).—One of the Protozoa that is continually changing its shape.

Amorphous (*ămōr' fūs*).—Without a definite figure; shapeless; especially applicable to sponges.

Amphibia (*ăm-fīb' i-ă*).—A class of vertebrates, breathing in water while young and in air when mature. The term amphibious is applied to fishes, molluscs, etc., that are capable of changing the nature of their respiration at will.

Annelida (*ăn-nēl' i-dă*).—Articulate animals whose bodies possess no jointed members, as the leech, and worm tribe.

Annulate (*ăn' ū-lăt*).—Animals whose bodies are composed of a series of ring-shaped divisions.

Anthropoid (*ăn-thrō-poid*).—The highest order of apes.

Apterous (*ăp' tēr-ūs*).—Destitute of wings.

Arachnida (*ă-răk' nī-dă*).—Articulate animals with legs, but without wings, including spiders, mites, scorpions, etc.

Arthropoda (*ăr-thrōp' o-dă*).—Articulated animals with jointed feet, as crabs, insects, etc.

Asexual (*ă-sēks' ū-ăl*).—A term applied to animals, as Aphis, in which the reproductive organs are imperfect, and the young are produced by budding.

Auricle (*ă' rī-k' ū*).—The cavity of the heart which receives the blood and transmits it to the ventricle.

Bacteria (*băk-tē' rī-ă*).—Microscopic vegetable organism, belonging to the class Algæ, usually in the form of a jointed, rod-like filament, and found in putrefying organic infusions. Bacteria are destitute of chlorophyll, and are the smallest of microscopic organisms. They are very widely diffused in nature, and multiply with marvelous rapidity. Certain species are active agents in fermentation, while others appear to be the cause of certain infectious diseases.

Batrachia (*bă-tră' kī-ă*).—Applied to frogs, toads, and salamanders.

Bimana (*bīm' a-nă*).—Two-handed animals whose posterior extremities are used only to keep them in an erect position, and for the purpose of locomotion. They comprise the varieties of man.

Blastoderm (*blăs' tō-derm*).—The outer layer of the germ-cells of the embryo.

Carapace (*kăr' â-păs*).—A sort of shell which protects and encloses the bodies of tortoises and some reptiles, etc.

Carnivora (*kăr-nīv' ō-ră*).—Group of mammals, including the lion, tiger, wolf, bear, seal, etc. They feed upon flesh, though some of them, as the bears, also eat vegetable food. The teeth are large and sharp, suitable for cutting flesh, and the jaws powerful.

Carnivorous (*kăr-nīv' ō-rus*).—Eating or feeding on flesh. The term is applied to animals which naturally seek flesh for food, as the tiger, dog, etc.

Cephalopoda (*sēf-a-lōp' ō-dă*).—The highest class of Molluscs.

Cetacea (*sē-tă' shē-ă*).—The whales.

Chiroptera (*kī-rōp' tē-ră*).—The bats.

Chrysalis (*kris' â-līs*).—The pupa state of an insect.

Coelenterata (*sē-lē' tē-ră' tă*).—The group of Invertebrates, comprising hydrozoa and actinozoa.

Coleoptera (*kol-e-op' tēr-a*).—The beetles.

Cilia (*sīl' i-ă*).—Hair-like organs of Infusoria. Microscopic filaments attached to cells, usually within the body, and moving usually rhythmically.

Crustacea (*kru-s-tă' shē-ă*).—Applied to lobsters, crabs, etc.

Dipnoi (*dīp' nō-ī* or *no-ī*).—An order of fishes.

Diptera (*dīp' tē-ră*).—Two-winged flies; an order of insects.

Echinodermata (*e-kī' nō-dēr' mă-tă*).—Applied to the sea-urchin, a subdivision of animals.

Edentata (*ē' dēn-tă' tă*).—Those animals having imperfect dental apparatus. Their digits, too, are generally sunk in large and crooked claws.

Elasmobranchii (*ē-lăs' mō-brănk-ē*).—The sharks and rays.

Fauna (*faw' nă*).—The native animals of a certain locality.

Flagellum (*flă-jēl' ūm*).—A whip. The appendage of some Protozoa.

Foraminifera (*fō-răm' i-nīf' e-ră*).—Animals with perforated shells.

Ganoid (*gă' noid* or *găn' oid*).—Applied to a certain class of fish.

Gasteropoda (*găs' tē-rōp' ō-dă*).—A class of Molluscs. Some of them form shells, while others are destitute of them,—as the slug, snail, etc.

Grallatores (*grăl' lâ-tō' rēz*).—Wading-birds.

Hibernation (*hī-bēr-nă' shūm*).—The state of animals that sleep throughout winter.

Hymenoptera (*hī-mē-nōp' tē-ră*).—An order of insects with two pairs of membraneous wings.

Ichthyology (*ik-thī-ōl' ō-jī*).—The science of fishes, or that part of zoology which treats of fishes, their structure, habits, etc.

Infusoria (*in' fū-sō' rī-ă*).—Minute animals that live in stagnant water. A class of Protozoa.

Insectivora (*in' sēk-tīv' ō-ră*).—Insect-eaters. They comprise the shrew, mole, hedgehog, etc.

Invertebrate (*in-vēr' tē-brăt*).—Animals that have no vertebral column, or bones properly so called.

Larva (*lăr' vă*).—The second stage of the insect, a caterpillar, grub, or maggot.

Mandible (*măn' dī-bl*).—The upper jaw of insects; the lower jaw of vertebrates.

Marsupial (*Măr-su' pī-ăl*).—An order of mammals that carry their young in a pouch, as the kangaroo.

Mollusc (*mōl' lūs-k*).—Animals whose bodies are soft and pulpy.

Monotremata (*mon-ō-trē' ma-tă*).—An order of mammals having the intestine and the ducts of the urinary and genital organs open into a common orifice.

Myriapoda (*mīr-i-ōp' ō-dă*).—A class of arthropoda. Articulate land animals having many legs, as the centipede.

Natatores (*nă' tă-tō' rēz*).—An order of birds that swim.

Neuroptera (*nū-rōp' tē-ră*).—An order of insects with four membraneous wings, as dragon-flies.

Nocturnal (*nōk-tūr' năl*).—Of the night. Nocturnal birds are birds that fly abroad during the night only.

Notochord (*nō' tō-kōrd*).—A primitive backbone.

Omnivorous (*ôm-nīv' ō-rūs*).—Living on both vegetables and flesh.

Orthoptera (*ōr-thōp' tē-ră*).—An order of straight-winged insects, as cockroaches, grasshoppers, etc.

Oviparous (*ō-vīp' â-rūs*).—Applied to animals which produce eggs instead of living young.

Ovipositor (*ō' vī-pōz' i-tēr*).—In insects an organ by which eggs are deposited in wood, etc.

Pachydermata (*păk' tēr-mă-tă*).—A group of hoofed mammals distinguished for the thickness of their skins, including the elephant, hippopotamus, rhinoceros, tapir, horse, and hog.

Pelagic (*pē-lăj' ik*).—Living on the high seas, away from the coast; in mid-ocean.

Polyp (*pōl' īp*).—Separate coral animals.

Protoplasm (*prō' tō-plăz'm*).—The albuminous, elementary matter forming cells and the body-substance of Protozoa.

Protozoa (*prō' tō-zō' ō*).—The lowest forms of animal life.

Pupa (*pū' pă*).—The third, or usually quiescent, chrysalis stage of insects.

Paleontology (*pă-lē-ōn-tōl' ō-gī*).—The science of ancient beings or creatures; applied to the science of the fossil remains of animals and plants now extinct.

Quadrumania (*kwōd-rōō' mă-nă*).—Monkeys.

Quadruped (*kwōd' ru-pēd*).—Four-footed animals.

Radiates (*ră' dī-ăts*).—Animals having a central mouth, around which the body forms a star-shaped figure.

Ratitæ (*ră-tī' tē*).—A division of birds with a keelless, raft or punt-like sternum.

Rhizopoda (*rī-zōp' ō-dă*).—The root-footed Protozoa.

Rodentia (*rō-dēn' shī-ā*).—An order of animals which gnaw.

Rotifera (*rō-tīf' ē-rā*).—An order of crustacea with a pair of ciliated appendages in motion, resembling wheels.

Ruminantia (*roo-mī-nā' shī-ā*).—The cloven-footed quadrupeds. Those that chew the cud. They have cloven feet, want incisors, and have a stomach with four cavities.

Taxidermy (*tāks' ī-dēr-my*).—The art of preparing and preserving specimens of animals.

Teleostei (*tē' lē-ōs' te-ī or tēl' ē*).—An order including most of the bony fishes.

Thorax (*thō' rāks*).—The chest of vertebrates, the middle portion of insects, etc.

Ungulata (*ūn-gū-lā-tā*).—The order of hoofed mammals.

Vertebra (*vēr' tē-brā*).—One of the bones of the spinal column.

Vertebrates (*vēr' tē-brāts*).—Animals provided with vertebræ. One of the grand divisions of the animal kingdom, comprising all animals that have a backbone composed of bony or cartilaginous vertebræ, together with those in which the backbone is represented by a simple undivided notochord.

Viviparous (*vi-vīp' ā-rūs*).—Applied to animals which bring forth their young alive.

Zoophyte (*zō' ō-fīt*).—Applied to the animals which resemble plants, such as the sea-anemones, sponges, etc.

BOOK OF RACES AND PEOPLES

[267]

Man, though a member of the animal kingdom, is so superior and distinctive that he must be set entirely apart for special consideration. The branches of knowledge or science, concerning his nature, origin and development are of the highest importance to us because of their relation to our very selves as part of the great family of Mankind. Strictly speaking, there can be but one science of man—*Anthropology*—but the various parts of this *supreme* science have received various district names. (1) Man as an *animal* belongs to *Biology* and *Zoology*; (2) his *structure* and *functions* belong to *Anatomy* and *Physiology*; (3) his *mind* falls under *Psychology*; (4) the facts and theories as to his *speech* and *language* come under *Philology*; (5) the study of the various *races*, their origin, physical and mental differences, migrations, and geographical distribution, falls under *Ethnology*; and (6) *human culture*, or civilization, which includes government, social institutions, customs and usages, traditions, folklore, religion, etc., belong to *Sociology*. In a certain sense, *Anthropology* also includes *History*, which is the record of the *doings* of *civilized* man in the order in which they occurred; but this branch of knowledge is so vast in itself that it is usually assigned a province of its own.

MAN AND THE HUMAN FAMILY

In the colorless language of science, man is classed under the order Primates (Lat., *primus*, first) and suborder Bimana (Lat., *bis*, twice; *manus*, a hand) which means a two-handed animal. Although the contrast between man and other animals is more distinct among the higher members of the human species, it may be traced in all. It is less of degree than of kind, and is rather intellectual and spiritual than physical.

In size man is dwarfed by numerous animals; in strength he is no match for some that do not attain his proportions. He is short-sighted compared to the eagle; deaf compared to the hare; and almost without the sense of smell compared to the wild dog or the vulture, who perceives the faintest scent borne to it upon the breeze.

HOW MAN DIFFERS FROM OTHER ANIMALS

In adult life man is unique in his erect posture, and in the freedom of his hands from any direct share in locomotion. His body is usually naked, his canine teeth are not longer than their neighbors, his thumbs are larger than those of monkeys, and his feet are distinguished by the horizontal sole which rests flatly on the ground. His face is notably more vertical than that of apes, lying below rather than in front of the forehead of the brain-case; the jaws, the orbits, and the ridges above them are relatively smaller; the nose-bones project more beyond the upper jaw; and the chin is more prominent than in other Primates.

BRAIN-POWER THE SUPREME DIFFERENCE

Probably the most important difference between man and other members of the same or any order, is the higher physical development of the brain. Not only is the size greater in proportion to the rest of the body, but it presents a more elaborate series of folds, or convolutions. When it is understood that the physical processes corresponding to the highest mental activities are located in the cortex, or rind of the brain, it is seen that the extent and number of the convolutions, by increasing the area of the cortex, must play a considerable part in determining the intellectual effectiveness of the animal.

In addition to mere size of brain, may be noted the adaptability of his hands to many uses, allowing a degree of skill impossible to other animals. The

senses, too, are so nicely balanced and accurately adjusted as to enable him to obtain an intimate acquaintance with the properties of the world around him, in a manner that will contribute to his pleasure, and at the same time ensure his elevation and happiness. He possesses the gift of language by which to denote his wants; the colors of the earth and sea and sky gladden his eye; melody enchants his ear; the sweet odors of flowers delight his nostrils; the fruits of summer please his palate; the glorious sun and the spangled canopy of heaven entrance him—and all lead him to the contemplation of the Deity, of whose wondrous scheme he is himself the corner-stone.

When differences other than physical are considered, the superiority of man is so great as to incline many to the opinion that he is a separate creation on the ground of his mentality alone.

However great this superiority is, it does not appear that man possesses any faculty or fairly fundamental mental process which is not possessed in some degree by some lower animal or other. Memory, the powers of abstraction, and of reasoning are possessed by certain animals, if only in a very simple form.

He alone can produce fire; and this acquaintance with fire and the art of cooking has also frequently been regarded as the most distinctive characteristic of the human race. Clothing and decoration are also early peculiarities of man. Alone among animals, he covers himself with the skins of the beasts he has slain, and adorns himself with feathers, shells, teeth, and bones. Yet from these simple beginnings all the arts gradually developed.

MAN AND HIS DEAD

Man is one of the few animals to pay special attention to his dead. Funeral rites differ much from place to place, and form a special subject of anthropological study. Tumuli, pyramids, standing-stones, and other forms of funeral monument have each their history and implications. Especially does man almost everywhere believe in some sort of survival of the individual after death, and in the existence within himself of a soul or spirit which outlives its fleshly habitation. The origin of religion is largely connected with these ideas of a future life and a future world. Herbert Spencer traces it directly to the theory of hosts and ancestor-worship; Dr. Tylor, to what he calls animism, or the belief in souls universally pervading all natural objects.

Man alone also wilfully indulges in intoxicating, stupefying, or exciting substances, such as alcohol, tobacco, bhanga, opium, hashish, etc.

THE GREAT QUESTION OF MAN'S ORIGIN

As to man's origin, two main views may be said at present to contest the field. Has man sprung from a single or from several stocks? Do the races of men constitute so many members of *one* family, or are they *four* or more unrelated groups? One answer, formerly the accepted one, is based either upon the literal interpretation of Scripture or upon natural theology, and regards him as a distinct creation, separate from and superior to the remaining animals. The other, accepted by many competent authorities, regards him as descended from a hairy ancestor, more or less remotely allied to the anthropoid apes. This theory of his antecedents has been elaborated in profuse detail by Charles Darwin, whose *Descent of Man* forms the great storehouse of information and speculation on the question. In the beginning, according to the evolutionary view, man was apparently homogeneous—a single species, speaking a single primitive rude tongue (largely eked out by signs and gesture-language), and not divided into distinct varieties. At an early period, however, the species broke up into several races, now inhabiting various parts of the world.

MAN'S PRIMEVAL HOME AND HIS EARLIEST KNOWN REMAINS

If man is therefore essentially one, he cannot have had more than one primeval home. This human cradle, as it may be called, has been located with some certainty in the Eastern Archipelago, and more particularly in the island of Java, where in 1892 Dr. Eugene Dubois brought to light the earliest known remains that can be described as distinctly human. From the Pliocene (late Tertiary) beds of the Trinil district he recovered some teeth, a skull, and a thigh-bone of a being whom he named the *Pithecanthropus erectus*, thereby indicating an "Ape-man that could walk."

In this "first man," as he has been designated, the erect position, shown by the perfectly human thigh-bone, implies a perfectly prehensile (grasping) hand, with opposable thumb, the chief instrument of human progress, while the cranial capacity suggests vocal organs sufficiently developed for the first rude utterances of articulate speech.

PROBABLY THE FIRST MIGRATIONS OF MAN

The Javanese man was thus already well equipped for his long migrations round the globe. Armed with stone, wooden, bone, and other weapons that lay at hand, and gifted with mental powers far beyond those of all other animals, he was assured of success from the first. He certainly had no knowledge of navigation; but that was not needed to cross inland seas, open waters, and broad estuaries which, indeed, did not exist in Pliocene and later times. The road was open across the Indian Ocean to Madagascar and South Africa by the now submerged Indo-African Continent. The Eastern Archipelago still formed part of the Asiatic mainland from which it is separated even now by shallow waters, in many places scarcely fifty fathoms deep. Eastwards the way was open to New Guinea, and thence across Torres Strait to Australia and thence to the Islands of the Pacific Ocean. In the northern hemisphere Europe could be reached from Africa by three routes, one across the Strait of Gibraltar, another between Tunis, Malta, Sicily and Italy, and a third from Cyrenaica across the Ægean to Greece, and the British Isles from Europe via the Strait of Dover and the shallow North Sea. Lastly, the New World was accessible both from Asia across Bering Strait, and from Europe through the Orkneys, the Shetlands, the Faroes, Iceland, and Greenland. Here were, therefore, sufficient land connections for early man to have gradually spread from his Javanese cradle to the uttermost confines of the habitable globe.

THE OLDEST EXTANT REMAINS OF THE HUMAN RACE

APE-MAN OF JAVA (*Pithecanthropus erectus*)

as restored from the remains found by Dr. Dubois in Java in 1892. It is estimated that he lived at least 500,000 years ago.

PILTDOWN MAN

of Sussex, England, whose antiquity is thought to be over 100,000 years. This restored model indicates a marked progress in type and intelligence.

NEANDERTHAL MAN

whose remains were found in central France. It is probably a type of a hunting race existent more than 25,000 years ago.

CRO-MAGNON MAN

skeletons of which type were found in the grotto of Cro-Magnon, Vézère valley, France, in 1868. Supposed antiquity, 12,000 years.

WHEN THE WORLD WAS FIRST PEOPLED

Much trustworthy evidence has been collected to show that the whole world had really been peopled during the period which roughly coincides with what is known in geology as the Ice Age; that is, when a large part of the northern and southern hemispheres was subject to invasions of thick-ribbed ice advancing successively from both poles. The migrations were most probably begun before the appearance of the first great ice-wave, then arrested and resumed alternately between the glacial intervals, and completed after the last glacial epoch, say, some two or three hundred thousand years ago.

At that time the various wandering groups had already made considerable progress both in physical and mental respects, as is seen in the Neanderthal skull, which is the oldest yet found in Europe, standing about midway between the Javanese ape-man and the present low races. All were still very much alike, presenting a sort of generalized human type which may be called Pleistocene man, a common undeveloped form, which did not begin to specialize—that is, to evolve the existing varieties until the several primitive groups had reached their respective homes as disclosed at the dawn of history.

EVIDENCES OF MAN'S ADVANCEMENT IN PREHISTORIC AGES

From human remains, weapons, tools and other vestiges of human activity, found in the more recent deposits on the earth's surface, the presence of man in these far off ages is made increasingly certain. The Pleistocene or Quaternary epoch, as represented by these objects of primitive culture, ranged over a vast period of time which has been conveniently divided into two great epochs, the Paleolithic or Old Stone, and the Neolithic or New Stone Age, these being so named from the material chiefly used by primitive peoples in the manufacture of their weapons and other implements. The distinction between the two periods, which are not to be taken as chronological, since they overlap in many places, is based essentially on the different treatment of the material, which during the immeasurably longer Old Stone Age was at first merely chipped, flaked, or otherwise rudely fashioned, but in the New more carefully worked and polished.

MAN IN THE OLD STONE AGE

Evidence is, however, that it is not always possible to draw any clear line between the Old and New Stone Ages. In one respect the former was towards its close even in advance of the latter, and quite a "Paleolithic School of Art" was developed during a long period of steady progress in the sheltered Vézère valley, of South France. Here were produced some of those remarkable stone, horn, and even ivory scrapers, graters, harpoons, ornaments and statuettes with carvings on the round, and skilful etchings of seals, fishes, reindeer, harnessed horses, mammoths, snakes, and man himself, which also occur in other districts.

In Tunisia many implements lie under a thick bed of Pleistocene limestone deposited by a river which has since disappeared. The now absolutely lifeless Libyan plateau is strewn with innumerable worked flints, showing that early man inhabited this formerly fertile region before it was reduced by the slowly changing climate to a waste of sands. The same story of man's great age is told by discoveries in Burma, India, North and especially South America, and now also in Great Britain.

MAN IN THE NEW STONE AGE

Outstanding features of the New Stone Age are the Swiss and other lake-dwellings, the Danish peat-beds with their varied contents, the shell-mounds occurring on the seaboard in many parts of the world.

In the more civilized regions, such as Egypt, Babylonia, parts of Asia Minor, and the Ægean lands, the Stone Ages were at an early date followed by a period vaguely designated as "prehistoric," during which stone as the material of human implements was gradually replaced by the metals, first copper, then various copper alloys (arsenic, sulphur, nickel, cobalt, zinc, and especially tin) generally called bronze, lastly iron.

[271]

1 to 29.—Implements of the Stone Age. 30 to 48.—Implements of the Bronze and Early Iron Ages. 49 to 60.—Implements of the Late Iron Age.

Large illustration (273 kB)

Thus were constituted the so-called Metal Ages, during which, however, overlappings were everywhere so frequent that in many localities it is quite impossible to draw any well-marked dividing lines between the successive metal periods. Indeed a direct transition from Stone to Iron may be suspected in some places, and in any case the pure copper period appears to have nowhere been of long duration except in America, where there was no iron and little bronze.

THE AGE OF LETTERS OR PICTOGRAPHS

Besides the metals, letters also, or at least pictorial writings such as the old rock carvings of Upper Egypt, were introduced in the Prehistoric Age, which comprises that transitional period dim memories of which lingered on far into historic times. It was an age of popular myths, folklore, demi-gods, heroes, traditions of real events, and even philosophic theories on man and his surroundings, which supplied ready to hand the copious materials afterwards worked up by the early poets, founders of new religions, and later lawgivers.

So also in China the early historians still remembered the still earlier "Age of the Three Rulers," when people lived in caves, ate wild fruits and uncooked food, drank the blood of animals, and wore the skins of wild beasts (our Old Stone Age). Later they became less rude, learned to obtain fire by friction, and built themselves habitations of wood and foliage (our New Stone Age).

Of strictly historic times the most characteristic feature is the general use of letters, most fruitful of human inventions, since by its means everything worth preserving was perpetuated, and all useful knowledge thus tended to become accumulative. Writing systems, as we understand them, were not suddenly introduced, but gradually evolved from pictures representing things and ideas to conventional signs or symbols which first represent words, as in the Chinese script and our ciphers, and then articulate sounds, as in our alphabet. Between the two extremes—the pictograph and the letter—there are various intermediate forms, such as the rebus and the full syllable, and these transitional forms are largely preserved both in the Egyptian and Babylonian systems, which thus help to show how the pure phonetic symbols were finally reached. That was probably six thousand years ago, since we find various ancient scripts widely diffused over the Greek Archipelago (Crete, Cyprus, Asia Minor) in very early times. The hieroglyphic and cuneiform systems whence they originated were very much older, since the rock inscriptions of Upper Egypt are prior to all historic records, while the Mesopotamian city of Nippur already possessed half-pictorial, half-phonetic documents some six thousand years before the New Era.

[272]

This is an inscription in hieroglyphic writing found at Meidum, Egypt. It records the life events of King Rahotep and his Queen Nefert.

Here is an Egyptian pictograph representing the Nubians bearing gifts to the King of Egypt.

DEVELOPMENT OF THE HUMAN RACE THROUGH THE AGES

This chart falls within the **Cenozoic** (*sē 'no-zō 'ik*), or "Recent life," Period of the Earth and should be compared with it. Estimated Age of the Cenozoic Period, 3,000,000 years.

[273]

Geological Epochs of the Earth	Successive Upward Stages in the Development of Civilized Man	Estimated Time and Duration of
--------------------------------	--	--------------------------------

				Periods
Quaternary (<i>Kwā-ter 'na-rī</i>) or "Fourth" Sedimentary System of the Earth. Age of Man.	Recent or Alluvial Epoch; called by Geologists Holocene (<i>ho 'lo-sen</i>)	Historic Period.—Rise of Civilization through the gradual organization of mankind into social groups and nations, for the protection of life, liberty and property and the advancement of the arts, sciences and religion.	Age of Letters or Pictorial Writing This period offers an unbroken record of events from the first dated monuments and documents down to the present day. With the discoveries of archaeologists in Babylonia, Egypt, Southern Arabia, and the Ægean lands, the beginnings of historic times are constantly receding farther into the background, and to the Mesopotamian city of Nippur is already ascribed an antiquity of about eight thousand years.	800 B.C. to Present Time.
			Late Iron Age In this age man begins to bestir himself towards discovery and invention. He organizes into tribes, makes laws, records observations—in fact, develops into nations such as manifest themselves on the earliest monuments of Egypt and Babylonia. In Europe it is characterized by forms of implements, weapons, personal ornaments, and pottery, and also by systems of decorative design, which are altogether different from those of the Bronze Age.	In Europe, 500 B.C. to Roman times.
			Early Iron Age, or Hallstatt Period The earliest evidence of this age was found near Hallstatt, in Upper Austria, in a famous Celtic burial-ground. The excavations here yielded swords, daggers, javelins, spears, helmets, axes, shields, and various forms of jewelry, also amber and glass beads; silver was apparently not known. Most of the weapons were of iron, only a few being of bronze.	In Europe, 1000 to 500 B.C. In Orient 1800 to 1000 B.C.
	Pleistocene (<i>plis 'to-sên</i>) or Glacial Epoch	Pre-historic Period.—Dawn of mind, industry and art. This period merged imperceptibly into the more strictly historic period when letters were introduced.	Bronze Age Here flint is cast aside, and gold as an ornament begins to attract him. This was the stage reached by the Aztecs and the aborigines of Peru when discovered by Europeans in the early sixteenth century. The implements and weapons include knives, saws, sickles, awls, gouges, hammers, anvils, axes, swords, daggers, spears, arrows, shields. The forms of each class differ in different areas, and vary with advancing time. The workmanship is always of a very high order, the shapes graceful, and the finish fine.	In Europe, 2000 to 1000 B.C. In Orient 4000 to 1800 B.C.
			New Stone Age or Neolithic (Gr., <i>neos</i> , new; <i>lithos</i> , stone) The Neolithic implements occur in river-terraces, alluvial deposits, lake dwellings and caves. The weapons and tools were made of highly polished stone. With the relics of Neolithic man are found remains of the Irish elk, the reindeer, beaver, brown bear, etc. Besides these were the remains of domesticated forms such as the cat, horse, sheep, dog, and goat. The tribes were acquainted with agriculture, and were advanced in the arts of weaving and pottery-making.	In Europe, about 12,000 to 3000 B.C. Cro- Magnon, and Grimaldi Races (about 10,000 B.C.)
Tertiary (<i>ter-shi-a-rī</i>), or "third." Age of mammals.	Pliocene (<i>plī 'ô-sên</i>), or "more recent."	Period of the probable appearance of the Human Races.		...
		Miocene (<i>mī 'ô-sên</i>), or "less recent."	Gradual formation of man-like types.

		Miocene (<i>mī 'ô-sên</i>), or "less recent."	Gradual formation of man-like types.		...

From the pictorial and plastic remains recovered from these two earliest seats of the higher cultures it is now placed beyond doubt that all the great divisions of the human family had at that time already been fully developed. Even in the New Stone Age, the present European type had been thoroughly established, as shown by the remains of the "Cro-Magnon Race," so called from the cave of that name in Perigord, France, where the first specimens were discovered. In Egypt, where a well-developed social and political organization may be traced back to the seventh century B. C., Professor Petrie discovered in 1897 the portrait statue of a prince of the fifth dynasty (3700 B. C.) showing regular Caucasian features. Still older is the portrait of the Babylonian King Sargon (3800 B. C.), also with handsome features which might be either Semitic or even Aryan. Thus the Caucasian, that is, the highest human type, had already been not only evolved but spread over a wide area (Europe, Egypt, Mesopotamia) some thousands of years before the New Era. The other chief types (Mongol, Negro, and even Negrito) are also clearly portrayed on early Egyptian monuments, so that all the primary groups had already reached maturity probably before the close of the Old Stone Age.

Early picture writing of the Chippewa (Ojibwa) Indians.

But these primary groups did not remain stationary in their several original homes; on the contrary they have been subject to great and continual fluctuations throughout historic times. Armed with a general knowledge of letters and other cultural appliances, the higher races soon took a foremost place in the general progress of mankind, and gradually acquired a marked ascendancy, not only over the less cultured peoples, but to a great extent over the forces of nature herself. With the development of navigation, and improved methods of locomotion, inland seas, barren wastes, and mountain ranges ceased to present insurmountable obstacles to their movements, which have never been completely arrested, and are still going on.

HOW THE RACES ARE CLASSIFIED

On the basis of bodily characteristics, including form, color and features, modern ethnologists have divided mankind into four primary groups, or families: the Caucasian, Mongolian (or Tartar), Negro and American; or, according to color, the *white*, *yellow*, *black* and *red* races. It must not be supposed that these types were sharply marked off from one another; indeed, there must have been a great range of varieties then, as now, due to the conditions under which man lived, as well as to actual race mixtures.

It is probable, however, that all these primary groups had reached definite characteristics before the close of the Stone Age.

The term Caucasian is taken from the mountain-range between the Black and Caspian seas, near which region the finest physical specimens of man have always been found. Mongolian is derived from the wandering races that inhabited the plateaus of central Asia. Negro is the Spanish word for "black." American is applied to the red, or copper-colored, race found in this continent when it was discovered.

The sub-joined table brings into parallel columns the chief distinguishing characteristics of the races:

PHYSICAL AND MENTAL CHARACTERS OF THE PRIMARY HUMAN GROUPS

Points of Contrast	Caucasian, or White	Mongolian, or Yellow	Negro, or Black	American, or Red
Hair	Rather long, straight, wavy and curly, black, all shades of brown, red, flaxen.	Coarse, lank, dull black, round in transverse section.	Short, jet black, woolly, flat in transverse section.	Very long, coarse, black, lank, nearly round in section.
Skin	White, florid, pale, swarthy, brown and even blackish; altogether very variable.	Dirty yellowish and brown (Malays.)	Very dark brown or blackish.	Coppery, yellowish, various shades of brown.
Skull	Two distinct types; long, 74, and short, 80 to 90.	Short; index 84 to 90.	Long; index 72.	Very variable; ranging from 70 to over 90.
Cheekbone	Small, inconspicuous but high in some places.	High prominent laterally.	Small, somewhat retreating.	Moderately prominent.
Nose	Large, straight or arched (hooked, aquiline), narrow.	Very small, snub, but variable.	Flat, small, very broad at base.	Large, arched, rather narrow.
Eyes	Blue, gray, black, brown, moderately large, and always straight.	Small, black, oblique; vertical fold of skin over inner canthus.	Large, round, black, prominent, yellowish cornea.	Small, round, straight, black sunken.
Stature	Variable; 5 ft. 4 in. to 6 ft.	Undersized; 5 ft. 4 in., but very variable.	Above the mean; 5 ft. 10 in; Negrito often under 4 ft.	Above the mean; 5 ft. 8 in. to over 6 ft., but variable.
Speech	Mainly inflecting; in the Caucasus agglutinating.	Agglutinating, with postfixes; isolating, with tones.	Agglutinating; of various and postfix types.	Polysynthetic almost exclusively.
Temperament	Serious, steadfast, solid in the north; fiery, impulsive, south; active, enterprising, imaginative everywhere; science, art, and letters highly developed.	Sluggish, somewhat sullen with little initiative but great endurance, generally frugal and thrifty; moral standard low; little science; art and letters moderately developed.	Sensuous, indolent, improvident, fitful, passing easily from comedy to tragedy, little sense of dignity, hence easily enslaved; slight mental development after puberty.	Moody, taciturn, wary, impassive in presence of strangers; science and letters slightly, art moderately developed.

GEOGRAPHICAL DISTRIBUTION OF THE RACES OF MANKIND

DISTRIBUTION OF THE CAUCASIAN OR WHITE DIVISION OF MANKIND

ORIGINAL HOME.—North Africa between Sahara and the Mediterranean.

EARLY EXPANSION.—To Europe, the Eurasian Steppes between the Carpathians and the Pamir, Asia Minor, Syria and Palestine, Arabia, Mesopotamia, Iran, or Persia, India, Northeast Asia, Southeast Asia, Malaysia, Polynesia.

LATER EXPANSIONS.—The Caucasian race has now spread, through colonization, over the whole world, but its proper region is Europe, western Asia, and the northern strip of Africa. Nine-tenths of the people of Europe belong to the Caucasian family, the other tenth consisting of the Turks, the Magyars (in Hungary), the Finns, the Laplanders, and the tribe called Samoieds in the extreme northeast of European Russia. In Asia, the Caucasians include the Arabs, the Persians, the Afghans, and the Hindus. In Africa, the Caucasians are spread over the whole north, from the Mediterranean to the south of the Sahara Desert, and to the farthest border of Abyssinia as well as to the greater portion of South Africa. In North and South America three-fourths of the people are now Caucasian. In Australia and New Zealand the Caucasian colonists have almost extinguished the native races.

RELIGION.—The Caucasian race now supports various forms of Christianity in Europe, America, and their Colonies; Buddhism in India; Mohammedanism in Central Asia, Siberia, Turkey, Arabia, North Africa, Irania, India, Malaysia. Originally nature-worship was more pronounced than the cult of ancestor-worship. The Egyptians did not worship but embalmed the dead. The chief gods of the Semites were those of the sun and moon; and those of the Aryans were Dyaus, Indra, Zeus, Jupiter, Apollo, Saturn, etc., all personified elements of the upper regions which later became the basis of extensive systems of mythology. Later these forces were symbolized in wood or stone, which led to idolatry—that is, the worship of the image itself, which still persists among the uneducated in some parts of Christendom. The belief in magic, demons, witchcraft, omens, ghosts and allied superstitions was also very prevalent.

Out of the general polytheism were slowly evolved various shades of monotheism, whence arose the historical religions of the West, such as Judaism, Christianity and Mohammedanism, while crass polytheism persisted in the East—Brahmanism in India, degraded forms of Buddhism in Ceylon and elsewhere. Intermediate between monotheism and polytheism was the Persian religion, which refers light and all good to Ormuzd and his host of angels, night and all evil to Ahriman and his host of demons. Although already denounced by Isaiah, whose Jehovah is the one source of all things, this twofold principle no doubt found its way into the early Christian teachings.

DISTRIBUTION OF THE MONGOLIC OR YELLOW DIVISION

ORIGINAL DOMAIN.—Probably the Tibetan tableland.

EARLY EXPANSION.—Mongolia, Siberia, China, Indo-China, Malaysia, Mesopotamia (?). The earlier Mongolians were extremely migratory, but the more settled tribes developed into the later Japanese, Chinese, Burmese, Siamese, and other peoples in the southeast and east of Asia; and the native tribes of the Siberian plains. The wandering tribes developed into the Turks, Magyars (Hungarians), Finns, Laplanders, and Samoieds, of Europe, and the Esquimaux of America.

RELIGION.—Animism in the widest sense is the dominant note of Mongolian religions. The worship of spirits extended both to the disembodied human soul (ancestor-worship, which is now perhaps the most prevalent form) and to the innumerable spirits, bad and good, which people earth, air, water, the celestial and underground regions. Although nominal Buddhists, the Chinese, Indo-Chinese, and Mongols live in terror of malevolent spirits, and the Annamese scrupulously observe "Roast-pig Day," as they call their All-Souls Day, by littering the graves of the dead with scraps of victuals. Among the Siberians this spirit-cult takes the form of Shamanism, in which the Shaman (wizard or medicine man) is the "paid medium" of communication between his dupes and the invisible good or evil genii. In Tibet demonology still survives beneath the official Lamaism; the Eastern Siberians are Bear-worshippers; and the Polynesians have deified both the living and dead members of their dynasties.

The historical religions are largely a question of race, the Mongols proper, Manchus, Koreans, Japanese, Indo-Chinese, and Tibetans being at least nominal Buddhists. The Turks, Tartars, and most Malays are Mohammedans; and the Finns, Lapps, and Magyars now Christians. Other so-called state religions—Confucianism and Taoism in China, Shintoism and Bushidoism in Japan are other ethical codes fostered and upheld for political purposes.

DISTRIBUTION OF THE NEGRO, OR BLACK RACE

ORIGINAL DOMAIN.—The Eastern, or Oceanic, Section had its home in Malaysia, Andamans, Philippines, New Guinea, Melanesia, Australia, Tasmania; with no later expansion. The Western, or African, Section lived in Africa south of the Sahara.

LATER EXPANSION.—Subsequently the Africans spread, either voluntarily or were taken as slaves to Madagascar, north Africa, southern United States, West Indies, and Latin America.

Religion.—Spirit-worship very prevalent among native Negro races, and totemism in Australia. The Melanesian system is distinctly animistic, distinguishing between pure spirits, that is, supernatural beings that never were in a human body, and ghosts—that is, men's disembodied spirits revisiting their former abodes. There are prayer, sacrifice, divination, omens, death and burial rites, a Hades too, with trees and houses, as on earth, also a ghostly ruler, but no supreme being. There is little or nothing of all this in Australia or New Guinea, where the religious sentiment is so little developed that many close observers have failed to detect it.

Among African tribes, though religion is animistic, ancestor-worship seems much more prevalent than nature-worship. There is no supreme being anywhere. The chief deities are *Munkulunkulu*, with many variants along the eastern seaboard, and *Nzambi*, also with many variants on the west side, both intermingling in the interior. Witchcraft, omens, and ordeals are very prevalent; pure fetishism and human sacrifices prevail in Upper Guinea, in Uganda and other parts.

DISTRIBUTION OF THE AMERICAN, OR RED DIVISION

Original Domain.—The New World. The chief sub-divisions were as follows:

(1) NORTH AMERICAN: *Eskimo*, *Athabascan* (Chippewaian, Taculli, Hupa, Apache, Navajo); *Algonquian* (Cree, Chippewa, Mohican, Delaware, Shawnee, Cheyenne, Illinois, etc.); *Iroquoian* (Erie, Huron, Mohawk, Tuscarora, Cherokee, etc.); *Siouan* (Dakota, Assinaboin, Missouri, Iowa, Winnebago, Mandan, Tutelo, Catawba); *Muskhogeian* (Seminole, Choctaw, Creek, Chickasaw, Alabama, Apalachi); *Salish*; *Shoshone*; *Pawnee*; *Pueblo* (Zuñi, Hopi, Tegu).

(2) CENTRAL AMERICAN: *Opata-Pima* (Yuma, Cora, Tarahumara, Tepeguana); *Nahuan* (Aztec, Huichol, Pipil, Niquiran); *Maya-Quiché* (Huastec, Maya, Lacandon, Quiché, Pocoman, Zenzil, Chol, Zotzil, Cachiuel, Mamé); *Zapotec Mixtec* (Mixé); *Lencan* (Chontal, Wulwa, Rama, Guatusa); *Bribri*; *Cuna*.

(3) SOUTH AMERICAN: *Chibcha*; *Choco*; *Quichua* (Inca, Chanca); *Aymara* (Colla, Calchaqui); *Antisuyu*; *Jivaro*; *Zaparo*; *Pano*; *Ticuna*; *Chuncho*; *Carib* (Macusi, Akawai, Bakairi, Arecuna); *Arawak*; (Atoará, Wapisiana, Naypure, Parexi); *Warrau*; *Chiquito*; *Bororo*; *Botocudo*; *Tupi-Guarani* (Chiriguana, Caribuna, Goajira, Omogua, Mundrucu); *Payagua*; *Mataco*; *Toba*; *Araucan*; *Puelche*, *Tehuelche* (Patagonian); *Fuegian* (Ona, Yahgan, Alakaluf.)

PRESENT RESTRICTED DOMAIN.—The Arctic seaboard, Greenland, Alaska; numerous reservations and some unsettled parts of the United States and Canada; most tribes of Mexico, Central and South America are partly intermingled with the whites and blacks and still partly in the tribal state. By far the greater part of the native tribes never progressed beyond the savage state, except in the United States and Canada, where during the past quarter century, and particularly during the last decade, the Indians have rapidly advanced in civilization.

RELIGION.—Shamanism was widely diffused among the North America aborigines. But still more prevalent is the cult of the aerial gods, who support the four quarters of the heavens, and of animals (bear, wolf, raven, jaguar) which has given rise to strange wehrwolf superstitions, and to totemistic systems similar to those of the Australian natives.

Solar worship prevailed in Peru, while the cultured peoples of Mexico (Aztecs, Mayas, Zapotecs and others) had developed a complete pantheon of ferocious deities, such as *Tezcatlipoca*, *Quetzalcoatl* and *Tlaloc*, whose thirst for human blood was insatiable. Thus arose an established order of priests, who sacrificed human victims on solemn occasions, and presided over their other sanguinary rites often accompanied by unutterable horrors. Aztec women cast their infants into the Mexican lagoons to propitiate the Rain-god *Tlaloc*.

Some modern races, like the Zuñis, have an elaborate and highly mystical ritual, to the exhibitions of which none but the initiated are admissible. The snake-dance of the Moquis of Arizona is a most curious ceremonial and attracts many visitors. The ritual of the Roman Catholic Church has strong attractions for the Indian; and the less elaborate service of the Episcopalians has in several instances helped to win over to Christianity tribes which had long rejected the teachings of missionaries of other denominations.

THE CAUCASIAN THE REAL HISTORIC RACE

Of all these races the only one whose history is important for us is the Caucasian or white race, to which we ourselves belong. This race is "historical" because it displays the most highly civilized type of mankind,—that type whose progress and achievements are the true province of history.

THREE DIVISIONS OF THE CAUCASIAN RACE

This grand stock—the Caucasian race—has been classified into three main branches,—(1) the Aryan or Indo-European; (2) the Semitic; (3) the Hamitic.

The Hamitic branch is named from Ham, the son of Noah, and ancestor of some of its peoples, most notable of which was the ancient empire in Egypt. Accounts of their conquests, under great dynasties of kings, have come down to us in hieroglyphic inscriptions. The Egyptians became highly civilized at a very early time, and exerted a marked influence on the civilization of succeeding ages.

The Semitic branch is so called from Shem, also a son of Noah, described in the Bible as ancestor of some of the nations which it includes. Its chief historical representatives are the Hebrews, Phœnicians, Assyrians, Arabs, and Babylonians. The early Semitic race conquered Chaldea, united Sumer and Accad, and have similarly left us records of their early civilization in cuneiform inscriptions and tablets. It is distinguished in religious history, because from it originated the three faiths whose main doctrine is that there is but one God; namely, the Jewish, the Christian, and the Mohammedan. Apart from this, and with the special exception of the ancient Phœnicians and Carthaginians, the Semitic nations have not been generally distinguished for progress and enterprise, but have mainly kept to their old home between the Mediterranean, the river Tigris, and the Red Sea.

THE SUPREMACY OF THE ARYANS IN HISTORY

The leading part in the history of the world has been, and is still, played by the Aryan nations. The Caucasian presents us with the highest type among the five families of man; the Aryan branch of the Caucasian family presents us with the noblest pattern of that highest type.

The Aryan branch includes nearly all the present and past nations of Europe, the Greeks, Latins, Teutons or Germans, Celts and Slavonians; as well as three Asiatic peoples,—the Hindus, the Persians, and the Afghans and the modern Americans. It is the Aryans that have been the parents of new nations, and that have reached the highest point of intellectual development, as shown in their political freedom, and in their science, literature, and art.

The term Aryan is derived either from one ancient word implying that they were "cultivators of the soil," or from another meaning "worthy, noble." There was a time when these ancestors of the Celts, the Germans, the Slavonians, the Greeks and Italians, the Persians, the Hindus, and of nearly all the European nations, were living together, separate from the ancestors of the Semitic race. Their earliest known home was the high tableland of central Asia, north and northwest of the Himalaya Mountains, near the sources of the Oxus and Jaxartes rivers.

Through pressure of numbers, and spurred on by their own enterprising nature, these Aryan peoples for ages moved mainly westward, from their ancestral seats. A branch went southward across the Himalayas, and peopled Hindustan, Persia, and the intervening lands; another branch at different times and long intervals moved westward into Europe.

The Celts were the first European emigrants and spread themselves over a great part of the continent; as a distinct people they are now only found in parts of the British Isles and France. Later came the Italic (*Latin*) tribes who possessed the peninsula now known as Italy; the Hellenic (or *Grecian*) tribes, who occupied the peninsula of Greece; the Teutonic tribes, who replaced the Celts in central Europe, and finally also occupied Denmark and the Scandinavian peninsula (Sweden and Norway). The last of the Aryans were the Slavonians, now spread over Russia, Poland, and Bohemia, and the Lithuanians, settled on the Baltic coast, partly in Prussia, partly in Russia. Thus was Europe gradually overspread by successive waves of Aryan settlement.

ARYAN CIVILIZATION BEFORE THE MIGRATION

The study of the early Aryan languages tells us what progress had been made by this race, before the time arrived for starting south and west, to possess the Western world. Whatever words are alike in these Aryan tongues must be the names of implements, or institutions, or ideas, used or conceived before the first wave of migration made its way. We thus learn that, at that far distant time, the Aryans had houses, plowed the earth, and ground their corn in mills. The family life was settled—basis as it is of all society and law—and had risen far above the savage state. The Aryans had sheep, cattle, horses, dogs, goats, and bees; drank a beverage made of honey; could work in copper, silver, gold; fought with the sword and bow; and had the beginnings of kingly rule which subsequently became the central element of the state.

DICTIONARY OF THE HISTORICAL RACE GROUPS

Albanian (*al-bā'ni-an*).—The native and aboriginal race or people of Albania, unlike most of the so-called European "races," is a distinct race physically and not merely in language. It resembles most the Celtic race, but the type is taller: the northern Albanians, like the Montenegrins, rival the Scotch and the Norwegians in stature.

The Albanians are today a mixed race, as is every European people. They are brave, but turbulent in spirit—warriors rather than workers. Even their own tribes are at enmity among themselves and tribal and family feuds are common. It is the most backward in cultivation of all; and therefore not surprising that the rate of illiteracy is one of the highest in Europe.

In religion the Albanians are about equally divided among the Mohammedan, the Catholic, and the Greek faiths.

The Albanians go under many different names. Skipetar and Arnaut are equivalents of Albanian. All mean "highlander." Until about the fifteenth century they were called Illyrians, or Macedonians. From them came the name of the ancient Roman province of Illyricum, embracing Epirus and parts of Macedonia. All the Slavs of the Balkan Peninsula made their settlements during the middle ages. The Albanians, or Illyrians proper, previously occupied the entire country north to the Danube.

Arabian (*a-rā'bi-ān*).—One of the three great groups of the Semitic branch of the Caucasian race. The Arabians are related to the Hebrews and include Arabs proper and the wandering Bedouin tribes of the desert. They have long since spread out from the country that bears their name and settled in distant portions of Africa and Asia, as well as penetrated into Europe. They have given their language, through the Koran, to the vaster populations of Mohammedan faith. They are not to be confounded with the Turks who are Mongolian, Tartar, in origin and speech, rather than Caucasian. Neither are they closely related to the Syrians who are Christians and Aryans, not Semites; nor even to the Berbers and the modern Moors of north Africa, who are Hamitic rather than Semitic in origin. Yet Syrians and Moors alike have long used the Arabic tongue.

Armenian (*ār-mé'ni-an*) or **Haik**.—The Aryan race, or people of Armenia, in Asiatic Turkey. In language they are more European than are the Magyars, the Finns, or the Basques of Europe. The nearest relatives of the Armenic tongue are the Persian, the Hindu, and the Gypsy. In religion the Armenians differ from all the above-named peoples excepting the Syrians in that they are Christian. They boast a church as old as that of Rome.

Only a fraction of the Armenians are found in their own country, Armenia; perhaps one-eighth. Over 1,000,000 live in Russia; 400,000 in European Turkey; 100,000 in Persia; about 15,000 in or near Hungary; and 6000 in India and Africa. About half their number still live in different parts of the Turkish dominions. Large numbers have migrated because of the persecutions of the Turks and Kurds directed against them.

Assyrians (*a-sir'î-āns*).—The Assyrian is an ancient language extinct for at least two thousand years. No people today can claim pure physical descent from this stock. The arid region occupied by the early Assyrian empire has been swept by one civilization after another. Their ancient Hamitic speech was largely replaced by that of conquering Medes and Persians and, later, of Mohammedan hosts. It finally disappeared after the Babylonians and Chaldeans, who used a Semitic tongue replaced the Assyrians in Mesopotamia. Turkish, Persian, Kurdish, and Arabian blood has been added to the ancestral stock of the modern Assyrians. Reclus says: "The Assyrians and Chaldeans were either exterminated or else absorbed in the victorious races, forfeiting name, speech, and the very consciousness of their race."

Babylonians (*bab-i-lō'ni-āns*).—Babylonia has always been a land of mixed races and tongues. The earliest of the inscriptions has revealed that the first population was a people belonging to the Mongolian family. The linguistic connection was afterwards confirmed by the discovery by de Sarzec of statues of these primitive inhabitants which present an undoubted Tartar type of features. The skull is that of the Mongolian race with high cheek-bones, curly black hair, the eyes oblique and bright; the type being ethnically related to the Elamites of Susiana and the first Medean stock to which we find this early race linguistically related.

These people were not aboriginal to the plains of Chaldea, but came, as their traditions indicate, from the mountains to the northeast, and brought with them the already fairly advanced elements of civilization which they planted in Chaldea. At a very early period in the history of Babylonia the Semites appear as an element in the population, their type being clearly indicated in the sculptures connecting them with the Hebrew and northern Arabs, while the same relationship is linguistically established. From time to time, by war or commerce, other elements were introduced into the population, until almost every nation finds its representative in the "mixed crowd of nations" inhabiting the plains of Chaldea.

The Semites, having once obtained a footing in Babylonia, soon assimilated themselves to the more advanced culture of their Sumero-Accadian masters. They borrowed the cuneiform mode of writing, the religion, mythology, and much of the science of that inventive people, and so rapidly increased in numbers and power, that as early as about 3800 B. C. we find a dynasty of Semitic kings under Sargon of Accad and his son Naram-Sin, ruling in northern Babylonia.

THE WANDERING ARAB LOVES THE DESERT SANDS

Warlike by nature, here we see him scouting the silent wastes with his ever faithful companion in peace or war—restless as the shifting sands.

The desert oasis is his place of assembly for recreation or trade. In the above picture we have a view of a desert market held far remote from any city but at the junction of several caravan routes.

Basques (*bāsks*).—A race inhabiting the Basque provinces and other parts of Spain in the neighborhood of the Pyrenees, and part of the adjacent territory in France. They were formerly Iberian as to language, the sole non-Aryan language of western Europe. But few now live in the old province of southwestern France, Gascony, formerly called "Vasconia," after them; about 500,000 still remain in northwestern Spain. They are a fragment, perhaps the only distinct remnant, of the pre-Aryan race of Europe. Recent researches connect them, not with the Mongolian Finns as formerly, but with the Hamitic (Caucasian) Berbers of northern Africa. They are not now easily distinguished in physical appearance from their Spanish or French neighbors, although many still speak the strange Basque tongue. The latter is not inflected, like most European (Aryan) languages, but agglutinative, like the typical languages of northern Asia.

[280]

Berbers (*bér bérz*).—A race of people constituting, with the Cushites, the Hamitic family, which is found scattered over North Africa and the Sahara, from the Red Sea to the Atlantic. The complexion of the Berbers varies from white to dark brown; their features remind one of the Egyptian type; their stature is medium. They have occupied their present habitat since the dawn of history. Never have their indomitable tribes become entirely subject to a foreign master, or lost their racial and linguistic characteristics, in spite of Punic, Roman, Germanic, Arabic, and Saracen conquests. In the mountains they are agricultural; in the Sahara, nomadic. For centuries they have been the middlemen between the Mediterranean coast and the Negro states of the Sudan. In religion the Berbers are nominally Mohammedan. A few tribes have adopted the Arabic, and so have a few Arabs adopted Berber dialects. The Berber languages are often called Libyan. They number at least 7,000,000 in Morocco and Algeria and 500,000 in Tunis and Tripoli.

Bulgarians (*bul-gā 'ri-anz*).—The people of Bulgaria are supposed to be Finnic (Mongolian) in origin, are also the most numerous people in European Turkey. The Bulgarians and their neighbors on the north, the Roumanians, are among the rare races that are physically of one stock and linguistically of another. Both possess adopted languages. While the Bulgarians appear to be Asiatics by origin who have adopted a Slavic speech, the Roumanians are Slavs who have adopted a Latin language. While the Bulgarians adopted the language of the Slavs, whom they conquered and organized politically, they were themselves swallowed up in the Slavic population. They lost not only their ancient language but their physical type. While they are the most truly Asiatic in origin of all the Slavs, they are Europeanized in appearance and character. In some respects their life is more civilized and settled than that of some of the Slavs farther west, as in Montenegro and Dalmatia. They are not only less warriors in spirit than these, but are more settled as agriculturists. Yet they seem to feel that they do not belong to the civilization of Europe, properly speaking, for they say of one who visits the countries farther west that he "goes to Europe."

There would appear to be little doubt that the Bulgars came through southern Russia to their present home in the time of the early migrations of the middle ages. Some records locate them in the second century on the river Volga, from which they appear to have taken their name. In fact, a country called "Greater Bulgaria" was known there as late as the tenth century. If the common supposition be correct, the Bulgarians are most nearly related in origin to the Magyars of Hungary and the Finns of northern Russia. After these they are nearest of kin to the Turks, who have long lived among them as rulers. But Turks and Finns alike are but branches of the great Ural-Altai family, which had its origin in northern Asia, probably in Mongolia.

Carthaginians.—See **Phœnicians**.

This group of present day Bulgarian college girls shows that a striking transformation has been wrought by European influences upon a people of Mongolian origin centuries ago.

Celts, or Kelts (*kelts*).—The peoples which speak languages akin to those of Wales, Ireland, the Highlands of Scotland, and Brittany, and constitute a branch or principal division of the Indo-European families. Formerly these peoples occupied, partly or wholly, France, Spain, northern Italy, the western parts of Germany, and the British Islands. Of the remaining Celtic languages and peoples there are two chief divisions, viz., the GAELIC, comprising the Highlanders of Scotland, the Irish, and the Manx, and the CYMRIC, comprising the Welsh and Bretons.

[281]

Irish, because of its more extensive literature and greater antiquity, is considered to be the chief branch of the Gaelic group. Modern Erse or Scotch is thought to be a more recent dialect of Irish. Manx is the dialect spoken by a small number of persons in the Isle of Man. Welsh is the best preserved of the Cymric group. It has a literature nearly if not quite as rich as that of Irish, and is spoken by a larger population than any other Celtic language found in the British Isles. Low Breton, or Armorican, is the speech found in Lower Brittany, in France. It is spoken by nearly two-thirds as many persons as are all other Celtic dialects combined.

This "Celtic" race seems to have had its main center of dissemination in the highlands of the Alps of midwestern Europe. While all Celtic-speaking peoples are mixed races, those of the British Isles are distinctly long-headed and tall, in fact, are among the tallest of all Europe. It is almost impossible to give the population of the Celtic race—that is, of those whose ancestral language was Celtic—since most of its members now speak English or French only.

Chaldean.—See **Babylonian**.

Chinese (*chī-nés* ' or *-néz*).—The race or people inhabiting China proper. Linguistically, one of the Sinitic groups of the Mongolian or Asiatic race. The name Chinese is also applied, erroneously from an ethnical standpoint, to all the natives of the Chinese Empire, including China proper; that is, to the entire Sibiric group. These are, on the northeast the Manchus, on the north the Mongols, on the west the tribes of Turkestan and of Thibet. The name does not properly apply to the other Sinitic peoples—the Cochinchinese and the Annamese of the French colonies and the Burmese of the British colonies, all of whom border on China on the south and southwest. The people of Manchuria and of Mongolia are not so nearly related linguistically to the Chinese as they are to the Japanese. All these "Sibiric" peoples have agglutinative languages, while the Chinese is monosyllabic, being more nearly related to the languages stretching from Thibet southeast to the Malay Peninsula.

The Chinese physical type is well known—yellowish in color, with slanting eyes, high cheek bones, black hair, and a flat face. The eye is more properly described as having the "Mongolic fold" at the inner angle. This mark is found to some extent in all Mongolian peoples, in the Japanese, and now and then in individuals of the European branches of this race in Russia and Austria-Hungary.

Egyptian (*é-jipt* ' *é-án*).—The ancient race or people of Egypt, best represented to-day by the Copts or Fellahs, although those are generally of mixed stock. In a political sense,

any native of Egypt.

The origin of the Egyptians is still a matter of dispute. It is quite probable that they were Hamitic and belonged to the Berber type. They have no real negroid trace about them, though probably there is a strain from intermarrying; thus it is likely that they may have been a fair-skinned indigenous race, mixed also with people of Asiatic origin, and a certain amount of negro blood. The earliest types, as pictured by themselves on monuments, show men of fine build with no trace of the negroid type; the males are painted red-brown and the females a light yellowish tint.

The fellah (Arabic for ploughman) forms the bulk of the peasantry. They are chiefly Mohammedan in faith, though the Copts, also natives of Egypt, have kept their Christian belief.

The Egyptian features are as unchangeable as the pyramids themselves. On the right is the sculptured likeness of Queen Ty of four thousand years ago; on the left of an Egyptian girl of the present day.

The fellah is a hard-working and industrious person, of big build, with a fine, oval face, smooth black hair (the head is usually shaved), and well formed features. The women are often of great beauty, both in form and figure, though they lose their youth early. The Copts are racially the purest descendants of the ancient Egyptians. The coloring of the fellah varies from a fair yellowish shade in Lower Egypt to a deeper tone in Middle Egypt, and in Upper Egypt the majority are a deep bronze. The Arab portion of the population are of two classes: the Arabic speaking tribes who come from the deserts, and the Hamitic tribes who speak a language of their own. The Nubians are chiefly mixed with Arab blood. The foreigners are mainly Greeks, Turks, Italians, British, French, Syrians, Levantines, and Persians.

Etrurians (*ê-tru 'ri-anz*), or **Etruscans** (*ê-trus 'kanz*).—The ancient inhabitants of Etruria, the modern Tuscany. The Etrurians are the most mysterious people of antiquity. According to ancient tradition, they came from Lydia in prehistoric times, and colonized Latium. Certain details of their costumes and customs appear to be identical with those of Lydia, and the legend is probably based upon fact.

The Etruscans were proverbially a religious people. Their tombs bear witness to a belief in a future life, and a dread of the malignant power of their deities.

Greeks.—The ancient Greeks belonged to Aryan or Indo-European race. They entered Greece from the North, and as they moved south in separate tribes, the foremost tribes were impelled forward by the pressure of those behind. Even when the whole of the peninsula had been for some time filled and fully occupied, a fresh wave of immigrants swept over the whole country, disturbing everything. Such a wave was the "Return of the Heraclidæ," or the Dorian Invasion. The result was to drive emigrants on to and over the isles of Greece, and to plant Greek cities and Greek culture on the coasts of Asia Minor. At later times Sicily, the Black Sea, Libya, etc., were dotted with Greek colonies, the ancient Greeks were pre-eminent in philosophy and science, leaders in the civilization of their own day, and laid the foundations of modern civilization.

The modern Greek race or people is that which has descended, with considerable foreign admixture, from the ancient Greeks. While the stock has changed much, physically and otherwise, the modern language is more nearly like the ancient Greek than Italian, for instance, is like the ancient Latin.

The Greek race of today is intensely proud of its language and its history, and naturally wishes to be considered as genuinely Hellenic. The official title of the country is now the "Kingdom of Hellas," and any citizen, however mixed in race, styles himself a Hellenic. The people are wide-awake on political questions, are avid readers of newspapers, and, like the Greek of older times, eager to learn some new thing. Generally speaking, in customs, superstitions, and folklore, the modern race is a continuation of the ancient.

It may not be commonly known that the greater part of the Greeks live outside of Greece, probably twice as numerous as those in Greece. Ripley says that they form a third of the total population of the Balkan States. On the other hand, von Hellwald says that of the population of Greece itself only about 1,300,000 are truly Greek in race.

Gypsies (*jip 'sêz*).—A peculiar wandering race which appeared in eastern Europe in the fourteenth century and is now found in every country of Europe, as well as in parts of Asia, Africa, and America. The Gypsies are distinguishable from the peoples among whom they rove by their bodily appearance and by their language. Their forms are generally light, lithe, and agile; skin of a tawny color; eyes large, black and brilliant; hair long, coal black, and often ringleted; mouth well shaped; and teeth very white. Ethnologists generally concur in regarding the Gypsies as descendants of some obscure Hindu tribe. They pursue various nomadic occupations, being tinkers, basket-makers, fortune-tellers, dealers in horses, etc.; are often expert musicians; and are credited with thievish propensities. They appear to be destitute of any system of religion, but traces of various forms of paganism are found in their language and customs.

The Gypsy calls himself "Rom," whence comes Romany as a name for the language. Special names are applied to Gypsies in the different countries where they are found. Some of these relate to the supposed origin of this singular people, as Gypsy or Egyptian in the British Isles, Bohémien in France, Gitano (Egyptian) in Spain, and Tatare in Scandinavia. In some countries they are known, by a term of contempt, as Heiden (heathen) in Holland, Harami (robbers) in Egypt, and Tinklers in Scotland, but in most parts of Europe a local form of the word Zingani is used to designate them, as Zigeuner in Germany, Cygany in Hungary, and Zingari in Spain.

Intermarriage with other peoples is becoming more frequent. Through loss of language, the assumption of a sedentary life, and intermarriage, Gypsies are decreasing in numbers and seem everywhere doomed to extinction by absorption.

Of the total population of Gypsies in the world, three-fourths are in Europe. There are 200,000 in Roumania, 100,000 each in Hungary and the Balkan Peninsula, 50,000 each in Spain, Russia and Serbia, and 50,000 in Germany and Italy combined. The number in the British Isles is variously estimated at from 5,000 to 20,000. There are thought to be 100,000 in Asia and 25,000 in Africa. Only a few thousand are found in the Americas.

Hebrews (*hê 'bruz*), **Jewish** or **Israelite**.—The race or people that originally spoke the Hebrew language. They were primarily of Semitic origin, and according to tradition, descended from Heber, the great-grandson of Shem, in the line of Abraham, Isaac, and Jacob. They are scattered throughout Europe, especially in Russia, yet preserve their own individuality to a marked degree. Linguistically, the nearest relatives of the ancient Hebrew are the Syriac, Assyrian, and Arabic languages. While the Hebrew is not so nearly a dead language as the related Syrian, Aramaic, or the ancient Assyrian, its use in most Jewish communities is confined mainly to religious exercises. The Jews have adopted the languages of the peoples with whom they have long been associated. More speak Yiddish, called in Europe "Judeo-German," than any other language, since the largest modern population of Jews borders on eastern Germany and has been longest under German influence.

Physically the Hebrew is a mixed race. In every country, however, they are found to approach in type the people among whom they have long resided. The two chief divisions of the Jewish people are the northern type, and the Spanish or southern type. The latter are now found mainly in the countries southeast of Austria. They consider themselves to be of purer race than the northern Jews and in some countries refuse to intermarry or worship with the latter. Their features are more truly Semitic.

The social solidarity of the Jews is chiefly a product of religion and tradition. Taking all factors into account, and especially their type of civilization, the Jews of today are more truly European than Asiatic or Semitic.

The Jews are endowed with the most varied qualities, as shown by the whole course of their checkered history. Originally pure nomads, the Israelites became excellent husbandmen after the settlement in Canaan, and since then they have given proof of the highest capacity for poetry, letters, erudition of all kinds, philosophy, finance, music, and diplomacy. The reputation of the medieval Arabs as restorers of learning is largely due to their wise tolerance of the enlightened Jewish communities in their midst.

This remarkable Cliff Palace of Chapin's Mesa, Colorado, is believed to have been constructed either by the Pueblo Indians or their immediate predecessors. Originally it was a city in itself, being prepared for siege, drought, and famine, besides the necessities of every-day life.

In late years the persecutions, especially in Russia and Roumania, have caused a fresh exodus, and flourishing agricultural settlements have been founded in Argentina and Palestine.

Jewish immigrants usually, however, settle in the cities. New York City, for example, has the largest Jewish population of any city in the world, now estimated by some at about 1,000,000, or nearly one-fourth of the total population. About 50,000 more are added annually. Among large cities, Warsaw and Odessa have a still larger ratio of Jewish population, namely, one-third. In London, on the contrary, only one-fiftieth of the population is Hebrew. The Jewish population of the entire United States is less than 2,000,000.

Hindus (*hin 'duz*), or **Hindoos**.—The native race in India descended from the Aryan conquerors. Their purest representatives belong to the two great historic castes of Brahmans and Rajputs. Many of the non-Aryan inhabitants of India have been largely Hinduized. More loosely the name includes also the non-Aryan inhabitants of India.

It is not generally realized how great a number of races and tribes there are in India, many of them extremely low in civilization and approaching the Negro in physical characteristics. Such are some of the Dravidas and Mundas, who occupy all of southern India. In greatest contrast with these are the Aryan Hindus of the north, more closely related in language, if not in physical appearance, to the northern Europeans than are the Turks, Magyars, and various peoples of eastern Russia.

Hindi and Hindustani are the most widely spread modern languages or group of dialects of India. Hindustani is generally understood to be the polite speech of all India, and especially of Hindustan. Hindi, in the wider sense of the term, is spoken by 97,000,000 of people, mainly of northern India. The darker non-Aryans and Mongolians along of India nearly equal the population of the United States. There are one hundred and forty-seven peoples or tribes speaking different languages.

Indians (*in 'di-anz*).—The aboriginal inhabitants of North America were so named on the supposition that the lands discovered by the early navigators were parts of India. This erroneous name has continued in use ever since, notwithstanding attempts at its correction. The Indians were not nomadic until after the arrival of Europeans, who drove many tribes from their established seats to those occupied by other tribes. From the same Europeans they procured the horse and firearms, both of which were necessary to a nomadic life under the existing conditions.

Explorers and early settlers gave fanciful names to many of the groups of Indians which they encountered. Efforts to reproduce native tribal names (unpronounceable in foreign tongues) in the traveler's own language, resulted in many different names for the same tribes. Several thousand names for Indian tribes or groups are found in the English and European writings of the last three hundred years.

Recent ethnological study tends to recognize possibly two marked types of North American Indians. (1) those facing the Pacific and the Asiatic Continent with its broad-headed Mongolic races; and (2) those found chiefly on the Eastern Slope, looking toward Africa and Europe. They incline to the view, also, that the race is not traceable to a "single origin, but that immigrants came by many routes from many regions." While a similarity in the new environment tended to bring the fragments of the old populations into similarity of physical type, likenesses in language, are accepted as the sound basis for classification of Indian tribes and groups.

Major J. W. Powell, in 1891, recognized "fifty-eight linguistic families," and mapped the geographic distribution of these great stocks over the continent. The Pacific coast has a multiplicity of small linguistic families; while the more populous central and eastern parts have comparatively fewer linguistic stocks. Dr. McGee, in 1896 estimated the number of Indian tribes belonging to various linguistic families at 782—the largest number of these, tribes of little importance, numerically or historically. Some of the

principal linguistic families are:

1. THE ALGONQUIAN (including thirty-six tribes) originally distributed along the Atlantic Coast from Newfoundland and Nova Scotia as far south as North Carolina, and throughout the middle portion of the continent from Tennessee, northward throughout the main part of Canada. Among them were the tribes found in New England and Virginia by the earliest settlers from Europe,—the Abnaki, Delawares, Narragansetts, Pequots, Powhatans, Mohegans, Ottawas, Illinois, Objibwa (Chippewa), Cheyennes, Siksika and Arapaoes, with the now largely civilized and dispersed Potawatomi.

2. THE ATHABASCAN (fifty-three tribes) chiefly found now in Northwestern Canada, but including also the large Southwestern tribe of about 30,000 Navahoes, in Arizona and New Mexico; the Apaches and the Mescaleros, with a few small tribal groups on the coast of central and northern California.

3. THE IROQUIAN (thirteen tribes) among which were the famous "Five Nations" of New York, including the Cayugas, Oneidas, Senecas, Onondagas, Tuscaroras, Mohawks, the numerous Cherokees, and the Hurons, nearly annihilated in 1650 by the Iroquois.

TWO INSTRUCTIVE VIEWS OF THE AMERICAN INDIAN

The former free and open life of the plains is now supplemented with the refinements and even luxuries of modern American life. Rich in lands, and protected by the guardianship of the American government, the future of the Indian is unusually safe-guarded.

The Indian farmer is under the instruction of upward of five hundred skilled specialists who demonstrate the art of profitable farming. His lands equal in area all New England and New York, and their value is placed at six hundred million dollars.

4. THE SIOUAN (sixty-eight tribes) including the great Dakota (Sioux) tribes, with their numerous sub-divisions; the Omahas, Poncas, Osages, the Winnebagos, Iowas, Crows; and the Catawbas in Carolina, who perhaps mark the original eastern habitat from which Siouan tribes moved northwest.

5. THE SHOSHONEAN (twelve tribes) including the Comanches, Utes, Hopis, and Shoshone.

6. THE MUSKOGEOAN (nine tribes) including the Creeks, Choctaws, Chickasaws, and Seminoles.

7. THE ESKIMAUIAN family (seventy tribes) scattered through Greenland and the Arctic Coast and islands of Central and North America and Alaska.

8. THE PUEBLO, including the Zuñi, Hopi and Tegna.

On the continent of North America, north of Mexico, three or four hundred years ago, there were probably about 1,150,000 Indians. Of these, perhaps 850,000 were on territory now that of the United States proper; 220,000 in British America; 72,000 in Alaska; and 10,000 in Greenland. Numerous and prolonged intertribal wars, ravages of tuberculosis, and fevers, are known to have swept off entire populations of large districts, before contact with Whites had greatly accelerated the death-rate of the American Indians. Smallpox, introduced by the Whites, has nearly extinguished entire tribes, time after time. Whiskey, and attendant dissipation, sexual diseases brought in by Whites, and the lowered vitality which results from changed conditions of life, with tuberculosis, rendered much more deadly in the conditions of life forced upon Indians by the Whites, had largely reduced the Indian population before 1800, and have steadily tended toward the extermination of Indians since that date, although intermarriages and enrolment of mixed-bloods have kept up the numbers on tribal rolls.

The most interesting groups of Indians in Central and South America have been the (a) Aztecs, (b) Pipils, making the *Nahuatlan* group; and the (a) Mayas, (b) Quichés, (c) Pocomans, making the *Huastecan* group.

THE AZTECS were the dominant race in Mexico prior to their conquest by Spaniards. Although the name is usually extended to all the semi-civilized tribes of Nahuatlan (*Aztlan*, "heron clan") stock, it properly belongs only to a small group of seven related clans. The principal tribe had its capital at Tenochtitlan, now the city of Mexico. They developed a form of astronomy which was mainly astrological, and could take accurate observations, not only of lunations, but also of the periods of Venus. They divided the solar year into eighteen months of twenty days each and named each day by consecutive hieroglyphics. Their writing system was mainly pictorial. The Aztec monuments, however, or pyramids surmounted by temples, were not to be compared with those of Yucatan, while the finest in Mexico itself (Teotihuacan, Colula, Papantla) were the work of their Toltec predecessors.

Possessed of a high degree of culture, the Aztecs were also notorious for their cruelty and the barbarous character of their religious rites. Some of their descendants, comparatively pure in blood and retaining the ancient language, are still to be found in the neighborhood of the city of Mexico.

INCAS (*ing káz*).—The reigning and aristocratic order in ancient Peru from the thirteenth to the sixteenth century. They were originally a tribe or family of the Quichés who inhabited certain valleys near Cuzco and first became dominant under Manco Capac about 1240. Their own traditions described Manco Capac as a child of the Sun. From him descended the twelve other historical sovereigns of Peru, the last reigning one being Huascar, though the lineage was preserved long after. These sovereigns (the Incas in a restricted sense) always married their own sisters, and the throne was inherited, in general, by the oldest son proceeding from this marriage. Children by their other wives could not, by custom or law, receive the crown, though this rule was broken when Atahualpa inherited a part of the empire in 1523. The rule of the Incas was absolute, but very mild. They had attained to a high state of civilization before the arrival of the Spaniards. They cultivated many of the arts, and had some knowledge of astronomy. They had domesticated the llamas and alpacas, had brought under cultivation maize, potatoes and other edible roots, understood mining and the working of metals, and excelled as masons, weavers, potters, and farmers. They brought the science of government to a high pitch of perfection. The Incas composed songs and dramas; and as soldiers their skill and prowess enabled them to conquer and consolidate a vast empire. Three centuries of oppression under Spanish rule have deteriorated the character of the Inca Indian, but he is still industrious and honest, and retains some of the virtues of his ancestors.

Israelites.—See **Hebrews**.

Japanese.—The Japanese and Koreans form the easternmost group of the great Sibiric branch, which, with the Sinitic branch (Chinese, etc.) constitutes the Mongolian race. The Japanese and Koreans stand much nearer than the Chinese to the Finns, Lapps, Magyars, and Turks of Europe, who are the westernmost descendants of the Mongolian race. The languages of all these peoples belong to the agglutinative family, while Chinese is monosyllabic.

Although many people may mistake a Japanese face for Chinese, the Mongolian traits are much less pronounced. The skin is much less yellow, the eyes less oblique. The hair, however, is true Mongolian, black and round in section, and the nose is small. These physical differences no doubt indicate that the Japanese are of mixed origin. In the south there is probably a later Malay admixture. In some respects their early culture resembles that of the Philippines of today.

Then there is an undoubted white strain in Japan. The Ainos, the earliest inhabitants of Japan, are one of the most truly Caucasian-like people in appearance in eastern Asia. They have dwindled away to less than 20,000 under the pressure of the Mongolian invasion from the mainland, but they have left their impress upon the Japanese race. The "fine" type of the aristocracy, the Japanese ideal, as distinct from the "coarse" type recognized by students of the Japanese of today, is perhaps due to the Aino.

The race, as a whole, is physically under-developed, the men being small, and harsh in feature, while the women lose their good looks after the first bloom of youth is over. The girls, with their rosy cheeks, fascinating manners, and exquisitely tasteful dress, are, however, particularly attractive, and the children are bright and comely, being allowed full liberty to enjoy themselves—indeed Japan is the paradise of children.

The Japanese have many excellent qualities, they are kindly, courteous, law-abiding, cleanly in their habits, frugal, and possessed of a high sense of personal honor which makes sordidness unknown. This is associated, moreover, with an ardent patriotic spirit, quite removed from factiousness. On the other hand the people are deficient in moral earnestness and courage, which leads to corruption in social life and institutions.

The people of Japan are noted for their love of things beautiful. The above scene is a typical picture of an exquisite garden, presided over by several picturesquely gowned Japanese girls.

The town costume of the Japanese gentleman consists of a loose silk robe extending from the neck to the ankles, but gathered in at the waist, round which is fastened a girdle of brocaded silk. Over this is worn a loose, wide-sleeved jacket, decorated with the wearer's armorial device. White cotton socks, cleft at the great toes, and wooden pattens complete the attire. European costume has been prescribed by government as the official dress, and the empress and her suite have recently adopted foreign costume, being followed to a certain extent by the fashionable ladies of the capital. Hats are not generally worn, except by those who follow European fashions or in the heat of summer.

The women wear a loose robe, overlapping in front and fastened with a broad heavy girdle of silk (*obi*), often of great value. In winter a succession of these robes are worn, one over the other. The formerly universal chignon coiffure of the women, stiff with pomatum, which was done up by the hair-dresser once or twice a week, is rapidly yielding to the simpler Grecian knot.

MODE OF LIVING.—Japanese houses are slight constructions of wood. In the northern districts at least two sides of the house are closed in with walls of mud plastered on wicker-work. The floors are covered with thick soft straw mats, measuring six by three feet, and the accommodation of the houses is reckoned by the number of these mats. On them the inmates sit, eat and sleep, the bed-clothes—heavily padded quilts—being kept during the day in adjoining closets. Rice is the staple food of the people, but in the poorer mountainous regions millet often takes its place. Fish, seaweed, and beans in all forms are served with the rice, especially in the soups, which likewise contain bean curd, eggs, and vegetables. Chestnuts and hazel-nuts are also largely eaten, and the walnut is made into a sweetmeat. *Shōyu* (soy), a sauce made of beans and wheat, is the universal condiment. Fowls are now pretty widely used for the table, and pork and beef, as well as bread, are increasingly eaten.

MANNERS AND CUSTOMS.—The social position of women is more favorable than in most non-Christian countries, but still leaves much to be desired. Marriages are arranged through an intermediary, and both sexes marry at an early age. As the continuance of families is a point of great importance, adoption is largely resorted to in order to prevent families dying out. Great respect is paid to the dead, and posthumous names are conferred after death, some of the most celebrated names in Japanese history being posthumous titles. Heavy sums are lavished on funerals.

[287]

The Jinrikisha (*jin-rik-i-shaw*) or two-wheeled carriage generally in use in Japan.

Until lately the only vehicles in Japan were two kinds of palanquin; but in all the more level districts these have now been superseded by the *jinrikisha* (man-power-carriage), a sort of two-wheeled perambulator drawn by a man who runs between the shafts. In many of the more mountainous regions the roads are impracticable even for the *jinrikisha*.

The Japanese are essentially a pleasure-loving people, and spend comparatively large sums upon amusements. The theater, though formerly despised by the *samurai* class, who refused to enter its doors, forms one of the chief national resorts. The time of greatest festivity is the New Year, now held contemporaneously with our own, when pine-trees are planted before the doors, the houses are gay with decoration, and presents are lavishly made. The favorite game at this season is *oyobane*, a kind of battledore and shuttlecock. January is the kite season; the smaller kites are of various fantastic shapes, while the larger and more powerful ones are usually rectangular. Wrestling, juggling, and archery are favorite sports.

RELIGIONS OF JAPAN.—There are two prevailing religions in Japan—*Shintoism* (The way of the gods), the indigenous faith; and Buddhism, introduced from China in 552.

The characteristics of Shintoism in its pure form are the absence of an ethical and doctrinal code, of idol-worship, of priestcraft, and of any teachings concerning a future state, and the deification of heroes, emperors, and great men, together with the worship of certain forces and objects in nature.

Of Buddhists there are no fewer than thirty-five sects. The monks have assumed the functions of priests, and Japanese Buddhist worship presents striking resemblances to that of the Roman Catholic Church. Notwithstanding the increased patronage recently bestowed upon Shintoism by the government, Buddhism is still the dominant religion among the people.

Japan is a land of temples, but many are now falling into decay, while others are turned into schoolhouses. Every grove has its shrine and *torii*, a structure in wood or stone, consisting of two upright pillars joined at the top by two transverse beams or slabs; metal *torii* are also not unknown. The Buddhist monasteries in the Japanese middle ages were undoubtedly wonderful centers of civilization, and the priests for long commanded reverence by their self-denial.

Latins, or Latini (*la-ti-ni*), or **Romans.**—The ancient Latins inhabited Latium, on the west coast of central Italy, before the existence of Rome. It would seem that they had branched off from the Aryan stem next after the Celts, and upon entering Italy soon united with the primitive Ligurians, later forming a confederation or league of which Alba Longa became the head.

Out of the Latins, **Etruscans** (which see) and Sabines (another primal stock), the Roman people were originally formed, each speaking a most marked variety of the original Italic mother-tongue. The principal element was *Latin*, as the language shows. The next in importance was the *Sabine*, and the third, in order both of time and of influence, was the *Etruscan*. But with the spread of the Roman arms (the Romans were Latins), all were absorbed by the Latin variety, which still lives in its modern progeny—Italian, Spanish, Portuguese, Langue d'Oc (South France), Langue d'Oil (North or Standard French), Roumanian, Walloon of Belgium, Rumansch or Ladin and Vaudois of Switzerland. Thus half of Europe has been Latinized, while the different nationalities still retain their distinctive physical and mental characters.

Malays (*mālāz*).—Blumenbach, the father of ethnology, regarded the Malays as one of the five grand divisions of mankind; but the weight of modern authorities is in favor of considering them as a branch of the Mongolian race. They are distinguished in color by a variety of shades of brown, and are native to the Malay Archipelago and Peninsula and the Island of Madagascar, with perhaps a few related remnants of tribes in Indo-China. The Malay Archipelago includes the Philippines, but not New Guinea on the east. Within this archipelago there is no other native race with the exception of the small groups of pigmy Negroes called Negritos distantly related to the Papuan of New Guinea, if not to the Australian.

All the languages spoken by the Malay race belong to the great Malayo-Polynesian family of languages, which are found everywhere among Polynesians; that is, as far east as the waters of South America and northward to include the Hawaiian Islands. The term Malay is also applied in a narrower sense to that part of the Malay race called the "true Malay" or "*Orang Malaya*," that is, the section speaking the standard Malay tongue and which lived originally in and about the Malay Peninsula.

[288]

While linguistically the Malays are radically distinct from the Mongolians, physically they approach them more nearly than any other great race. The lighter brown color found in some sections approaches the yellow of the Chinese, and the slanting eye or "Mongol fold" of the upper lid is frequently found where no intermixture can be assumed. The appearance of the face and head is also somewhat similar in these races. In temperament and native civilization, however, the Malay is quite distinct. He has primitive, cruel instincts more like those of the American Indian. He has nowhere accepted the Mongolian type of civilization so much as the Caucasian type. The Filipinos are far in advance of any other Malay people in the latter respect, although the earlier Malayan civilization was most highly developed in Java. Buddhism has here been replaced by Mohammedanism, which has extended even into the southern Philippines.

The question of their origin has been much discussed, some fixing the cradle of the race on the Asiatic mainland, others in Sumatra.

The Malay intellect is of a low order, and the race has never developed a native culture, their civilization being entirely due to foreign influences, chiefly Hindu and Arab.

Mongolian (*mon-gō 'li-ān*).—The second in Blumenbach's classification of the races of mankind. The chief characteristics are broad cheekbones, low, retreating forehead, short and broad nose, and yellowish complexion. It included the Chinese, Japanese, Turks, Tartars, Indo-Chinese, Lapps, etc. The Mongolian and the Caucasian are the two largest races, or divisions, of mankind,—the latter being somewhat the larger because it includes the greater part of the population of India.

Finish girl of to-day—a descendent of Mongolian ancestors who settled in Europe centuries ago.

Just as the Caucasian race extends into southwestern and southern Asia, so the Mongolian race extends far into Europe, embracing not only the Lapps of Scandinavia, the Finns, Cossacks, and many other peoples of Russia, and the Turks of southern Europe, but even the Magyars of Hungary, the most advanced of all the Europeans of Mongolian origin. The main western branches of the Mongolians, although Europeanized in blood as well as in culture, still possess a Mongolian speech.

Brinton divides the Mongolian race into two great branches, the Sinitic and the Sibiric.

The word "Sinitic" is derived from the late Latin *Sina*, China. It comprises that branch of the Mongolian race of which the Chinese, Indo-Chinese, and Tibetan groups are the chief representatives.

The Sibiric branch of the Mongolian race comprises the Japanese, Arctic, Tungusic, Finnic, Tataric, and Mongolic groups, and therefore all the Mongolian peoples which have invaded Europe, such as the Finns, Lapps, Magyars, and Osmanlis or Turks.

Moors is a term applied to very different peoples of northwestern Africa. In Roman history it is applied to inhabitants of Mauretania (Morocco and Algeria), who were in part Phoenician colonists. In Spanish history the "Moors" and "Moriscos" were mainly Berbers rather than, as commonly supposed, Arabs. Today the word is wrongly applied to the Riffs of Morocco and to the town dwellers of Algeria and Tunis. The latter call themselves generally "Arabs," although often in part of Berber blood. The Moors, in a stricter racial sense, are the mixed Trarza and other tribes on the western coast, from Morocco to the Senegal, mainly of nomadic habits. They are of mixed Berber, Arab, and often Negro blood. Many speak Arabic.

Negro.—The only negroes to whom practically all ethnologists are willing to apply the term are those inhabiting the central and western third of Africa, excluding even the Bantus, who occupy practically all Africa south of the Equator. The Bantus, well typified by the Zulu subdivision, are lighter in color than the true negroes, never sooty black, but of a reddish-brown. From the negroes proper of the Sudan have descended most American negroes.

To some extent the northern Negro stock has become intermixed with the African Caucasian, especially about the Upper Nile, in Abyssinia, and in Gallaland and Somaliland farther east. Keane's theory is that the Australians and Africans represent the earliest offshoots of the precursors of man who inhabited the continent now submerged in the Indian Ocean. In line with this theory is the claim that the Veddahs and Dravidians of India are still more divergent branches toward the north which have become more affected by Caucasian or, perhaps, Mongolian elements.

The Papuans and Nigrites of Australasia, having all or most of the characteristics of the African negroes, are classed with them.

There is a bewildering confusion in the terms used to indicate the different mixtures of white and dark races in America. Thus, all natives of Cuba, whether colored or white, are called "creoles," as this word is loosely used in the United States; but creole, as more strictly defined, applies only to those who are native-born but of pure European descent. This is the use of the word in Mexico. In Brazil and Peru, on the contrary, it is applied to those possessing colored blood in some proportion; in Brazil to Negroes of pure descent; and in Peru to the issue of whites and mestizos. "Mestizo" is the Spanish word applied to half-breeds (white and Indian.)

SLAVE TRAFFIC IN AMERICA.—The importation of Negroes into America has been going on steadily since the early years of the sixteenth century, when it was begun by the Spaniards, even the good Las Casas recommending it in the interest of the native Indians. Both Queen Elizabeth and King James I. issued patents to English slave-trading companies operating between the coast of Guinea and the American colonies. Britain, by the Treaty of Utrecht in 1713, engaged to carry out the contract of the old French Guinea Company, and to import into the New World one hundred and thirty thousand slaves in the course of the next thirty years, and is said to have more than made good the engagement.

In the United States the traffic was open and active until the passage of the Act of 1794 prohibiting the importation of slaves into any of the federal ports. Long after this it continued to be a brisk business in the West Indies and South America. As late as 1840 there were seventy-five ships plying constantly between Brazilian ports and the African coast, bringing cargoes of three or four hundred slaves at each trip. The principal points at which the slaves were obtained were along the coast of Guinea, especially on what was known as the Slave Coast, between the rivers Lagos and Assinie, where were the crowded marts of Waidah and Anamaboe, and again along the Angola coast. In these two regions the traders encountered two quite different branches of the African race, and their human wares in America show that they were derived from different sources. Along the Guinea coast, whence most of the slaves brought to the United States were derived, the population belongs to the true negro type.

In Brazil and other parts of South America the preponderance of importations was from the negroid stock of the equator, whose dialects and physical traits are allied to those of the Kaffirs and Zulus of the east coast (Bantus). The slaves in all parts, however, being from mixed stocks, their descendants do not present any well-marked peculiarities inside those of the race. As a rule, they are in strength equal to the whites, and in endurance of exposure and labor under a tropical sun are superior to all other immigrants.

It is usually held that the negro is not naturally industrious; but this seems to some extent answered by the severe field labor of many tribes, both men and women, in their native continent, and by the official reports of the United States government showing a greater acreage of land under cultivation in the former slave states and a larger crop of cotton than before the Civil War. When under the control of a strong social organization, and with obvious motives for industry and economy before his eyes, the American negro is both industrious and provident, and the instances are numerous where members of the race have accumulated fortunes of respectable size. Their vitality appears on the whole to be about the same as the whites, except in the more northern states, where it is unquestionably much less. In New England and Canada negroes gradually but surely perish.

NEGRO CHARACTERISTICS.—The negro is a tireless talker and story-teller. Many of them reveal a high stage of the art of story-telling, as the Georgia tales collected from the southern states by various writers attest. Many of them belong to the class of "beast-fables," similar to some which have been collected among the American Indians and the natives of the African continent, and such as were favorite staples of amusement in Europe during the middle ages.

One of the principal figures is the rabbit—the "brer rabbit" of the "Uncle Remus" tales. He figures conspicuously not only in the southern United States, but in the West Indies and on the Amazons, and in the folklore of the Venezuelan negroes.

Along with story-telling, singing and music are favorite diversions of the colored population. This tendency is a direct inheritance from their African ancestry, as throughout that continent the natives are passionately fond of these diversions. In Central America the negroes still employ the *marimba*, a native African instrument with wooden keys placed over jars or gourds, the keys being struck with a stick. In the United States the violin, the fife, and the guitar are used, but the favorite is the banjo, an instrument of African derivation, modified from the guitars with grass strings still in use on the Guinea coast. With these simple means they produce music of pleasant though not artistic character. In individual instances (as Blind Tom, born in Georgia in 1849) members of the race have attained remarkable skill on the piano and organ, rendering the most difficult compositions with spirit. No negro composer, however, has attained wide celebrity. Their songs are numerous, many of them of a religious character, others turning on the incidents of daily life. They are generally defective in prosody and without merit, being often little more than words strung together to carry an air.

Persians (*per shanz*).—The natives or inhabitants of ancient or of modern Persia. The Persian race or people is quite different from the Persian nationality. The latter includes several very different peoples, as will presently be seen. Linguistically the Persian is the chief race of Persia speaking an Iranian language, that is, one of the Aryan tongues most nearly related to the Hindi. Physically, the race is of mixed Caucasian stock. It is almost entirely composed of Tajiks. The small section known as "Parsis" or, incorrectly, "Fire worshippers," have for the most part emigrated to India. The Armenians are so closely related to the Persians as to be put with them by some into the Iranian branch. The Kurds, the Beluchis, and the Afghans also belong to the latter.

Of the 9,500,000 estimated population of Persia about two-thirds are true Persian or "Tajik." The other third is also Caucasian for the most part, including Kurds (400,000), Armenians (150,000), and other Iranians (820,000), and the non-Aryan Arabs (350,000). There are 550,000 Turks and 300,000 Mongols in the Empire. The only Christians are the Armenians and a small group of 25,000 "Chaldeans," "Assyrians," or "Nestorians," really eastern Syrians, about Lake Urmia, on the northwestern border.

In intellect, if not in civilization the Persian is perhaps more nearly a European than is the pure Turk. He is more alert and accessible to innovation. Yet he is rather brilliant and poetical than solid in temperament. Like the Hindu he is more eager to secure the semblance than the substance of modern civilization.

MODERN RUSSIAN POLICE OFFICER

Slavs (*slavz*).—Peoples widely spread in eastern, southeastern, and central Europe. The Russian and Polish are its leading tongues. The Slavs are divided into two sections—the southeastern and the western. The former section comprises the Russians, Bulgarians, Serbo-Croatians, and Slovenes; the latter, the Poles, Bohemians, Moravians, Slovaks, Wends, etc.

RUSSIAN POSTMAN

Physically, and perhaps temperamentally, the Slavs approach the Asiatic, or particularly the Tartar, more closely than do the peoples of western Europe. In language they are as truly Aryan as ourselves. Of course, languages do not fuse by interbreeding; physical races do. There is some truth in the old saying, "Scratch a Russian and you find a Tartar," especially if he come from southern Russia, where once lived the Mongol conquerors of the Russians.

Yet the common conception of the Slav as dreamy and impractical does not seem to fit with the greatness of the new nation which impresses the imagination of the beholder more than any other in Europe. The fact is that we do not know the Slav. Unfortunately the unlikeness of the language to those of western Europe, perhaps even the unfamiliarity of the alphabet used, has delayed the study of what must soon be regarded as one of the great languages and literatures of civilization. Its spread, like that of the Russian Empire, has been more rapid than that of any other in the present century.

If the Slav be still backward in western ideas, appliances, and form of government, it is nevertheless conceivable that the time is not far distant when he will stand in the lead. The race is still young. Its history is shorter than that of any other important people of Europe.

Turning to the physical characteristics of the Slavs, it is found that there is not, properly speaking, a Slavic race. Deniker says that no fewer than five European races are represented among the Slavs, besides Turkic and Ugric or Mongolian elements. These are the fair, but broad-headed and short races, in Poland and White Russia especially; the dark, very broad-headed, and short peoples among the Little Russians of the south, the Slovaks, and some Great Russians; and the taller, but still dark and broad-headed races among the southwestern Slavs or Serbo-Croatians and some Czechs and Ruthenians. In the northwest the Russians have been modified by the blond or Teutonized Finns, in the northeast by the dark Finns, and in the southeast by the Tartars; but all such alike are broad-headed Mongolians in origin. With the exception of these Asiatic remnants and the related Magyars and Turks, and the Greeks, all of Europe east of Germany is filled with Slavs. They occupy more than one-half of the continent of Europe, and their presence has been a fertile source of political and governmental dissensions for many centuries, particularly in the Balkan countries. Indeed the scourge of war which has been ravaging all Europe, since 1914, is traceable in no small degree to this admixture of racial elements.

Servian Slav woman showing the native costume worn by the Servian women on feast days.

Russian Slavs, in native costumes, from a southern province on the Black Sea.

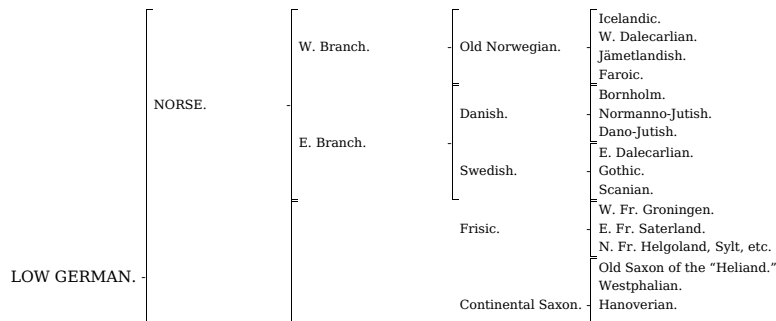

Teutonic.—This great branch of the Aryan family of languages and "races," includes all those of northwestern Europe excepting the Celtic. The Teutonic was the second Aryan swarm in Western Europe, that which came after the Celts, and is the one with whose history we are more concerned than with that of any other; for it is the branch of the Aryan family to which we ourselves belong. The Teutons were the forefathers of the Germans and the English, and of the Danes, Swedes, and Norwegians in Northern Europe. They do not appear in history till a much later time than the Celts, and then we find them lying immediately to the east of the Celts, chiefly in the land which is now called Germany. From this they spread themselves into many of the countries of Europe; but in most cases they were absorbed into the earlier inhabitants, and learned, like them, to speak the language of the Romans. The chief parts of Europe where Teutonic languages are now spoken are Germany, England and Scandinavia.

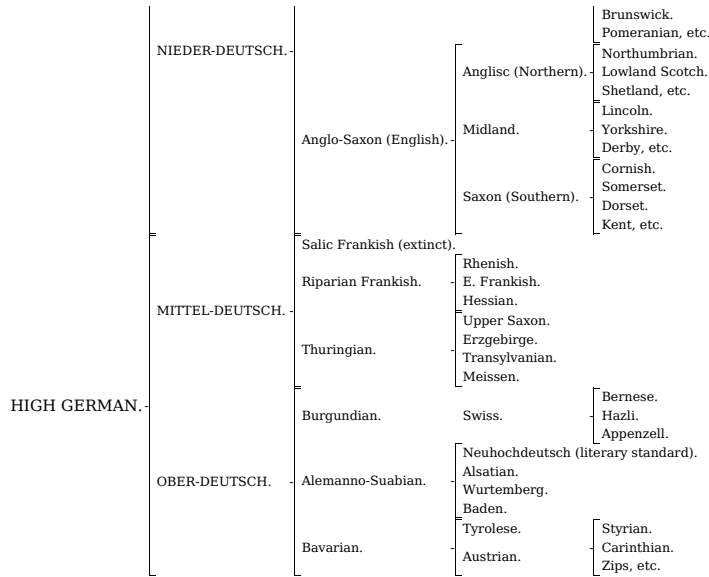

[291]

In Scandinavia we cannot doubt that the present Teutonic inhabitants were the first Aryan settlers; for they found a Mongolian people there, some of whom still remain, by the name of Lapps and Finns, in the extreme north of Sweden and Norway and on the eastern coast of the Baltic. But in most places the Teutons, as the second wave, came into land where other Aryan settlers had been before them. Sometimes they may have simply come in the wake of the Celts as they were pressing westward; but, sometimes they found the Celts in the land and drove them out, as was specially the case in Britain. Of the first coming of the Teutons into Europe we can say nothing from written history, any more than of the first coming of the Celts.

The Teutonic stock of nations, as they exist at the present day, is divided into two principal branches: (1) The Scandinavian, embracing Danes, Swedes, Norwegians, Icelanders; and (2) the Germanic, which includes, besides the German-speaking inhabitants of Germany proper and Switzerland, also the population of the Netherlands (the Dutch), the Flemings of Belgium, and the descendants of the Angles, Saxons and Jutes in Great Britain, together with their offspring in North America, Australia, and other British colonies—the English-speaking peoples of the world. It is necessary in this case, as in all similar cases, to guard against making language the sole test of race. In many parts of Germany, where German now prevails, Slavic dialects were spoken down to recent times, and in some places are not yet quite extinct. And in Great Britain it is unreasonable to suppose that the Anglo-Saxon invaders exterminated the native Celtic population, or even drove more than a tithe of them into Wales and the Highlands.

THE TEUTONIC RACIAL GROUP

[292]

**GROUP OF OLD SCHOOL TURKISH GENTLEMEN OF
CONSTANTINOPLE**

The modern Turk is very far from being of purely Mongolian stock. In truth the mixed blood of practically all the peoples of southeastern Europe and western Asia courses in his veins.

Turks (térks) or Ottomans, the race now dominant in Turkey, lived originally in central Asia. They belong to the Sibiric or Tartar division of the Mongolian race, and reached Europe, probably in straggling bands, before the Christian Era (See [Mongolian](#)). To the same race division belong the European Finns, Lapps, Hungarians, Bulgarians, and Basques. Physically and in culture the Turks have become Europeanized, though to a less degree than the related Finns and Magyars. Instead of becoming blond, as the Finns, they have approached the brunette type of southern Europe, probably in part through their frequent intermarriages with the Circassian and other Mohammedan peoples of the Caucasus. In fact, today they are not so much Turkish by blood as Arabian, Circassian, Persian, Armenian, Greek, and Slavic. They prefer to be considered as Arabo-Persian in culture rather than as Turkish. In religion they are almost universally Mohammedan.

The Turks are in the minority in their own country, especially in the European part of Turkey, where the Turks, Greeks, Albanians, and "Slavs" (Bulgarians and Servians) are to be found in nearly equal parts. The first three named have been estimated to constitute seventy per cent of the population. No census of Turkey has ever been taken. The following estimates are compiled from various sources. The entire Ottoman Empire, excluding states practically independent, has a population of about 24,000,000. Of these 10,000,000 are Turks. In European Turkey, 1,500,000 out of a population of 6,000,000 are Turks. Here they are without doubt decreasing in numbers. In Macedonia the Turks number about 500,000 out of a population of 2,200,000. Of the latter number, however, only about 1,300,000 are Christians. In the capital itself, Constantinople, the Turks constitute only about one-half of the population of 1,200,000. In Turkey in Asia, on the other hand, the Turkish race is in the majority. The Mohammedans number perhaps 10,000,000 in a total population of 13,000,000 in Asiatic Turkey and Armenia. There are about 500,000 Turks in Bulgaria out of a total population of 4,000,000. The Mohammedan population of Bosnia and Herzegovina—550,000 out of a total of 1,600,000—is mainly Slavic rather than Turkish.

[293]

COMPARATIVE CLASSIFICATION OF RACES AND PEOPLES

Showing also the latest estimated population of the various subdivisions throughout the world, together with a view of the numerous races entering into the population of the United States.

N.B.—Races in *italic* are either now non-existent or have merged with later peoples thus forming mixed races.

The disastrous Russian campaign of Napoleon in 1812, which resulted in the destruction of the city of Moscow by its own inhabitants to prevent it from falling into the hands of the French, was the virtual turning point in European history. From that time Napoleon's star declined, and Europe was reconstituted a few years later practically as it is today.

THE BOOK OF NATIONS

We shall perhaps gain the best idea of the gradual expansion of the world to-day if we go back to the earliest times of which we have any definite historical records, and from that as a starting point, picture to ourselves the world at important epochs as it was divided among the more civilized nations. In spite of revolutions and the rise and fall of nations, the course of history has been continuous. The periods of history are not separated by gaps or breaks, but really merge gradually one into another. Bearing this in mind, the general history of the world may be viewed in two great divisions—ancient and modern. *Ancient history* begins with the dawn of civilization, and traces the progress of mankind among those nations which have now ceased to exist—or at least have ceased to contribute anything to the world's progress. *Modern history*, on the other hand, deals with the origin and growth of those nations which still exist and are working out the problems and ideals peculiar to their own national life.

THE ANCIENT EXTINCT NATIONS

In the Oriental world we see the beginnings of civilized life—the first successful efforts of man to subdue the earth and to utilize the resources of nature; the beginnings of science and of a well-defined written language; the first evidences of architectural skill in the construction of great buildings; and the first marked tendency in the direction of great empires and of centralized governments. The chief nations may be summarized as follows:

EGYPTIANS.—One of the earliest civilized nations—the great representative of the Hamitic race—developed apart—were not a conquering or aggressive people—wonderful builders in the massive style—made great progress in mechanical arts, and some advances in science—government a monarchy restricted in authority by law, custom, and powerful priesthood—religion a nature-worship—popular worship the adoration of animals—an artistic, industrious and peculiar nation—always wonderful and interesting to foreigners—did not greatly influence others.

BABYLONIANS.—As ancient a race in civilization as the Egyptians—partially of Tartar race, mainly Semitic—made great progress at an early date in science—reached a high pitch of power and civilization—known to us, in great measure, from ruins with inscriptions in cuneiform writing—invented permanent system of weights and measures—great in astronomy—the Chaldean priests developed into a caste of learned men, continuing (in the later Babylonian and Persian empires) long after extinction of their own nation as an independent power.

ASSYRIANS.—A Semitic people—warlike and conquering race—great in architecture and sculpture—very wealthy and luxurious—empire extended over Asia Minor (east of river Halys), Syria, Phoenicia, Palestine, most of Egypt, Media, and countries on Tigris and Euphrates to Persian Gulf—artistic workers in glass, metals, gems—rule despotic over loosely connected nations.

BABYLONIANS (Later kingdom).—A Semitic people—as a political power ruled for only eighty-seven years, 625-538 B.C., from end of Assyrian power to conquest by Persians under Cyrus—were a commercial and luxurious race—city of Babylon emporium for trade between eastern Asia and western Asia, Egypt and Europe—great in manufactures of woven stuffs and gem-engraving.

HEBREWS.—A pure Semitic race—little influence on political history of antiquity—distinguished by their worship of one God, and for the Scriptures transmitted to future ages—a great monarchy under David and Solomon, then declined—a non-artistic, unscientific nation in ancient history.

PHENICIANS.—A pure Semitic people—greatest commercial and colonizing race of early times—distinguished as transmitters of civilization from East to West—never formed one great independent state—several independent cities, sometimes in alliance, sometimes hostile—Tyre and Sidon famous for dyes, glass-making, embroideries, brass-work, weaving of cloth in linen and cotton, ship-building, mining—developers of alphabet still used by modern nations—religion a sensual worship—a crafty, money-making people—Carthage was the greatest of all the Phœnician colonies.

MEDES AND PERSIANS.—Pure Aryans in race—warlike people, great in cavalry and as archers—Median monarchy ended 558 B.C., then Persian monarchy arose—Persians a lively, brave, poetical people, simple in life at first, after their great conquests degenerated into luxury—more like Europeans in civilization than any other Asiatics—were the great ruling power in Asia from time of Cyrus to conquest by Alexander the Great (558-331 B.C.)—first Asiatics that tried to conquer in Europe—signally failed—empire extended over all western Asia, and over Egypt—religion recognized two principles, a good and a bad spirit—had taste in architecture—no literature of importance.

HINDUS.—Until recent times almost isolated from the western world—unwarlike, dreamy specimens of Aryan stock—early advance in civilization—a rich and remarkable religious and poetical literature in Sanscrit, one of the oldest of the Indo-European tongues—first known in real history on invasion by Alexander the Great, 327 B.C.—progress greatly checked by rigid system of castes—government of native princes thoroughly despotic—no free aspirations or political instincts in the people—popular religion grossly superstitious—Brahminism (a philosophic deism), creed of the educated, along with Mohammedanism, introduced by conquest in thirteenth century A.D.—skilled at an early period in mathematics, manufactures, architecture—a tasteful, intelligent, but unpractical, non-historical people.

[298]

THE ASSYRIAN EMPIRE AND THE REGION ABOUT THE EASTERN MEDITERRANEAN, 750-625 B. C.

Large map (482 kB)

[299]

GREEKS.—In the Greek world we see a finer type of humanity: a versatile intellect, expressed in exalted works of philosophy and literature; a refined æsthetic taste embodied in the most beautiful specimens of architecture and sculpture; and a strong love of freedom, shown in the development of democratic institutions.

ROMANS.—In the Roman world we see a more practical genius and a more vigorous manhood; a great capacity for military and political organization; a broad sense of civil justice, expressed in an enduring system of law; a wide cosmopolitan spirit, capable of appropriating the ideas of other peoples—in short, a civilization which expressed the highest unity and broadest culture of the ancient world.

HISTORICAL GEOGRAPHY AND DISCOVERY

No intelligent knowledge of the historical nations is possible without a corresponding knowledge of their geography. The first and most important question that geography answers for us is *where*. Historical Geography answers both *where* and *when*? *Where* is Rome located? *Where* and *when* did the Babylonian Empire exist?

History not only answers the questions *when* and *who* but, in addition, gives us a consecutive account of the doings of civilized mankind in their progress toward the most valued and elevating of social and political blessings. It deals rather with the life of *nations* than with *rac*es of men; and its special function is to sketch the career and describe the conditions of those great nations whose ideas and institutions, or whose achievements in politics, war, literature, art and science, were remarkable in their own epoch, or, by influencing other nations, helped to make the civilized world what it is now.

WHERE THE FIRST CIVILIZATIONS BEGAN

The first scenes in the drama of human history are laid in two remarkable river valleys—the one formed by the Euphrates and the Tigris in western Asia, and the other formed by the river Nile in northeastern Africa. The Euphrates and the Tigris poured their waters into the Persian Gulf, the Nile flowed north into the Mediterranean Sea. Both these valleys were possessed of a rich, alluvial soil, that favored the early development of industrial life among their dwellers. Along the lower courses of the Asiatic rivers were the Babylonians, and later, by conquest, the Chaldeans. In the upper reaches were the Assyrians. On the banks of the Nile were the Egyptians. Such, according to our present knowledge, is the first historic zone in which the real history of the civilized world began.

In the basins of the Tigris and the Euphrates were several distinct territories: Armenia, or the mountainous region between Asia Minor and the Caspian Sea; Assyria proper, between the Tigris and the Zagros Mountains; Babylonia, the great plain between the lower courses of the Tigris and of the Euphrates, and extending westward to the Syrian Desert; Chaldæa (in the narrower sense, as a province of the Babylonian Empire), west of the Euphrates, at the head of the Persian Gulf; Mesopotamia, between the middle courses of the Tigris and the Euphrates; *Elam* or Susiana, east of the Tigris, and at the head of the Persian Gulf.

THE REGION WEST OF THE EUFRATES

West of the Euphrates we have the peninsula of Asia Minor which later contained the important Lydian nation, and many Greek colonies connected with later history; Syria, on the eastern shore of the Mediterranean Sea, divided into three distinct parts,—Syria proper; Phœnicia, or the strip of coast between Mount Lebanon and the sea; and Palestine, south of Phœnicia; the peninsula of Arabia, extending southeastward, and having little to do with ancient history.

THE HISTORIC PLATEAU OF IRAN

East of the Zagros Mountains lay Media and Persia proper,—Media, northeastward, towards the Caspian Sea; and Persia, on the tableland of Iran stretching southward to the Persian Gulf. The latter absorbed the great monarchies of Babylonia and Assyria in the sixth century B. C., and extended almost from the Indus to the Mediterranean, Ægean, Euxine, and Caspian Seas, when it had reached the summit of its power.

THE FAR DISTANT ORIENT

Farthest to the east was ancient China, drained by two great rivers, the Hoang and the Yangtze. Its remote situation and the barriers on the west formed by the spurs of the Himalayas, combined to make this land the most isolated of the civilized lands of the Old World.

To the west of China lies India, also drained by two great rivers, the Indus and the Ganges, which rise among the slopes of the Himalayas and flow in different directions to the sea. These two countries—China and India—stood nearly alone in ancient times, separated from the peoples of western Asia by the wide, dry plateau of Iran, and hence these countries did not exercise a great influence upon the ancient world, or come into historical view until much later.

[300]

THE KNOWN WORLD—ABOUT B.C. 450.

ABOUT B.C. 325

ABOUT A.D. 300

EGYPT WAS A GIFT TO MANKIND FROM THE NILE

The Nile is one of the longest rivers of the world; rising in the distant lakes of central Africa, it pursues a course of about four thousand miles on its way to the sea. But the part of the valley occupied by the Egyptian people extended only about six hundred miles from the mouth of the river—to the rapids called the “first cataract,” on the borders of Ethiopia. The valley is inclosed on either side by low ranges of mountains, which furnish stone suitable for building; and it should be noticed that this abundant supply of stone gave to the Egyptians a great advantage over the Babylonians, who were obliged to use the less durable materials, clay and brick, for building.

The valley of the Nile is only about seven or eight miles in width—except at the delta, where it spreads out into an open plain. Not only has this valley been cut by the Nile, but its fertility was anciently due to the annual overflow of the river, for the climate is dry and rain rarely falls. This river was also the great highway of Egypt, affording a ready means of communication from one part of the country to another. The fertile soil of Egypt was especially suitable for the raising of vegetables and grain. Rice, oats, barley, and wheat grew there in great abundance, so that the country became the granary of the ancient world.

THE DIVISIONS OF UPPER AND LOWER EGYPT

Egypt may be divided into two principal parts. (1) The lower, or northern, part includes the extended plain about the delta, where the soil is most fertile, and where the earliest civilization was developed. It was here that the first empire was established, with its center at Memphis. (2) The upper, or southern, part includes the remainder of the valley as far as the “first cataract.” This formed a second area of civilization, with its center at Thebes. In either direction from these two centers the banks of the Nile became dotted with a multitude of towns and villages, each one of which was a seat of industry and art.

THE MOST HISTORIC SEA IN THE WORLD

But the most important center of ancient civilization was the Mediterranean Sea. This body of water formed the world’s greatest highway, and was possessed successively by the Phœnicians, the Greeks, and the Romans, who made it an important factor in the development of a wider world commerce and a higher world culture.

Known World about B. C. 450.—About this period the decadence of the great Persian Empire had already begun. Greece was becoming a strong power, and had flourishing colonies all round the Mediterranean and Black Seas, at Syracuse in Sicily, on the southern shores of Italy, at Massilia (the present Marseilles), on the coast of Spain, at Cyrene in North Africa, at Cypress, at Byzantium (Constantinople), and at many points between these.

Carthage had already risen from its condition of a colony to that of a great independent state, which held practically all the north African coast. The Carthaginians had come in contact with the Greeks in Sicily, and in their first trial of strength the Carthaginian army under Hamilcar had been defeated. Rome had been founded for perhaps three hundred years. Already the Romans had taken the lead in Latium, and the Republic was in constant warfare with its neighbors on all sides—the southern Etruscans, the Volscians, and the Æqui.

Thus the great events of this period were clustered round the Mediterranean shores. As yet the unknown peoples of the west and north beyond these were vaguely called the Hyperboreans by the Greeks, “the dwellers behind the north wind;” and eastward, beyond Persia and the Indies, Herodotus could only mark “unknown deserts” on his map.

World About B. C. 325.—This little map represents the short-lived Macedonian empire of Alexander, at the date of his return to Persia, when his power was at its height. To his victorious career the world owed a vast increase of geographical knowledge; all eastern Asia had been unveiled, and the road to India, with its boundless wealth, was disclosed to Europeans.

Westward also, about Alexander’s time, the geography of the Greeks was greatly extended by Pytheas, a bold navigator of the Greek colony of Massilia (Marseilles), who, from Gadeira (Cadiz), coasted Iberia and the country of the Celts (France), and reached Britain. He followed the southern and eastern shores of the islands, and, after six days’ sail from the Orcades (Orkney Islands), discovered Thule, a land of fogs in the north, which has been variously identified as the Shetland Islands, the Norwegian coast, or even Iceland.

In Italy the Romans were continuing their struggles with the neighboring nations. The whole of southern Etruria had yielded to their supremacy, and was kept in check by Roman garrisons; while towards the south, at this time, a terrible conflict was in progress with the heroic Samnite highlanders. Of Sicily the Carthaginians held the western, the Greek colonists the eastern half, a brief lull having taken place in the fierce wars which had been waging between these powers for the possession of the island, during which the prosperity of the great fortified city and seaport of Syracuse was rapidly reviving.

World About A. D. 300.—Almost six hundred years has elapsed, and the Great Roman Empire is already in its decline. A special map of the Roman Empire at its height will be found later on. This little map represents the empire in the time of Constantine.

Under Constantine the Great two great changes took place—the introduction of Christianity as the religion of the State, and the transference of the seat of government from Rome to Byzantium (A. D. 330), which was re-named after the emperor, Constantinople.

Persia at this time, under the Sassanian dynasty, attained a height of prosperity and power such as it had never before reached, and against it even the veteran Roman legions could gain no lasting laurels.

[302]

ABOUT A.D. 500

ABOUT A.D. 800

ABOUT A.D. 1000

In China authentic history begins with the Chow dynasty (1122-255 B. C.) when Confucius and Mencius flourished (600 B. C.). In the next (Tsin) dynasty Shih Hwang Ti (221-209 B. C.) reduced the independent petty states, and built the Great Wall as a protection against the barbarous Hiong-non (Huns) or Tartars of the north. Shortly after the beginning of the Christian era the Chinese seem to have begun intercourse with the Parthians and to have known the Roman Empire as Ta-tsin; and about the time of Constantine's establishment of his new capital the Chinese emperor's court was fixed at Nanking, the southern capital. The increase of geographical knowledge during the period in which Rome was spreading out its power in all directions could not fail to be very considerable. Already in the latter part of the first century B. C., a general survey of the Roman Empire had been begun by the collection and arrangement of the itineraries of the roads to places in the empire. One of these traces the main roads of all the region stretching from Britain to the mouth of the Ganges in India.

[303]

World About A. D. 500.—For more than two centuries prior to this map, the whole of northern Europe, had begun to pour forth wave after wave of barbarian hordes, against the Roman Empire. By the invasions of the tribes of Goths, Franks, Vandals, etc., the western emperors lost their power outside of Italy, and the empire itself ceases to exist in 476, when it is nominally joined to the Eastern Empire. The Vandals had established their rule along north Africa; the Visigoths ruled in Spain; the Ostrogothic monarchy of Theodoric the Great extended over Italy, France, and all the countries round the Alps as far as the middle Danube; and the Franks, under Clovis, had possession of the whole of Gaul between the Loire and Somme.

Persia, still under the energetic Sassanian dynasty, not only maintained its integrity as an empire, but had begun to repel the Roman or Byzantine power in Asia, and had added part of Armenia. Westward, however, the arms of the Byzantine Empire were triumphant, the reign of the Emperor Justinian having been rendered famous by the expedition of his great general Belisarius to Africa, where, after a campaign of two years, he completely overthrew the Vandals and led their king captive to Constantinople. In a second war, Belisarius wrested all southern Italy from the Ostrogoths, pursuing them northward to Rome and Ravenna, and thus began the re-conquest of the peninsula, which was completed by his successor, the imperial general Narses, after which the Ostrogoths disappear as a distinct nation.

At this time, under Khosru, the greatest of the great monarchs of the Sassanian dynasty, the Persian Empire stretched from the Red Sea to the Indus, and from Arabia far into central Asia.

World About A. D. 800.—The end of this century finds three great empires in Europe and eastern Asia: the Mohammedan or Saracenic Empire, the Eastern or Byzantine Empire, and the Frankish Empire of Charlemagne. The Mohammedan Empire had spread itself out to central Asia and to Spain, and had already passed the zenith of its greatness. The dynasty of the Omniades of Damascus had given place to that of the Abbassides in the east, though a branch from it had set up an independent Caliphate at Cordova, in Spain. The Abbasside Haroun-al-Rashid, whose praises are sung by eastern poets, had his capital at Bagdad, on the Tigris, a city which had been founded by his predecessor in 762.

Charlemagne had consolidated and extended the Frankish Empire, received the ambassadors sent from the court of Bagdad to salute him, and had been crowned by the Pope at Rome. Irene, the mother of the Byzantine emperor, Constantine VI., had conceived the bold plan of uniting the east and west of Europe in one great empire, by marrying the Frankish emperor, a scheme which was frustrated by her overthrow and her banishment to the Isle Lesbos in the Ægean Sea (802).

Britain, so far as occupied by the Angles and Saxons, was divided into seven (or eight) little kingdoms, known as the Saxon Heptarchy.

World About A. D. 1000.—Germany, or the Eastern Franks, becomes at this time the greatest power in Europe, uniting to itself Upper Italy and Lotharingia. France, or the Western Franks, early in this century is invaded by the Norsemen or Normans,—bold seafaring adventurers from Denmark and other northern lands, from whom the name Normandy is derived. The kingdom of France, however, began in 987.

The Saracenic Empire was divided at the beginning of this century into no less than seven independent caliphates, of which the most distinguished was that of the Fatimites. The Saracenic civilization in Spain is now at its height. By the end of the century the power of the Saracens in the East is of but little account politically.

The Magyars, or Hungarians, before the end of the century have established a strong kingdom in the southeast of Europe; and to the north the Slavonic states of Poland and Bohemia are planted.

Denmark, Norway, and Sweden are powerful kingdoms by the close of this century and England, now one kingdom, is engaged in struggles with the Danes.

The hardy Scandinavian seamen had pushed back the clouds of ignorance over the vast region of the north Atlantic, and had reached the shores of the American continent nearly five centuries before Columbus. About the year 994 an expedition under Leif, son of Erik the Red, set sail for this new country. The regions discovered were named Helluland (Slateland), supposed to be Labrador; Markland, or Woodland, probably Southern Labrador; and Vinland, a country named from the wild vine growing there, which some identify with Newfoundland, while others transfer it to the New England coast, opposite the island of Martha's Vineyard.

World About A. D. 1300.—Before the middle of the thirteenth century the vast Mongol Empire, under Ghengis Khan, had stretched out from China to Poland and Hungary, over all Asia except India and Asia Minor—an empire which far surpassed in extent any that had yet been known on the surface of the globe.

[304]

ABOUT A.D. 1300

ABOUT A.D. 1500

The great Mongol expansion forced the removal of the Ottoman Turks, who retreated from the steppes east of the Caspian to the mountains of Armenia. Othman or Osman, a chief of the tribe, on the destruction of the Seljuk power, obtained possession of Bithynia, attacked the Asiatic portion of the sinking Byzantine empire with success and founded there (1299) the subsequently great empire of the Ottoman or Osmanli Turks, as they are named from him.

In the course of his conquest Genghiz Khan had carried off multitudes of western Asiatics as slaves. Twelve thousand of these, mostly Turks and Circassians, were bought by the Sultan of Egypt (a successor of Saladin), who formed them into a body of troops. From being servants these well-armed slaves rose to be masters in Egypt, and placed one of their own number in the sultanate (1254), thus founding the Mameluke (or slave) dynasty in Egypt, which lasted for nearly three centuries, bringing the country again into great prosperity and power.

Thus, about the year 1300 the once great Mohammedan Empire had been restricted to its original seat, and to the western region of north Africa, all else having fallen into the hands of the Turks. The Calif of Bagdad had taken refuge under the protection of the Mamelukes of Egypt, retaining his spiritual power only; the Omniade califate in Spain had long fallen.

The English, under Edward I., had incorporated Wales after ten years' contest; Scotland was fighting for independence, led by Wallace and Bruce; and long wars engaged England and France, leading finally to a great increase in French territory and power. Denmark, Sweden and Norway were separate states. In central Europe, Poland and Hungary had been brought to the verge of ruin by the Mongol invasions, which had swept away for the time the divided principalities of Russia. In the south, the old Greek Empire was fast sinking through the assaults on it by the Turks.

The German Empire in this century both loses and gains territory, without material change.

Italy is still divided into independent commonwealths, which more and more fall under the power of princely families or tyrants.

In the Spanish Peninsula there are few geographical changes in this century, but Spain is steadily consolidating into a great power.

The Venetian, Marco Polo, the greatest of medieval travelers, passed seventeen years in exploring the kingdoms of Asia, and opened up to accurate knowledge not only the vast region of the central Asiatic continent, but also the disclosure of the existence of Japan, which he called Zipangu. While Venice opened up new paths to commerce towards the east, Genoa looked westward, sought to open up a new road to India by sailing through the Strait of Gibraltar and round the southern extremity of Africa. It was Genoese who first, in modern times, ventured upon the Atlantic; discovered the Canaries, Madeira, and the Azores; and who first felt their way along the west coast of Africa.

World About A. D. 1500.—Previous to this century the nations with which we have been concerned has been restricted to Europe, a little of western Asia, and a small part of northern Africa. An immense enlargement of these bounds now suddenly occurs in consequence of the application of the compass to navigation. From this time dates the period of greatest maritime enterprise and discoveries.

The Portuguese took the lead in bold projects of adventure by sea. The Cape of Good Hope was discovered and doubled by Bartholomew Diaz in 1487, and in 1498 the feat of reaching India by water was accomplished by Vasco da Gama, who, rounding the Cape of Good Hope, reached Calicut in Malabar.

The general excitement about maritime discovery among the Portuguese suggested to Columbus the bold plan of reaching India, not by way of Africa, but by steering to the west across the Atlantic. The result of his voyage was the final discovery of the American continents. India he did not reach, but discovered instead, the island of Guanahani or San Salvador, in 1492, the main continent being discovered a few years later (June 24, 1497) by John Caboto, or Cabot, a Venetian sailor.

In the far east China had recovered its independence under the Ming dynasty, and its supremacy was acknowledged over Mongolia and eastern Turkestan, though the states of Tonquin and Cochin China, in the southern peninsula beyond India, had assumed a political independence. Western Asia had been reconquered by Timur, or Tamerlane, of western Turkestan. The Ottoman Turks had extended their European territory to its widest limit over the ruins of the Greek Empire; and Russia had become a united kingdom under Ivan the Great, and threw off the Tartar yoke.

In western Europe, the Swiss mountaineers had secured their independence. France was recovering from the calamities inflicted on it by the English, who had all but lost their hold on the land. In the south the reaction of Christendom against Mohammedanism had begun. The Christian kingdoms of Spain and Portugal had driven back the Moors across the Straits into Africa, and had consolidated their strength over the whole Peninsula. The Moors in turn settled along the north African coast. Morocco at this time had been formed into a monarchy, and enjoyed great prosperity.

World About A. D. 1600.—Spain is the chief power at this time. Besides vast continental dominions in the New World, its European possessions comprised the whole of the Spanish Peninsula, the Netherlands and other lands of the House of Austria, the Sicilies, Sardinia, and Milan. But, by the revolt of the United Provinces of the Netherlands, Spain loses a considerable portion of her territory before the end of the century.

ABOUT A. D. 1600

ABOUT A. D. 1700

Large map [top](#) (466 kB)
[bottom](#) (515 kB)

The German Empire continues, but more as a dignity than as an independent power. The emperors are uniformly chosen from the princes of the House of Austria, which now by its hereditary possession becomes one of the chief powers of Europe. In the person of the Emperor Charles V., who united the crown of Spain with the sovereignty of Austria, the imperial power reached its greatest extent.

France is engaged in wars civil and religious and foreign, but without much change of territory, except in America, where some colonies were established. England makes some attempts at colonization in America during this century, but the real settlements begin in the next.

Italy, during this period, is a battle-field of contention among the rival princes of Europe. The peninsula was made up of principalities and commonwealths, some of which were independent, but the most of which, during the greater part of this century, were under the dominant influence of Austria and of Spain. The northern provinces of the Netherlands throw off the yoke of Spain, and are united in a federal commonwealth. The union of Denmark, Norway, and Sweden ceases in the early part of this century, by the independence of Sweden, which now plays an important part in European history. Poland is an important state in this century, with extensive possessions.

The Turkish or Ottoman Empire is largely extended in this century by the annexation of Syria, Egypt, a great part of the northern coast of Africa, and the conquest of a large part of Hungary.

In Asia the Chinese Empire remained unshaken; Persia had again become an independent empire; the Mohammedan Moguls had begun to reign in northern India; the once great Tartar empire had been reduced to the states east of the Caspian. In the north, Russia was spreading eastward over Asia, and had come in contact with the Ottoman Empire, now expanding to its greatest extent in the South, and with Sweden in the northwest. The great Reformation had passed over Europe, separating its Catholic states of the south from the Protestants of the north, and giving rise to fierce wars and many political changes. Maritime discovery and adventure and commerce were being eagerly extended by the nations of western Europe. Four times the world had been circumnavigated—by the Portuguese Magellan, by the English Drake and Cavendish, and lastly by the Dutchman Van Noort. Spain had extended her conquests to Mexico, Peru, and Chile, which were now ruled by Spanish viceroys. The Portuguese had established themselves firmly on the African shores; their possessions and settlements in the East Indies included the Malabar coast of India, Ceylon and Malacca; and their traffic reached to all the islands of the Asiatic archipelago, to China and Japan.

The English and Dutch, after vainly seeking an independent highway to the northeast or northwest through the ice-fields of the Arctic region, had become formidable rivals of the Spaniards and Portuguese in their own lines, both in the West Indies and round the Cape of Good Hope to the eastward.

World About A. D. 1700.—In Europe, France under Louis XIV., now becomes the leading power, and makes great accessions of territory. England also becomes one of the important nations, and, besides being engaged in civil and foreign wars, was planting colonies in America and in India. Austria had increased her power in Italy and Hungary. The Spanish monarchy is broken up, and Spain sinks to an inferior position. Prussia has risen into prominence under the great elector, Frederick William. The United

[305]

[306]

[307]

Provinces held a high place and had been engaged in a long struggle with France. Italy had fallen to a low condition. Savoy was slowly gaining in power, and Venice was engaged in wars with the Turks. Sweden was at the height of its power and possessions. Russia is rapidly rising, and Poland is declining. The Turks press forward into Austria, from which they are driven out, and make some important conquests in other parts; but their power is on the decline.

In Asia, this was the period at which the Mohammedan Empire in India was raised to its highest point of splendor and greatness by Shah Jehan, the "King of the World," and by his son, the famous Aurungzeb, the crafty and ambitious "reviver of religion." It was during these reigns that the English began to gain a hold on India.

Outside of Europe it cannot fail to be observed how completely the spread of knowledge on the outer borders of the known world was controlled by events which took place in western Europe. Chief of these was the gradual crippling and decay of the maritime supremacy of Spain and Portugal, and the rise of that of the Dutch and British into strength. Maritime enterprise had passed to Holland, England, and France.

In America the British dominion was extended by the formation of the Hudson Bay Company. In 1690 this fur company had built several forts and factories on the coasts, whence from time to time their operations extended inland.

The French also, after La Salle first descended (1682) the great river, Mississippi, "the father of waters," invaded Spanish claims by settling in Louisiana, about the mouth of the great river, in 1699.

World About A. D. 1800.—In Europe France holds about the same position till near the close of the century, when the Revolution breaks out, and the republic makes large accessions of territory in the Austrian Netherlands, Savoy, Piedmont, and the islands of the Mediterranean. Through the very enormity of the excesses of the revolutionary period, the form of government soon gave way to a new constitution, known as the Directory, under which Napoleon Bonaparte came to the front as the central figure in the affairs of Europe. During these last years of the century the French Republic was engaged in constant wars with the various coalitions formed against it by the other powers. In the year 1799 the Directory came to an end, and the supreme control was vested in the hands of Napoleon, who was made First Consul.

[308]

ABOUT A. D. 1800

ABOUT 1915

Large map (558 kB)

Great Britain is engaged in foreign wars, and has lost a large part of her American colonies, which win their independence in 1783. The British dominion in India is greatly extended during this period. The scattered settlements of British merchants and of the East India Company, now become firmly established by the military achievements of Clive. The French and native troops were overthrown, and one after another the provinces of India were brought under English control. Spain rises very considerably in importance. The United Provinces become in the last years of the seventeenth century a dependency of France. The Turkish dominion, though with occasional successes, is on the decline. Prussia becomes an important European state under Frederick the Great. Austria is engaged in frequent wars, with somewhat diminishing power. The German Empire, though still in existence, is more a dignity than a power, its functions being wielded chiefly by the great kingdoms of Austria and Prussia. Russia, under Peter the Great, rises to a front rank among the states of Europe and makes large gains of territory.

[309]

In the latter part of the seventeenth century Poland disappears from the map of Europe, the territory being divided between Russia, Prussia, and Austria; and in 1795 Poland, as a kingdom, ceased to exist.

In America, the United States of America come into being as an independent nation in 1783.

France, at the beginning of the nineteenth century under Napoleon I., was the chief power in Europe. The battle of Waterloo finally overthrew the empire of Napoleon, and brought to an end the succession of wars which had lasted with little interruption for twenty-three years. By the terms of peace agreed upon by the Allies, the conquests of France were given up, and the boundaries of the European states re-established.

From the starting-point of this re-arrangement of the map of Europe we may now follow rapidly the subsequent changes of territory in each of the leading states of Europe which have given them the limits they occupy at the present day.

England rises to the front rank of European states, by her part in the Napoleonic wars. In the nineteenth century she made some small acquisitions of territory in Europe, and greatly extended her colonial empire.

The marked feature of the political movements in Europe in the last quarter of the nineteenth century was the tendency to consolidate the petty and weak states, into which a great part of the Continent had been broken up, into strong central governments. This tendency is shown specially in the confederation of the smaller German states under the leadership of Prussia, and the formation of the present German Empire which has become the first military power in Europe. The old German Empire came to an end in 1806. In Italy the same tendency has shown itself in the establishment of the new kingdom of Italy, with Rome for its capital.

Austria was entirely separated from Germany, and united into one state with Hungary. Russia has become one of the greatest European powers. Denmark lost considerable territory, taken from her by Prussia. The new kingdom of Belgium has been formed. Spain loses Mexico and the republics of Central America. Greece secured its independence, and became a kingdom. The power of Turkey is still declining.

In America, the United States were greatly increased by the addition of new States and Territories. The attempt at secession of the southern States in 1861 proved abortive; and the restored Union, freed from the disturbing element of slavery, advanced in wealth, power, and the arts of peace, at a rate of progress never equalled in past history.

Mexico, which had belonged to Spain, revolted and became an independent republic.

In Asia, Japan renounced its former isolation, opened her ports to foreign trade, and changes of almost startling rapidity were adopted in the country. The whole political constitution of the empire was remodeled; and Japan took rank with the great powers of the world.

The continent of South America was apportioned among the various present-day countries; Africa has been colonized and divided among the European powers; and the commonwealths of Canada, Australia and New Zealand have taken a foremost place among the colonies of Great Britain.

World About A. D. 1915.—In the realm of geographical discovery the supreme events were the attainment of the North Pole by Admiral Peary, and that of the South Pole by Captain Roald Amundsen.

The geographical changes resulting from the great European War are noted in connection with the nations and colonies directly affected.

B.C.1400-1250.—Egyptians make invasions of Habesh, Arabia, Phœnicia, Syria.

B.C.1350(?)—Greeks undertake Argonautic expedition to Colchis.

B.C.1000.—Phœnicians voyage to Ophir, Gades, Britain.

B.C.750.—Greeks extend colonies in the Mediterranean and Pontus Euxinus.

B.C.700.—Samians discover Spain (Tartessus) for the Greeks.

B.C.600.—Phœnicians circumnavigate Africa by order of Necho.

B.C.—Himilco (Carthag.) visits Atlantic coast of Europe, Sargasso Sea. Said to have visited Britain.

B.C.500.—Anaximander (of Miletus) makes the first maps.

B.C.500.—Hecataeus (of Miletus) writes the first geography.

B.C.470.—Hanno (Carthag.) coasts west Africa as far as Cape Palmas.

B.C.330.—Pytheas of Massilia sails to Thule, North Sea, Scandinavia.

B.C.330.—Nearchus (Macedon.) sails from the Indus to Red Sea.

B.C.329-325.—Alexander the Great makes expedition to Iran, Turan and India.

B.C.290.—Egyptians navigate the east coast of Africa.

B.C.218.—Hannibal crosses the Alps.

B.C.120 (*about*).—Eudoxus of Cyzicus attempts circumnavigation of Africa.

B.C.61-58.—Romans, under Julius Cæsar in Gaul, Germany, and Britain.

B.C.30 (*since*).—Romans extend their geographical knowledge and commerce as far as central Asia.

B.C.20.—Strabo (Greek) describes Roman Empire and first mentions Thule and Ireland.

B.C.15.—Tiberius discovers the Lake of Constance; Drusus, the Brenner Pass.

A.D.84.—Roman general, Agricola, circumnavigates Britain.

150.—Claudius Ptolemy (Egypt.) constructs his geography and atlas.

518-21.—Hoei-sing (Chinese) visits Pamirs and Punjab.

671-95.—I-tsing (Chinese) visits Java, Sumatra and India.

861.—Norsemen discover the Faroe Islands. North Cape of Europe rounded.

865.—Naddod (Norse) discovers Iceland. Visited by Irish monks about 795.

876.—Gunnbjörn (Norse) reaches Greenland coast. Rediscovered by Erik the Red (983).

985.—Erik the Red (Norse) colonizes Greenland.

1000(?)—Lief Erikson (son of Erik the Red) discovers Newfoundland (Helluland), Nova Scotia (Markland), and coast of New England (Vinland)[?].

1154.—Edrisi (Sicily), geographer to King of Sicily, produces his geography.

1200 (*about*).—Arabian trading merchants discover Siberia.

1253.—Ruysbroek reaches Karakorum, the ancient seat of the Mongol Empire.

1271-95.—Marco Polo (Venet.) travels in central Asia, China, India, Persia.

1290.—Genoese reach the Canaries, Azores, etc.

1325-52.—Ibn Batuta (Arab.) travels through the whole Mohammedan world, northern Africa, eastern Africa, southern Russia, Arabia, India and China.

1327.—Sir John Mandeville (Eng.) travels in India.

1415-60.—Prince Henry (Port.) gives an impetus to Portuguese voyages of discovery.

1419-20.—J. Gonzales and Martin Vaz (Port.) discover Porto Santo and Madeira.

1442.—Nuno Tristao (Port.) reaches Cape Verde, etc.

1460(?).—Cintra and Costa (Port.) sail to coast of Guinea.

1474.—Toscanelli (Ital.) sends Columbus his map showing the western route to Cathay (China).

- 1485.—Diego Cam (Port.) reaches the mouth of the Congo river.
1487.—Bartholomew Diaz (Port.) rounds Cape of Good Hope.
1492-98.—Columbus (Gen.) discovers America, West Indies, Trinidad, Cuba, etc.
1497-98.—John Cabot (Anglo-Ven.) sails along eastern coast of America from Labrador as far as Florida.
1498.—Vasco da Gama (Port.) finds route to India by Cape of Good Hope.
1499.—Amerigo Vespucci (Ital.) discovers Venezuela, and that America was not "part of Asia."
1499.—Pinzon (Span.) discovers mouth of Amazon river and Cape St. Roque.
1500.—G. Cortereal (Port.) reaches entrance of Hudson Strait, called by him Strait of Anian.
1500.—Alvarez Cabral (Port.) coasts Brazil (named by him Ilha da Vera Cruz, being southern part of Bahia State).
1502.—Columbus(Gen.) reaches central America on his fourth voyage.
1512.—Ponce de Leon (Span.) reaches Florida.
1513.—Portuguese reach the Moluccas.
1513.—Balboa (Span.) crosses Isthmus of Panama and discovers Pacific Ocean.
1516.—Solis (Span.) reaches La Plata.
1517.—Sebastian Cabot (Eng.) discovers Hudson Strait.
1519-21.—Cortez (Span.)—conquers Mexico.
1519-21.—Magellan (Span.) first to circumnavigate the globe. Passes through the Strait of Magellan, crosses the Pacific, and discovers the Philippines.
1534.—Pizarro (Span.) completes the conquest of Peru.
1535.—Diego d'Almagro (Span.) conquers Chili.
1535-42.—Jacques Cartier (Fr.) finds Gulf of St. Lawrence. Ascends river to Hochelaga (Montreal).
1539.—Francesco de Ulloa (Span.) explores Gulf of California.
1540 (about).—French continent of Australia seen by French sailors.
1541.—Pizarro and Orellana (Span.) discover Amazon river.
1542.—Antonio de Mota first reaches Japan.
1542.—Ruy Lopez de Villalobos (Span.) discovers Pelew Islands, and takes possession of Philippine Islands for Spain.
1542.—Pinto (Port.)—visits Japan.
1553.—Sir H. Willoughby (Eng.) reaches Nova Zembla.
1576.—Frobisher (Eng.) coasts Labrador and Baffin Land.
1577-80.—Sir F. Drake (Eng.) made second circumnavigation of the globe, and first saw Cape Horn. Explored western coast of North America nearly as far as Vancouver Archipelago.
1587.—J. Davis (Eng.) finds Davis Strait.
1596.—Barentz and Heemskerck (Dut.) discover Spitzbergen, Bear Islands, etc.
1598.—Mendaña (Span.) discovers Marquesas Islands.
1606.—Quiros (Span.) reaches Tahiti (Sagittaria), and other South Sea Islands.
1606.—Torres (Span.) discovers Torres Strait. Dutch reach Australia.
1608.—Champlain (Fr.) discovers Lake Ontario.
1610.—H. Hudson (Eng.) reaches Hudson Bay and makes discoveries in North America.
1614-17.—Spillbergen (Dut.) circumnavigated the globe.
1616.—W. Baffin (Eng.) enters Baffin Bay.
1616.—La Maire and Schouten (Dut.) round Cape Horn.
1616.—Dirk Hartog (Dut.) sails up west coast of Australia.
1618.—G. Thompson (Eng.) sails up Gambia.
1642.—Abel Tasman (Dut.) discovers Van Diemen's Land (Tasmania) and New Zealand.
1643.—Vries (Dut.) explores eastern coast of Japan, Saghalien, and Kurile Island.
1645.—Deshnev (Cossack) rounds east cape of Asia from the Kolyma to the Anadyr.
1660.—French discover the lake region of the St. Lawrence.
1673.—Marquette and Joliet (Fr.) explore the Mississippi from the north.
1725-43.—Russians explore the coasts of Siberia.
1728 and 1741.—Bering (Dan.) and Tishirikov (Rus.) explore Bering Strait and the northwestern coast of America.
1768-79.—Capt. Cook (Eng.) voyages round the world. Surveys the Society Islands, Sandwich Islands, eastern coast of Australia, Cook Strait in New Zealand, Antarctic Ocean, northwestern coast of America, etc.
1770.—James Bruce (Scot.) discovers sources of the Blue Nile.
1770.—Liakhov (Rus.) discovers New Siberian Islands.
1785-88.—La Perouse (Fr.) explores north of Japan, Saghalien, etc.
1789.—A. Mackenzie (Scot.) explore the Mackenzie river.
1792.—Vancouver (Eng.) visits Vancouver Island, discovered by Perez, 1774. Exploration of the northwestern coast of America.
1795-1806.—Mungo Park (Scot.) journeys to and explores the Niger districts.
1799-1804.—Alex. von Humboldt (Ger.) makes explorations in South America and writes "Cosmos."
1801-1804.—Flinders (Eng.) explores southern coasts of Australia.
1803-6.—Krusenstern (Rus.) surveys in Sea of Japan and Sea of Okhotsk, Saghalien, etc.
1804-6.—Lewis and Clark make extensive explorations in northwestern United States from the Mississippi to the Columbia river.
1805-9.—Salt (Eng.) makes visit to Abyssinia.
1807-8.—Klaproth (Ger.) makes exploration of the Caucasus.
1819.—Long (U.S.) makes exploration of Rocky Mountains.
1819.—Wm. Smith (Eng.) explores South Orkney Islands and South Shetlands. Visited by Weddell in 1822.
1823.—Wrangel (Rus.) discovers Wrangel Land.
1823.—Denham and Clapperton (Eng.) discover Lake Chad.
1825-26.—A. G. Laing (Scot.) reached Timbuktu from Tripoli, Africa.
1827-8.—René Caillie (Fr.) made journey from Kakandy to Timbuktu and Morocco, Africa.
1830-32.—Biscoe (Eng.) discovers Enderby Land and Graham Land.
1831.—Sir J. C. Ross (Eng.) finds magnetic North Pole.
1832.—Laird and Oldfield (Scot.) explore the Niger and Benué rivers.
1835.—Sir F. Schomburgk (Ger.) makes explorations in Guiana, South America.
1837.—Wood (Eng.) discovers sources of the Oxus.
1840.—Trümmer discovers remains of ancient Nineveh.
1841.—Sir James C. Ross (Eng.) discovers Victoria Land, with volcanoes Erebus and Terror.
1841-73.—D. Livingstone (Scot.) spends thirty years' travel in central South Africa.
1845.—Sir John Franklin (Eng.) sails on his last voyage never to return.
1848.—Rebmann and Krapf (Ger.) discover Mt. Kilima-njaro. Sighted Mt. Kenia.
1849-55.—Richardson and Barth (Eng.-Ger.) explore western Sudan and Sahara.
1850.—Sir R. M'Clure (Irish) discovers Northwest Passage.
1852-4, 1861.—Sir C. R. Markham (Eng.) makes explorations in Peru.
1856-59.—Du Chaillu (Fr.) explores basin of Ogowé river, west Africa.
1858.—Sir R. Burton (Scot.) discovers Lake Tanganyika.
1858.—Speke and Grant (Brit.) discover Victoria Nyanza.
1860.—Sir S. Baker (Eng.) explores Upper Nile. Discovers Albert Nyanza, 1864.
1867-72.—Richthofen (Ger.) makes extensive explorations in China.
1869.—G. Nachtigal (Ger.) makes explorations in Lake Chad region and central Sudan, Africa.
1870-1886.—Prejevalsky (Rus.) journeys in Mongolia, Tibet, etc.
1872.—Payer and Weyprecht (Austrian) explore Franz Josef Land.
1872-76.—"Challenger" Expedition (Brit.) explores the depths of the oceans.
1874-75.—Lieut. Cameron (Eng.) crosses equatorial Africa.
1876-90.—H. M. Stanley (Eng.) explores Congo Basin; Mt. Ruwenzori; Forests on the Aruwimi, etc. Africa.
1878-79.—Nordenskjöld (Swed.) finds northeast passage.
1878-89.—Thomson (Scot.) journeys through Masai Land, British South Africa, Sokoto, Morocco, etc.
1878-85.—Major Serpa Pinto (Port.) twice crosses Africa.
1878-92.—Emin Pasha (Ger.) travels and surveys in Equatorial Africa.
1879.—Moustier and Zweifel (Swiss) find sources of the Niger.
1881-85.—Greely (U. S.) discovers Grinnell Land and northwestern coast of Greenland.
1885.—Wiesmann (Ger.) journeys across Africa from west coast, Congo Basin.
1886.—Peary (U. S.) explores North Greenland.
1887.—Capt. Younghusband (Eng.) travels from Pekin to Kashmir.
1893-96.—Nansen (Norw.) reached his "Farthest North" in lat. 86° 13' 6" N.
1897.—Jackson (Scot.) makes surveys and explorations in Franz Josef Land.
1893-97.—Sven Hedin (Swed.) makes explorations in north central Asia.
1895-96.—Pr. Henri d'Orléans travels in Tonkin and China.
1897.—Andrée (Swed.) attempts to cross over the North Pole in a balloon, with fatal results.
1898-99.—De Gerlache (Belgian) attempts to reach the South Pole with the "Belgica," first ship to winter within Antarctic circle.
1899.—Major Gibbons makes explorations in Congo and Zambezi headwaters.
1900.—Borchgrevink (Brit. Ex.) reached lat. 78° 50' S. via Victoria Land.
1900.—Duke of Abruzzi (Ital.) reached lat. 86° 33' N. via Franz Josef Land.
1900-02.—Sven Hedin (Swed.) made important journey in central Asia.
1908.—F. A. Cook (U. S.) claims to have reached the North Pole, April 21.
1909.—R. E. Peary (U. S.) reached the North Pole, April 6.
1911.—Roald Amundsen (Norw.) reached the South Pole, December 14.
1912.—Capt. Scott (Eng.) reached the South Pole, but perished before returning.

COMPARATIVE HISTORY OF NATIONS

Showing their Origin, Chief Events, Changes or Extinction, from the Earliest Period to the Present

I. [1]FROM EARLIEST HISTORIC RECORDS TO THE TIME OF ABRAHAM, X-2250 B. C.

[1] All dates down to the First Olympiad, 776 B. C., are almost wholly conjectural. Dates here given, however, are from the latest and best authorities.

The earliest history of mankind, so far as we now know, begins with the peoples known as Semites. Northern Arabia is generally accepted as their primitive home. Issuing thence, they conquered or settled Babylonia and Egypt, and through amalgamations with the native races (of which we know very little), became the earliest historic Babylonians, Assyrians, and Egyptians. Historians sometimes assume that the native races were Mongolians, traces of which still persist in China, Thibet, Finland, The Caucasus, and perhaps, among the American Indians.

			Border
--	--	--	---------------

B. C.	Greeks (Cretans and Mycenæan)	Egypt (Heb. Misraim)	Border Peoples (Between Egypt and Babylonia)	Babylonia (Heb. Shinar)	Peoples (East of Babylonia)
		I. Prehistoric Period		I. Sumerian Period	
5000	5000. Extensive excavations in Crete reveal a prehistoric civilization before the Bronze Age.	5000. Egyptian records name the Gods as the earliest rulers and Kings, who were descendants of gods, succeeded them. Actual history begins by revealing, in the Nile valley, a number of districts or nomes held together chiefly by a religious bond.	A variety of tribes and peoples dwelt on the ill-defined borders of Egypt and Babylonia. We come to know their names later through their attacks upon the various states. These tribes and other migratory peoples from the older Semitic centers became the founders of the Syrian states and Asia Minor.	5000. Government in Babylonia had reached the form known as the city state. The southern group of cities (known collectively as Sumer) comprised Eridu, Lagash (Shirpurlu), Ur, Larsa, Uruk (Erech) and Isin: the northern group (known as Accad or Akkad) comprised Agade (Accad), Sippar, Nippur, Kutha, and later Babylon.	Out of these tribes developed the Elamites, Medes, Persians, and Hindus.
4000		4241. Earliest fixed date marking the introduction of the calendar. 4000. Pre-dynastic kingdoms flourish in Upper and Lower Egypt. 3800-3600. Pre-dynastic kings Ka-ap and Ro are placed within these dates according to recent interpretations of tombs and vases.		4000. Lugalzaggisi of Uruk, first great conqueror made expeditions to the Mediterranean and north of Mesopotamia. II. Semitic or Chaldean Period 3800. SARGON I. begins to rule. He and his son Naram-Sin, kings of Agade, extend their conquests to Armenia, Elam, Arabia and the Mediterranean. <i>These reigns were an early "Golden Age" of Babylonia.</i> 3750. Naram-Sin built temple of Sun-god at Sippar. Fusion of Sumerians and Semites follows his reign.	
	I. Prehistoric Period	II. The Old Kingdom (Includes Dynasties 1 to 10) 3400. Accession of MENES and beginning of dynasties. Under Menes the kindgoms were unified. Tombs erected at Abydos by successive kings; wars with Libyans and others; mining in Sinai.			
3000	3000-2500. Rising civilization on coasts and islands of the Aegean Sea and in Crete.	2900-2750. Fourth dynasty is most important. Kings memorialized by Pyramids at Gizeh and Abu Roash. Capital probably at Memphis. 2590-2570. Primitive sea-voyages made to Palestine. Government centralized at Memphis. Landed nobles in evidence.	2700. The Phœnicians settle on the Sidonion coast and build Aradus (Arvad); later Tyre and Byblos.	3000. The Kings of Ur. Under this dynasty Ur became the seat of government. Temples were built in both North and South. 2800. GUDEA, priest-king, or governor of Lagash (Shirpurlu or Tello) became the chief ruler. Built a palace, temples and statues of bronze. 2600-2400. Dynasties of Isin and Larsa, respectively. This was a period of strife among the various centers.	3000. Assyria (Asshur) founded by a colony from Babylonia. Niniveh also in existence.
2500	2500. The cities of Mycenæ and Tiryns already founded.	2500. Semitic (Amoritic) migrations into Syria and Palestine, about Jerusalem.	2445-2160. Kings resided at Heracleopolis; numerous struggles with Thebes to which seat of government was finally removed.	2400. First Babylonian dynasty. The South lost its political power and the city of Babylon became for the first time the seat of government.	2400. Chedorlaomer, king of Elam, invades South Babylonia.

Capital probably at Memphis. 2590-2570. Primitive sea-voyages made to Palestine. Government centralized at Memphis. Landed nobles in evidence.	2700. The Phœnicians settle on the Sidonion coast and build Aradus (Arvad); later Tyre and Byblos.	3000. The Kings of Ur. Under this dynasty Ur became the seat of government. Temples were built in both North and South. 2800. GUDEA, priest-king, or governor of Lagash (Shirpurlu or Tello) became the chief ruler. Built a palace, temples and statues of bronze. 2600-2400. Dynasties of Isin and Larsa, respectively. This was a period of strife among the various centers.	3000. Assyria (Asshur) founded by a colony from Babylonia. Niniveh also in existence.
2500	2500. The cities of Mycenæ and Tiryns already founded.	2500. Semitic (Amoritic) migrations into Syria and Palestine, about Jerusalem.	2445-2160. Kings resided at Heracleopolis; numerous struggles with Thebes to which seat of government was finally removed.	2400. First Babylonian dynasty. The South lost its political power and the city of Babylon became for the first time the seat of government.	2400. Chedorlaomer, king of Elam, invades South Babylonia.

II. FROM THE AGE OF ABRAHAM TO THE RISE OF ASSYRIA, 2250-1100, B.C.

GREAT EVENTS OF PERIOD. Abraham becomes first great leader of the Hebrews. Egyptian revolt from the Shepherd Kings. New Egyptian empire. Rise of Assyria—originally settled by emigrants from Babylonia. Wars with Babylonia. Sidon, a Phœnician city, at its zenith. Phœnician colonies established round the Mediterranean. Advanced civilization in Crete. Exodus of the Hebrews from Egypt under Moses. Hittites rise to great power, contending equally with Egypt and Assyria.

B. C.	Greeks	Egypt	Hebrews and Phœnicia	Babylonia-Assyria	Border Peoples
2500		2250. Rise and triumph of Thebes.	I. Patriarchal Age (2250-1200) 2250. Period of ABRAHAM, patriarch of the Hebrews, who left Ur, wandered north to Horan and finally entered Canaan (Palestine).	III. Early Babylonian Empire (2250-1750) 2250. HAMMURABI (Amraphel?), great ruler and lawgiver, united the whole of Babylonia. His code of laws one of the most important of Oriental discoveries. Under him Babylon reached high degree of culture. 2100. Second Babylonian dynasty: lasted about 300	
		III. Middle Kingdom			

2000	2000-1000. Achæans and Greeks settle in Greece proper, and Ionians in Asia Minor.	(Includes Dynasties 11 to 17) 2000-1788. This period reached its highest development in the Twelfth dynasty, which was Theban. Obelisks, public works, regulation of Nile, Lake Mœris, and the Labyrinth belong to this period.	2000. Semitic emigrants enter Phœnicia.	years.	
	1800-1600. "Golden Age" of Cretan civilization. Great palace at Knossos completed.	1788-1580. The HYSKOS, or Shepherd Kings, conquer Egypt and rule about 100 years. The invaders introduce the horse into Egypt. Period of comparative obscurity. IV. The Egyptian Empire (Includes Dynasties 18-20) 1580. After the expulsion of the Hyksos, Egypt was organized as a military state. Syria was conquered and made tribute by 1500.	1800. Hiksos (Hittites?) consolidate Syrian power at Kadesh and over-run Egypt.	IV. Kassite Period (1750-1150) 1750. Third, or Kassite, dynasty of foreign kings in power for nearly 600 years.	1800-1500. Assyria ruled by patesis or governors. 1750. The Kassites, a mountain people north of Elam, subdue Babylonia. An Elamite dynasty with its capital at Susa, gave rise to the Persian nation (1750-836).
1500		1479-1447. Thutmose III. rules at Thebes and the Empire increased rapidly in power and extent. Egyptian fleet was developed, temple at Karnak erected.	1550. Phœnicia made tributary to Egypt. 1500-1220. Palestine under Egyptian domination.		
1400	1400. Probable Mycenaean invasion destroyed Cretan civilization. 1400-1300. Bloom of the Agean and Mycenaean civilization.	1414-1383. AMENHOTEP III., Great king, called the "Magnificent." Built temple at Luxor and elsewhere. Tel-el-Amarna Letters with Syria and Babylon. 1383-1365. AMENHOTEP IV. Very important reign. Official religion changed from polytheism to monotheism; chief seat of worship removed from Thebes to Tel-el-Amarna. Syria lost. 1326-1300. SETI I. Restorer of ancient monuments; great temple at Abydos; began great hall at Karnak; tomb in Valley of Kings.	1350. JOSEPH in Egypt. Hebrews settle in Goshen.	1400. BURNABURIASH, greatest of Kassite kings, established political relations with Egypt. Settled boundary with Assyria. See Tel-el-Amarna Letters.	
1300		1300-1234. RAMESES II., the Great. Subdues Syria at Kadesh; built temples at Abu and Simbel; built Pithom and Raameses. Supposed Pharaoh of the Israelite oppression.	1300. Period of Sidon's greatest power. 1250. Oppression of the Israelites. 1220. Exodus of the Israelites under MOSES.	1300. Kassites absorbed into the Semitic population of Babylonia. 1250-1210. Decline of Babylonian power and rise of Assyria.	1350. Great expansion of Assyria; capital removed from Asshur to Kalkhi (Ninevah). 1275. Continuous struggle between Assyria and Babylonia. 1250. King of Assyria conquers Babylon and rules seven years.
1200	1200. Dorian invasion ended the grand prehistoric age of Greece. 1193-1184. TROJAN WAR.	1202-1171. RAMESES III., greatest king in twentieth dynasty. Built temples at Karnak and Medinet Habu. Great naval battle at Pelusium. V. Decay of the Empire (1150-525)	II. Period of the Judges (1160-1020)	1100. Babylon subjected by TIGLATH PILESER I. of Assyria. Great expansion of Assyrian empire.	

B. C.	Greeks	Egypt	Hebrews and Phœnicia	Babylonia-Assyria	Border Peoples
2500		2250. Rise and triumph of Thebes.	I. Patriarchal Age (2250-1200) 2250. Period of ABRAHAM, patriarch of the Hebrews, who left Ur, wandered north to Horan and finally entered Canaan (Palestine). 1100	1100. The Etruscans already in central Italy.	II. Formation of Greek States (1100-500) 1100-950. Great migrations in Greece of Dorians and Thessalians. Ionic colonies founded in Asia Minor. 1068. Codrus, last king of Athens. Beginning of rule of archons.	1091. At beginning of the twenty-first dynasty two lines of kings: one at Thebes and another at Tanis. Power of Tanis established and great wall built.	1100. Tyre attains first rank among Phœnician seacoast towns.	1040. SAMUEL, last of the "Judges." III. Period of Monarchy 1020. SAUL, king, Jerusalem, the capital of all Israel. 1000. DAVID, king.	VI. The Assyrian Empire. 1100-930. History of Babylon of little importance until 600 B. C. Assyria the great power of Western Asia till the rise of the New Babylonian Empire after the destruction of Nineveh in 607 B. C.	1100. Formation of a powerful empire in Bactria. Deeds of kings celebrated in the Shahnameh of Firdusi.	China: 1123-255. Chow dynasty. Feudal system developed.	1100
1000		1000. Period of HOMER. Poems of Homer reflect the Mycenaean and Aegean period of the Greeks.	<i>A very complex and obscure period.</i> 987-952. Pasebkhanu II. King Solomon married one of his daughters. 952. Sheshanq (Shishak of the Bible), married to sister of the wife of King Solomon. Great conquests in Syria. Capture of Jerusalem.	970. King Hiram sent material for Solomon's Temple.	977-937. SOLOMON, king. Began building the temple about 973. Married a daughter of King Pasebkhanu II. of Egypt.		1000. Period of ZOROASTER and Zoroastrianism, was chief of the Magi, a priestly tribe of Media.		1000
900					IV. Divided Monarchy (937) Judah and Israel	930-640. <i>Brilliant epoch of Assyria. A period of conquest, expansion, architecture, sculpture and literary activity.</i>			900
800	I. Mythical Period of the Kings (753-510) 753-716. Romulus. 753. ROME founded. 750. Sabines incorporated with Romans.	820. Legislation of LYCURGUS founded the stability of Sparta. 776. FIRST OLYMPIAD, OF first year the Olympian victor was recorded. 750-550. Colonizing period of the Greeks. 743-724. FIRST MESSENIAN WAR between Messenia and Sparta.	780. Rise of independent kingdom in Nubia.	846. CARTHAGE founded by Elissa (Dido). 800. Phrygia an independent monarchy.	735-715. Ahaz became tributary to Assyria. ISALAH denounced the alliance.	886-858. Ashur-Nasir-Pal. One of the greatest Assyrian kings. Extended the empire. Moved the government to Calah (Nimrod) from Ashur. Built a great palace there. 858-823. Shalmaneser II. Ceaseless wars made him master of Western Asia. First contact with Israelites. Jehu, King of Israel, among those who sent tribute. Built palace at Calah (Nimrod). Protectorate over Babylon. 810-781. Ramari-nirari IV. captured Damascus. Married Babylonian princess Semiramis.	I. Ancient Persian Period (836-640)	India: 800. Bramanic period of Vedic literature. China: 780-700. Constant struggles between central power and feudal states.	800
				728. Midas of Phrygia foments rebellion against rule of		745-727. Tiglath-Pileser II. (Identical with the king Pul of the Bible) made Babylonia subject to Assyria.	740. Western Iran (Media and Persia) subject to Assyria.		

				Sargon in Northern Syria. 727. Tyre captured by Assyria. Phoenician decline begins.		727-722. Shalmaneser IV. suppressed the revolt of the Phoenician cities and the kingdom of Israel.		
700	715-673. Numa Pompilius. Traditional founder of religious institutions. 700-200. Etruscan influence very strong.		VI. Nubian Period (722-654) 722. Egypt lost Palestine to Assyria. 707. Shabako, the Nubian, gains all Egypt, incites revolt in Syria and Palestine against Sargon. Later is defeated by Sennacherib.	700. Cimmerian invasion shortly destroys Phrygian Kingdom. 689. GYGES, first important King of Lydia.	715-686. Hezekiah. Began religious and social reforms.	722-705. SARGON II. conquered Samaria and destroyed the Kingdom of Israel. He received tribute from Arabia, Egypt, and Cyprus; suppressed revolts in Armenia, Media and Babylonia, and united the latter with Assyria. 705. SENNACHERIB. Invaded Judah. Palace at Nineveh and library. Assyrian art most flourishing from Ninth to end of Seventh Century.	700-600. Scythians sweep over Media, Persia and Assyria.	700
	673-641. Tullus Hostilius. Alba Longa destroyed.		670-660. Assyrian supremacy. Nubians expelled by Ashur-bani-pal but hold Thebes until 654.				II. Period of the Median Empire. 655-633. Phraortes united Media.	
	641-616. Ancus Marcius. Capture of Ostia. War with Latins.	645-628. SECOND MESSENIAN WAR. Sparta victorious.	653-610. PSAMETIK I. reunited Egypt. In alliance with Gyges, King of Lydia, made Egypt independent of Assyria. Built a magnificent palace at Sais, the new capital. <i>Revival of art, religion and literature.</i>	636. Last Assyrian governor of Phoenicia.			640. Medes revolt from Assyria and establish the Median Empire (640-558).	Japan: 660-585. Jimmu Tenno, first Mikado. Largely legendary.
		625. Corinth at its zenith. PERIANDER, tyrant. 621. LAWS OF DRACO at Athens.				626. Assyrian power declining at death of Ashur-bani-pal. NABOPOLASSOR, Assyrian governor of Babylon, makes the latter independent, and wars against Assyria.	633-593. CYAXERES, with Nabopolassar of Babylonia, capture Nineveh and destroy the Assyrian Empire.	
600	616-578. Tarquinius Priscus. Treaty with Latins. Temple of Jupiter on the capitol. <i>Important advance in power and civilization.</i>		610-595. NEKU II. Invades Syria, but is vanquished at Carchemish by Nebuchadnezzar II. of Babylonia.	610. Alyattes, King of Lydia, battles with Cyaxares of Media. Erected magnificent buildings at Sardis.	608-597. Jehoiakim. JEREMIAH.	610. Fall of Nineveh. END OF ASSYRIAN EMPIRE, divided among Medes and Babylonians. 608. New Babylonian Empire. 604-551. NEBUCHADNEZZAR II. makes Babylonia the leading nation of the East. Conquered Jerusalem (586) and subdued Tyre (585). <i>Splendid architectural era at Babylon.</i>		
		600-590. FIRST SACRED WAR. 594. SOLON, archon of Athens. <i>Laws and reforms.</i>		586-573. Tyre besieged by Nebuchadnezzar. Phoenicia a Persian province (538).	586. CAPTURE OF JERUSALEM by Nebuchadnezzar. temple destroyed and Jews made captive.		593-558. Astyoges, last King of Medes. Cyrus revolted, deposed the king, became king of Persia and master of the East.	
	578-534. Servius Tullius. Rome consolidated. Rise of patricians and plebians.	560-527. PISISTRATUS, tyrant of Athens. Ionia and Greek cities of Asia conquered by Cyrus of Persia.	570-526. AAHMES II. Encouraged Greek settlement. Magnificent buildings at Naucratis and Sais.	568. CRESUS, son of Alyattes, subdued all the Grecian cities of the coast.			II. Period of the Persian Empire (558-330) 558-529. CYRUS, emperor. Conquered Croesus, King of Lydia.	China: 551. CONFUCIUS born. Greatest figure in Chinese history.
				546. SARDIS CAPTURED and Lydia absorbed into Persian Empire.		555. NABONIDUS, father of the Biblical Belshazzar, great builder and restorer of temples.		
				538. Phoenicia became a Persian province.	538-332. Palestine under Persian dominion.	539-538. War of Cyrus against the Babylonians. Babylon captured. The Babylonian Empire incorporated with the Persian.		
	534-510. Tarquinius Superbus. End of the Kings. Rome a Republic with two Consuls.	The Rise of Athens.		530. CARTHAGE becomes independent.		529-522. CAMBYSES conquered Egypt by his victory at Pelusium.		
			525. Psametik III. defeated by Cambyses at Pelusium. Egypt a Persian province.			521-485. DARIUS son of Hystaspes was made king. <i>Darius has special interest because he was first to extend Persian authority into Europe, and thus paved the way for the subsequent invasion of Greece.</i>		
			520. Capture of Thebes (Luxor) and transplantation of 6000 Egyptians to Susiana.	Phoenicia: through its influence the whole country is allowed to carry on its	520-516. Temple rebuilt at Jerusalem.

	334. Battle at Granicus.						
	333. Founded Alexandria in Egypt. Occupied Babylon, subdued Persia and Darius III. Invaded India in 327.		333. Palestine under Alexander the Great. Remained under Greek domination to 198 B. C.	331. Battle of Arbela. The Persians defeated by the Macedonians and Greeks under Alexander the Great. END OF THE PERSIAN EMPIRE.			
		EUCLID (Alexandria). (fl. 325).					
325	The Immense Greek Empire of Alexander The Great						
	323. Death of Alexander at Babylon. His empire split up among his generals after his death. Perdicas became regent in Asia for Alexander's half brother and his posthumous son. Antipater and Craterus shared the regency of the west. The other generals received lieutenantcies: Ptolemaeus, Egypt; Antigonus, Pamphylia, Phrygia and Lycia; Eumenes, Alexander's secretary, Paphlagonia and Cappadocia; and Cassander, Caria; Leonnatus, Phrygia on the Hellespont.						
	323-301. WARS OF ALEXANDER'S SUCCESSORS FOR HIS ASIATIC DOMINIONS. The first partition of the empire was made 322, but twenty-two years elapsed before peace was concluded between the contending claimants.						
	<i>KINGDOMS AND STATES which arose upon the DIVISION OF THE MACEDONIAN EMPIRE AT THE DEATH OF ALEXANDER THE GREAT.</i>						
	Macedonia	Greece	Thrace	Egypt	Palestine	Phrygia, Lycia, Pamphylia	Syria
	323. Perdicas appointed	323-322. Lamian War; Phocian at	323. LYSIMACHUS	323. Ptolemy I. Soter, the son of Lagus.	323. Annexed with Phoenicia to Syria.		

	regent; slain 321.	head of affairs. Death of Demosthenes.	is appointed governor of Thrace.						
319.	Polysperchon succeeds Antipater, and proclaims liberty to the Grecian cities.	321. Antipater, regent of the empire.		320. Ptolemy makes himself master of Cyprus and Syria.		320. Phrygia, Lycia, Pamphylia fell to the share of Antigonos, who defeats Eumenes and makes himself master of all Asia Minor.		321. The Kingdom of the Seleucidæ founded by SELEUCUS Nicator, who received Babylon as his province.	
		317. Phocion put to death by the Athenians. Demetrius Phalereus governs Athens.							
		315. Cassander rebuilds Thebes.							
302.	CASSANDER, king of Macedonia.	303. Demetrius Poliorcetes, general of the Grecian states, opposes Cassander.	307. Lysimachus seizes the throne.	305. Ptolemy assumes the regal title of Egypt. Alexandria begins a great period.					
			302. Invades Asia.						
					312. Capture of Jerusalem by Ptolemy. Colony of Jews in Alexandria.				
					311-301. Subject to Antigonos.				
						315. Formation of a league against Antigonos by Ptolemy, Cassander, Seleucus, and Lysimachus			312. Syria ruled by Seleucus Nicator; he takes Babylon. Era of the Seleucidæ.
					301. Again under Egypt.				
						301. Battle of Ipsus. Antigonos killed.			301. After the battle of Ipsus, Seleucus gains the provinces of Syria, Cappadocia, Mesopotamia, and Armenia.
301. AFTER THE BATTLE OF IPSUS ALEXANDER'S EMPIRE WAS AGAIN DIVIDED INTO FOUR CHIEF PARTS.									
300	Macedonia	Greek States	Egypt	Palestine	Seleucid Kingdom				
	296. Death of Cassander. Quarrels of his two sons, Antipater and Alexander.		The empire of the Ptolemies extended over Egypt, Libya, Cyrene, Arabia Pettræa, Judæa, Phœnicia, Damascus, and Cyprus. Golden age of the Ptolemies.	300. Canon of Old Testament, under Simon the Just.	299. Seleucus built or improved a great number of cities including Antioch, Seleucia, Apamea, and Laodicea.				
	287. Demetrius expelled by Pyrrhus. Lysimachus drives Pyrrhus out of Macedonia.	287. Athens revolts from Demetrius.				287. Seleucus defeats Demetrius Poliorcetes and keeps him prisoner.			
	283. Death of Demetrius. 281. Lysimachus defeated and slain by Seleucus.	281. The ACHEAN LEAGUE created. Lysimachus defeated and slain by Seleucus in the battle of Korupedion.	283-247. PTOLEMY II. Philadelphus, the most magnificent of the Egyptian kings, is associated by his father in the kingdom. Canal of Arsinoë. Obelisk.	284. The <i>Septuagint</i> translation of the <i>Old Testament</i> , begun at Alexandria, by order of Ptolemy Philadelphus.					
	280. Sosthenes ascends the throne and liberates his country; but falls, 278. 277. ANTIGONUS GONATAS, King of Macedonia, descendant of one of Alexander's generals, master of all Greece except Sparta.					280. Antiochus I. succeeds Seleucus. 278-250. Nicomedes I.			
275		274. Pyrrhus invades Macedonia, defeats Antigonos, and is proclaimed king. 272. Pyrrhus besieges Sparta and Argos—is slain, and Antigonos is restored. 266. The Chremonidean War. Athens and Sparta allied in revolt against Macedonia.	273. Ambassadors sent to Rome. 272. Roman embassy sent to Egypt.		277. Gauls (Galatia) invaded Asia Minor.				

V. FROM THE BEGINNING OF THE PUNIC OR CARTHAGINIAN WARS TO THE FOUNDING OF THE ROMAN EMPIRE, 264-30, B. C.

GREAT EVENTS OF PERIOD. 300-200: Rome mistress of Italy; then, victorious over Carthage, extends her influence to Greece and Spain. Peasant proprietors replaced by slaves in Italy. 200-100: Greece, Macedonia, Carthage, and Spain under Roman rule; decline of the Roman Oligarchy; the Gracchi begin the democratic revolution which ends in the empire. Eastern luxury introduced among the Romans. 100-1: The Romans govern all the countries around the Mediterranean. Roman Oligarchy is followed by establishment of the empire.

[322-327]

B. C.	Carthage	Rome	Macedonia	Greek States	Seleucid Empire	Palestine	Egypt	Parthia	China, India, Japan	B. C.
		III. Epoch of the Punic Wars, and Beginning of the Universal Rule of Rome (264-146)								
	264-241. FIRST PUNIC WAR. Carthaginians led by Hamilcar, father of Hannibal.	260. First Roman fleet built. Victory at sea. SCIPIO AFRICANUS. ARCHIMEDES (287-212).	262. Antigonos took Athens. End of its independence and political importance.	255. Antigonos liberates Athens. Athens joins the Achean League.	261. Revolt of Parthians from Seleucid rule. Parthian kingdom formed.					
250	256. Regulus invades Africa and is defeated by Xanthippus, a Spartan general.									
	241. Peace with Carthage. The ceded parts of Sicily formed the first Roman province there.	241. The Roman fleet under Catulus defeats the Carthaginians off the Ægæan Islands.	227. War between Cleomenes, King of Sparta, and the Ætolian league.				247-30. Ptolemy III., Euergetes. Extended his empire by conquests in Mesopotamia, Babylonia, Persia, Susiana, and Media, and extends his influence as far as Thrace and Macedonia.	250-248. Arsaces I. founds the kingdom of Parthia, having killed Agathocles, and expelled the Macedonians.		250
	238. HAMILCAR begins establishment of Carthaginian power in Spain.									
	HANNIBAL (247-183).		226. Athens freed from Macedonia allied with			The Jews				

225	<p>221. Hannibal succeeds Asdrubal in the command.</p>	<p>224. The Romans first cross the Po.</p> <p>219. Hannibal takes Saguntum and crosses the Alps.</p>	<p>Rome.</p>		<p>223. ANTIOCHUS III., the Great, ruled Syria, Phoenicia to Egypt.</p>	<p>remained</p> <p>subject</p> <p>to</p> <p>Egypt</p> <p>down</p> <p>to</p> <p>B. C.</p> <p>203,</p> <p>in</p> <p>comparative</p> <p>peace.</p>		<p>221-210. China: Chi-Huang-Ti, first universal emperor. GREAT WALL BUILT.</p>	225
	<p>218-201. SECOND PUNIC WAR. Hannibal crossed the Alps.</p>	<p>217. Romans defeated at Lake Trasimeno.</p> <p>216. Romans at Cannæ totally defeated by Hannibal. Fabius Maximus, Dictator.</p> <p>215. Treaty between Hannibal and Philip V. of Macedonia.</p> <p>214-205. FIRST WAR WITH MACEDONIA.</p> <p>212. Syracuse taken by Marcellus. Archimedes killed.</p> <p>211. Capua taken by the Romans.</p> <p>209. Publius Scipio takes New Carthage.</p> <p>207. Nero and Livy defeat Hasdrubal at the Metaurus—Hasdrubal killed. Here it was decided that the civilization of the world was to be Roman rather than Carthaginian.</p> <p>206. The Carthaginians defeated in the battle of Ilipa and driven out of Spain.</p>	<p>211. Alliance of Rome, the Ætolians, Spartans, Eleans and Illyria.</p>	<p>211. The Ætolians secure the alliance of Rome against the Achæans and the Macedonians.</p> <p>207. Battle of Mantinea: Philopœmen, the general of the Achæan League, defeats the Spartans.</p>	<p>217. Antiochus III. defeated by Ptolemy Philopater in the battle of Raphia.</p> <p>212-206. 		decisive victory at Xeres, 712, in which Rhoderic, the last of the Goths is killed. END OF GOTHIC MONARCHY OF SPAIN.	712. Constantine opposes the emperor Philippicus Bardanes in the question of the Monothelite heresy. 712-744. Luitbrand, a great and virtuous prince. Luitbrand takes advantage of the civil broils in Italy, captures Ravenna and several cities from the pope.			712. India: Abab conquest begins.
725		713-714. Tarik and Musa complete the conquest of Spain. The Christians maintain themselves in the Asturias and Navarre.	715. Death of Pipin, succeeded after a long struggle by his son. 715-741. CHARLES MARTEL. Complete master of the French monarchy. 720-729. The Arabs invade France, but are several times defeated and driven back by Eudes, Duke of Aquitaine.	715. Pope GREGORY II. engages in controversy with the Emperor Leo the Isaurian over image-worship. 722. Boniface consecrated bishop of Germany. 730. Gregory excommunicates the emperor. 731. Pope GREGORY III.	718-741. Leo III., the Isaurian. 726. Edict forbidding image worship.	
750		739. Alfonso founds the kingdom of Leon which maintains its independence till 1230.	732. Charles Martel gains the decisive victory of Tours which saves the liberties and religion of Europe. Carlovingian Dynasty	749-756. Aistulf. 752. He defeats the Greek exarchs, and demands a tribute from Rome.		720. India: Parsees settle at Bombay. 750. Savage civil wars among Saracens. Caliphate of Bagdad under the Abbasides (750-1258).
	755-794. Offa, King of Mercia, overthrows the armies of Sussex, Kent, Wessex and founds the Abbey of Bath and of St. Albans.	755-1031. Caliphate at Cordova. 755-787. Abderrahman having escaped from Bagdad, wrests Spain from the caliphate of the Abbassides—establishes a military government.	754-756. Pipin makes two expeditions into Italy and bestows the exarchate upon the pope, thus laying the foundation of the temporal power of the Papacy. END OF THE GREEK EXARCHATE	756. Commencement of the pope's temporal power under the auspices of Pipin, who bestows on Stephen the exarchate of Ravenna. Didier, the last king, quarrels with Pope Adrian, 772, at whose request Charlemagne crosses the Great St. Bernard from Geneva, takes Pavia, dethrones Didier, and thus, 774, ENDS THE KINGDOM OF THE LOMBARDS which had lasted 206 years. 768. Pope STEPHEN III. 772. Pope HADRIAN I., whom Charlemagne confirms in possession of Pipin's donation.	756. The exarchate of Ravenna lost. 755. Saracen Empire divided. Abderrahman, escaped to Spain, and founded there the	
775			768-814. CHARLEMAGNE, and Carloman, the former one of the greatest monarchs, becomes sole ruler upon the death of Carloman, 771.	768. Pope STEPHEN III. 772. Pope HADRIAN I., whom Charlemagne confirms in possession of Pipin's donation.	756. Caliphate of Cordova. 762. Bagdad becomes the seat of Caliphs the center of commerce, and rises to great opulence and splendor.	763-80. China: Incessant Tartar invasion.
	789. First landing of Northmen in Britain.	791-842. Alphonso II., the Chaste, defeats and expels the Arabs, who invade his dominions, and from this time may be dated the real <i>independence of the Christians.</i>		787. The seventh general council at Nice, in which the doctrine of the Iconoclasts was condemned. 795. Pope LEO III. Image-worship condemned by Synod of Frankfort.	786. Haroun-al-Raschid, Caliph at Bagdad. The Empire broke into a number of separate States at his death. <i>Arab art flourishing, and Arab civilization at its zenith.</i>	
800			800. Charlemagne or Charles the Great crowned Emperor by Pope Leo III. The Holy Roman Empire founded. It included all France, Germany, Spain to the Ebro, Italy to Benevento, several isles of the Mediterranean, and the greater portion of Pannonia.	801. Negotiations with Charlemagne respecting a marriage with him and a union of the two empires. 802. Irene is deposed by Nicephorus, and banished to Lesbos—died 803. 802-811. Nicephorus. 803-806. The Saracens defeat the Greeks, ravage Asia Minor, capture Cyprus, and compel Nicephorus to pay a tribute. 811. Nicephorus is defeated and killed by Crunnus, King of the Bulgarians.	797-802. Irene reigns alone, after killing her own son. 801. Negotiations with Charlemagne respecting a marriage with him and a union of the two empires. 802. Irene is deposed by Nicephorus, and banished to Lesbos—died 803. 802-811. Nicephorus. 803-806. The Saracens defeat the Greeks, ravage Asia Minor, capture Cyprus, and compel Nicephorus to pay a tribute. 811. Nicephorus is defeated and killed by Crunnus, King of the Bulgarians.	794. Japan: Kioto becomes the capital. 800-855. India: Rise of the Rajput states.
	802. Egbert, King of Wessex.		806. Charlemagne divides the empire between his three sons, two of whom die, 810, 811. 808. Descent of the Normans or Northmen upon France. Many bishoprics founded—Great increase of monastic institutions. 813. National assembly at Aix. Louis co-ruler. Charlemagne dies there 814. 814-840. Louis, the Pious, crowned emperor at Rheims, 816, by Pope Stephen IV. 817. Louis divides the empire between his three sons, and, 823, a fourth, Lothaire, is associated in the empire. 820. Second invasion of the Normans.	802-811. Nicephorus. 803-806. The Saracens defeat the Greeks, ravage Asia Minor, capture Cyprus, and compel Nicephorus to pay a tribute. 811. Nicephorus is defeated and killed by Crunnus, King of the Bulgarians. 813-820. Leo, the Armenian. 820-829. Michael II., the Stammerer. 823. Crete lost to the Arabs, and Sicily to the African Aglabites.	813-833. Mamun. The reign of this prince may be regarded as the Augustan period of Arabian literature. Immediately after the reigns of Haroun-al-Raschid and Mamun the power of the caliphs began to decline. 827. Saracens landed in Sicily and gradually conquered it. 833. El Motassem, Caliph. <i>Struggle with Byzantine Empire continued throughout the century. Mohammedan rule firmly established in Egypt.</i>	
825		827. Egbert becomes king of all England. 837. Ethelwolf succeeds to the throne.	830. Rebellion of Louis's three sons, and succession of quarrels between them till Louis's death—Field of lies at Alsace, 833—Louis is deposed, but soon restored. 841. Battle of Frontenai between Lothaire, Charles and Louis; Louis is defeated.	829-842. Theophilus. 837. Wars with the Saracens.	827. Saracens landed in Sicily and gradually conquered it. 833. El Motassem, Caliph. <i>Struggle with Byzantine Empire continued throughout the century. Mohammedan rule firmly established in Egypt.</i> 840. Arabs sailed up the Tiber to Rome. Sacked St. Peter's and St. Paul's.	

	842. Ramiro I., King of Orildo.	843. PARTITION OF THE CARLOVINGIAN EMPIRE AT VERDUN, <i>when properly begins the history of France, Germany and Italy as separate states.</i> The Treaty of Verdun was originally merely a family contract, made without regard to national differences. In Louis' kingdom, however, the German element was in the majority; in that of Charles the Romance element prevailed. Thus there developed, in the course of the following centuries, from the East Frankish element the German, from the West Frankish the French nationality. The East Franks called their language, in contrast to the Latin used by the educated clergy, the deutsche, i. e. the language of the people, and gradually those who spoke Deutsche came to be called Deutsche, or German.	842. Empress Theodora restores image worship.		Gwalior to the Himalayas.									
	844. Irruption of the sea kings.	<table border="1"> <thead> <tr> <th>France</th> <th>Germany</th> <th>Italy</th> </tr> </thead> <tbody> <tr> <td>843-987. A. D.	Spain	Franks and Germans	Italy and Church
625	623. The Greeks expelled from Spain.	<i>The power of the mayors of the palaces increases by their being appointed regents over the countries conquered by Clotaire.</i> 628-633. Dagobert I., King of all the Frankish realms. 633. Death of Dagobert I., and long minority rule of his sons. 636-687. Continued decline and final decay of the Merovingians.	625-638. Honorius I. Much money spent in building churches. <i>Africa and Asia, with the churches of Jerusalem, Alexandria, and Antioch, lost to the Christian world by the progress of Mohammedanism.</i> 636-652. Rotharis. <i>Legislation of Rotharis and gradual formation of the Italian language.</i> Invasion of the Slavs, who are repulsed. 649. POPE MARTIN I.
650	638. Council of Toledo; decree against the Jews.		662. Grimoald, Duke of Benevento, comes to aid Gondebert, but kills him and seizes the crown. 664. Roman Christianity triumphs in England at the Council at Whitby.
675		687-714. Pipin, Mayor of the Palace. The Alemani, Bavarians, Frisons, Thuringians and Saxons, while France is occupied with the dissensions of the mayors of the palace, shake off the Frankish yoke.	680-681. The sixth general council at Constantinople condemns the Monothelites. 697. Venice begins to have its Doges.
700	711. Tarik lands at Gibraltar, gains a decisive victory at Xeres, 712, in which Rhoderic, the last of the Goths is killed. END OF GOTHIC MONARCHY OF SPAIN. 713-714. Tarik and Musa complete the conquest of Spain. The Christians maintain themselves in the Asturias and Navarre.	715. Death of Pipin, succeeded after a long struggle by his son. 715-741. CHARLES MARTEL. Complete master of the French monarchy. 720-729. The Arabs invade France, but are several times defeated and driven back by Eudes, Duke of Aquitaine.	710. Emperor Justinian II. confirms the Roman See in its privileges. 712. Constantine opposes the emperor Philipppicus Bardanes in the question of the Monothelite heresy. 712-744. Luitbrand, a great and virtuous prince. Luitbrand takes advantage of the civil broils in Italy, captures Ravenna and several cities from the pope. 715. Pope GREGORY II. engages in controversy with the Emperor Leo the Isaurian over image-worship. 722. Boniface consecrated bishop of Germany.

725			730. Gregory excommunicates the emperor. 731. Pope GREGORY III.
739. Alfonso founds the kingdom of Leon which maintains its independence till 1230.		732. Charles Martel gains the decisive victory of Tours which saves the liberties and religion of Europe.	
750		Carolingian Dynasty	749-756. Aistulf.
		751. With Pipin the Short (741-768), Charles Martel's son, the Carolingians became kings of the Franks.	752. He defeats the Greek exarchs, and demands a tribute from Rome.
		754-756. Pipin makes two expeditions into Italy and bestows the exarchate upon the pope, thus laying the foundation of the temporal power of the Papacy.	END OF THE GREEK EXARCHATE
755-1031. Caliphate at Cordova. 755-787. Abderrahman having escaped from Bagdad, wrests Spain from the caliphate of the Abbassides—establishes a military government.		768-814. CHARLEMAGNE, and Carloman, the former one of the greatest monarchs, becomes sole ruler upon the death of Carloman, 771.	756. Commencement of the pope's temporal power under the auspices of Pipin, who bestows on Stephen the exarchate of Ravenna. Didier, the last king, quarrels with Pope Adrian, 772, at whose request Charlemagne crosses the Great St. Bernard from Geneva, takes Pavia, dethrones Didier, and thus, 774, ENDS THE KINGDOM OF THE LOMBARDS which had lasted 206 years. 768. Pope STEPHEN III.
775			772. Pope HADRIAN I., whom Charlemagne confirms in possession of Pipin's donation. 787. The seventh general council at Nice, in which the doctrine of the Iconoclasts was condemned. 795. Pope LEO III. Image-worship condemned by Synod of Frankfurt.
791-842. Alphonso II., the Chaste, defeats and expels the Arabs, who invade his dominions, and from this time may be dated the real <i>independence of the Christians.</i>			
800		800. Charlemagne or Charles the Great crowned Emperor by Pope Leo III. The Holy Roman Empire founded. It included all France, Germany, Spain to the Ebro, Italy to Benevento, several isles of the Mediterranean, and the greater portion of Pannonia. 806. Charlemagne divides the empire between his three sons, two of whom die, 810, 811. 808. Descent of the Normans or Northmen upon France. Many bishoprics founded—Great increase of monastic institutions. 813. National assembly at Aix. Louis co-ruler. Charlemagne dies there 814. 814-840. Louis, the Pious, crowned emperor at Rheims, 816, by Pope Stephen IV. 817. Louis divides the empire between his three sons, and, 823, a fourth, Lothaire, is associated in the empire. 820. Second invasion of the Normans.	
825		830. Rebellion of Louis's three sons, and succession of quarrels between them till Louis's death—Field of lies at Alsace, 833—Louis is deposed, but soon restored. 841. Battle of Frontenai between Lothaire, Charles and Louis; Louis is defeated.	
842. Ramiro I., King of Orildo.		843. PARTITION OF THE CARLOVINGIAN EMPIRE AT VERDUN, <i>when properly begins the history of France, Germany and Italy as separate states.</i> The Treaty of Verdun was originally merely a family contract, made without regard to national differences. In Louis' kingdom, however, the German element was in the majority; in that of Charles the Romance element prevailed. Thus there developed, in the course of the following centuries, from the East Frankish element the German, from the West Frankish the French nationality. The East Franks called their language, in contrast to the Latin used by the educated clergy, the deutsche, i. e. the language of the people, and gradually those who spoke Deutsche came to be called Deutsche, or German.	
		France	Germany
		843-987. Carolingian Kings of France.	843-911. Carolingians in Germany.
844. Irruption of the sea kings.		843-877. Charles the Bald obtains France; boundaries: the Meuse, Saone, Rhone Scheldt and Ebro.	843-876. Louis the German obtains Germany to the Rhine, with Mayence, Spire and Worms.
			Italy
			843-875. Carolingians in Italy. 843-855. Lothaire, Emperor, obtains Italy and Lotharingia, or Lorraine.
		<i>The power of the monarchs declines, and the nobles become independent. The empire by the almost universal system of division and subdivision, is broken up into an immense number of feudal states.</i>	

NOTE: The comparative outline of the History of Nations is continued by Table IX.

EGYPT'S STORY SCULPTURED IN ETERNAL ROCKS

[342]

THE SPHINX AND PYRAMIDS AT GIZEH

This most mysterious of all Egyptian sculptures stands near the Second Pyramid. The body of the Sphinx is one hundred and fifty feet long, its paws are fifty feet and its height is seventy feet (See page 351).

This wonderful temple at Abu-Simbel in Nubia is the most northerly of a group of three, but is separated from the others by a deep ravine. It was dedicated to the goddess Hathor, and built by

ISRAEL IN EGYPT—From a Painting by Sir Edward J. Poynter

This picture portrays the hardships of the enslaved peoples in Pharaoh's time. Not only the Israelites but the Egyptians as well were forced into service to build the great Pyramids to immortalize Egypt's rulers.

EXTINCT NATIONS OF THE PAST

THE SPELL OF EGYPT: ANCIENT AND MODERN

For hoary antiquity, for the massive and sublime, for the quaintly picturesque, Egypt stands unrivalled in the world,—the region where the Pharaohs reigned, where Moses grew from birth to manhood, where Joseph came forth from a dungeon to rule in wisdom at the king's right hand, and whence the chosen people of God went out into the wilderness towards the promised land.

THE BEGINNINGS OF THE OLDEST CIVILIZATION

When the Egyptians first appear on the page of history they are already possessed of a marvelously advanced civilization, extending back thousands of years before the even remote period of the pyramid builders. Long before the chosen people, the Hebrews, came into possession of the promised land of Canaan, Egypt had kings, priests, cities, armies; laws, temples, learning; arts and sciences and books. Egypt is, beyond all other lands, the land of ruins, surpassing all in gigantic and stately monumental remains, the result of immense human labor.

HOMELAND OF THE EGYPTIANS

Egypt proper occupies little more than twelve thousand square miles. Including the oases in the Libyan Desert, the region between the Nile and the Red Sea, and El-Arish in Syria, but excluding the Sudan, the area is about four hundred thousand square miles.

In ancient as in modern times Egypt was always divided into the Upper and Lower, or the Southern and the Northern country; and at a very early period it was further sub-divided into a number of *nomes*, or departments, varying in different ages. It is practically confined to the bed of the flooded Nile, a groove formed by its waters in the desert; and the bordering desert and the southern provinces of Nubia, Khartum and others, toward the equator form no part of the Egypt of nature or of history, though from time to time they have been politically joined to it. Without the Nile Egypt would never have existed; and therefore a brief account of this wonderful river is very important.

THE LIFE GIVING RIVER NILE

Though the longest river in Africa, the Nile has little historic interest above Khartum, where the White Nile and Blue Nile unite their waters. Below Khartum navigation is rendered extremely dangerous by the cataracts which obstruct the bed of the river, the sixth occurring not far north of Khartum, the first near Assuan, in Egypt. The Nile enters the Mediterranean by a delta which separates into two main channels, the Rosetta and the Damietta, which are intersected with canals. The valley of Upper Egypt is narrow, and the fringe of mountains on either side are of no great height, so that the landscape varies but little and might appear to be monotonous but for the rich and wondrous coloring of all the scenery, the vivid green of the fields, the rich red-brown of the river, the bright yellow of the rocks, with overhead a deep blue sky and brilliant sunshine. The river flows into Egypt proper north of the second cataract, a little south of Wadi-Halfa. The Blue Nile joins the river at Khartum; this stream brings down an immense quantity of red mud. The cataracts are six in number.

[344]

THE NILE'S ANNUAL OVERFLOW

The important feature of the river is its annual inundation. At the end of May the river is at its lowest level, it rises gradually in June and continues rising until the middle of September; it then remains stationary from two to three weeks, rising again until the end of October; it is then at its highest level and begins gradually to fall, until by May it is once more at its lowest. The river rises from twenty-one to twenty-eight feet; when it did not reach this level the crops failed, and when it exceeded it, the land was overflowed and ruin faced the people. Nowhere in the world is there such a large population depending solely on the produce of the soil.

THE RISE OF IRRIGATION BEGINS WITH THE NILE

As the climate is exceedingly dry, irrigation became as early as the second dynasty (about 4514 B. C.) an object of national importance. All through the ages can be marked the tireless persistence and mechanical ingenuity employed in the problems of irrigation. During the nineteenth century, Mehemet Ali Pasha began a gigantic system of canals and locks and weirs. A French engineer of great ability, Mougel Bey, was employed to carry out this difficult task; his great barrage across the Nile, at the apex of the delta, is still a very impressive work; unfortunately the system was a failure. Later British engineers undertook the management of irrigation, and in 1902 the Nile dam, at the head of the first cataract above Assuan, was completed. The dam is such a height that the beautiful temples on the islet of Philæ are partially submerged; and during several months of the year the ruins are no longer visible.

EGYPTIAN LAKES, CLIMATE AND OASES

The chief lakes of Egypt, from west to east are Mareotis, Edku, Burlus, and Menzala; these lie only a few miles from the coast and are shallow and brackish. The seven famous natron lakes lie in a valley in the desert, eighty miles from Cairo. In the province of the Fayum is the Birket-el-Kerum, thirty miles long and five miles wide, forming the remains of the ancient Lake Moeris, which Herodotus believed to have been artificially constructed.

The climate is extremely dry. Egypt lies in an almost rainless area. The days are warm and the nights are cool. January is the coolest month. On the coast rain falls during the winter months, but snow is unknown. In Sinai, snow occasionally falls during the winter, and heavy storms of rain occur, which occasionally flood the rocky ravines. One interesting feature of the climate is the continuous north wind, which blows throughout the year, and the sailing boats are thus able to ascend the Nile against the strong current. During the spring the Kamsin occurs, a hot, dry south wind laden with sand, forming a yellow stifling fog almost obscuring the sun; it lasts from one to three days.

There are five large oases or fertile places in the western desert—Siwa, Baharia, Kharga, Dakla, and Farafra. These have been occupied since 1600 B. C. Kharga possesses a temple of Ammon, built by the Persian conqueror, Darius I., and also other interesting ruins of the time of the Ptolemies. Siwa contains the oracle temple of Jupiter Ammon, consulted by Alexander the Great. The town is built on the rocks and has the appearance of a fortress.

ANCIENT POPULATION OF EGYPT

The population of the country must have been large at the earliest period, as one hundred thousand men were employed in the construction of the Great Pyramid alone during the fourth dynasty, nearly 3600 years B. C. It has been placed at seven million under the Pharaohs, distributed in eighteen hundred towns, which had increased to two thousand under Amasis (525 B. C.), and upwards of three thousand under the Ptolemies. In the reign of Nero it amounted to seven million eight hundred thousand. In 1707 it was eleven million, one hundred and forty thousand in Egypt proper, or, including Nubia and other dependencies nearly twenty millions.

TITANIC IRRIGATION DAMS OF MODERN EGYPT

[345]

THE BARRAGE AT ASSIOUT ACROSS THE NILE

This dam, though not so large as that of Assuan, is still a gigantic structure. It is over half a mile in length and its massive wall is pierced by one hundred and ten bays or sluices, each over sixteen feet in width.

This is a view of the great dam at Assuan, across the Nile in upper Egypt, showing the ruins of the beautiful Temple of Philæ partially submerged. The Assuan dam was the largest in the world until the completion of the Elephant Butte dam, New Mexico, in May, 1916.

HOW WE KNOW THE HISTORY OF EGYPT

Until the last century, what we knew about ancient Egypt was mainly obtained from Greek and Roman historians. At the present time our knowledge of the "land of pyramids and priests" has been greatly increased by the deciphering of the inscriptions on the monuments, and by extended observation of the countless sculptures in which the olden Egyptians have recorded their ways of life, their arts, arms, sciences, religion and customs. In carving or in painting, the obelisks, the temple walls, and temple columns, the inner walls of tombs, the coffins of the dead, artistic objects—all are covered with the strange characters known as hieroglyphics.

THE STORY OF THE HIEROGLYPHICS

This word, of Greek extraction, means "sacred carvings," given to the sculptures in the supposition that all such characters were of religious import, and known only to the priests of ancient Egypt. The meaning of the characters had been lost for hundreds of years, and the word "hieroglyphics" had long become proverbial for mysteries and undecipherable puzzles, when a keen-eyed Frenchman put into the hands of scholars the clew to their translation.

DISCOVERY OF THE ROSETTA STONE

An artillery officer of Napoleon's army in Egypt, named Bouchart, discovered near Rosetta, in 1799, an oblong slab of stone engraved with three inscriptions, one under the other. The upper one (half of which was broken off) was in hieroglyphics, the lowest one was in Greek, and the middle one was stated in the written characters of the country. The Greek inscription told scholars that all three inscriptions expressed a decree of the Egyptian priests, sitting in synod at Memphis, in honor of King Ptolemy V.

Hieroglyphs are representations on stone, wood, or papyrus, of objects or parts of objects, including heavenly bodies, human beings in various attitudes, parts of the human body, quadrupeds and parts of quadrupeds, birds and parts of birds, fishes, reptiles, etc., geometric and fantastic forms, amounting in all to about a thousand different symbols.

More than six hundred are ideographic (idea-writing); i. e., the engraved or painted figure, either directly or figuratively conveys an idea which we express by a word composed of alphabetic signs. Thus, directly, the figure of a man means "man;" figuratively the same figure means "power."

PHONETIC HIEROGLYPHICS

About one hundred and thirty of the hieroglyphs are phonetic (sound-conveying); i. e., represent words (which are nothing but sound with a meaning attached thereto) of which the first letter is to be taken as an alphabetic sign, and thus phonetic hieroglyphs answer the same end as our letters of the alphabet. For example: in ideographic writing, a bird, a mason, a nest, mean "birds build nests;" in phonetic hieroglyphic the figures of a bull, imp, rope, door and ship would give the word "birds," and the words "build" and "nests" would be expressed in the same round-about and clumsy fashion.

THE HISTORY OF EGYPT

From the old Greek writers and from records of the monuments we have a fairly complete story of this wonderful country and people.

FIRST MONARCH OF THE OLD KINGDOM

The first king of Egypt, Menes, whose date is set at 3400 years before Christ, is said to have founded the city of Memphis, near the site of the modern Cairo, which became the capital of Egypt; Thebes, in Upper (or Southern) Egypt, afterwards taking this position.

The building of the Great Pyramid at Gizeh, near Cairo, is ascribed to a king named Cheops (*kē'ops*) by Herodotus, otherwise called Khufu (*kōō'fōō*), according to the hieroglyphic royal name found inside the structure. He is believed to have reigned about the twenty-eighth century before Christ. Cheops was the second and most celebrated monarch in the fourth of the dynasties which ruled at Memphis. The third king in this list, Khafra (*kha'f rā*) also founded a pyramid, as did the fourth, Menkaura (*men-kā-rā*) or Nycerinus, a sovereign beloved and praised in poetry for his goodness. His mummified remains are in the British Museum. In the sixth dynasty was a female sovereign noted for her beauty, named Nitocris, who built a pyramid and reigned at Memphis. The monarchy then was for some time divided, the chief power being held by the kings ruling at Thebes, in Upper Egypt, who developed great power, and constructed many notable works.

THE INVASION AND RULE OF THE SHEPHERD-KINGS

About 1800 B. C. the Hyksos or Shepherd-kings, said to be of Arabian race, conquered Lower Egypt, and then subdued the kingdom of Thebes, ruling the whole land down to 1580 B. C. Probably to this period the story of Joseph in Egypt belongs. The shepherd-kings were expelled with the aid of the Ethiopians from the south, and then came the great period of Egyptian history. During this time, Egypt was a great empire with Thebes for its capital. Under Thutmose III., Amenhotep III. and IV., and Seti I., Egypt rose to great heights of development and art.

GREAT EPOCH OF RAMESES II.

The greatest monarch of this, or perhaps of any, age of Egypt's history was Rameses the Great (called by the Greeks, Sesostris). To him have been attributed many of the monuments and pictures which represent triumphal processions and captives. Rameses the Great reigned for nearly seventy years in the fourteenth century before Christ. Among his many monuments two are chiefly remarkable, the Memnonium or palace-temple at Thebes, and the great rock-cut temple of Abu-Simbel in Nubia. These architectural works possess an interest more historical than that of the pyramids. He is said to have subdued Ethiopia, carried his arms beyond the Euphrates eastward, and among the Thracians in southeast Europe. The monumental sculptures and paintings tell us of war-galleys of Egypt in the Indian seas, and of Ethiopian tribute paid in ebony and ivory and gold, in apes and birds of prey, and even in giraffes from inner Africa. Other sculptures display the Egyptians fighting with success against Asiatic foes. To this monarch was due a vast system of irrigation by canals for conveying the waters of the Nile to every part of the country.

The next sovereign of note was Sheshanq (*Shi'shak*), who, in the latter part of the tenth century before Christ, took and plundered Jerusalem. The empire continued to decline, and was entirely reduced by Esarhaddon and Ashurbanipal, and became for a time tributary to the Assyrian monarchs. In the early part of the reign of the king Psametik I. (653-610 B. C.)

IMPORTANT REIGN OF PSAMETIK I. FOLLOWS AN AGE OF DECAY

We find Egypt in connection, for the first time in its history, with foreign countries, otherwise than as conquering or conquered. Psametik I. (653-610 B. C.) had in his pay a body of Greek mercenaries, and sought to introduce the Greek language among his subjects. In jealousy at this, the great military caste of Egypt emigrated into Ethiopia, and left the king dependent on his foreign troops, with whom he successfully warred in Syria and Phœnicia, and likewise succeeded in making Egypt independent of Assyria.

Neku, son of Psametik (610-595 B. C.), was an enterprising prince, who built fleets on the Red Sea and the Mediterranean, and strove to join the Nile, by a canal, with the Red Sea. Africa was circumnavigated by Phœnicians in his service, who sailed from the Arabian Gulf, and passed round by the Straits of Gibraltar to the mouths of the Nile. He was the king who defeated Josiah, king of Judah, sustaining afterward defeat from Nebuchadnezzar II., king of Babylon, at Carchemish.

In 590 B. C., came Apries (the Pharaoh-Hophra of Scripture), who conquered Sidon, and was an ally of Zedekiah, king of Judah, against Nebuchadnezzar. After being repulsed with severe loss in an attack on the Greek colony of Cyrene, west of Egypt, Apries was dethroned by Aahmes II., who reigned from 570 to 526 B. C. His prosperous rule was marked by a closer intercourse with the Greeks.

EGYPT IS CONQUERED BY PERSIA

Psametik III., son of Aahmes, inherited a quarrel of his father with Cambyses, king of Persia, who invaded and conquered Egypt in 525 B. C. For nearly two centuries afterwards the history of Egypt is marked, disastrously, by constant struggles between the people and their Persian conquerors, and, in a more favorable and interesting way, by the growing intercourse between the land of the Nile and the Greeks. Greek historians and philosophers—Herodotus and Anaxagoras and Plato—visited the country, and took back stores of information on its wonders, its culture, and its faith.

CONQUERED BY ALEXANDER THE GREAT AND PASSES UNDER GREEK RULE

In 332 B. C., Egypt was conquered by Alexander the Great; and its new capital, the great Alexandria, destined to a lasting literary and commercial renown, was founded. Subsequently it passed under Greek rule, and the language of the government, and the administration and philosophy, became essentially Greek. The court of the Ptolemies became the center of learning and philosophy; and Ptolemy Philadelphus, successful in his external wars, built the Museum, founded the library of Alexandria. He purchased the most valuable manuscripts, engaged the most celebrated professors, and had the Septuagint translation made of the Hebrew Scriptures, and the Egyptian history of Manetho drawn up. His successor, Euergetes, pushed the southern limits of his empire to Axum. Philopator (221-204 B. C.) warred with Antiochus, persecuted the Jews, and encouraged learning. Epphanes, (204-180 B. C.) encountered repeated rebellions and was succeeded by Philometor (180-145 B. C.) and Euergetes II. (145-116 B. C.), by Soter II. and Cleopatra till 106 B. C., and by Alexander (87 B. C.), under whom Thebes rebelled; then by Cleopatra, Berenice, Alexander II. (80 B. C.), and Neos Dionysus (51 B. C.) and finally by the famous Cleopatra who maintained her power only through her personal influence with Julius Caesar and Mark Antony.

EGYPT BECOMES A ROMAN PROVINCE

On the defeat of Mark Antony by Augustus, B. C. 30, Egypt became a province of Rome. It was still a Greek state, and Alexandria was the chief seat of Greek learning and science. On the spread of Christianity the old Egyptian doctrines lost their sway. Now arose in Alexandria the Christian catechetical school, which produced Clemens and Origen. The sects of Gnostics united astrology and magic with religion. The school of Alexandrian Platonics produced Plotinus and Proclus. Monasteries were built all over Egypt; Christian monks took the place of the pagan hermits, and the Bible was translated into Coptic.

[348]

PASSES UNDER MOHAMMEDAN RULE

On the division of the great Roman Empire (A. D. 395), in the time of Theodosius, into the Western and Eastern Empires, Egypt became a province of the latter, and sank deeper and deeper in barbarism and weakness. It was conquered in 640 A. D. by the Saracens under Caliph Omar. As a province of the caliphs it was under the government of the celebrated Abbasides—Haroun-al-Rashid and Al-Mamun—and that of the heroic Sultan Saladin. The last dynasty was, however, overthrown by the Mamelukes (1250); and the Mamelukes in their turn were conquered by the Turks (1516-17). The Mamelukes made repeated attempts to cast off the Turkish yoke, and had virtually done so by the end of the eighteenth century, when the French conquered Egypt and held it till 1801, when they were driven out by the British.

BECOMES A PAWN OF TURKEY, FRANCE AND ENGLAND

On the expulsion of the French a Turkish force under Mehemet Ali Bey took possession of the country. Mehemet Ali was made pasha, and being a man of great ability, administered the country vigorously and greatly extended the Egyptian territories. At length he broke with the Porte, and after gaining a decisive victory over the Ottoman troops in Syria in 1839 he was acknowledged by the sultan as viceroy of Egypt, with the right of succession in his family.

By the Anglo-French agreement of 1904 France formally recognized the predominant position of Great Britain, and agreed in no way to obstruct British action in the government of Egypt. The European War of 1914-1916 has again thrown Egypt into the balance, and its political future seems to be entirely a matter of the fortunes of war and diplomacy.

EGYPTIAN GOVERNMENT AND CIVILIZATION

At an early period the form of government in Egypt became an hereditary monarchy, of a peculiar kind. The power of the king was restricted by rigid law and antique custom, and by the extraordinary influence of the priestly class. The soil was held by the priests, the warriors, and the king.

Their Kings.—The Egyptian monarchs appear to have used their authority well and wisely; we rarely hear of insurrection or rebellion, and many received divine honors after death for their beneficence and regal virtues. The common title "Pharaoh" is derived from the Egyptian word "Phra," the sun.

Social Castes.—The body of the people were divided into castes, not rigidly separated, as in India. The members of the different orders might intermarry, and the children pass from one caste to another by change of the hereditary occupation. The castes were: (1) priests; (2) soldiers; (3) husbandmen; (4) artificers and tradesmen; (5) a miscellaneous class of herdsmen, fishermen and servants. The priests and warriors ranked far above the rest in dignity and privilege.

The Priests.—The hierarchy in Egypt was the highest order in power, influence and wealth. To the priestly caste, however, many persons belonged who were not engaged in religious offices. They were a landowning class, and the solely learned class. In their possession were all the literature and science of the country, and all employments dependent, for their practice, on that knowledge. The priesthood thus included the poets, historians, lawyers, physicians, and the magicians who did wonders before Moses. They paid no taxes, had large landed possessions, exercised immense influence over the minds of the people, and put no slight check even on the king.

Soldiers and Warriors.—Egypt had an army of over four hundred thousand men, mainly composed of a militia supported by a fixed portion of land (six acres per man), free from all taxation. The chariots and horses were famous: the foot-soldiers were variously armed with helmet, spear, coat of mail, shield, battle-axe, club, javelin and dagger, for close fighting in dense array; and with bows, arrows and slings for skirmishing and conflict in open order. The soldier was allowed to cultivate his own land when he was not under arms, but he could follow no other occupation.

The Lower Castes.—The castes below the warriors and priests had no political rights, and could not hold land; to-wit, The husbandmen who tilled the soil paid rent in produce to the king or to the priests who owned it; and the artisan class, which included masons and the usual tradesmen, whose occupations are recorded upon the monuments. The herdsmen were the lowest class, and of these the swineherds were treated as outcasts, not permitted to enter the temples, or to marry, except among themselves.

RELIGION OF THE EGYPTIANS

In Egypt, life was the thing sacred. Hence all that had life, all that produced and all that ended life, was in a way divine. Hence death, too, was sacred. The Egyptian lived in the contemplation of death. His coffin was made in his lifetime; his ancestors were embalmed. The sovereign's tomb was built to last for, not centuries, but thousands of years.

The highest form of the religious belief of the Egyptians included the idea that the soul was immortal. In the religion of Egypt were united the worship of Nature, and of the spirit which underlies and animates Nature.

The Egyptian Gods.—Having depended on the Nile and the Sun for the vegetation needed for their food, the people conceived human forms for them, and for the prolific Earth, as deities; namely, Osiris as the Nile and the Sun, and Isis as the Earth. These were the only divinities that were worshipped throughout Egypt. In later times they came to be regarded as divinities of the sun and the moon.

Another god, Anubis, worshiped in the form of a human being with the head of a dog, is represented as an Egyptian Hermes.

Whatever higher religious ideas may have been held by learned priests, the worship of the common people was chiefly adoration of animals. The sacred bull, called Apis, was worshipped at Memphis with the highest honors. All Egypt rejoiced on his annual birthday festival, and there was a public mourning when he died. The dog, the hawk, the white ibis, and the cat, were also specially revered. The sparrow-hawk, with human head and outspread wings, denoted the soul flying through space, to animate a new body. Thus we find mingled, in the religion of Egypt, gross superstition in the masses of the people, along with the spiritual conceptions of cultivated minds.

[349]

The Future Life.—In a papyrus-book, discovered in the royal tombs of Thebes, called the Book of the Dead, we read in pictured writing of a second life, and of a Hall of Judgment, where the god Osiris sits, provided with a balance, a secretary, and forty-two attendant-judges. In the balance the soul is weighed against a statue of divine justice, placed in the other scale, which is guarded by the god Anubis. The assistant-judges give separate decisions, after the person on trial has pleaded his cause before them. The soul rejected as unworthy of the Egyptian heaven was believed to be driven off to some dark realm, to assume the form of a beast, in accordance with a low character and sensual nature. An acquitted soul joined the throng of the blest.

Embalming.—The religion of the people was connected with the practice of embalming the bodies of the dead. This art seems to have derived its origin from the idea that the preservation of the body was necessary for the return of the soul to the human form after it had completed its cycle of existence of three or ten thousand years. The art appears as old as 4000 B. C., at least, for the bodies of Cheops, Mycerinus, and others of the age of the fourth dynasty, were embalmed.

EGYPTIAN ARCHITECTURE AND SCULPTURE

The chief feature of Egyptian architecture is its colossal, massive grandeur, from the use of enormous blocks of masonry, and from the vast extent of the buildings, which produce in the beholder an unequalled impression of sublimity and awe. The approaches to the palaces and temples were paved roads, lined with obelisks and sphinxes; and the temples and the palaces themselves surpassed in size, and in elaborate ornament of sculpture and of painting, all other works of man.

The Pyramids.—Of about forty pyramids now left standing in Middle Egypt, the most remarkable are the group of nine at Gizeh, near the site of ancient Memphis. The removal of the vast blocks of stone from distant quarries, and their elevation to heights, which have sorely puzzled modern engineers, were effected, not by the ingenuity of mechanical contrivance, but by the lavish use of human labor. Thousands of men were employed for months in moving single stones.

The Temple Columns.—Egyptian columns were formed by their architects on the model of the palm-tree, whose feathery crown of foliage was ever before their eyes, or of the full-blown or budding papyrus. We find constantly in the mural decorations the figure of the famous lotus-plant, or lily of the Nile, beheld by the Egyptians with veneration, and used in sculpture and in painting as no mere ornament, but as a religious symbol. This water-lily of Egypt was consecrated to Isis and Osiris, and typified the creation of the world from water. It also symbolized the rise of the Nile and the return of the sun in his full power.

SCULPTURE AND PAINTING

Egyptian sculpture displays size, simplicity, stiffness, and little of what modern art calls taste or beauty. Neither did the Egyptians become true artists of the pictorial class. They used simple colors of brilliant hue; but of light and shade only little was known; and of perspective, nothing.

Their monuments prove, however, that they practiced the same mechanic arts, and used the same variety of tools, as the moderns. They were adepts at the finest work in every species of handicraft. We have here ample proof that the ancient Egyptians were a highly ingenious, artistic, tasteful, and industrious race.

CITIES AND HISTORIC MONUMENTS

The land of Egypt, teeming with population, abounded in cities and towns. Of these the greatest were Thebes, in Upper Egypt, and Memphis, in Middle Egypt, whose site was near the modern Cairo.

Abu-Simbel (*ā' hōō-sim' bel*) on the Nile, in Lower Nubia is the site of two very remarkable rockcut temples, among the most perfect and noble specimens of Egyptian architecture. Here there is no exterior and constructed part; the rock out of which they have been excavated rises too near the river. Still the temples have their façade, as richly decorated and as monumental in its character as those of the most sumptuous edifices of Thebes.

The colossal statues here, instead of being isolated monoliths, are a part of the façade itself, hewn out of the rock, though still forming part of it. The façade of the smaller temple, that of Hathor, is eighty-eight feet long and thirty-nine feet high. It has six colossal figures, about thirty-two feet high, of which four represent Rameses, and the other two his wife, Nefert-Ari. The façade of the great temple is larger, being one hundred and twenty-six feet long and ninety-three feet high.

Most striking are the four colossal figures of Rameses, two to the right, two to the left of the door. These are the largest figures of Egyptian sculpture, being sixty-six feet high. Everywhere are pictures like those at Luxor and Karnak, representing the battles and triumphs of Rameses.

Abytos (*a-bī' dōs*), next to Thebes the most important city in the ancient kingdom of Upper Egypt. Here was found, 1817, in a corridor of the temple of Seti I. a very important tablet giving a succession of sixty-five kings beginning with Menes, covering a period of about 2,200 years. A similar tablet containing eighteen names, found in the temple of Rameses in 1818, was removed by the French consul-general, sent to Paris, and finally purchased for the British Museum.

Alexandria, the third capital of Egypt, was founded by Alexander the Great in the autumn of the year 332 B. C. It was situated originally on the low tract of land which separates the lake Marcotis from the Mediterranean, about fourteen miles west of the Canopic mouth of the Nile. Before the city, in the Mediterranean, lay an island, upon which stood the famous lighthouse, the Pharos, built in the time of Ptolemy I. in the third century B. C, and said to have been four hundred feet high. The island was connected with the mainland by a mole, thus forming the two harbors.

[350]

The most magnificent quarter of the city, called the Brucheion, contained the palaces of the Ptolemies, the Museum, for centuries the focus of the intellectual life of the world, and the famous library; the mausoleum of Alexander the Great and of the Ptolemies, the temple of Poseidon, and the great theater.

To the south was the beautiful gymnasium. The Serapeum, or temple of Serapis, stood in the Egyptian quarter.

Much of the space under the houses was occupied by vaulted subterranean cisterns, which were capable of containing a sufficient quantity of water to supply the whole population of the city for a year.

From the time of its foundation, Alexandria was the Greek capital of Egypt. Its population in the time of its prosperity, amounted to about three hundred thousand free citizens, and probably a larger number of slaves. This population consisted mostly of Greeks, Jews and Egyptians, together with settlers from all nations of the known world.

After the death of Alexander the Great, Alexandria became the residence of the Ptolemies. They made it, next to Rome and Antioch, the most magnificent city of antiquity, as well as the chief seat of Greek learning and literature.

Alexandria had reached its greatest splendor when, on the death of Cleopatra, the last of the Ptolemies, in 30 B. C, it came into the possession of the Romans. Its glory was long unaffected, and it was the emporium of the world's commerce.

In the reign of Caracalla, however, it suffered severely. The strife between Christianity and heathenism in the third century—powerfully described in Kingsley's Hypatia—gave rise to bloody contests in Alexandria. The rise of Constantinople only served to hasten its fall. The choice of Cairo as capital of the Egyptian caliphs hastened the now rapid decay of the city; the discovery of America, and of the passage to India by the Cape of Good Hope, very much diminished its trade; and when, in 1517, the Turks took the place, the remains of its former splendor wholly vanished.

Under Mehemet Ali, however, the tide turned, and the city recovered rapidly. It is now again one of the most important commercial places on the Mediterranean with a population of about three hundred and fifty thousand. The Suez Canal diverted part of its trade; but this was more than compensated by the general impetus given to Egyptian prosperity.

Of the few remaining objects of antiquity the most prominent is Pompey's Pillar, as it is erroneously called. Of the so-called Cleopatra's Needles—two obelisks of the sixteenth century B. C. which long stood here—one was taken to England and erected on the Thames Embankment, London, 1878; and the other, presented by the khedive to the United States, was set up at New York in 1881.

Assuan or Assouan (*ās-swān*), the ancient Syene is the southernmost city of Egypt proper, on the right bank of the Nile, and beside the first or lowest cataract. It is noted for its granite, and was the place of banishment of Juvenal, the Roman poet. Here also is the great Nile irrigation system, begun in 1898, including a dam at Assuan and another at Assiout (two hundred and fifty miles nearer Cairo). The Assuan dam, finished in 1902 was designed to raise the level of the Nile for one hundred and forty miles above the first cataract. Its total length is one and one-quarter miles, the maximum height from the foundation about one hundred and thirty feet and the total weight of masonry over one million tons.

The difference of level of the water above and below is sixty-seven feet, and navigation is provided for by a series of four locks, each two hundred and sixty feet by thirty-two feet. The dam is pierced with one hundred and eighty openings, twenty feet by six feet, capable of discharging fifteen thousand tons of water per second. The reservoir, when opened, held something over one thousand million tons of water.

In 1907 the level was raised by twenty-three feet, steps being taken to preserve (as far as is consistent with partial submersion) the ruins of the temples on the island of Philæ within the area of the dam. Barrages at Zifteh and at Esneh help to regulate the flow.

Cairo (*kī' rō*).—The present capital of Egypt, is situated one mile east of the Nile. It has important transit trade, and is the starting-point for tours to neighboring pyramids, the sites of Memphis and Heliopolis, and the upper Nile. Its chief suburb is Bulak. It was founded by the Fatimite caliphs about 970, and made the capital. It was taken by the Turks in 1517, was held by the French 1798-1801, and was occupied by the British in 1882. It was the scene of the massacre of the Mamelukes in 1811.

There are about four hundred Mosques, some having six minarets, and adorned with beautiful granite columns, brought from Heliopolis and Memphis. About twenty deserve notice as works of art. The largest mosque is El Azhar, at the center of the city, regarded as a University for all Islam. The next in size is that of Sultan Hasan, in the Roumeyleh square, the finest structure in modern Egypt, and extremely light and elegant. It is built in the form of a parallelogram, and has a deep frieze running round all the wall, adorned with Gothic and Arabesque sculpture.

Other noticeable Mosques are the Tomb-Mosque of Kait Bey, built about 1470, one of the finest pieces of architecture in Cairo; and the Mosque of Amra, the oldest mosque in Egypt (founded 643 A. D.), and a remarkable Mohammedan monument.

The Citadel, or fortified Palace, erected by Saladin in 1176, was the only place of defence in the city; it fell into ruin, but was thoroughly repaired by a late pasha. Formerly it included a magnificent hall, Saladin's Hall, environed with twelve columns of granite, of prodigious height and thickness, brought from the ruins of Alexandria. These supported an open dome, under which Saladin distributed justice to his subjects.

The view embraces the city, and above thirty miles along the Nile, including the ruins of Old Cairo, site of Memphis, great Pyramids, Obelisk of Heliopolis, and Pyramids of Sakkara. The Khedive resides at the Abdin and Kubbeh Palaces.

The street scenes of Cairo are of inexhaustible interest and amusement; civilization and semi-barbarism constantly jostle, the garb of the east perpetually comparing, in the season, with the toilettes of London, Berlin and Paris; refinement and coarseness, culture and ignorance, Mohammedanism, paganism, Christianity, every tint of skin, all conceivable phases of existence, present themselves in the throng of a Cairo street.

Gizeh or Ghizeh (*gē' zē*) is situated on the Nile about three miles west-southwest of Cairo. The Gizeh group consists of the Great Pyramid, the second and third pyramids, and eight small pyramids.

THE GREAT PYRAMIDS is the tomb of the Pharaoh Khufu (Cheops), of the fourth dynasty. Its original height was four hundred and eighty-one feet (present height, four hundred and fifty-one), and the original length of the sides at the base, seven hundred and fifty-five. It is built of solid masonry in large blocks, closely fitted, with use of mortar. The exterior forms a series of steps, which were originally filled with blocks of limestone accurately cut to form a smooth slope. The entrance, originally concealed, is on the north side, forty-five feet above the base and twenty-four feet to one side of the center. The passage slants downward for three hundred and six feet; but the corridor, slanting upward to the true sepulchral chambers, soon branches off from it. A horizontal branch leads to the queen's chamber, about eighteen feet square, in the center of the pyramid, and the slanting corridor continues in the Great Gallery, one hundred and fifty-one feet long, twenty-eight feet high, and seven feet wide, to the vestibule of the king's chamber, which is thirty-four and one-half feet long, and seventeen feet wide, and nineteen feet high, and one hundred and forty-one feet above the base of the pyramid. It contains a plain, empty sarcophagus.

[351]

SECTIONAL VIEW OF THE GREAT PYRAMID OF CHEOPS OR KHUFU

This cross-section clearly exhibits the known passages within the seven million ton monument, which for six thousand years has stood to commemorate Cheops (See page 350).

[Large image](#) (518 kB)

THE SECOND PYRAMID, or pyramid of Chephren (Khafra), was originally four hundred and seventy-two feet high and seven hundred and six feet in base-measurement. It has two entrances, and interior passages and chambers similar to those of the Great Pyramid. It retains at the top, part of its smooth exterior casing.

THE THIRD PYRAMID, that of Menkaure, was two hundred and fifteen feet high, and three hundred and forty-six feet to a side at the base. The entrance-passages and sepulchral chambers are similar to those of the other pyramids. All three were built by the fourth dynasty. Temples, now ruined, stand before the eastern faces of the second and third pyramids.

SPHINX (*sfin'gks*).—This celebrated figure is a quarter of a mile southeast of the Great Pyramid. According to present opinion, it is older than any of the pyramids. It consists of an enormous figure of a crouching sphinx of the usual Egyptian type, hewn from the natural rock, with the flanks and cavities filled in with masonry. The body is one hundred and forty feet long; the head measures about thirty feet from the top of the forehead to the chin, and is fourteen feet wide. Except the head and shoulders, the figure has for ages generally been buried in the desert sand.

Between the paws were found an altar, a crouching lion with fragments of others, and three large inscribed tablets, one, fourteen feet high, against the Sphinx's breast, and the two others extending from it on each side, thus forming a sort of shrine. The Sphinx was a local personification of the sun-god.

Heliopolis (*hē-li-op' ō-lis*) the City of the Sun, or On—the oldest, perhaps, in this land of antiquities—was a sort of sacerdotal and university town, where Herodotus sought the wisest men in Egypt. Here Plato is said to have graduated. Here also lived Potiphar, who bought Joseph the patriarch. It consisted for the most part of temples and colleges; of which nothing now remains but a few isolated mounds, and one extremely ancient Obelisk. At the village of Metariyeh is reputed to be the place where the Virgin, St. Joseph and the infant Jesus stopped, under a sycamore.

[352]

Memphis (*mēm' tis*) after the fall of Thebes, became the capital of Egypt, and kept its importance till the conquest by Cambyses. It was built by Menes on the western bank of the Nile, south of Cairo. It suffered from the Hyksos, and was captured by the Assyrians and stormed by Cambyses. It continued to exist under the Roman Empire, but was gradually abandoned and ruined after the Mohammedan conquest in the seventh century A. D. The ruins of Sakkara are near it. The desert sands have overwhelmed its famous avenue of sphinxes; and the great Pyramids of Gizeh, and the colossal Sphinx, are the chief memorials of the past in its vicinity.

Although various opinions have prevailed as to their use, the Pyramids were really nothing more than the tombs of monarchs of Egypt who flourished from the first to the twelfth dynasty. With the exception of some very late pyramids in Nubia, none were constructed after the twelfth dynasty; the later kings were buried at Abydos, Thebes, and other places, in tombs of a totally different construction.

Thebes (*thēbz*) is the No or No Ammon of Scripture, and is situated on the Nile opposite Karnak and Luxor. It was at the height of its splendor, as capital of Egypt from about 1600 to 1100 B. C. Its vastness is shown by the existing remains, known (from the names of modern villages) as the ruins of Karnak, Luxor, etc. They consist of obelisks, sphinxes, colossal statues, temples, and tombs cut in the rock,—mighty monuments, with their countless sculptured details and inscriptions, themselves the historians of the Egyptian Empire of three thousand years ago. It was enriched by the spoils of Asia and the tributes of Ethiopia, and its fame and reputation had reached the early Greeks. At the Persian conquest in the sixth century B. C. Cambyses destroyed many of its noblest monuments.

At the present day the glory of Thebes consists in its ancient temples. Of these the best known are the El Kurna, the Rameseum and Medinet-Abu temples, founded by Seti I., Rameses II., and Rameses III. respectively. To Amenhotep III. are ascribed two temples on the west side of the city, as also the well-known temple at Luxor.

LUXOR (*luk' sor*).—The present front of the latter temple was preceded, at the end of a great dromos of sphinxes leading to Karnak, by two beautiful obelisks of red granite, one of which still remains, and the other stands in the Place de la Concorde, Paris.

Before the large double gateway of the court are two colossal seated statues. The court is surrounded by a double range of columns. Beyond, the avenue to the buildings of Amenhotep makes a sharp angle and meets the gateway of the court, which is surrounded by a double colonnade. The buildings behind the court contain a great number of chambers and an isolated sanctuary, all profusely sculptured and colored.

KARNAK (*kār' nak*).—The temple here originally founded in the twelfth dynasty, owes much of its magnificence to later kings. The Great Temple extends to a length of about twelve hundred feet from west to east, and is comparatively regular in plan. The double gateway of the great court is about three hundred and seventy feet wide; the court is colonnaded at the sides, and has an avenue of columns in the middle.

A second gateway follows, and opens on the famous hall, one hundred and seventy by three hundred and twenty-nine feet, with central avenue of twelve columns sixty-two feet high and eleven and one-half feet in diameter, and one hundred and twenty-two columns forty-two and one-half feet high at the sides. A narrow court follows, ornamented with figures and containing two obelisks.

Behind this building is another large open court, at the back of which stands the edifice of Thothmes III., an extensive building containing a large hall and many comparatively small halls and chambers.

The mural sculptures are vast in quantity, and highly interesting in character, particularly those which portray the racial characteristics of various conquered Asiatic peoples.

Suez (*sōō-ēz*).—A seaport of Egypt, situated at the head of the Gulf of Suez, is best known as the southern terminus of the Suez Canal. It was the ancient Arsinoë and the terminus of an ancient canal built by the Egyptian king, Rameses II., between the Nile delta and the Red Sea. This, having been allowed to fill up and become disused, was reopened by Darius I. of Persia. It was once more cleared and made serviceable for the passage of boats by Arab conquerors of Egypt.

In 1841 the French diplomat Lesseps set himself to study the isthmus of Suez thoroughly, and in 1854 he managed to enlist the interest of Said Pasha, khedive of Egypt, in his scheme for connecting the Mediterranean with the Red Sea.

Two years later the Porte granted its permission and the Universal Company of the Maritime Suez Canal was formed, receiving important concessions from the ruler of Egypt. The work was begun in 1859, and in 1869, the canal was duly opened for vessels. Between 1885 and 1889 the canal was enlarged and improved, and altogether over one hundred million dollars were spent in its construction. The total length is one hundred miles; the width of the water-surface was at first one hundred and fifty to three hundred feet, the width at the bottom seventy-two feet, and the minimum depth twenty-six feet. At Port Said two strong breakwaters, six thousand nine hundred and forty and six thousand and twenty feet long respectively, were run out into the Mediterranean; at Suez another substantial mole was constructed.

The making of the canal was facilitated by the existence of three or four valleys or depressions (formerly lakes), which, when the water reached them, became converted into lakes. Immediately south of Port Said the canal crosses Lake Menzaleh (twenty-eight miles long); and three more—Lake Ballah, Lake Timsah (five miles long), and the

Bitter Lakes (twenty-three miles) are traversed to the south of it. The highest point or elevation that was cut through does not exceed fifty feet above sea-level. At intervals of five or six miles sidings or side-basins are provided to enable vessels to pass one another. By 1890 the canal had been deepened to twenty-eight feet, and widened between Port Said and the Bitter Lakes to one hundred and forty-four feet, and from the Bitter Lakes to Suez to two hundred and thirteen feet.

In 1875 Lord Beaconsfield, Prime Minister of England bought for the British Government the khedive's shares—nearly half the canal stock—for \$20,500,000. They are now valued at about \$150,000,000, and bring in over \$5,000,000 annual revenue.

From Suez there is a tourist route to Mount Sinai, near the coast, under the range called Jebel-et-Tih past Elim, Pharaoh's Quarries, and Rephi-dim. The Sinai District comprises Mount Horeb, the Valley of Jethro, Church of the Burning Bush, Chapel of Elijah, and other historical sites. Thence it leads to Akabah, and up the deep pass of Wady Moosa, to Mount Hor (or Petra), Zoar, and Mount Seir, Beersheba and Hebron. (See [Holy Land](#)).

[353]

GREAT ASSYRIAN MONARCH, ASHURBANIPAL, AS A LION HUNTER

This famous conqueror was one of the most enlightened of Assyrian rulers. He encouraged literature, and through his wise counsels the annals of Babylonia and Assyria, written on clay tablets, have been preserved for us in the library of his palace. From these we have learned practically all we know of Babylonian-Assyrian history and religion.

BABYLONIA—ASSYRIA

In the very first ages of the world, Babylonia, with Egypt, led the way as the pioneers of mankind in the arts of civilization. Alphabetic writing, astronomy, history, chronology, architecture, plastic art, sculpture, navigation, agriculture, textile industry, all had their origin in one or other of these two countries.

GEOGRAPHY AND PHYSICAL FEATURES OF THE REGION

The ancient kingdom of Babylonia was bounded on the east by Elam or Susiana; on the south by the Persian Gulf; on the west by the deserts of Arabia; and on the north by Assyria. It was watered by two streams, the Tigris and the Euphrates, and it was intersected by a number of canals, branching out from these great rivers, and dug in order to save the country from the effects of the annual inundations.

From the head waters of the Tigris and Euphrates to the Persian Gulf is a distance of about eight hundred miles. The land included between the two rivers divides itself naturally into two parts.

The northern one of these, Assyria, is a great plain of limestone and selenite, in area almost equal to England. The northern and western portions of this plain are broken by mountains and are of a fertile character, as is also that part of Assyria which lies east of the Tigris.

The southern of the two principal parts, Babylonia, is of alluvial character, and in ancient times was about equal in area to the combined territory of Holland and Belgium or to the southern half of Louisiana, the latter a region to which it has been likened in character. On the east of the Tigris, the Babylonian plain stretches away for a distance of some thirty to fifty miles, to the mountains of Elam. On the west it merges into the Arabian desert, twenty or thirty miles from the Euphrates, where the low hills check the overflow of the river.

EARLY DIVISIONS AND FAMOUS CITIES OF BABYLONIA

Babylonia appears to have been divided into the two large provinces of Sumer or Shinar (South Babylonia), and Accad or north Babylonia. The capital of this latter province was, like Babylon, built on both banks of the Euphrates, the larger half being called Sippara of Samas, the sun-god (the modern Abu Habbā), and the smaller half Accad or Agade. The latter was afterwards named "Sippara of the moon-goddess." The greater part of Babylonia is now included in the modern Turkish province of Bagdad.

Ancient Babylonia also contained a number of other large cities and there was a succession of famous capitals: Babylon, of the Babylonian Empire, and afterwards of the Persian; Seleucia, founded by Seleucus, king of Syria, after the death of Alexander the Great; Ctesiphon, capital of the Parthian Empire; in modern times, Bagdad.

Babylon, on the Euphrates, is first mentioned in a tablet of 3800 B. C. From 2250 B. C. it became the capital of Babylonia and the holy city of western Asia. The name Babylonia is the Greek form of Babel, meaning "The Gate of the God." Its Persian name was Babirus. It was according to the accounts of Greek writers, the greatest city of antiquity.

Nebuchadnezzar, who took more pride in the buildings constructed under his auspices than in his victorious campaigns, concentrated all his care upon the adorning and beautifying the city. To this end he completed the fortification of the city begun by his father Nabopolassar, consisting in a double inclosure of mighty walls which were strengthened by two hundred and fifty towers and pierced by one hundred gates of brass. The city itself was adorned with numerous temples, chief among them Esagila ("the high-towering house"), temple of the city and of the national god Merodach (Babylonian *Marduk*) with his spouse Zirpanit. In the neighborhood of it was the royal palace, the site of which was identified with the ruins of Al-Kasr. Sloping toward the river were the Hanging Gardens, one of the seven wonders, the location of which is in the northern mound of ruins, Babel.

THE TOWER OF BABEL, which is supposed to be the temple of Nebo in Borsippa, not far from Babylon, represents the most imposing ruin of Babylonia. It is termed in the inscriptions *Ezida* ("the eternal house"), an ancient sanctuary of Nebo, and was restored with great splendor by Nebuchadnezzar. It represents in its construction a sort of pyramid built in seven stages, whence it is sometimes called "temple of the seven spheres of heaven and earth," and it is assumed that the narrative of the "Tower of Babel" which the builders intended to carry up to heaven, was connected with this temple.

In the conquest of Cyrus, 538 B. C., the city of Babylon was spared. Darius Hystaspis razed its walls and towers. Xerxes (486-465 B. C.) despoiled the temples of their golden statues and treasures. Alexander the Great wished to restore the city, but was prevented by his early death. The decay of Babylon was hastened by the foundation in its neighborhood of Selencia, 300 B. C., which was built from the ruins of Babylon. The last who calls himself in an inscription "King of Babylon" was Antiochus the Great (223-187 B. C.)

EARLY HISTORY RIVALS THAT OF EGYPT

It is now evident, from the monuments and inscriptions which have been obtained from the traditionally oldest cities, that the civilization of the ancient people of Babylonia has an antiquity rivaling that of ancient Egypt. The American discoveries at Nippur in 1888-90 carry back Babylonian civilization to about 7000 B. C.

The early struggles for supremacy among the city states seem to have been confined to the lower valley of the Tigris and Euphrates; but about 4000 B. C. a mighty conqueror, Lugalzaggisi of Uruk, made expeditions to the Mediterranean and to the mountains at the north of Mesopotamia. He styled himself "King of Uruk," "King of the Totality."

Very early, however, a Semitic invasion must have taken place, for the date of two Semitic kings, namely, Sargon I. and Naram-Sin, of Accad, is placed, according to the testimony of the later Babylonians themselves, at about B. C. 3800 and 3750 respectively. Gudea, the priest-king, and a famous builder, was the chief ruler about 2800 B. C.

GREAT PERIOD OF HAMMURABI

About B. C. 2250 Hammurabi sat upon the throne of Babylon, the name of which now first appears in cuneiform records, although it may have been founded centuries before. This great monarch, Hammurabi, has left records of his enlightened efforts for the agricultural development of the land, and a great law code, cut in the enduring rock, which carries our knowledge of the history of law back a thousand years before the age of Moses. As yet no inscription has been discovered giving the details of his wars; but it is evident that he destroyed the Elamite power in Babylonia, and his assumption of the ancient titles "King of Sumer and Accad," "King of the Four Quarters of the World," seems to indicate that his power extended far. In Larsa and Sippar he erected temples to the sun-god, and at Babylon and Borsippa he enlarged those already standing. His great canal running down through the heart of Babylonia made the bordering territory fertile; and the granary built at Babylon stored the increased crops of grain. It may be that Lugalzaggisi and Sargon I. exceeded Hammurabi in the extent of their sway, but Hammurabi made Babylon the center of culture for southwestern Asia during millenniums.

After him we know little of the history until Burnaburiash, a Hassite king who was on the throne about 1400 B. C., exchanged letters with Amenhotep III. of Egypt as recorded in the Tel-el-Amarna Letters.

About 1250 B. C. Babylonia was conquered by Assyria, and, though it soon regained its independence and was again ruled by native kings, it remained a politically subordinate power, and was repeatedly conquered by its more powerful neighbor, until the fall of Nineveh, consequently we must now consider Assyria, as the successor of the first Babylonian Empire, and go back a little into its history up to the time of Tiglath Pileser I., the conqueror of old Babylon.

[355]

THE TOWER OF BABEL RESTORED

This model of the famous "tower that reached to Heaven" was constructed by Sir Henry Rawlinson after years of study and exploration. The drawing, by O. Schulz, is now in the United States National Museum at Washington, D. C.

II. THE ASSYRIAN EMPIRE

Assyria proper, as heretofore stated, was a table-land, bounded on the north by part of Armenia; on the east by that part of Media which lies towards Mt. Zagros; on the south by Elam or Susiana and part of Babylonia; and on the west by the river Tigris, or later by the Chaboras, a branch of the Euphrates. The greater part of the ancient kingdom of Assyria is now contained in the modern province of Kurdistan. In size it may be compared to Great Britain.

DIVISIONS AND CITIES OF ASSYRIA

It was divided into seven provinces, and contained many great cities, of which the chief after Nineveh, the capital, were Asshur, which alone stood on the west bank of the Tigris, Calah, Dur-Sargon, Arbela, Tarbisi. The ruins of many cities are grouped around Nineveh; while lower down the Tigris is exhibited an almost unbroken line of ruins from Tekrit to Bagdad.

Nineveh was situated on the eastern bank of the upper Tigris opposite the modern Mosul, two hundred and thirty miles northwest of Bagdad. The ruins of the original capital, Asshur, now called Kalah Sherghat, are some sixty miles south. Nineveh, Calah (Nimrud), and Dur-Sargon (Khorsabad), ultimately supplanted it in importance. When Nineveh itself fell, the whole Assyrian empire—essentially a military power—perished with it. It was not until the excavations of Botta in 1842 and Layard in 1845 that the remains, first of Dur-Sargon, then of Nineveh itself, were revealed to the world.

As a result of these excavations, the general outline of the city, the remains of four palaces and numerous sculptures, and thousands of tablets (principally from the so-called library of Ashurbanipal) were discovered. The greater part of these is now in the British museum. The city had a circumference of from seven to eight miles, the ruins of the walls showing a height in some parts of fifty feet. Shalmaneser I. built a palace at Nineveh and made it the city of his residence. Samsi-ramman III. decorated and restored the temple of Ishtar, famous for a special phase of the cult of the goddess. For a time Nineveh was neglected, but Sennacherib (705-681 B. C.), was a special patron of Nineveh. He surrounded it with a wall, replaced the small palace at the northeast wall by a large one, built another palace which he filled with cedar wood and adorned with colossal bulls and lions, and beautified the city with a park. Esarhaddon finished a temple, widened the streets, and beautified the city, forcing the kings whom he conquered to furnish materials for adorning the city and palaces. Nineveh succumbed to the combined attack of the Medes under Cyaxares and the Babylonians under Nabopolassar in 608 B. C.

In its times of prosperity, Assyria extended its borders on every side; and the Greeks and Romans often included the whole of Syria and of the regions watered by the Euphrates and the Tigris under the name.

Assyria and the neighboring provinces were celebrated for their great fertility; they were the original home of wheat and barley, and the date-palm grew there to perfection. The irrigation of the crops was ensured by the annual overflow of the Tigris.

EARLY ASSYRIAN HISTORY SHOWN BY THE INSCRIPTIONS

The Assyrian kingdom first began to be powerful about 1350. Shalmaneser I. had become so powerful that he invaded and captured Babylon about 1250 B. C. His descendant in the direct line of kings was Tiglath-Pileser I., about 1100 B. C., the real founder of the first Assyrian empire, whose reign forms the zenith of the early empire. He spread the dominion of Assyria over all western Asia, from the frontiers of Elam to the shores of the Mediterranean, and from the slopes of the mountains of Armenia to the shores of the Persian Gulf. He captured Babylon, Sippara, and reduced Babylonia to the position of a tributary state. On the west he advanced as far as Khilikki (Cilicia), defeated the Hittites, captured their stronghold Carchemish, and received the homage of the people of Arvad and the cities of northern Phœnicia.

[356]

SECOND IMPORTANT DYNASTY ESTABLISHED

In 960 B. C. a new dynasty was founded by Assur-dân II., whose son Rimmon-nirari II., and great-grandson Asshur-nasirpal, by a long series of cruel wars once again extended the power of Assyria. The extensive trade carried on by Phœnician merchants in Assyria at this time is largely illustrated by the Phœnician bronzes and ivories disinterred in the palace of Asshur-nasirpal at Nimrud.

His son, Shalmaneser II., was successful in war against the monarch of Babylon, Benhadad, king of Damascus, the rulers of Tyre and Sidon, and Jehu, king of Israel. In 745 B. C., Tiglath-Pileser II. became king of Assyria, made himself master of Babylon, and had great successes in war against Syria and Armenia, extending the empire greatly.

REIGN OF SARGON THE ASSYRIAN

Sargon (722-705 B. C.) was engaged in war against Samaria, which he captured, carrying the people into captivity; against King Sabako of Egypt, whom he defeated; and the revolted Armenians, whom he thoroughly subdued. He then turned against Merodach-Baladan, king of Babylonia, and drove him from his throne, and, after extensive internal reforms, was succeeded by his son, the famous Sennacherib.

ASSYRIA BEGINS PERIOD OF GREATEST SPLENDOR

This warlike monarch marched into Syria in 701 B. C., captured Sidon and Askelon, defeated the forces of Hezekiah, king of Judah, with his Egyptian and Ethiopian allies, and made Hezekiah pay tribute. In 700 B. C. Sennacherib marched into Arabia, there defeated Tirhakah, king of Egypt and Ethiopia, and then his army perished before Libnah, in the south of Judah, by the catastrophe recorded in the Hebrew Scriptures. Sennacherib was engaged, on his return to Assyria, in crushing rebellions of the Babylonians, constructing canals and aqueducts, and greatly adding to the size and splendor of Nineveh.

In 681 he was murdered by two of his sons, and another son, Esarhaddon, became king in 680. Esarhaddon made successful expeditions into Syria, Arabia, Egypt, and as far as the Caucasus Mountains, and after the erection of splendid buildings at Nimrud and other cities, was succeeded in 668 by his son Asshur-banipal (the origin of the Greek "Sardanapalus").

GREAT EXTENT OF THE EMPIRE AT ITS HEIGHT

The Assyrian Empire was at its height of power under the kings Sennacherib, Esarhaddon, and Asshurbanipal. The states nominally subject to the Assyrian king, paying tribute and homage, extended from the river Halys, in Asia Minor, and the seaboard of Syria, on the west, to the Persian Desert on the east; and from the Caspian and the Armenian Mountains, on the north, to Arabia and the Persian Gulf, on the south; and latterly included Egypt.

DECLINE AND FALL OF THE EMPIRE

Ashurbanipal inherited Egypt as part of his dominions, but his power was not firmly established in that country until he led an expedition there, and sacked the city of Thebes. He erected splendid buildings at Nineveh and Babylon, and did much for literature and the arts; so that under him there was a great development of luxury and splendor. He died in 625 B. C.; and soon afterwards Babylonia, for the last time, and with success, revolted. The Babylonians marched from the south against Nineveh, under their governor Nabopolassar; and the now powerful Medes, from the north, came against it under their king, Cyaxares. Nineveh was taken and given to the flames, which have left behind them in the mounds the calcined stone, charred wood, and statues split by the heat, that furnish silent and convincing proof of the catastrophe. Thus, about 625 B. C., warlike, splendid, proud Assyria fell, after which it became a Median province.

III. LATER BABYLONIAN EMPIRE

The founder of the later Babylonian Empire (625 B. C. and ending 538, with its subjection to Persia) was Nabopolassar, who joined the Medes in the destruction of the Assyrian power. Babylon then became an independent kingdom, extending from the valley of the Lower Euphrates to Mount Taurus, and partly over Syria, Phœnicia, and Palestine.

THE FAMOUS REIGN OF NEBUCHADNEZZAR

Nabopolassar was succeeded by his son, the famous Nebuchadnezzar (604 to 561 B. C.), who carried his arms with success against the cities of Jerusalem and Tyre, and even into Egypt. The empire was at its height of power and glory under him, and extended from the Euphrates to Egypt, and from the deserts of Arabia on the south to the Armenian Mountains on the north.

The carrying into captivity of the Jews by Nebuchadnezzar and the pride of his heart,—his image of gold in the plain of Dura, his fiery furnace, his strange madness, recovery, and repentance,—are well known from the account in the Hebrew Scriptures by the prophet Daniel.

Nebuchadnezzar was succeeded by his son Evil-Merodach, the friend of Jehoiachin, captive King of Judah. He was followed by Neriglissar, a successful conspirator against his power and life; and he in turn, after some years, was defeated and slain in battle against the Medes and Persians. The assassination, after a few months, of the tyrant Laborsoarchoch brought the last Babylonian monarch, Nabonidus, to the throne, in 555 B. C.

ALL OF BABYLON UNDER BELSHAZZAR

The Medes and Persians to the north had now become a formidable power, and in 540 the Persian king, Cyrus, marched against Babylon, and under its walls defeated Nabonidus, who fled to Borsippa, south of Babylon. The capital was held by a son of Nabonidus, who had been made co-king with his father,—Belshazzar. The revelries of this sovereign during the siege, the handwriting on the wall, and his death the same night, are given in the scriptural narrative of Daniel. The Babylonian Empire fell in 538 B. C., and became a province of the Persian Empire. The site of the great city of Babylon is now a marsh, formed by inundations of the river, due to the destruction of the embankments and the choking up of the canals.

[357]

IV. CIVILIZATION IN BABYLONIA AND ASSYRIA

COMMERCE AND MANUFACTURES.—The Babylonians were a commercial and luxurious people; the Assyrians were pre-eminently warlike. The position of the great city of Babylon

on the Lower Euphrates, near to the Persian Gulf, made it a great emporium for the trade between India and eastern Asia and western Asia, with the nearest parts of Africa and Europe. From Ceylon came ivory, cinnamon and ebony; spices from the eastern islands; myrrh and frankincense from Arabia; cotton, pearls, and valuable timber, both for ship-building and ornament, from the islands in the Persian Gulf. There was also a great caravan trade with northern India and adjacent lands, whence came gold, dyes, jewels, and fine wool.

MANUFACTURES.—The wealth of Babylon became prodigious and proverbial, and her commerce was, in large measure, due to ingenious and splendid manufactures. Carpets, curtains, and fine muslins, skilfully woven and brilliantly dyed, of elegant pattern and varied hue, were famous wherever luxury was known. The Babylonian gems in the British Museum display art of the highest order in cutting precious stones.

GOVERNMENT AND LEARNING.—The system of government was a pure despotism, with viceroys ruling the provinces under the monarch, who dwelt in luxurious seclusion from his people. The priests and learned men of Babylon were mainly Chaldeans.

There were astronomers or, more properly, astrologers, in several of the cities; and the towers, such as that of Babel, were probably both temples and observatories. The clearness of the sky and the levelness of the horizon on all sides favored the study of the stars, which was more closely connected with religion than any form of science. The Chaldeans worshipped the heavenly bodies. When Babylon was taken by Alexander the Great, in 331 B. C., there was found in the city a series of observations of the stars dating from 2234 B. C.

ARCHITECTURE AND ART.—Assyrian art must be considered great in architecture and sculpture. The emblematic figures of the gods show dignity and grandeur. The scenes from real life, of war, and of the chase, are bold and vivid; and in succeeding ages marked progress is shown in the acquirement of a more free, natural, life-like and varied execution, though the artists never learned perspective and proportion.

The Assyrians constructed arches, tunnels, and aqueducts; were skilled in engraving gems, and in the arts of enamelling and inlaying; made porcelain, transparent and colored glass, and even lenses; ornaments of bronze and ivory, bells, and golden bracelets and earrings of good design and workmanship, were all produced. In mechanics, and for measuring time, they used the pulley, the lever, the water-clock, and the sun-dial.

IMPLEMENTS AND METHOD OF WARFARE.—The implements and methods used in war, as the monuments show, included swords, spears, maces, and bows and arrows, as weapons of offence; cavalry and chariots for charging; movable towers and battering-rams for sieges; and circular intrenched camps as quarters for a military force.

RELIGION.—In common with all Semites, the Babylonians were exceedingly religious, and were consequently greatly in the power of their priests, through whom tithes and offerings to their numerous gods were made.

Their earliest chief divinity was apparently the god *Ea*, lord of the deep, possessor of unsearchable wisdom, and creator of all things. When, however, Babylon became the chief of the city states of Babylonia, *Merodach*, the god of that city, assumed the first place. He was a reflection of the sun, or the light of day, and was worshipped as he who constantly sought to do good to mankind. His chief title was *Bel*, (Baal of the Bible) "the Lord"; and his vast temples were maintained by the Babylonian kings with pride. The priests attached to this temple were richly endowed, and the maintenance of the worship involved a great outlay. The impression made by this temple and its worship on the Jews during their captivity is reflected in the account of Bel and the Dragon in the Old Testament.

The other gods of Babylonia would seem to have been the same as those of Assyria, which borrowed its religion, as well as its other culture, from Babylonia. *Asshur* was the chief god, and is always named first in the invocations of the kings. *Sin* was the moon-god, *Shamash* the sun-god, *Anum* the god of the sky, *Bel* the god of the earth, and *Ea* the god of the abyss and of profaned wisdom. *Rammanu* (the Biblical Rimmon) was the ruler of the weather, *Ishtar* (the Biblical Ashtoreth) the goddess of love, *Nebo* the god of learning, and *Nergal* the god of war and hunting. The Assyrian temples always contained statues of the gods or goddesses, and sometimes a particular statue was held in special veneration, as the *Ishar* of Nineveh, or the *Ishar* of Arbela; only two statues of a god have been discovered in modern times, namely the two limestone figures of Nebo, disinterred in a temple at Nimrud, and dating from the eighth century B. C. With regard to public worship, we know that constant sacrifices and libations were offered to the gods, images were carried in procession, and a highly organized and richly endowed priesthood existed. The building and maintenance of temples were among the chief functions of the king, who himself boasted of the title of high priest.

JERUSALEM, THE HOLY CITY OF THE JEWS

THE HEBREWS AND THE HOLY LAND—PALESTINE

The history and characteristics of the Hebrews are fully dealt with in the Old Testament, the important parts of which should be familiar to everyone.

They were a pure Semitic race, akin to the Phoenicians, Chaldeans, and Assyrians. The founder of the nation was Abraham, who, about the twenty-third century before Christ, removed from the plains of Mesopotamia to the land of Canaan, on the southeastern coast of the Mediterranean Sea. This land has since been variously named Palestine, Canaan, the Land of Israel, or the Holy Land, and was the scene of most of the great events of the Bible. Just as the old name Canaan denoted originally the low-lying country along the coast, so Palestine means literally "Land of the Philistines," and was not used of the inland districts before the time of the Romans.

THE UNIQUE SITUATION AND IMPORTANCE OF THE HOLY LAND

The whole region is practically an isolated oasis, with a productive climate due to proximity to the sea.

All communication between the Babylonians, the Chaldeans and the Assyrians on the one hand, and the Egyptians on the other, was by the way of Palestine. Thus the Holy Land was at the very center of the ancient world. It is this position with its fundamental significance in history which renders it unique among the lands of the earth. It has always been the refuge of the drifting populations of Arabia. Never sought for itself alone, except by the Crusaders, it has been over-run constantly by invaders from the north seeking Egypt, or by the return attack. Thus the Hittites, Ethiopians, Assyrians, Egyptians, Scythians, Parthians, Persians, Seljuk Turks, and Mongols in turn devastated it. Alexander passed through to Egypt in 322 B. C.; the wars of the Seleucids and Ptolemies passed over it; Pompey in 65 B. C. brought it under the Roman Empire; the Crusaders established themselves there from 1098 to 1187; Napoleon in 1799 abandoned his first ambition on its soil. Yet its destiny was typified by the Arab conquest in 634 A. D.; there is everything to attract the desert tribes, but nothing for others except the religious sentiment of Christians.

HISTORY OF THE HEBREWS OR ISRAELITES

The ancestors of the Israelites were certain of the pastoral tribes having their abode in the wild tracts to the south and east of Palestine. Their nearest kinsmen were Edom, Ammon, and Moab. About 2200 B. C. they migrated under their tribal chief, Abraham, from Haran in Mesopotamia into the land of Canaan. Here the tribes continued to lead a pastoral life, and ultimately, in the time of Jacob, a famine in the land of Canaan led to a fresh migration into Egypt. This movement is especially associated with the name of Joseph.

ISRAELITES UNDER THE EGYPTIANS

Here they obtained leave from Pharaoh to dwell in the land of Goshen, where their continued adherence to their own customs and pastoral life led them to be accounted barbarians by the cultured Egyptians. In Egypt a time of great oppression came upon the Hebrews, and they were subjected to the harshest treatment and repressive measures, induced by a fear lest they should ally themselves with Egypt's foes. Then there arose the figure of Moses, the great founder of both the religion and the law of Israel.

THE EXODUS UNDER MOSES

Moses was the son-in-law of a priest of Midian, and at Horeb (i. e. Sinai), the mountain of God, he heard the call of Yahweh (Jehovah), his father's God, to deliver Israel from the bondage of Egypt. He had much difficulty in rousing the enthusiasm of those he was sent to save, but ultimately the work was accomplished by means of the miracles wrought by Yahweh on behalf of his people. Moses led the Israelites to Mount Sinai, and here a covenant was solemnly made with Yahweh, and the new religion of Israel was inaugurated, a religion that may rightly be called new, because based upon a conception of the Deity, more spiritual than any which had yet been conceived. From Sinai they passed to the work of conquering Canaan for which they had set out. An attempt made at Kadesh on the southern frontier was unsuccessful, and they returned to the wilderness, for a time which according to the Biblical narrative made the whole period forty years.

THEY ENTER THE LAND OF CANAAN

During this time Moses died, and it was under Joshua that the entry into Palestine was finally made. The Canaanites were put down, but intermarriage between Hebrews and Canaanites was frequent. Hence came the ills of idolatry. The Israelites now settled down to an agricultural and commercial life, entering in many cases into treaties of friendship with their Canaanite neighbors. This weakened the bonds of union between the various tribes and might well have led to the ultimate fusion of the two races; but it was prevented by the rise from time to time of the Judges, who roused the dying ardor of the tribes and led them to the extermination of the enemies of Yahweh.

PERIOD OF THE JUDGES

Fifteen such heroes are named in the Book of Judges, from which book it will be seen how various were the enemies with which they had to contend. Their period shows a regular alternation of sin, punishment, and salvation. After Joshua, comes a long period of falling away, followed by the rise of Othniel who delivers Israel from the oppressions of Cushan of Mesopotamia, into whose hands they had been given. On his death, Israel again sins and is punished by Eglon, king of Moab. This time salvation comes through Ehud, but his death is followed by another relapse into idolatry, and so things continue. Among the rest of the "Judges," the most famous are Deborah the prophetess, and Barak, Gideon, Jephthah, Samson, and the prophet Samuel.

During this period Israel does not come at all into contact with the great kingdoms of the East. At the time of the Hebrew settlement in Palestine, the country was under the suzerainty of the Pharaohs, but it is probable that by this time the suzerainty was little more than a name. The conflicts were rather with their own kinsmen, the Moabites, Ammonites, and also the Midianites.

THE POWERFUL PHILISTINE TRIBES

The Philistines were among the most powerful opponents of Israel, and the story of Samson relates particularly to them. It was while suffering under defeat from this race that the Israelites cried for a king, not only that by this centralization of authority more head might be made against the invaders, but also that they might be like "all the other nations." Samuel the prophet, who was at that time their leader, reluctantly consented to accede to their desires and chose as their king Saul, the son of Kish.

HEBREW MONARCHY, UNDER SAUL, DAVID AND SOLOMON

The sole monarchy occupied three reigns, those of Saul, David, and Solomon. Saul reigned for nearly forty years, and, after wars with the neighboring Moabites, Edomites, Amalekites, and others, was defeated and driven to suicide by the powerful Philistines.

Saul's son-in-law, David, the son of Jesse, reigned also about forty years, and, having conquered Jerusalem from the Jebusites (1048 B. C.) made it the capital of his kingdom, the seat of the national government and religion. David was a warlike monarch, and conquered the Philistines, Moabites, Edomites, and Syrians, extending his power from the Red Sea to the Euphrates.

THE MAGNIFICENT REIGN OF SOLOMON

His son, Solomon, succeeded him, and also reigned forty years (977-937 B. C.). Then the Hebrew nation attained the height of its power, and he confirmed and extended the conquests of David. Solomon married a daughter of a Pharaoh, king of Egypt, formed an alliance with Hiram, king of Tyre, built the magnificent temple at Jerusalem, and made his kingdom the supreme monarchy in western Asia.

An extensive commerce was carried on by land and sea. Solomon's ships, manned by Phœnician sailors, traded to the farthest parts of the Mediterranean westward, and from ports on the Red Sea to southern Arabia, Ethiopia, and perhaps India. From Egypt came horses, chariots, and linen; ivory, gold, silver, peacocks and apes from Tarshish or Tartessus, a district in the south of Spain; and gold, spices, and jewels from Ophir, variously regarded as in southern Arabia, India, and eastern Africa, south of the Red Sea. The corn, wine and oil of Judæa were exchanged by Solomon for the cedars of Lebanon supplied by Hiram, king of Tyre.

[360]

DECLINE AND DIVISION OF THE MONARCHY

On the death of Solomon, in 975 B. C., the temporal glory of the Hebrews was eclipsed. Ten of the twelve tribes revolted against Solomon's son and successor, Rehoboam, and formed a separate kingdom of Israel, with Samaria as capital; while the tribes of Judah and Benjamin made up the kingdom of Judah, having Jerusalem for the chief city. The Syrian possessions were lost; the Ammonites became independent; commerce declined; idolatry crept in and grew; the prophets of God threatened and warned in vain; gleams of success against neighboring nations were mingled with defeat and disgrace suffered from the Edomites, Philistines, and Syrians, until, in 740 B. C., Tiglath-pileser II., king of Assyria, carried into captivity in Media the tribes east, and partly west, of the Jordan.

FALL AND CAPTIVITY OF ISRAEL

In 721 B. C., Sargon, king of Assyria, took Samaria, and carried away the people of Israel as captives beyond the Euphrates. The kingdom of Israel thus came to an end after a duration of about two hundred and fifty years.

In 713 B. C., Judah, under King Hezekiah, was attacked by Sennacherib, king of Assyria, and relieved by the destruction of the Assyrian army. A time of peace and prosperity followed, but in 677 the Assyrians again invaded the country, and carried off King Manasseh to Babylon.

FALL OF JUDAH AND BABYLONIAN CAPTIVITY

In 624 B. C., the good king Josiah repaired the temple and put down idolatry, but was defeated and slain by the Egyptian king Pharaoh-Necho, in 610. In 606 B. C., Nebuchadnezzar, king of Babylon, took Jerusalem, and made the king, Jehoiakim, tributary; on his revolt, Jerusalem was again taken, and ten thousand captives of the higher class were carried off to Babylon, with the treasures of the palace and temple. In 593 B. C., the Jewish king Zedekiah revolted from Nebuchadnezzar, who now determined to put an end to the rebellious nation. In 588 B. C., Jerusalem was taken and plundered; the walls were destroyed; the city and temple burned, and nearly the whole nation was carried away as prisoners to Babylon. For over fifty years the land lay desolate, and the history of the Hebrew nation is transferred to the land where they mourned in exile. Then were raised the voices of the prophets Jeremiah and Ezekiel and Isaiah, in their definite predictions of the Messiah.

The history of the Jews during the Babylonian captivity.

RETURN OF THE HEBREWS TO JERUSALEM

In 537 B. C., Cyrus the Great became monarch of the Persian Empire. He issued an edict in 536 B. C., by which the Jews were allowed to return to Jerusalem and rebuild their temple. Nearly fifty thousand Jews, chiefly of the tribes of Judah and Benjamin, went to the old home of their race under the command of Zerubbabel and Jeshua, taking with them many of the vessels of silver and gold carried away by Nebuchadnezzar. Zerubbabel was appointed governor of the land, now a dependency of the Persian Empire. In 519 B. C., the Persian king Darius Hystaspis confirmed the edict of Cyrus, and in 515 the Temple was completed and dedicated. The ten tribes disappeared at this time from history, such of them as returned to their land having united themselves with the tribe of Judah, and henceforth the Hebrews are called Jews and their country Judea.

THE JEWS UNDER EZRA AND NEHEMIAH

In the reign of the Persian king Artaxerxes more of the Jews emigrated from Babylonia to Judea under the command of Ezra, 458 B. C., and Ezra was governor of the land until 445.

Nehemiah was governor (with an interval) from 445 to 420, and under him the walls and towers of Jerusalem were rebuilt, and the city acquired something of its ancient importance. With 420 B. C. the history of the Jews ends, as far as the Scriptural narrative goes.

JUDEA BECOMES SUBJECT TO PERSIA

From 420 to 332, Judea continued subject to Persia, paying a yearly tribute, and being governed by the high priest, under the Satrap of Syria. In 332 B. C., Alexander the Great, then engaged in the conquest of the Persian Empire, visited Jerusalem, and showed respect to the high priest and the sacred rites of the Temple. In 330 the Persian Empire fell under the arms of Alexander, who died at Babylon in 323 B. C. Judea was taken possession of by Alexander's general, Ptolemy Lagus, and from 300 to 202 B. C. was governed by the dynasty of the Ptolemies, ruling Egypt, Petra and southern Syria. The government was administered by the high priests under the Ptolemies, whose capital was at the new city of Alexandria in Egypt. Now the Jews began to spread themselves over the world, the Greek language became common in Judea, and the Septuagint (or Greek version of the Hebrew Scriptures) was written during this and the following century.

In 202 B. C., Antiochus the Great, king of Syria (including in its empire Asia Minor, Mesopotamia, Babylonia, etc.), conquered Judea from Ptolemy V. Antiochus Epiphanes, one of the sons and successors of the great Antiochus, drove the Jews to rebellion by persecution and profanation of their Temple and religion.

STRUGGLE UNDER THE MACCABEES AND HYRCANUS

Under the great patriot and hero Judas Maccabeus, the Jews asserted their religious freedom in 166 B. C. Antiochus Epiphanes died in 164, and Maccabeus fought with success against the Idumeans, Syrians, Phœnicians and others, who had formed a league for the destruction of the Jews. In 163, Judas Maccabeus became governor of Judea under the King of Syria, but fell in battle, in 161, while he was resisting an invasion of his country by the troops of Demetrius Soter, new ruler of the empire. His brother, Jonathan Maccabeus, ruled from 161 to 143 B. C., amidst many troubles from Syria, and was succeeded by his brother, Simon Maccabeus, who strengthened the land by fortifications, was recognized by the Romans as high priest and ruler of Judea, and fell by assassination in 136 B. C.

His son, John Hyrcanus, threw off at last the yoke of Syria, and made himself master of all Judea, Galilee, and Samaria, reigning then in peace till 106 B. C., when the line of the greater Maccabean princes ended. A miserable time of civil wars and religious and political faction followed.

[361]

THE CONQUEST BY ROME

These ended in the interference of Rome; and in 63 B. C. Pompey took Jerusalem, after a siege of three months, and entered the "Holy of holies" in the Temple, with a profanation before unheard of in Jewish history. From this time the Jewish state was virtually subject to Rome, and became, in the end, a part of the Roman province of Syria.

The turbulence of the Jews under Roman rule is well known, and a general rebellion ended, after fearful bloodshed and misery, in the capture and destruction of Jerusalem by Titus, A. D. 70. The history, as a separate political body, of the Hebrews thus ends with the dispersion of their remnant over the face of the civilized world.

GEOGRAPHY OF THE HOLY LAND

The area of the Holy Land is about eleven thousand square miles—nearly as large as Belgium; its greatest length, from Beyrout to the southern point of the Dead Sea, being one hundred and eighty miles, and its greatest breadth, east to west, about sixty-five miles. It has a nearly straight western coast-line, with but two indentations—the Bay of Sidon, and the Bay of Acre. Though the Sinaïtic Peninsula is not a *geographical* part of the Holy Land, its *history* is really one with it, and is so considered in this article.

Notwithstanding its narrow limits, Palestine presents a remarkable variety of surface, scenery, and climate. The central portion consists of an undulating tableland (the "hills" or "hill-country"), separated from Lebanon on the north by the fertile Plain of Esdraelon (Jezreel). It has a gentle slope towards the west, but descends abruptly to the Jordan valley, the surface gradually rising, as it extends southward, till it reaches its greatest elevation (about 3,300 feet) in the neighborhood of Hebron, beyond which, near Beersheba, it sinks into the Idumæan Desert. The northern part of this tract is more fertile than that towards the south, the least productive district being the country round Jerusalem; but even there, the vine is grown with success, and the barren aspect of the plateau is relieved in many places by gardens of olives and figs and luxuriant cornfields.

To the west of the central tableland and the Lebanon ranges, there runs a strip of low seaboard, which expands into the plain of Philistia; to the north is the Valley of Sharon, once the Garden of Palestine, but now for the most part a marshy or sandy wilderness. The maritime plain is intersected by deep gullies, traversed in some cases by perennial streams. Oranges, lemons, citrons, bananas and melons grow luxuriantly, especially in the gardens of Jaffa and Ascalon.

East of the central tableland is a deep fissure, increasing in width from five to thirteen miles, down which flows the Jordan. Beyond Jordan is another upland district, forming a prolongation of the Anti-Libanus ranges, with an elevation of two to three thousand feet, succeeded on the east by a plateau which stretches away to the Arabian Desert. This region contains wide tracts of excellent pasture.

The highest point in Palestine is Jebel Jermuk (three thousand nine hundred and thirty-four feet). The height of Carmel—a northwestern spur of the uplands terminating in a promontory—one thousand seven hundred and forty feet.

MOUNT NEBO, a summit of Abarim, Moab (two thousand six hundred and forty-three feet), seven miles northeast of the Dead Sea, was the place of the death of Moses.

MOUNT TABOR (*tā bor*), a wooded mountain in Palestine, six miles east of Nazareth, on the border of the plain of Esdraelon, according to a tradition, was the scene of the Transfiguration; and in the monastic ages it was peopled with hermits. Height, about one thousand eight hundred feet.

MOUNT SINAI (*sī nī* or *sī-nā-ī*) and the SINAITIC (*sī-nā-it 'ik*) PENINSULA. This peninsula, which, since 1907, has been included within the boundaries of Egypt, is situated between the Gulf of Suez and the Gulf of Akaba. In the north of the peninsula is the desert Paran, a desolate limestone plateau, bounded on the south by a tract of low sandstone mountains, ravines, and valleys rich in minerals which had been worked as early as 3000 B. C. Then rises the barren, rugged, and majestic triangle of the Sinai Mountain (also called Horeb) on which, tradition asserts, the Law was given to Moses.

From very early times it seems to have been regarded as a sacred mountain, perhaps as dedicated to the Babylonian moon-god Sin. These peaks are over six thousand feet high. At the base is a broad plain where the Israelites may easily have encamped. In a valley on the northeast of the same mountain, stands the famous convent of St. Catharine, with its beautiful gardens, which was originally founded by the Emperor Justinian (527-565). It became celebrated in recent years by the discovery of the Codex Sinaiticus (the Greek version of the Old Testament and the Greek New Testament), made in it by Tischendorf in 1844. There are two other valleys in the same vicinity, both of which are comparatively fertile and well-watered. The rocks of this region are steep and jagged and richly colored. They are composed of granite, porphyry, diorite, and gneiss. A path of stone steps leads up from the convent to the summit. Holy places marked by crosses cover the mountain. Near the top of Jebel Musa stands a chapel dedicated to Elijah.

[362]

MOUNT SINAI

where the Laws of Moses were received. The site is disputed, but these heights on the northwest cliffs of Jebel Mûsa seem to answer the required conditions better than any other mountain on the Sinaitic Peninsula. The law given from Sinai—"the book of the Covenant"—is contained in Exodus xx. to xxiii. 19. Besides the Ten Commandments there are rules for justice, equity and purity far transcending any known ancient legislation.

RIVERS, LAKES AND OTHER HISTORIC WATERS

The principal river of Palestine is the Jordan, which rises in Anti-Libanus in several streams, that unite to flow through Lake Merom, and then through the Sea of Tiberias, or Galilee, running due south into the Dead Sea. Several other streams flow into the Dead Sea, of which the best known is the Kedron, that rises near Jerusalem. A similar series of small rivers flows through the coast plains into the Mediterranean, the principal being the Kishon and Leontes.

THE JORDAN (meaning "the descender").—The highest source of the Jordan is seventeen hundred feet above sea-level on the west of Mt. Hermon, near the village of Hasbeya. The most important feature in its course between the Sea of Galilee and the Dead Sea is the rocky cleft known as the Ghor, some sixty-five miles long and from three to twelve miles in breadth, through which it passes. It then falls into the Dead Sea at a point twelve hundred and ninety-two feet below the level of the Mediterranean. The course of the Jordan is extremely tortuous, its total length being about two hundred miles.

The upper reaches are much obstructed by growths of reeds and shrubs, and though narrow it is deep, and can only be passed by the fords, of which there are many, the most famous being that of Bethabaca, near Jericho.

During its annual swelling it was miraculously crossed by the Israelites, probably at the ford above mentioned. In its waters Naaman was healed and an iron axehead made to swim. In it our Saviour was baptized.

SUPPOSED FORD OF BETHABACA, NEAR JERICHO, WHERE THE CHILDREN OF ISRAEL CROSSED THE RIVER JORDAN ON THEIR WAY TO THE "LAND OF PROMISE."

GALILEE, SEA OF, called also in the New Testament the Lake of Gennesaret and the Sea of Tiberias, is a large lake in the north of Palestine. Lying six hundred and eighty-two feet below sea-level, it is thirteen miles long by six broad, and more than eight hundred feet deep. It occupies a great basin, and is of volcanic origin. Although the Jordan runs into it red and turbid from the north, and many warm and brackish springs also find their way thither, its waters are cool, clear and sweet. In the time of Jesus the region round about the lake was the most densely populated in Galilee.

DEAD SEA, scripturally called "Salt Sea," "Sea of the Plains," "Sea of the Arabah," is near the southern extremity of Palestine. Its length is forty-six miles and its greatest breadth is nine and one-half (average eight and one-half) miles. The long oval of the lake is unequally divided by the El Lizan peninsula, of loose calcareous formation. North of the peninsula the greatest depth is twelve hundred and seventy-eight feet, south of that it is only three to twelve feet. It receives the Jordan and six other rivers, but has no outlet, the surplus water being carried off by evaporation. The water is intensely salt, with a specific gravity one-sixth greater than water. Fish cannot live in the lake but it has a healing reputation for lepers, and the inhabitants on the banks are quite healthy. It is surrounded by high cliffs of bare limestone, and masses of sulphur exposed by periodically occurring earthquakes lie on its borders.

CHIEF TOWNS AND INDUSTRIES

Modern Palestine forms part of the "pashalic" of Syria, under the Turkish Government, the chief towns of importance in modern times include: Jerusalem, with a population of about sixty thousand consisting of Moslems, Jews, and Christians; Damascus, with a population of two hundred thousand, has a trade in silk and cotton stuffs, jewelry, saddlery, and sword blades; Acre, a seaport, twelve thousand; Beyrout, one hundred and twenty thousand, considered to be the port of Damascus; Joppa, or Jaffa, a seaport, fifty-five thousand. The country is mainly agricultural, the crops consisting of wheat, barley, maize, vines and olives. The land is naturally fertile, but it suffered centuries of neglect.

JERUSALEM (signifying probably "abode of peace"), the "Holy City," central point of Hebrew worship and Christian tradition, was founded by the ancient Canaanite inhabitants upon a spur of the limestone ridge that forms the watershed of this part of Palestine. Standing at an elevation of twenty-six hundred feet upon a plateau about half a mile square and cutoff by the deep valleys of Gihon on the west, Hinnon on the south, and Jehoshaphat east, the city held an almost impregnable position, and was only wrested from the Jebusites by David, who made it the base of his military and political enterprises. The modern city proper is surrounded by a wall of hewn stones, two and one-half miles in circumference, and probably built by the Sultan Solyman the Magnificent. This wall is surmounted by thirty-eight towers and pierced by eight gates. The inner city is divided into four quarters—the Armenian in the southwest, the Jewish in the southeast, the Moslem in the northeast, and the Christian in the northwest. Since 1858 extensions have been made towards the north and west. In the older part the streets are narrow, dull, and dirty. The Mosque of Omar, the Church of the Holy Sepulchre, and the Jews' Wailing Place, are among the more interesting places.

It has always been a sacred city. Its drama of events included the reigns of David and Solomon; the sieges of Egyptian, Assyrian, and Babylonian hosts; the Greek conquest; the heroism of the Maccabees; the events of the Roman dominion; our Saviour's appearance and crucifixion; the siege of Titus and its destruction, A. D. 70; its rebuilding by Hadrian, A. D. 120; the Crusades, and its capture by Godfrey of Bouillon (first Christian King of Jerusalem), Richard Cœur de Lion, and its final capture by the Ottoman Turks in 1516.

The later-built additions extend much beyond the walls of Our Lord's time, and beyond the reputed site of Calvary (He "suffered without the Gate"), which is now in the middle of the city. Of the eight gates, one is called St. Stephen's, or Bâb Sitti Maryam (Lady Mary Gate), at the end of the via Dolorosa, leading to Gethsemane, Mount of Olives (where He beheld the city and wept over it), and Bethany. The Golden Gate, which He entered on Palm Sunday, is walled up. The relics of the old city are buried twenty to forty feet below the present site.

The Church of the Holy Sepulchre in the northwest quarter of the city is so called because alleged to contain under its roof the very grave in which the Saviour lay. This church, which was built by Helena, the mother of Constantine the Great, is remarkable for the richness of its decorations and the number of pilgrims by whom it is visited.

On Mount Moriah, Solomon is supposed to have built his famous temple, where a rectangular walled space called the Harâm at present encloses the Mosque of Omar and the El Aksa Mosque, once, perhaps, a Christian church. Recent explorers believe that they found traces of Solomon's masonry here, and the foundations of the existing walls are more safely identified with those of the sacred building as reconstructed by Hadrian.

According to the Jews, Abraham sacrificed here, the intended offering of Isaac was here, and Jacob anointed the rock. The Order of Knights Templar was founded in this Mosque. Just outside the extreme northeast corner of the Harâm, to be seen from the windows in north wall, down in a ravine, is the Pool of Bethesda, rarely containing water, half filled with rubbish.

North of the Harâm is a huge rocky platform, where the residence of the Turkish governor marks the site of the Court of Pontius Pilate.

The Golgotha Chapels on Mount Calvary are off the south side of the east end of the Church of the Crusaders. Steps lead up to them, their elevation being fourteen and one-half feet above the main building. Just beyond the top of the steps is a silver lined opening where the Cross was inserted in the rock; at a distance of about five feet the spots of the thieves' crosses are indicated—some searches are satisfied that the cross of the penitent thief would be the one to the north.

GETHSEMANE is at the base of Mount Olivet, and near it is the traditional Grotto of the Agony, with the spot where Judas betrayed his Master. This grotto is held in great veneration, and near it is the Church of St. Salvatore, said to have been erected by the mother of Constantine, containing the tombs of St. James, St. Ann, and St. Joseph.

THE VIA DOLOROSA, or Way of the Cross, possesses a number of places of much interest, even if partly legendary. Among them the place where Christ is said to have pronounced the words "Daughters of Jerusalem, weep not for me." Where the Virgin is said to have faintly on meeting her Son. At a truncated column where Jesus fainted under the Cross, and they called on Simon of Cyrene to help him. The house of Dives, and the stone on which Lazarus sat. The Gate of Judgment, formerly marking the limits of the town, and the Calvary itself, now inclosed within the Church of the Holy Sepulchre.

MOUNT ZION (though used in the Scriptures as identical with Jerusalem) is just outside the southwest corner of the city wall. There were Christian churches erected here at very early dates over the spot where the Holy Ghost descended upon the Apostles, but there followed so many destructions, mutilations, and confusions, that little certainty attaches to the cluster of buildings now standing. Here is reputed to be the tomb of David, and the Room of the Last Supper, once part of a Christian Church.

THE MOUNT OF OLIVES is a range of eminences and slight depressions on the east side of Jerusalem, parallel with the hill of the Temple, but on higher ground. Here is the Tomb of the Virgin within a subterranean church, where she lay until her "assumption." A few yards from the Tomb, off the south side of the road, is the Garden of Gethsemane. The Chapel of the Ascension marks the tradition of the Ascension of Christ from this spot.

Bethlehem (*beth lē-em*), (Heb., "house of bread"), is six miles south of Jerusalem. It was the birthplace of David, the scene of Ruth's story, and, most important of all (according to Matthew, Luke and John), the birthplace of Christ. The Church of St. Mary, at Bethlehem, is built over the birthplace of Christ. The Chapel of the Nativity is in the crypt of the church, under the great choir; here in the pavement is a star and the words "Hic de Virgine Maria Jesus Christus natus est." (Here Jesus Christ was born to the Virgin Mary); opposite the Chapel of the Nativity is the Chapel of the Manger.

Hebron (*hē bron*) is situated on a hill among the mountains of Judah, about seven hours south of Jerusalem. It is one of the oldest existing biblical towns and was the home and burial-place of the patriarchs. Afterward it became an important city in the territory of Judah. David resided here the first seven years of his reign. Later it was taken possession of by the Idumeans, from whom Judas Maccabeus recaptured it. Upon the traditional site of the burial-place of the patriarchs, Machpelah, a magnificent mosque is erected.

Canā of Galilee, a decayed town near Nazareth, is celebrated in Scripture as the scene of our Saviour's first miracle, where He turned water into wine. Near it is the Mount of Beatitudes, the supposed scene of the Sermon on the Mount.

Damascus (*da-mas kus*) formerly the capital and most important city of Syria, is situated in a fertile valley east of the Anti-Lebanon, on the edge of the desert. On account of its beautiful fertile surroundings, its lofty position, and its richness in fresh water, Damascus had been praised in antiquity and in modern times as the "paradise of the earth," "the eye of the desert," and "the pearl of the Orient." Originally a Hittite city, it became the capital of Syria, and a great part of the country was called by its name.

[365]

MARKET PLACE IN THE VILLAGE OF BETHLEHEM. THE CHURCH OF ST. MARY, NEARBY, IS BUILT OVER THE BIRTHPLACE OF OUR SAVIOUR, AND CONTAINS THE CHAPEL OF THE NATIVITY

In the Old Testament the name of Damascus occurs as early as the history of Abraham. After the time of David, Damascus often came into sharp collision with Israel. In the New Testament Damascus is known especially from the history of Paul.

Its chief modern glory is the Omayyad Mosque, and the ever changing color and variety of the street traffic, the costumes and the animation of the bazaars. The mosque was the subject of extravagant description by Arabian writers. In 1069 fire destroyed part of the building, and again in 1893 immense injury was done by fire; it has been restored, though it has not its ancient magnificence.

Jericho (*jer i-kō*), situated west of the Jordan and fourteen miles east-northeast of Jerusalem, was destroyed by Joshua and rebuilt by Ahab. It was the residence of Herod the Great; was destroyed by Vespasian, rebuilt by Hadrian, and again destroyed by the Crusaders.

Nazareth (*naz a-reth*) is celebrated as the dwelling-place of Jesus during his childhood and early manhood. The Church of the Annunciation here was founded by the empress Helena, but ruined in the middle ages, and rebuilt later. It is well proportioned, and, while much of the architecture is new, it preserves interesting memorials of the past. In the crypt is the traditional place of the Annunciation.

Petra (*pē trā*).—On the northwest edge of the Arabian desert, about midway between the Gulf of Okabah and the Dead Sea, among desolate mountains, stand the remains of the rock-hewn city of Petra, best reached from Jerusalem. These ruins probably date from the time of Roman rule in 105 A. D., though some of the magnificent monuments were built by the Edomites who dwelt here before the Greeks and Romans.

This wonderful city is approached through a narrow gorge called the Sik, a kind of gateway in the rocks, like the entrance to a Roman amphitheatre.

Here one is confronted by a temple cut in the rock, with the most exquisite Corinthian columns, and entering the doorway he finds himself in the heart of the hill, surrounded by subterranean architecture of the most elaborate beauty of form and workmanship. This is called the Khaznet or Treasury of Pharaoh, which is rightly regarded as one of the wonders of the East. It is attributed to the Emperor Hadrian, who visited the place in A. D. 131, and erected here a temple to Isis. The rock wall from which it is hewn is an exquisite rose-pink. It is in a state of remarkable preservation. The imposing facade shows two rows each of six majestic columns, one row above the other, with niches in which are rock-hewn equestrian and other statues, the whole terminating above in a miniature temple crowned by a huge urn, the entire height being one hundred and two feet. Within is a bare lofty room and some chambers. The urn is said to contain treasures of Pharaoh. Neither the Coliseum at Rome, grand and interesting as it is, nor the ruins of the Acropolis at Athens, nor the Pyramids, nor the mighty temples of the Nile, present a more marvelous spectacle.

But this is only an introduction to the marvels behind. The gorge opens out into a narrow valley, some three miles in circumference, everywhere sunk deep beneath the enclosing mountains, and the walls of this valley are filled with the remains of other rock-cut temples, tombs and dwelling places. In one place are the remains of an open air theatre, the workmanship of which is Greek. Some of the structures, cut in the face of the rock, are several stories in height, while their architectural details excite the wondering admiration of the beholder. A stairway of many hundreds of steps leads to the largest of the ruins, El Deir, or Convent. In design it somewhat resembles the Treasury of Pharaoh.

[366]

THE TREASURY OF PHARAOH MARVELOUS ROCK-HEWED

REMARKABLE NATURAL ENTRANCE

TEMPLES AT PETRA—(See under Petra)

The cliffs that enclose the valley are simply dotted all over with the handiwork of artists of a bygone age. Here is a portion of a heathen temple, there the remains of a palace, yonder a column, and beyond, again, a stately portico or pediment. They stand at varying elevations. Most of them are conspicuous, while others are hidden in the mountain recesses. There are tombs by the hundred, and on the mountain tops many places of sacrifice, where strange religious ceremonies were enacted. They challenge admiration by the variety of styles they embody, and by the exquisite hues of the sandstone from which they are hewn, varying from the prevailing purplish-red of the mountains and cliffs to a delicate pink and rose.

Until quite recently, this ancient city built out of rocks was seldom visited and almost unknown. Now, however, by means of the new Damascus to Mecca Railway, they are within easy reach. The journey from Jerusalem to Maan may be made in less than a day. From the latter place the ruins can be reached in six to eight hours by horseback.

Palmyra (*pal-mi ra*), or **Tadmor** (*tad mōr*), a famous ancient city situated on an oasis in the desert east of Syria, is said to have been built by Solomon. After the decline of Petra in 105 A. D., Palmyra took its place as the chief commercial center in northern Arabia. Its merchant aristocracy reaped great advantage from the long-protracted wars between Rome and Parthia by acknowledging the supremacy of Rome. One of its chiefs, Odenathus, husband of the more famous Zenobia, extended his power over most of the adjoining countries, from Egypt to Asia Minor. Aurelian at length crushed in 272 the attempt of the Palmyrenes to found an independent empire. After the Roman empire became Christian, Palmyra was made a bishopric. When the Moslems conquered Syria, Palmyra also submitted to them. From the fifteenth century it began to sink into decay, along with the rest of the Orient. Magnificent remains of the ancient city still exist, chief among them being the great temple of the Sun (or Baal); the great colonnade, nearly one mile long, and consisting originally of some fifteen hundred Corinthian columns; and sepulchral towers, overlooking the city.

[367]

Jaffa, is a maritime city in Palestine, Syria, fifty-four miles by rail northwest of Jerusalem, of which it was the port in King David's time. Extensive fruit and orange orchards surround the city. Its fortifications were destroyed by Saladin in 1188, and, during the Crusades, Richard the Lion-Hearted was confined here by sickness. In 1722 it was attacked by the Arabs, and in 1799 by Napoleon. The principal exports are oranges, wheat, soap, hides, olive oil, wool, and barley.

Phœnicia was a narrow strip of country on the southeastern coast of the great inland sea of antiquity, lying chiefly between Mount Libanus (Lebanon) and the Mediterranean shore, and extending for about one hundred and twenty miles north of Mount Carmel. Here lay the cities Tyre and Sidon, Byblus and Berytus, Tripolis and Ptolemais. The land was fertile, and rich in timber trees and fruits, such as the pine, fir, cypress, sycamore, and cedar; figs, olives, dates, pomegranates, citrons, almonds. Here was material for trade abroad, and comfort and prosperity at home, and the coast was so thickly studded with towns as almost to make one continuous populated line.

HISTORY AND GOVERNMENT OF PHŒNICIA

The history of Phœnicia is peculiarly a history of separate cities and colonies, never united into one great independent state, though now and then alliances existed between several cities in order to repel a common danger. Each city of Phœnicia was governed by a king or petty chief, under or with whom an aristocracy, and at times elective magistrates, appear to have held sway. But the genius of the race cared little for political development; they devoted themselves almost exclusively to commercial pursuits.

THE GREAT CITIES OF SIDON AND TYRE

Sidon was probably the more ancient of the Phœnician cities. Its richly embroidered robes are mentioned in the Homeric poems. It was the greatest maritime city of the ancient world until its colony, Tyre, surpassed it, and it seems to have been subject to Tyre in the time of David and Solomon. About 700 B. C., it became independent again, but was taken by Nebuchadnezzar, king of Babylon, about 600 B. C., and became subject to Persia about 500 B. C. Under the Persian rule, it was a great and populous city, and, coming into the hands of Alexander the Great in 333 B. C., helped him with a fleet in his siege of Tyre. Its history ends with submission to Roman power, 63 B. C.

Tyre was a powerful city as early as 1200 B. C. The friendship of its king, Hiram, with Solomon is well known from the Hebrew Scriptures; and at this time the commerce of Tyre was foremost in the Mediterranean, and its ships sailed into the Indian Ocean from the port of Elath on the Red Sea. Tyre is celebrated for its obstinate resistance to enemies. Sargon, king of Assyria, besieged the city in vain for five years (721-717 B. C.). Nebuchadnezzar took thirteen years (598-585 B. C.) to capture it only partially, and it was taken by Alexander the Great after a seven months' siege, in 332 B. C. The old glory of Tyre departed with the transfer of its chief trade to the newly created city of Alexandria, though the indomitable energy of the Phœnicians again, in Roman times, made it a great seat of trade.

PHŒNICIAN MARINERS FOUND CARTHAGE

Phœnicia was at the height of prosperity from the eleventh to the sixth centuries B. C. As a colonizing country it preceded the Greeks on the shores and islands of the Mediterranean, and sent ships to regions that the Greeks knew nothing of, save by report of the bold mariners of Tyre. Until the rise of Alexandria about 300 B. C., the sea trade of Phœnicia was rivaled only by that of Carthage, its own colony; and Phœnician merchants still kept up their great land trade by caravans with Arabia, central Asia and northern India, Scythia and the Caucasian countries.

By far the most renowned of all Phœnician colonies—famous in history for Hannibal's heroic hate of Rome and warlike skill—was Carthage, in the center of the northern coast of Africa. The date of its foundation is put about 850 B. C. At Utica and Tunis, to the north and south, Phœnician settlements were already existing.

VAST EXTENT OF PHŒNICIAN COMMERCE

The trade of Tyre and her sister cities reached almost throughout the world as then known. They imported the spices—notably the myrrh and frankincense—of Arabia; the ivory, ebony, and cotton goods of India; linen yarn and corn from Egypt; wool and wine from Damascus; embroideries from Babylon and Nineveh; pottery, in the days of Grecian art, from Attica; horses and chariots from Armenia; copper from the shores of the Euxine Sea; lead from Spain; tin from Cornwall. Phœnicia exported not only these articles of food and use and luxury, but the rich purple dyes made from the murex (a kind of shell-fish) of its own coast, the famous hue of Tyre, with which were tinged the silken costly robes of the despots. From Sidon went the famous glass produced in part from fine white sand, found plenteously near Mount Carmel. There was gold from Ophir, and interchange of cedar, sent by Hiram, king of Tyre, for building Solomon's Temple, in barter for the wheat and balm and oil of Israel's fertile land.

So important was the trade by caravans through Babylon with the interior of Asia that the great town Palmyra (or "Tadmor in the desert") was founded or enlarged by Solomon to serve the traffic on its route through Syria to the valley of the Tigris and Euphrates.

THEIR ARTS OF CIVILIZATION INCLUDED OUR ALPHABET

As a money-making race the Phœnicians were skilled in arts by which the grand aim of its life could be attained. Great as they were at the dyeing vat and loom, adepts in working brass and other metals, and in fabricating glass, they were also the best ship builders and the most famous miners of their time. Their greatest service to civilization seems rather to have been in appropriating, developing, and spreading the ideas of others, especially in forming an alphabet for the Western world.

While the mythical story about Cadmus, taking his sixteen letters from Phœnicia into Greece, must be rejected, the European world owes to this race of traders the alphabetic symbols now in use. The gradual change of shape is easily traced in most of the signs as here given. The simple and ingenious device by which each sign stands for one elementary sound of human speech is largely due to the Phœnician people, as an improvement on the cumbrous hieroglyphics of Egypt. Of literature they have left nothing whatever recognized as really theirs.

THEIR CHARACTER AND RELIGION

They had a name for craftiness in trade, and wealth led to worse than luxury,—to flagrant vice. Their religion was a kind of nature worship closely related to that of the Babylonians. They adored the sun and moon and five planets, the chief deities being the male Baal, and the female Ashtoreth or Astarte. At Tyre a deity was worshiped with the attributes of the Greek god Hercules. There was also the worship of Adonis, under the name of Thammuz, in the coast towns; and this included a commemoration of his death, a funeral festival, at which the women gave way to extravagant lamentations. It was Phœnician women that allured Solomon to their form of religion; it was a princess of Phœnicia, Jezebel, that brought Ahab, her husband, king of Israel, to ruin; that slew the prophets of God, and left a name proverbial of infamy in life, and for ignominious horror in her death. The work done by Phœnicia in the cause of human progress was chiefly important and interesting in material or practical things.

THE MEDO-PERSIAN EMPIRE

With the Persian Empire we first enter on continuous history. A multiplicity of histories first met and commingled in that of Persia. The Persian Empire extended itself over the whole of western Asia, and into Europe and Africa; it drew together Bactria, Parthia, Media, Assyria, Syria, Palestine, Phœnicia, Asia Minor, Armenia, Thrace, Egypt, and the Cyrenaica. The voice of the Great King was law from the Indus on the east to the Ægean Sea and Syrian Gulf on the west, from the Danube and the Caucasus on the north to the Indian Ocean and the deserts of Arabia and Nubia on the south.

The empire of the Medes and Persians, commonly known as "the Persian Empire," absorbed all the territories of Western and Southwestern Asia (except Arabia), as well as Egypt and a small portion of Europe. The Medes and the Persians are treated of together, because of their intimate connection in race and the fact that Media was conquered by and included in Persia, as the latter empire rose into power and importance in the western Asiatic world.

GEOGRAPHICAL SITUATION OF MEDIA AND PERSIA

The [map](#) shows the position of Media on the tableland south of the Caspian Sea, east of Armenia and the Zagros Mountains, and north and west of the mountains of Persia proper and the great rainless Persian desert, or desert of Iran. The mountain ranges enclosed fertile valleys, rich in corn and fruits; and the Zagros Mountains had on their pastures splendid horses, which supplied the chargers of the king and nobles of Persia.

Persis, or Persia proper, was a mountainous district between the desert of Iran and the northeastern shore of the Persian Gulf. The country contained, among its hills, fertile plains and valleys abounding in corn, pasture and fruits.

ORIGIN AND CHARACTER OF THE MEDES

The close connection of the Medes, in origin and institutions, with the Persians, is shown in the famous expression, "The law of the Medes and Persians, which altereth not." The people migrated into Media at an early period, from the original abode of the Aryan race. By degrees they overcame the Scythian races whom they found in possession of the land. The Medes were a warlike race, strong in cavalry and archers. Their language was a dialect of the Zend, the ancient tongue of Persia, and their religion was the Magian.

Probably about 800 B. C. the Medes had established themselves in their new home. About 710 B. C., Sargon, king of Assyria, conquered some part of Media, and made settlements of Israelites taken captive by him from the cities of Samaria; but the Assyrians could never conquer the Medes, who at last grew into a powerful kingdom under native princes.

MEDIAN POWER FIRST ESTABLISHED BY CAYAXARES

The monarchy was founded by Cyaxares about 633 B. C. He extended the Median Empire westward, by conquest, through Armenia to the river Halys in Asia Minor. His great achievement was the capture of Nineveh, about 620 B. C., in alliance with the revolted Babylonians, and the consequent overthrow of the Assyrian Empire. Cyaxares reigned forty years, and died about 593 B. C.

He was succeeded by his son Astyages (*as-ty 'a-jēz*), who reigned for over thirty years,—a despot of quiet life and peaceful disposition. The end of the Median monarchy came in 558 B. C., with his dethronement by Cyrus of Persia.

ORIGIN AND CHARACTER OF THE PERSIANS

The Persians, in race, language, and religion, were closely connected with the Medes. They appear first in human records as hardy and warlike mountaineers, noble specimens of the great Aryan race,—simple in their ways of life, noted for truthfulness, keen-witted, generous, and quick-tempered. The language which they brought with them when they migrated is known as the Zend, closely allied to the Sanscrit, and now only existing in the sacred books of the Zendavesta, containing the doctrine of Zoroaster (Persian name, Zarathustra), the founder of the Magian religion.

The Persians were, in their early history, subject to the Medes, but governed by their native princes. The Median supremacy passed to the Persians with the dethronement of Astyages, king of Media, by Cyrus.

FOUNDING OF THE PERSIAN EMPIRE BY CYRUS

Master of Media, Cyrus came next into collision with the great kingdom of Lydia,^[2] in Asia Minor. Crœsus was king of Lydia when Cyrus met his attack and conquered him, in 546 B. C. The rising empire of Persia was thus extended to the western seaboard of Asia Minor. The Greek colonies on the coast next fell a prey to the arms of Cyrus, and in 538 B. C. he captured Babylon, as we have seen, and added the provinces of the later Babylonian Empire to the Persian. Before this he had conquered the territory eastwards between Media and the Indus, and restored the Jews from captivity. His power and life ended in his expedition against the Scythian people, by whom he was defeated and killed, in 529 B. C. Cyrus, the greatest as a king and the best as a man among all the Persian monarchs, had spread the Persian sway from the Hellespont on the west to the Indus on the east.

[2] Lydia, with its capital at Sardis, and extending from the coast of the Ægean Sea eastward to the river Halys, was easily one of the most powerful monarchies of the second class in Asiatic history. The Lydians were a highly civilized, wealthy, and energetic people, great in agriculture, manufactures, commerce and the arts. In music and metallurgy their names are famous as inventors or improvers; they were proverbial in the ancient world for luxury and the softer vices that attend it.

He was succeeded by his son Cambyses who is distinguished by his conquest of Egypt in 525. He died in 522, on his march from Egypt against a Magian pretender to the throne. The usurper reigned for a few months, and was then dethroned and slain in an insurrection headed by Darius, son of Hystaspes, a noble, who succeeded to the throne.

THE GREAT REIGN OF DARIUS

Darius Hystaspis, or Darius I, reigned from 521 to 485 B. C., and was a great and able monarch. He finished the work which Cyrus had begun, by setting in order the affairs of the vast empire which Cyrus and Cambyses had conquered.

A PORTRAIT OF DARIUS THE GREAT

Here "The Great King," with state umbrella and attendants, as carved on one of the door-jambes of the palace of Darius I. at Persepolis. The original bears considerable traces of color.

Darius is credited with the establishment of highroads and swift postal communication between the provinces and the court. The kings of Persia resided in the winter at Susa, a warm place in the plain east of the Lower Tigris; in the summer at Ecbatana, in Media, by the mountains; and Babylon was a third capital of occasional residence in winter. From these different centers of power the Persian monarchs, according to their measure of energy and resolution, controlled the conduct of the satraps in every quarter of their widespread dominions.

ATTEMPT TO INVADE EUROPE, AND WAR WITH THE GREEKS

About 508 B. C. Darius invaded Scythia, and, crossing the Danube, marched far into the territory which is now European Russia; but the expedition ended in a retreat without encountering the enemy, and with great loss of men from famine. On his return his generals subdued Thrace and Macedonia, north of Greece, and added them to the Persian Empire.

His famous war with the Greeks arose out of the revolt of the Ionian Greek cities in Asia Minor in 501, and the burning of the city of Sardis by their Athenian allies. An expedition sent against Greece under the general Mardonius, in 492 B. C., was defeated by the Thracians on land, and frustrated by a storm in the Ægean Sea. In 490 a great armament was sent by Darius under Datis and Artaphernes, and then was fought the decisive battle of Marathon. Darius's proposed and long-prepared revenge upon the Greeks was baffled by a rebellion in Egypt; and he died in 485, leaving the task to his son and successor, Xerxes.

REIGN OF XERXES THE GREAT

Xerxes reigned from 485-465 B. C., and he began with the suppression of the Egyptian revolt in 484, devoting the next four years to preparations against Greece. The grand effort made in 480 has been ever famous in history for the magnitude of the host of men and ships employed, for the heroism of the resistance on the one side, and the completeness of the final disaster on the other, as will be seen in the history of Greece. Xerxes returned to Sardis, after the destruction of his fleet at Salamis, toward the end of the year 480. The defeat of his general Mardonius at Platæa ended the war in Greece, and the Persians lost their last foothold in Europe by the capture of Sestos on the Hellespont.

ARTAXERXES II. AND THE "RETREAT OF THE TEN THOUSAND GREEKS"

Artaxerxes II., reigned 405-359. At the beginning occurred the revolt of his younger brother Cyrus, satrap in Western Asia, who marched against Babylon, and fell in the battle of Cunaxa, 401 B. C. He was supported by a body of Greek mercenaries, whose retiring march to the Black Sea over the mountains of Kurdistan has been immortalized by Xenophon's description in his *Anabasis*, and is known as the "Retreat of the Ten Thousand Greeks." After many conflicts between the Persians and Greeks, the peace of Antalcidas, concluded in 387 B. C., gave to the Persians all the Greek cities in Asia Minor. The Persian Empire, however, was now going to decay. Artaxerxes failed to recover revolted Egypt, and was constantly at war with tributary princes and satraps. The want of cohesion in the unwieldy, ill-assorted aggregate of "peoples, nations, and languages," was being severely felt.

DARIUS III. LAST OF THE PERSIAN EMPERORS

In 336 B. C., the last king of the Persian Empire, Darius III., surnamed Codomannus, succeeded to power. With the great battle in the plains of Gaugamela, in Assyria, known as the battle of Arbela, from a town fifty miles distant, where Darius had his headquarters before the struggle, the Persian Empire came to an end in October, 331 B. C. The defeat of Darius was decisive; and in 330 he was murdered in Parthia by Bessus, one of his satraps. Asiatic Aryans had succumbed at last to their kinsmen of Europe, who, after repelling Oriental assaults upon the home of a new civilization, had carried the arms of avenging ambition into Asia, and struck a blow to the heart of the older system.

SCIENCE AND THE ARTS IN PERSIA

In science, art, and learning, the Persians developed nothing that was new, except in architecture. In the conquest of the Assyrians, Babylonians, Phœnicians, and Egyptians, the Persian kings and nobles came into possession alike of the scientific acquirements and learning of those peoples, and of the products of their mechanical arts. The Persians were soldiers, and not craftsmen, and had no need to be producers, when they could be purchasers, of the carpets and muslins of Babylon and Sardis, the fine linen of Egypt, and the rich variety of wares that Phœnician commerce spread throughout the empire.

ARCHITECTURE.—In architecture, they were at first pupils of the Assyrians and Babylonians. The splendid palaces and temples of Nineveh and Babylon had existed for centuries before the Persians were anything more than a hardy tribe of warriors, and it was only after the acquirement of imperial sway that they began to erect great and elegant buildings for themselves. When that time came, the Persians showed that they could produce, by adaptation of older models, an architectural style of their own. This style was one that comes between the sombre, massive grandeur of Assyrian and Egyptian edifices and the perfect symmetry and beauty of the achievements of Greek art.

PALACES AND TOMBS, not temples, were the masterpieces of Persian building. The ruins of the city of Persepolis, in the province of Persis, are the most famous remains of Persian architecture. Here, on a terraced platform, stood vast and splendid palaces, the doorways adorned with beautiful bas-reliefs. The great double staircase leading up to the "Palace of Forty Pillars" is especially rich in sculptured human figures. The columns are beautiful in form, sixty feet in total height, with the shaft finely fluted, and the pedestal in the form of the cup and leaves of a pendent lotus. Throughout the ruins a love of ornament and display is visible. In the bas-reliefs are profuse decorations of fretwork fringes, borders of sculptured bulls and lions, and stone-work of carved roses.

PERSIAN CITIES

Babylon has been [already described](#).

Ecbatana, formerly the capital of the Median Empire, was a very ancient city, surrounded by seven walls, each overtopping the one outside it, and surmounted by battlements painted in five different colors, the innermost two being overlaid with silver and with gold. The strong citadel inside all was the royal treasury.

Susa was a square-built city unprotected by walls, but having strongly fortified citadel, containing a royal palace and treasury. The only remains of the place are extensive mounds, on which are found fragments of bricks and broken pottery with cuneiform inscriptions.

Persepolis was one of the two burial-places of the Persian kings, and also a royal treasury. Darius I. and Xerxes greatly enlarged and adorned the city, which retained its splendor till it was partially burned by Alexander the Great. The tomb of Cyrus and a colossal bas-relief sculpture of the great founder of the monarchy, was at Murghab, northeast of Persepolis.

Sardis, in western Asia Minor, once the capital of the Lydian monarchy, was an almost impregnable citadel, and the residence of the satrap of Lydia, and is often mentioned in connection with the Persian kings.

PERSIAN LIFE

The splendor of Persian life at court and abroad is known to us from many sources. The sculptures of Persepolis show something of the state and ceremony attendant on a Persian king. In the Book of Esther we read of King Ahasuerus (Xerxes) entertaining all "the nobles and princes of the provinces" for "a hundred and fourscore days," of his making a feast for seven days "in the court of the garden of the king's palace" for all the people of Susa; of pillars of marble, silver curtain rings, beds of gold and silver, pavements of marble that was red, and blue, and white, and black; of drinking vessels of gold diverse in shape and size, and "royal wine in abundance, according to the state of

the king"; of garments of purple and fine linen; and of the absolute power of a Persian despot in his caprices and his wrath, with his "seven chamberlains that served in his presence," and with the lives of men and women of all ranks held in the hollow of his hand.

THE MAGI.—The priests or Magi had great power, from the reverence of the people for them. The great objects of worship were the heavenly bodies. This national priesthood, like the Chaldeans in the Babylonian Empire, formed a caste to whom belonged all mental culture and legislation. The modern term "magic," in its superstitious sense, is connected with their professions and practices.

[372]

THE GREEKS: GLORY OF THE ANCIENT WORLD

The interest of the great story of ancient Greece is inexhaustible. Of all histories of which we know so much, this is the most abounding in consequences to us who now live. The Greeks are the most remarkable people who have yet existed. This high claim is justly made on the grounds of the power and efforts that were required for them to achieve what they did for themselves and for mankind. With the exception of Christianity, they were the originators of most of the great things of which the modern world can boast. The period from the permanent settlements in Greece until its final reduction to a Roman province covers about two thousand years.

The name Greece was almost unknown by the people whom we call Greeks, and was never used by them for their own country. It has come to us from the Romans, being really the name of a tribe in Epirus, northwest of Greece, the part of the country first known to them.

THE LAND OF HELLAS AND THE HELLENES

The Greek writers and people called their land Hellas, the term meaning all territory in which their own people, the Hellenes, were settled. Hellas included not only the Greek peninsula, but many of the islands of the Ægean Sea, and the coast settlements and colonies above referred to. The peninsula, much indented by bays, was broken up into many small divisions, connected by the sea. There were numerous mountains in ridges, offshoots, and groups; there were plains, valleys and small rivers. All was diversified. The position and conformation of the country undoubtedly helped to render the Greeks the earliest civilized people in Europe, both by developing, in a life of struggle with nature on land and sea, their special and innate character, and by bringing them into contact with the older civilizations, in Egypt and Phœnicia, on the eastern shores of the Mediterranean. The mountains that divided the country into small isolated districts had a great political importance in giving rise to many separate and independent states, the rivalries and conflicts of which favored the working-out of political problems and the growth of political freedom.

GREAT DIVISIONS OF GREECE

Greece naturally divides itself into Northern, Central and Southern. Northern Greece contained two principal countries, Thessalia and Epirus, though the Greeks themselves did not regard the inhabitants of Epirus (the Epirots) as being of real Hellenic race. It was only in later times that Macedonia, north of Thessalia, was considered a part of Hellas.

Central Greece had nine separate states, the most important of which was Attica, the peninsula jutting out southeastward, and renowned forever through its possession of the city of Athens.

Southern Greece, or the Peloponnesus (meaning "island of Pelops," a mythical king), contained seven principal states, Laconia being the most important, and sharing the fame of Attica because it contained the city of Sparta.

THE FAMOUS GRECIAN ISLANDS

The largest of the islands on the coast was Eubœa, about ninety miles in length, noted for good pasturage and corn. On the west coast was the group known to modern geography as the "Ionian Isles." To the south lay Crete, one hundred and sixty miles in length, noted for the skill of its archers. In the Ægean Sea were the two groups called the Cyclades and Sporades. The Cyclades (or "circling isles," the chief being Delos) are clearly shown upon the map. The Sporades (or "scattered isles") lay to the east off the southwest coast of Asia Minor. Northward in the Ægean, in mid-sea, or on the Asiatic coast, were Lemnos, Scyros, Lesbos, Chios and Samos.

THE EFFECT OF GREEK COLONIZATION

The establishment of so many colonies in countries pre-eminently favored by nature in productions and climate, and so situated as to prompt the inhabitants to navigation and commerce, gave a great impulse to the civilization of the Hellenic race, and may be regarded as the main cause of its rapid progress.

[373]

HISTORY OF THE GREEKS

I. THE PRE-HISTORIC PERIOD.—This period includes the mythical accounts of the origin of the Greeks, the Trojan war, the more certain story of the excavations, and the establishment of the peculiar Greek institutions under the so-called rule of the half-mythical kings. Down to the time of the Trojan war very considerable progress had already been made, and civilization among the Greeks had received its first important impulse. The oracles at Delphi and Dodona had been established; the mysteries at Eleusis; the four sacred games; the court of Areopagus at Athens; and the celebrated Amphictyonic Council. The arts and sciences likewise received considerable attention. Letters had been introduced by Cadmus. The accounts of the siege of Thebes and that of Troy show that progress had been made in the various arts pertaining to war, but the history of the period as a whole exhibits that singular mixture of barbarism with cultivation, of savage customs with chivalrous adventures, which marks what is called an *heroic age*.

According to the Greek historians, the earliest inhabitants of Hellas were the so-called Pelasgians, but the information afforded by the ancients on the subject is scant and vague.^[3] For our knowledge of the inhabitants and civilization of prehistoric Greece, we are therefore dependent on the more certain witness of the excavations, which, in recent years, have yielded very important results.

[3] Many of the early myths and legends, as narrated by Homer and preserved by Hesiod (in his Theogony), were gathered into somewhat systematic form to explain the genealogy of the Hellenic tribes, their subdivisions, and the origin of the Greek cities. The foundation of Athens, for example, was ascribed to Cecrops, regarded by some as a native of Egypt; he is said to have introduced into Attica the arts of civilized life, and from him the Acropolis was first called Cecropia. Argos was believed to have been founded by another Egyptian, named Danaus, who fled to Greece with his fifty daughters, and who was elected by the people as their king, and from whom some of the Greeks received the name of Danaï. Thebes, in Bœotia, looked to Cadmus, a Phœnician, as its founder; he was believed to have brought into Greece the art of writing, and from him the citadel of Thebes received the name of Cadmea. The Peloponnesus was said to have been settled by, and to have received its name from Pelops, a man from Phrygia in Asia; he became the king of Mycenæ, and was the father of Atreus, and the grandfather of Agamemnon and Menelaus; chieftains in the Trojan war. Such traditions as these show that the early Greeks had some notion of their dependence upon the Eastern nations.

LEGENDS OF EARLY NATIONAL EXPLOITS.—The legends are not only grouped about particular places and individual heroes, but have for their subjects national deeds, marked by courage and fortitude.

One of these stories describes the so-called "Argonautic expedition"—an adventurous voyage of fifty heroes, who set sail from Bœotia under the leadership of Jason, in the ship Argo, for the purpose of recovering a "golden fleece" which had been carried away to Colchis, a far distant land on the shores of the Euxine.

Another legend—the "Seven against Thebes"—narrates the tragic story of Œdipus, who unwittingly slew his own father and married his own mother and was banished from Thebes for his crimes, after having been made king; and whose sons quarreled for the vacant throne, one of them with the aid of other chieftains making war upon his native city.

But the most famous of the legendary stories of Greece was that which described the Trojan war—the military expedition of the Greeks to Troy, in order to rescue Helen, who was the beautiful wife of Menelaus, king of Sparta, and who had been stolen away by Paris, son of the Trojan king. The details of this story—the wrath of Achilles, the battles of the Greeks and the Trojans, the destruction of Troy, and the return of the Grecian heroes—are the subject of the great epic poems ascribed to Homer. All these legends, whether derived from a foreign source, or produced upon native soil, received the impress of the Greek mind. They form one of the legacies from the prehistoric age, and reveal some of the features of the early Greek character.

THE MINOAN AGE

Excavations at Knossus in Crete have revealed to us the civilization of the Minoan age of Greek history. This civilization is the oldest of which we have knowledge. It flourished about 2000 B. C. Prehistoric Knossus was a city of massive structure in which the fine arts flourished and had reached a remarkably high stage of development (specimens of Minoan pottery are of exceptional beauty and grace) and in which the art of writing was known. This last fact is of great importance, as until recently the art of writing in Greece was supposed to be post-Homeric.

THE MYCENEAN AGE

The next age of Greek civilization on which archaeology has concentrated its searchlight is the Mycenean (fl. c. 1600-1100 B. C.). The Mycenean civilization is revealed to us by excavations in the sites of Mycenæ, Tiryns, etc. The characteristic features of these splendid cities is their massiveness and solidity. Pausanias relates that tradition attributed the building of Tiryns and Mycenæ to the Cyclopes (hence the expression "Cyclopean walls" used to denote structures of this massive type), thus testifying to the gigantic edifices of prehistoric times as contrasted with the masonry of a later date. The jewelry, pottery and weapons excavated from these ancient cities are of rare beauty. Iron was practically unknown in the Mycenean age. Its use is more extensive in the Homeric age, and therefore Homeric civilization is probably post-Mycenean.

THE SO-CALLED DORIAN INVASION

But vast invasions swept over Greece, and a ruder civilization displaced this early culture. In the latter half of the eleventh century B. C., the Dorians ravaged Greece. They were a coarser, harder stock than the peoples they conquered, but they brought to Greece a new vigor and a new robustness, which when toned and harmonized by the finer influences of the land, produced that civilization which is the world's marvel for all time.

II. PERIOD OF MIGRATIONS AND FORMATION OF STATES.—The first governments of Greece were small monarchies, and they continued such until after the Trojan war. Soon after this we find the country involved in fatal civil wars, in which the people, under a number of petty chieftains hostile to each other, suffered extremely from calamity and oppression. These evils led to change in the form of government, and the substitution of the *popular* instead of the *regal* system. The same evils also probably contributed to the spirit of emigration, which so strikingly marks the period. During this period of colonization we notice the origin of the four principal dialects in the Greek language. In this period two of the Grecian states are chiefly conspicuous—Athens and Sparta, whose special effort was to provide themselves with a suitable political constitution, civil code and government.

[374]

These great migrations which swept over Greece created a congestion of the population which was eventually relieved by widespread colonization on the west coast of Asia Minor and in the neighboring islands of the Ægean Sea. These colonies were settled by the three races, the Æolians, Ionians and Dorians. The Æolians colonized the northwestern part, the coast of Mysia, and the island of Lesbos. The Ionians settled in the central part, on the coast of Lydia, and in the islands of Chios and Samos. The Dorians occupied the southwest corner of Asia Minor (the coast of Caria) and the adjacent islands. Of all these by far the most important, wealthy and powerful were the Ionians.

OTHER GREEK COLONIES

The Greeks gradually spread themselves in settlements along the northern coast of the Ægean Sea and the Propontis, in Macedonia and Thrace, so that the whole Ægean became encircled with Greek colonies, and its islands were covered with them. The tide of emigration flowed westward also in great strength.

The coasts of Southern Italy were occupied by Dorians, Achæans, and Ionians in settlements which grew to such importance that the region took the name of Magna Græcia, or Greater Greece. The cities of Tarentum, Croton and Sybaris became famous for their wealth, the latter giving rise to the proverbial name for a luxurious liver.

On the southwestern coast of Italy was Rhegium, and farther north came Pæstum, Cumæ, and Neapolis (Naples). In Sicily flourishing Greek settlements abounded, the chief being Messana, Syracuse, Leontini, Catania, Gela, Selinus, and Agrigentum. Farther west still a colony from Phocæa, in Asia Minor, founded the city of Massilia, now Marseilles. On the southern coast of the Mediterranean, westwards from Egypt, the Greek colony of Cyrene became the chief town of a flourishing district called Cyrenaica.

The establishment of the later of these colonies brings us down well within authentic historical times, and the whole period of Greek colonization extends from about 1100 to 600 B. C., the colonies being, in many cases, offshoots of colonies previously established and risen to wealth and over-population. In all these movements and settlements, the enterprise and ability of the Greeks made them great commercial rivals to, and successors of, the Phœnicians.

CONTRAST BETWEEN IONIANS AND DORIANS

The two leading races of Greece were the Ionians and the Dorians, and they stand to each other in a strong contrast of character which largely affected Greek political history. These prominent points of difference run through the whole historical career of the two chief states, *Ionian* Athens and *Dorian* Sparta, and were the cause of the strong antagonism that we find so often in action between them. The Dorian was distinguished by severity, bluntness, simplicity of life, conservative ways, and oligarchic tendency in politics; the Ionian was equally marked by vivacity, excitability, refinement, love of change, taste in the arts, commercial enterprise, and attachment to democracy. The Dorian, in the best times of his history, revered age, ancient usage, and religion; the Ionian, at all periods of his career, loved enjoyment, novelty and enterprise.

THE EARLY CAREER OF SPARTA

The Spartans, or the people of Lacedæmon, properly the southern half of Laconia, first became the dominant nation in that part of Greece. Of Spartan doings and fortunes we know almost nothing until the time of the great Legislator Lycurgus, who is said to have organized, about 850 B. C. the famous Spartan constitution. The probable account is that he altered and reformed existing usages, and that the reverence of after ages ascribed to him the promulgation and establishment of a full grown, brand new set of institutions, which must have been, in many points, of gradual growth.

THE FAMOUS LAWS OF LYCURGUS

The government was that of an aristocratic republic under the form of a monarchy. There were two kings, whose powers were nominally those of high priests, judges, and leaders in war, but in the two latter capacities their functions were in time greatly restricted and almost superseded. The chief legislative and judicial and much of the executive, power lay with the Senate, or council of twenty-eight elders. No citizen could be a member of this body until he had become sixty years of age, and the office was held for life. The popular assembly, open to every Spartan citizen over thirty years old, really handed over its powers to a board of five commissioners, officers called Ephors ("overseers"), whom it annually elected. These high officials had a secret and irresponsible control over the executive power, both at home and abroad; and in military enterprises, where the kings were the nominal leaders, the two Ephors who accompanied the army exercised much influence. The whole body of Spartan citizens was an aristocracy, and among themselves entire political equality existed.

TRAINING OF THE SPARTAN CITIZEN

The object of the peculiar training of Spartan citizens, ascribed to Lycurgus, was the maintenance of Spartan supremacy over the subject population. It was necessary for society that the small body of men, surrounded by enemies in their own land, should be ready at all points, against every attempt at opposition or rebellion, and against the outside world as well.

As every man had to be a soldier, and the citizen existed only for the state, the state took the Spartan citizen in hand at his birth, and regulated him almost from the cradle to the grave. From the age of seven the body was cultivated, and every means was used to give the instrument the finest temper, in a physical sense, and to bring it to the sharpest edge. Such training lasted till the sixtieth year of life, when the Spartan became qualified by age, if not by wisdom, for election to the Senate, or "assembly of old men," above described.

The girls were trained in athletic exercises like those of the youths, and everything was done to produce vigorous and stern women, prepared to gladly see their sons die on the battle-field for Sparta.

The result of all was that the Spartans became a race of well-drilled and intrepid warriors, but a state distinguished in the history of Greece for the display of a domineering arrogance, a rapacity, and a corruption, which contributed not a little to its downfall. However, the Spartan institutions were very successful in giving the state security at home and success in war abroad. Sparta was free from domestic revolutions, and the spectacle it presented of constancy to fixed maxims of policy gave it a great ascendancy over the Hellenic mind.

EARLY HISTORY OF ATHENS. THESEUS

The Athenians became by far the most famous, in political ascendancy and in artistic and intellectual eminence, of all the Ionian race, to which they belonged.

At first they were under kings like the other Hellenes; but about 1050 B. C. the title of king became changed to that of archon ("ruler"), though the office was still held for life, and continued in the same family. The archon was responsible for his acts to a general assembly of the people, in which, however, the nobles had the chief influence; and down to long after the time of the first Olympiad, Athens may be regarded as an oligarchic republic, in which the supreme office, the archonship, was confined to one family; and members of the chief court of justice, called Areopagus (lit. "hill of Ares," the place of its assembly at Athens), were elected only from the noble houses.

IMPORTANCE OF THE OLYMPIADS IN GREEK CHRONOLOGY

We come, in the year 776 B. C., to the era when the chronology of Grecian history becomes consecutive, and dates are reckoned by Olympiads. These were the periods of four years each which elapsed between the successive celebrations of the Olympic games in honor of the Olympian Zeus (the chief Greek deity) in the plain of Olympia in Elis (in Peloponnesus). The first Olympiad began at midsummer, 776 B. C., the second Olympiad at midsummer, 772 B. C., and so on—any event being dated by a particular year of a specified Olympiad.

THE UNPOPULAR LAWS OF DRACO

Down to the year 621 B. C. the people were still without a substantial share in the government, and popular discontent demanded a written code. Consequently Draco, one of the archons, drew up laws, the severity of which has become proverbial, and which were intended, by their rigor, to check the growth of the democracy that was clamoring for a change. The penalty of death was assigned to all offenses, great or small, to enable the nobles to get rid of dangerous leaders of the people; but such a system did not long continue.

Anarchy prevailed in Attica, owing to the various factions of the oligarchs, the democrats, and a middle party (the moderates).

OLON REFORMS THE LAWS

A wise reformer was found in Solon, chosen as an archon in 594 B. C., and invested by his fellow citizens, for the special purpose of restoring tranquility, with unlimited power to change the laws. He was already distinguished as a poet and as a general in the war of Athens against her neighbor, Megara. His great object was to remove the oppressive and excessive power of the aristocracy without introducing pure democracy.

Solon began with the abolition of Draco's code, but retained the penalty of death for murder. His celebrated disburdening ordinance for the relief of debtors won the complete confidence of the people. This had the immediate effect of mitigating the oppressions caused by the old laws of debt: in future neither the person, family, nor estate of the debtor might be pledged in security for the loan. A further democratic character was given at the outset to the constitution of Solon by the division of the people into four classes, according to property, which was now substituted for birth as a qualification for the higher offices of state.

A council of state, or senate, called the Boule (council) was chosen annually by lot, to prepare measures for submission to the popular assembly, or Ecclesia, in which the citizens of the fourth or lowest class (who could hold no state office) had the right of voting. The Ecclesia included all classes of the citizens, who there legislated, elected the magistrates, decided on peace or war, and other matters sent down to it from the Boule.

For the courts of justice below the Areopagus, a body of six thousand jurors was to be annually selected by lot from the popular assembly, and the causes were tried by divisions of the whole body.

Solon was also the author of many laws which regulated private life and rights, public amusements, slavery, marriage, and other matters. Among his miscellaneous enactments may be noted that which legalized the export of olive oil only, that which obliged the father to teach his son a trade, that which penalized a citizen for remaining neutral on the outbreak of civil strife, and that which empowered a man who died childless to dispose of his property by will.

OLON'S CONSTITUTION OVERTHROWN BY PISISTRATUS

During Solon's absence on a tour of travel a renewal of factions followed and their struggles ended in the seizure of power by Pisistratus, in the year 560 B. C. He was one of the class of rulers called "Tyrants" by the Greeks, who held power in Greek states during this and the preceding century.

The Greek Tyrants were aristocratic adventurers who took advantage of their position and of special circumstances to make themselves masters of the government in their respective states.

It is to Pisistratus, however, that the world owes the preservation in their present form of the poems of Homer, which he caused to be collected and edited in a complete written text. He was succeeded by his sons Hippias and Hipparchus, as joint rulers; but the severity of Hippias (after the murder of Hipparchus) caused his expulsion by the people, and the end of the despotism at Athens, 510 B. C.

ATHENS A PURE DEMOCRACY UNDER CLEISTHENES

The government at Athens now (507 B. C.) became a pure democracy, under the auspices of Cleisthenes. At the head of the popular party he effected important changes in the constitution. The public offices of power were thrown open to all the citizens, the whole people was divided into ten tribes or wards, and the senate (Boule) now consisted of five hundred members, fifty from each ward or tribe.

POLITICAL OSTRACISM.—Cleisthenes introduced the ostracism (from ostrakon, the oyster-shell, on which the vote was written), by which the citizens could banish for ten years, by a majority of votes, any citizen whose removal from the state might seem desirable. This device was intended to secure a fair trial for the new constitution by checking the power of individuals who might be dangerous to popular liberties, and by putting a stop to quarrels between rival politicians.

Athens had at last secured a government of the thoroughly democratic type, and from this time began to assume a new and ever-growing importance in Greece, and was soon regarded as the chief of the Ionian States. The people, through the Ecclesia, became thoroughly versed in public affairs, and practically, as well as legally, supreme in the state.

GROWTH AND IMPORTANCE OF SPARTA

As Athens had Draco and Solon as its great lawgivers, so Sparta found in Lycurgus her lawgiver. His institutions gave a permanent cast to the Spartan character, and were not abolished until the last ages of Greece. The system of Lycurgus, meanwhile, had made Sparta a thoroughly military state, and in two great wars (743-723 and 685-668 B. C.) it conquered its neighbors on the west, the Messenians, reducing them to the condition of the Helots, and appropriating their land. By this and by successful war against its northern neighbors, the people of Argos, Sparta acquired the supremacy and became the leading Dorian state of Peloponnesus and of the Grecian world. These two great states of Greece, Athens and Sparta, now were (about 500 B. C.) with the rest of Greece to encounter Persia; and Europe, with united Greece for her champion and representative, was to triumph over the older civilization and prowess of Asia.

III. PERIOD OF PERSIAN WARS AND MILITARY GLORY.—To this age the Greeks ever after looked back with pride, and from its history orators of every nation have drawn their favorite examples of valor and patriotism. The Persian invasion called forth the highest energies of the people, and gave an astonishing impulse to Grecian mind. The design of subjugating Greece originated in the ambition of Darius the Persian king, the second in succession from Cyrus the Great. He found a pretext and occasion for the attempt in a revolt of his Greek subjects in Asia Minor, in which Sardis, the capital of Lydia, was pillaged and burned. The war was carried on by three successive kings, Darius, Xerxes and Artaxerxes, but on neither of them did it confer any glory; while the battles of Marathon, Thermopylæ, Salamis, Mycale, and Plataea, secured immortal honor to the Greeks. A succession of splendid names adorns the history of Athens during this period. Miltiades, Themistocles, Aristides, Cimon, and Pericles, acted distinguished parts in the brilliant scene. Sparta also justly gloried in the self-sacrifice of Leonidas and his three hundred brave companions. The period of the Persian war was the age of the highest elevation of the national character of the Greeks. Before it, there existed little union comparatively between the different states, and it was not till Athens had alone and successfully resisted the strength of Persia at the battle of Marathon, that other states were aroused to effort against the common enemy. In the confederation which followed, Sparta was the nominal head, but the talents, which actually controlled the public affairs, were found in the statesmen of Athens. To Athens, therefore, the supremacy was necessarily transferred, and before the close of the war this state stood, as it were, the mistress of Greece.

Persia at this time was the chief power of the world, and, by the conquest of the Lydian kingdom, had become master of the Greek cities on the coast of Asia Minor. In 500 B. C. a general revolt of these Ionian cities took place, and the Athenians sent a force of ships and soldiers to help their kinsmen. The united Ionians and Athenians took and burned Sardis, the capital of Lydia, in 499, but, after a six years' struggle, the power of Darius conquered the whole seaboard of Ionia, and left Persia free to punish the Athenians for interfering between the great Eastern empire and her revolted subjects. In 490 B. C. a great Persian force, under Datis and Artaphernes, was sent across the

Ægean, and the fleet landed the Persian army near Marathon, on the east coast of Attica, with a view to an advance upon Athens.

THE FAMOUS BATTLE OF MARATHON

The first and most important battle of the Persian War, and one of the most momentous in history, was that of Marathon. At the plain of Marathon, near Athens, a small Athenian force of about ten thousand men (with the help of six hundred men from Plataea), under the famous general Miltiades, routed a Persian army of perhaps one hundred and ten thousand, in 490 B. C. This memorable battle, resulting as it did in the defeat of the power which had conquered the greater part of the known world, first taught the Greeks their own strength and gave Athens a position in Greece which it had never yet held. The leading men in Athens at this time were Themistocles and Aristides.

The death of Darius, in 485 B. C., prevented him from renewing the Persian attack on Greek liberties, and the task was bequeathed to his son Xerxes. The invasion of Greece by Xerxes took place ten years after the battle of Marathon with an immense force by sea and land (two million five hundred thousand men according to Herodotus).

[377]

STAND OF THE THREE HUNDRED AT THERMOPYLAE

Then was fought the memorable battle of Thermopylae (gates of the hot springs, from hot springs situated there), in which the Spartan Leonidas with a mere handful of men held the whole Persian army at bay in the narrow pass of Thermopylae; but, a way around the pass being shown the Persians by a treacherous Greek, they were able to attack Leonidas in the rear. Part of the Greek forces retreated on learning of this movement of the Persians, but Leonidas with three hundred Spartans and seven hundred Thespians refused to retreat, and, advancing against the overwhelming numbers of the enemy, sold their lives as dearly as possible.

This little remnant of the Greeks, armed only with a few swords, stood a butt for the arrows, the javelins, and the stones of the enemy, which at length overwhelmed them. Where they fell they were afterwards buried.

GREEK VICTORY AT SALAMIS

Xerxes, having taken the pass of Thermopylae, moved towards Athens, when the inhabitants had fled, taking refuge in their ships, according to their interpretation of a decree of the oracle that they must seek safety in their "wooden walls." The Persians burned Athens, and the fate of Greece was then decided by the naval battle of Salamis (480 B. C.), which resulted in a complete victory for the Greeks.

The battle of Salamis, with the battles of Plataea and Mycale, in the next year, decided the war, and the Persians were driven out of Greece forever, and finally, after several years, were driven wholly out of Europe. The arbitrary rule of an irresponsible despot was overcome by the spirit of voluntary obedience to law, the freedom of Greece was maintained, and the future civilization of Europe was secured.

IV. AGE OF PERICLES AND GREEK LUXURY.—This period includes the portion from the close of the Persian war to the Supremacy of Philip, B. C. 337. At the beginning of this period the general affairs of Greece were in a highly prosperous condition, and Athens was unrivaled in wealth and magnificence under the influence of Pericles. But a spirit of luxurious refinement soon took the place of the disinterested patriotism of the preceding age, and the manners of all classes became signally marked by corruption and licentiousness. The events of most prominent interest were: (1) the Peloponnesian war between Athens and Sparta; (2) the accusation of Socrates, disgraceful to the city and all concerned; (3) the expedition of Cyrus the Younger which involved the Greeks in another war with Persia; (4) the successive downfall of Athens, Sparta and Thebes, and the rise of Macedon.

The half-century following the battle of Salamis (480-430 B. C.) forms the most brilliant period of Athenian history, and one of the greatest eras in the history of the world.

ATHENS UNDER CIMON

After the fall of the great Athenian Themistocles,—who was banished by ostracism in 469 B. C., at the instance of the aristocratic party,—the rich, able, and popular Cimon, son of Miltiades, the victor at Marathon, was at the head of affairs. In 466 B. C. he gained a great victory, by land and sea, over the Persians, at the mouth of the river Eurymedon, in Pamphylia, on the south coast of Asia Minor. A part of the value of the plunder taken was devoted to the adornment of the city of Athens, which Themistocles had rebuilt and fortified. Cimon spent large sums of his own on the city, and under his direction the defenses of the famous Acropolis (the citadel of Athens) were completed. In 461 B. C. the democratic party at Athens banished Cimon by the ostracism, and the illustrious Pericles, for some years his rival, came to the front.

PERICLES AND HIS GREAT ACHIEVEMENTS

Pericles began to be distinguished in Athenian politics about 470 B. C. as leader of the democratic party.

In the constitution of Athens a wide scope was given for the development of great political characters, because the system not only allowed the display of a man's powers, but summoned every man to use those powers for the general welfare. At the same time, no member of the community could obtain influence unless he had the means of satisfying the intellect, taste, and judgment, as well as the excitable and volatile feelings, of a highly cultivated people.

Such a man was Pericles. From the force of his personality, and his majestic oratory, he was called "the Zeus of the human Pantheon of Athens." For over thirty years (461 to 429 B. C.) this great man swayed the policy of Athens. Pericles was at once a statesman, a general, a man of learning, and a patron of the fine arts. He recovered for Athens (445 B. C.) the revolted island of Euboea; he was the friend of the famous sculptor Phidias, and in his age the great dramatic compositions of Sophocles were presented on the Athenian stage. To him Athens owed the Parthenon, the Erechtheum, left unfinished at his death, the Propylaea, the Odeum, and numberless other public and sacred edifices; he also liberally encouraged music and the drama; and during his rule industry and commerce were in so flourishing a condition that prosperity was universal in Attica.

THE PELOPONNESIAN WAR

The supremacy over the other states of Greece which Athens attained after the Persian War, and maintained during the Age of Pericles, with her constant prosperity and unparalleled growth, raised up jealousy and hatred against her, and during that brilliant period were sown the seeds of a civil warfare which was destined to destroy the power and splendor of Greece. After the death of Pericles, Athens had trusted to unworthy demagogues, of whom the most notorious was Cleon.

The other leading state of Greece was Sparta, and there was a general gravitation in the different cities to these two centers of Grecian life, those in which democratic sentiments prevailed looking to Athens for leadership, the rest (those in which the aristocratic or oligarchical element prevailed) regarding themselves as the natural allies of Sparta. The conflict between these two opposing principles, democracy and oligarchy, broke out in 431 B. C., and is known as the Peloponnesian War. Athens was the stronger by sea, Sparta by land.

[378]

Pinakotheka, or Museum of Pictures. Propylaea, or Porch. Nike Apteros. Parthenon, or Temple of Athena Parthenos.

THE ACROPOLIS OF ATHENS AS IT APPEARED DURING THE AGE OF PERICLES

Pericles, with the sculptor Phidias, covered the Acropolis with a mass of beautiful buildings, making it the glory of Athens, if not of the whole ancient world. No finer structure has ever been known than the Parthenon. It is to be seen on the highest point of the Acropolis, on the right hand of the picture.

CHIEF LEADERS IN THE WAR

The chief generals on the Athenian side were Demosthenes (not the great orator of a later time) and Nicias; the Spartan chief was the famous Brasidas, who had much success against the Athenian colonies on the coast of Thrace. The brilliant Alcibiades began to display his powers as a statesman at Athens. In 422 B. C. a battle near Amphipolis, on the coast of Thrace, ended in the defeat of the Athenians, and the deaths of Cleon and of Brasidas, the latter an irreparable loss to Sparta. In the place of Cleon, the mild Nicias became one of the leading statesmen at Athens, and his efforts resulted in a truce between Athens and Sparta, in 421 B. C.

[379]

SECOND PERIOD OF WAR

Questions as to keeping the truce, and the mutual distrust and jealousy between these states increased their antagonism. Athens, now mistress of the sea, had the ambition, under the incitement of the great Alcibiades, to acquire complete sway in the Mediterranean.

Perhaps the most important and decisive event of the war was an attack made (415 B. C.) by Athens upon Syracuse in Sicily, when the Spartans helped the Syracusans, and which resulted in the total failure of the expedition (413 B. C.), and great damage to the power of Athens. The Athenians had sent a more powerful armament against Sicily than had ever before been turned out in the history of Greece. The consequences of the defeat of this force were felt all over Greece, the enemies of Athens were stimulated to much greater activity, and thought that the fate of that city was sealed.

THIRD AND LAST PERIOD

Henceforward Athens could only fight for her life as an independent state. In 412 B. C. many of her subject states revolted, including the wealthy Miletus, on the coast of Asia Minor, and the islands of Chios and Rhodes. Sparta formed an alliance with Persia, and used Eastern gold to furnish ships and mercenaries against Athens. Alcibiades, having quarreled with the Spartans, rejoined his country, and conducted her war, in some of its closing years, with brilliant success. In 411 B. C. a revolution took place in Athens which really swept away the democratic constitution of Solon, and substituted an oligarchical faction in power.

DOWNFALL OF ATHENS

The war was chiefly carried on in Asia Minor, where Alcibiades and others defeated the Spartans and their allies by land and sea; but in 405 B. C. the tide of success for Athens turned again, and the Athenian fleet was captured by the Spartan admiral Lysander, at Ægospotami, in the Hellespont, the Athenian galleys being seized, by surprise, on the beach. In 404 B. C. Athens, blockaded by the Spartans both by land and sea, surrendered to Lysander after a four months' siege, and the war ended in the downfall of Athens, and the formal abolition of the great Athenian democracy.

RESULT OF PELOPONNESIAN WAR

Henceforward Athens was a subordinate power. Sparta was, for a time, supreme; a Spartan garrison held the Acropolis; Alcibiades, who might have restored Athens, was assassinated in Persia through the influence of Lysander; and though, after a brief period of rule by the Thirty Tyrants, set up by Lysander, a counter-revolution restored, in part, the constitution of Solon, the political greatness of Athens had departed.

Even the disastrous Peloponnesian War, which lasted twenty-seven years, did not destroy the impulse given to the Greek intellect during the preceding age, and literature, oratory, and philosophy flourished.

SOCRATES AND THE SHAME OF ATHENS

Socrates, the great and good Athenian philosopher, lived (469-399 B. C.) during a period covering much of the age of Pericles, and the whole time of the Peloponnesian war. Though opposed to the oligarchical tyranny of the Four Hundred and the Thirty, Socrates was even more adverse to the unmixed democracy, with its election by lot and its payment for political services. Accordingly, on the triumph of the demagogues, he was in 399 B. C. accused of denying the gods and corrupting the young, and being convicted by an overwhelming majority of the jury, was sentenced to death. He passed thirty days before execution in the noble discourses on the immortality of the soul, which are recorded in Plato's *Phædo*, drank the cup of hemlock, and died.

SUPREMACY OF SPARTA AND THEBES

Sparta was now at the head of Greece, and for thirty-four years (405-371 B. C.) wielded power over the Greek states. Her sway was harsh and despotic.

RETREAT OF THE TEN THOUSAND

After the Peloponnesian War, some of the Greeks were hired by Cyrus, the Persian prince, to help him in an attempt to wrest the Persian throne from his brother Artaxerxes. The attempt failed, and the memorable retreat (400 B. C.) homeward of the Greeks is famous as the "Retreat of the Ten Thousand."

THE RISE OF MACEDONIA

Macedonia, north of Thessaly, was not considered by the Hellenes as a part of Hellas, and had no political importance till now. Yet the peoples had elements in common, being Thracians and Illyrians, with a large mixture of Dorian settlers among them.

KING PHILIP OF MACEDON

The line of Macedonian kings being of Hellenic descent, Greek civilization had been cultivated by some of them.

Philip of Macedon was a prince of great ability, educated at Thebes during the Theban supremacy, and trained in war by Epaminondas, on whose tactics he founded his famous invention, the "Macedonian phalanx." His fame has been overshadowed by that of his illustrious son, but he made Macedonia the leading power in Greece, and gave Alexander the basis for his great achievements. He was a man of unscrupulous character, determined will, prompt action, and patient purpose; and when he became King of Macedon, in 359 B. C., he designed making his country supreme in the Hellenic world, as Athens, Sparta and Thebes had successively been.

[380]

THE FIRST SACRED WAR

From 356 B. C. to 346 B. C. the Phocian or First Sacred War was waged between the Thebans and the Phocians, with allies on each side, the origin of the war being a dispute about a bit of ground devoted for religious reasons to lying perpetually fallow. Philip of Macedon was called in to settle matters, and thereby his ambition secured a firm foothold in Greece. He possessed himself by force of the Athenian cities Amphipolis, Pydna, Potidæa, and Olynthus, being vigorously opposed throughout by the great Athenian orator and patriot Demosthenes, who strove to rouse his countrymen against Philip's dangerous encroachments, in the famous speeches known as the Olynthiac and Philippic orations.

THE GREATEST PERIOD OF GREEK ORATORY

This was the most brilliant time of Greek oratory, which reached its perfection in the contest between Æschines, who advocated the cause of Macedonia, and Demosthenes, who opposed the designs of Philip. It was also a period of great mental activity in the region of scientific inquiry and speculative thought. Plato, whose birth fell in the preceding century, founded the Academic school, which took its name from the groves of Academus in the vicinity of Athens, where the philosopher was accustomed to lecture. Aristotle (called the Stagyræite, from his birthplace, Stagyræ, in Macedonia) was the instructor of Alexander the Great, and founded, at the Lyceum in Athens, what is known as the Peripatetic school, from his habit of walking about while conversing with his disciples.

After the battle of Chæronea, Philip, having made Greece subject to his power, planned to unite all the forces of that country in an aggressive war against the great power of Persia, but was murdered in 336 B. C.

V. MACEDONIAN PERIOD AND EMPIRE OF ALEXANDER THE GREAT.—This period extends from the supremacy of Philip, gained by the battle of Chæronea, to the capture of Corinth, 146 B. C. By the disastrous defeat at Chæronea the genuine fire of the Grecian spirit was extinguished, and the subsequent history exhibits little else than the steps by which the country was reduced to a dependent province. Alexander, who succeeded his father Philip, as king of Macedon, and autocrat of Greece, cast an imperishable glory on the first years of this period by his extensive conquests reaching from the Hellespont to the Granicus, to Issus, to Tyre, to the Nile, to the desert of Libya, to the Euphrates, and the Indus. For twenty years after Alexander's death the vast empire he had formed was agitated by the quarrels among his generals. By the battle of Ipsus in Phrygia, B. C. 301, these contests were terminated, and the empire was then divided into practically four kingdoms. To the first of these the Grecian states belonged. Patriotic individuals sought to arouse their countrymen to cast off the Macedonian yoke; but jealousy between the states and the universal corruption of morals rendered their exertions fruitless. All that is really memorable in the affairs of Greeks at this later time, is found in the history of the Achæan league.

After the assassination of Philip, the task of subjugating the Persian Empire was left for his son Alexander, who subsequently proved himself one of the greatest commanders of any age. Alexander's exploits were all performed in the short rule of thirteen years (336-323 B. C.). Coming to the throne of Macedon at the age of twenty, he put down rebellion in his own kingdom, marched into Greece and overawed Thebes, which had been intriguing against him, and in a congress of Greek states at Corinth he was appointed to command the great expedition against Persia.

THE DESTRUCTION OF THEBES

In 335 B. C. he made a successful expedition against the Thracians, Getæ, and Illyrians, and on his return found Thebes in revolt. He took Thebes by storm; the inhabitants were all slain or sold as slaves; and all the buildings, except the temples and the house which had been that of Pindar the poet, were razed. This capital had defied Alexander, and ceased to exist.

ALEXANDER'S INVASION OF PERSIA

In 334 B. C. Alexander crossed the Hellespont with an army of thirty thousand foot-soldiers and five thousand cavalry, and first met the foe at the river Granicus, in Mysia. The result was a Persian defeat, which cleared the way through Asia Minor, and brought the Macedonians to the borders of Syria. The second, a great battle (333 B. C.), was fought at Issus, in the southeast of Cilicia. There Alexander met the King of Persia himself, Darius III., and gained a complete victory over a vastly superior force. Darius fled, leaving his wife and mother prisoners in the conqueror's hands, by whom they were treated with the greatest courtesy and kindness.

SYRIAN AND EGYPTIAN CAMPAIGNS

The Persian resistance thus disposed of for a time, Alexander turned southward, left behind him nothing unsubdued before his advance into the interior of Asia, and made an easy conquest of the cities of Phœnicia, except Tyre, which resisted obstinately for seven months, and was taken in the summer of 332 B. C. After taking Gaza, Alexander marched into Egypt, which received him gladly, from hatred of her Persian rulers. Early in 331 B. C. the Macedonian king handed down his name to future ages by founding, at the mouth of the western branch of the Nile, the city of Alexandria, which was destined to become so famous for commerce, wealth, literature, and learning.

[381]

ALEXANDER'S SECOND INVASION OF PERSIA

In the spring of 331 B. C. Alexander set out again for Persia, where Darius had been gathering an immense force with which to make a last struggle for the empire of the world. After traversing Phœnicia and Northern Syria, Alexander crossed the Euphrates and Tigris, and came out on the plain near the little village of Gaugamela, to the southeast of the ruins of Nineveh. Then took place the great and decisive battle of Arbela, with the Persians, October, 331 B. C.

After receiving the surrender of the other two capitals, Susa and Persepolis, Alexander spent the year 330 B. C. in conquering the northern provinces of the Persian Empire, between the Caspian Sea and the Indus. In 329 B. C. he marched into Bactria, over the mountains now called the Hindu Kush, caught and slew the traitor Bessus, who murdered Darius, and advanced even beyond the river Jaxartes. In 328 he was engaged in the conquest of Sogdiana, between the Oxus and Jaxartes, the country of which the capital was Maracanda, the modern Samarcand.

HIS INVASION OF NORTHERN INDIA

In the spring of 327 B. C., Alexander marched through what is now Afghanistan, crossed the Indus, and defeated an Indian king, Porus, on the banks of the Hydaspes (the Jhelum). On his way to the Indus he stormed the capital of an Indian tribe, now Mooltan, and was himself severely wounded. In 326 he sailed in a fleet, built on the spot, down the Indus, into the ocean; detached a part of the army on board the ships, under his admiral Nearchus, by sea coastwise into the Persian Gulf, and marched himself with the rest through what is now Beluchistan, reaching Susa early in 325 B. C.

ALEXANDER SETTLES IN BABYLON

During the rest which the troops took here, Alexander, many of his generals, and many thousands of his soldiers, married Asiatic women, and, with the same view of bringing Europe and Asia into one form of civilization, great numbers of Asiatics were enrolled in the victorious army, and trained in the European fashion. For the improvement of commerce, the Tigris and Euphrates were cleared of obstructions. From Susa, in the autumn of 325 B. C., Alexander visited Ecbatana (in Media) and thence proceeded to Babylon, which he entered again in the spring of 324 B. C.

It was the intention of Alexander to make Babylon the capital of the empire, as the best medium of communication between east and west; and he is said to have meditated the conquests of Arabia, Carthage, Italy, and of Western Europe. For commercial and agricultural purposes he intended to explore the Caspian Sea, and to improve the irrigation of the Babylonian plain. All his plans were made vain by his sudden death by fever at Babylon, in the summer of 323 B. C.

ESTABLISHMENT OF VARIOUS GREEK KINGDOMS

Alexander the Great left no heir to his immense empire. In Bactria (the modern Bokhara), Asia Minor, Armenia, Syria, Babylonia, and above all in Egypt, Greek kingdoms were established as centers of science, art, and learning, from which Greek light radiated into the world around them. In Europe, besides that of Macedon, a kingdom of Thrace, stretching beyond the Danube, another in Illyria, and another in Epirus, were under the rule of Greek princes. To Alexander the world owed, among other great cities built by him or his successors, Alexandria in Egypt, and Antioch in Syria.

LASTING INFLUENCE OF GREEK THOUGHT IN ASIA

The Greek language became the tongue of all government and literature throughout many countries where the people were not Greek by birth. Throughout Asia Minor, Syria, and Egypt the Hellenic character that was thus imparted remained in full vigor down to the time of the Mohammedan conquests; and the early growth and progress of Christianity were aided by that diffusion of the Greek language and civilization.

Beyond the Euphrates, Grecian influences largely modified Hindu science and philosophy and the later Persian literature. The intellectual influence of ancient Greece, poured on the Eastern world by Alexander's victories, was brought back to bear on Mediæval Europe through the Saracenic conquests. The learning and science of the Arabians, communicated at that epoch to the western parts of Europe, were merely the reproduction, in an altered form, of the Greek philosophy and the Greek learning acquired by the Saracenic conquerors along with the territory of the provinces which Alexander had subjugated, nearly a thousand years before the armed disciples of Mohammed began their career in the East.

ALEXANDER'S SUCCESSORS

On the death of Alexander, in 323 B. C., a struggle of more than twenty years' duration ensued among his principal generals and their heirs—Perdiccas, Ptolemy, Antigonus, his son Demetrius Poliorcetes, Cassander, Seleucus, and others. At last, in 301 B. C., a decisive battle was fought at Ipsus, in Phrygia, between Antigonus (with his son Demetrius) and a confederacy of his rivals. The result was to distribute the provinces of Alexander's empire in the following way: To Lysimachus, nearly the whole of Asia Minor; Cassander, Greece and Macedon; Seleucus, Syria and the East; Ptolemy had Egypt and Palestine. The two most important kingdoms were that of the Ptolemies in Egypt,

and that of the Seleucids^[4] in the East. (See further under [Comparative Outlines](#), and [Egypt](#).)

[4] The Syrian monarchy of the Seleucidae began in 312 B. C. with Seleucus I. (surnamed Nicator), one of Alexander's generals, and under him was extended over much of Asia Minor, including the whole of Syria from the Mediterranean to the Euphrates, and the territory eastwards from the Euphrates to the banks of the Oxus and the Indus. Seleucus I. was an able and energetic monarch, and sedulously carried out the plans of Alexander the Great. He died in 280 B. C., having founded the city of Antioch in Syria as the capital of the kingdom. His successors, the dynasty known as the Seleucidae (or "descendants of Seleucus"), ruled for about two centuries. The most notable of these monarchs were named Antiochus. The third of the name, Antiochus the Great (223 to 187 B. C.), was the monarch at whose court Hannibal, the great Carthaginian, took refuge. Antiochus invaded Greece in 192 B. C., and there the Romans defeated him both by land and sea, and compelled him to yield a large part of his dominions in Asia Minor. Much of the eastern territory had been lost before this time, as well as Phoenicia, Palestine, and Western Syria, conquered by Ptolemy Philopator, king of Egypt. Antiochus Epiphanes (175-164 B. C.) oppressed the Jews to introduce the worship of the Greek divinities. Against him the brave Maccabees rose in rebellion. The Syrian kingdom ended in 65 B. C., conquered by the Romans under Pompey.

LATER HISTORY OF MACEDONIA AND GREECE

The last period in the history of Greece presents us with long wars among different successors of Alexander for the sovereignty of the Greek states, and factions and intrigue rife in and between the different communities. From time to time great and patriotic men arise, making a struggle glorious but vain for the restoration of political freedom and the spirit of the olden time. We find "leagues" and confederations formed in order to resist the coming doom of political extinction.

THE FATAL LAMIAN WAR

A great effort to free Greece from the Macedonian supremacy was headed by Athens in 323 B. C. The renowned Athenian orators Demosthenes and Hyperides were its political heroes, opposed by Phocion, a man of pure character, but who despaired of a successful rising against Antipater, ruler of Macedonia before and after Alexander the Great's death. Athens was joined by most of the states in Central and Northern Greece; and the war derives its name from Lamia in Thessaly, where Antipater, after being defeated by the confederates, was besieged for some months. The war ended in 322 B. C., by Antipater's complete victory at the battle of Crannon in Thessaly. Demosthenes ended his life by poison in the same year; Hyperides was killed by Antipater's orders; Phocion died by the hemlock at Athens, in 317 B. C., on a charge of treason.

HEROIC EFFORTS OF DEMETRIUS

The distinguished Demetrius Poliorcetes (besieger of cities) was king of Macedonia from 294 to 287 B. C. His life was passed in fighting with varied success and he was driven from the throne at last by a combination of enemies, including the famous Pyrrhus, king of Epirus. Demetrius was a man of wonderful abilities and resources, deriving his surname from the enormous machines which he constructed for the siege of Rhodes, one of his warlike enterprises. He freed Athens for a time from Macedonian domination before he became ruler of Macedon.

A famous personage was Pyrrhus, the warlike king of Epirus, the territory in the northwest of Greece, inhabited by descendants of the old Pelasgians and Illyrians. The first king of the whole country was Alexander, the brother of Olympias, mother of Alexander the Great. He ruled from 336 to 326 B. C.

THE WARRIOR PYRRHUS, KING OF EPIRUS

Pyrrhus (295 to 272 B. C.) is renowned as the greatest warrior of his age. He had been driven by his subjects from Epirus, but, assisted with a fleet and army by Ptolemy I. of Egypt, returned thither and began his actual reign in 295 B. C. His first efforts were turned against Macedonia; but, after much fighting, he lost his hold there, in 286 B. C. It was in 280 B. C. that he began his great enterprise by crossing over into Italy, to aid the Tarentines against the Romans. In his first campaign he defeated the Romans in the battle of Heraclea in Lucania. His skill was aided by a force of armored elephants, and by the Macedonian formation of the phalanx, both novelties to the Romans. In the second campaign (279 B. C.) Pyrrhus gained a second dearly bought victory over the Romans at Asculum, in Apulia, yet with no decisive result; in 278 B. C. he crossed into Sicily, to help the Greeks there against the Carthaginians.

REPULSES AND DEATH OF PYRRHUS

At first he was very successful and defeated the Carthaginians, taking the town of Eryx; but he failed in other operations, and returned to Italy in 276 B. C., again to assist the Tarentines against the Romans. In 275 B. C. his career in Italy was closed by a great defeat, inflicted by the Romans at the battle of Beneventum, and Pyrrhus returned to Epirus with the remnant of his army. In 273 B. C. he invaded Macedonia with such success as to become king, and his restless spirit then drove him to war in Peloponnesus. He was repulsed in an attack on Sparta, and, after entering the city of Argos to assist one of its factions, was knocked from his horse by a heavy tile hurled from a house-top by a woman's hand, and killed by the enemy's soldiers. Thus died Pyrrhus, in the forty-sixth year of his age, and the twenty-third of his reign,—a man of the highest military skill, capable of great enterprises, but without the steady resolution and the practical wisdom to bring them to a successful issue.

GALLIC INVASION OF GREECE

The Gauls invaded Greece in 280 B. C. After penetrating through Macedonia and Thessaly they were defeated under their leader Brennus (namesake of the captor of Rome a century earlier), near Delphi in Phocis. Some of the Gauls in this irruption made their way into Asia Minor, and ultimately gave their name to the province Galatia, adopting the Greek customs and religion, but keeping their own language.

THE CELEBRATED ACHAEAN LEAGUE

The Achaean League was founded, in its new form, in 280 B. C., consisting of the towns in Achaea, and afterwards including Sicyon, Corinth, Athens, and many other Greek cities, so that it became the chief political power in Greece. In 245 B. C. Aratus (sometimes called the "last of the Greeks") became head of the league, and much extended its influence by skillful diplomacy. Philopœmen, another distinguished man of this period, general of the league in 208 B. C., and again in 201 and 192 B. C., was successful in battle against the Spartans when they assailed the League, and in 188 B. C. took Sparta, leveled the fortifications, and replaced the institutions of Lycurgus by the Achaean laws.

Greece from this time forward was greatly distracted; Greek power, Greek energy, Greek genius, might now be found indeed anywhere rather than in Greece. The Achaean League from time to time made spasmodic efforts, but Rome constantly interfered in Greek affairs. Domestic faction helped Roman intrigues, and the battle of Pydna (in Macedonia), gained by the Romans in 168 B. C. over Perseus, the last king of Macedon, formally ended the dominion established by Phillip II., nearly two centuries before. Macedonia was made a Roman province in 147 B. C.

GREECE BECOMES A ROMAN PROVINCE

The Achaean League had gradually languished and in 150 B. C. war with Rome began, as a last effort on behalf of Greece. It ended in the defeat of the forces of the League by the Roman general Mummius, and the capture of Corinth (146 B. C.), which was plundered, and burned to the ground; the Achaean League was formally dissolved, and Greece was made into the Roman province Achaia, in 146 B. C. The city of Athens was allowed to retain a kind of freedom, and became, along with Alexandria, a university town of the civilized world, in which students of art, philosophy and literature found the best models, the best instruction, and the highest inspirations.

THE GREEKS UNDER FOREIGN RULE UNTIL 1832

Under the Romans Greece was at first treated fairly well, and much of the old municipal life was left. Hellenic culture fascinated the conquerors. Greek teachers poured into Rome, and Athens became the university for wealthy Roman youths. Little by little, however, the government became more oppressive. In the Mithradatic War the Greeks rose in a revolt which led to a devastating march of Sulla across the country and to the storming of Athens and the massacre of its inhabitants. Greece was then exposed to the exactions of the Roman officials on the one hand, and to the ravages of pirates on the other. In 267 B. C. the Goths swept across the land, destroyed many towns, and captured Athens, from which they were dislodged by the forces of the historian Dexippus.

In internal affairs the tendency during the following centuries was to more and more centralize rule on the part of the Romans. The Emperor Hadrian attempted to improve the condition of the Greeks by giving them rights equal to those of Roman citizens, by reforming the administration of justice, and by paying attention to roads and buildings. Constantine, the first Christian Emperor, took the important step of changing the capital from Rome to Byzantium, which he solemnly dedicated in 333 A. D. and called, after himself, Constantinople. The Emperor, having been the political head of the pagan religion, naturally assumed the same direction of the Christian faith, and, in the opposition of the orthodox Church to the Arianism of the first Christian Emperors the people found a vent for the national feeling which chafed against the despotism of an alien court. Theodosius the Great (378-395) first established Christianity as the religion of the state. His sons, Arcadius and Honorius divided the Roman dominions between themselves, and Constantinople became the capital only of the Eastern Empire. At this time a great danger threatened Greece from Alaric, king of the West Goths, who invaded Greece in 396 and occupied Athens. Though the city and country were pillaged by the Goths, Alaric strictly protected the honor of Greek women and religious edifices.

GREECE UNDER THE BYZANTINE EMPIRE

On the division of the Roman Empire, Greece fell of course to the eastern or Byzantine half. In 1204 the Crusaders and Venetians captured Constantinople, and divided the Empire—an act which has been taken as the end of "the Byzantine Empire." Baldwin, Count of Flanders, was elected Emperor of Roumania, and reigned at Constantinople. Many new states sprang out of the partition, and new empires were founded at Nicæa, Trebizond, and Thessalonica. The feudal system was established in Greece. Athens became a fief of Roumania, governed by dukes; a great part of the Peloponnesus was kept first by Franks and then by Neapolitans, as the Principality of Achaea. The Venetians obtained possession of most of the islands.

Of all the confused and crowded events of these times probably the most important, was the capture of Constantinople in 1261 by Michael Paleologus, Emperor of Nicæa, but no attempt to hold Greece could long endure in the face of the Ottoman Turks who soon began to threaten from the East. In 1453 the Sultan Mohammed II. took Constantinople. The Venetians finally surrendered all claim to most of their Greek possessions by the Treaty of Passarowitz in 1718.

UNDER TURKISH RULE DOWN TO THE WAR OF GREEK INDEPENDENCE

During the rule of the Turks the Greeks endured many hardships, including a curious tribute of children, who were educated by Mohammedans and trained for service in the corps of Janissaries. It was, however, to the interest of the Sultans for the sake of their revenues to encourage Greek commerce, and so there were wealthy classes with culture enough to make a fruitful soil for the teaching of the French Revolution. The spirit thus implanted led to the War of Greek Independence in 1821—memorable for the generous sympathy of Byron, for the long siege of Missolonghi, and for the accident which led to the defeat of the Turkish fleet at Navarino in 1827 by English, French, and Russian vessels.

From this period down to the present the history of Greece belongs to the modern kingdom.

From the Painting by LUDWIG THIERSCH

ALARIC, KING OF THE WEST GOTH, IN ATHENS

Though Alaric was a fierce warrior and ruthless in his attacks in both Greece and Rome, he held the women and the religious temples of the places overrun with the strictest sanctity. This was in strong contrast with the social and political corruption of the time in both Greece and Rome and did much justify this powerful conqueror of a decadent state.

ROME: MISTRESS OF THE WORLD

[385]

IMPORTANCE OF ROMAN HISTORY

The greatness of Roman history lies in the fact that it is, in a large sense, the history of the world from the time of Rome's supremacy. Out of the Roman language, law and institutions are still, in changed forms, alive and active in the modern world. The influence of Christianity, and of Greek art and literature, have to a great extent been preserved and transmitted to us through Rome. Rome brought all the civilized peoples of the West, including Western Asia, under one dominion and one bondage; and the culture which was thus gathered up into one vast reservoir was given off in streams that, in due season, fertilized the mental soil of the rude and restless nations which succeeded the fallen empire.

GEOGRAPHICAL CENTER OF THE ROMAN EMPIRE

The study of Roman history properly begins with the geography of Italy, because it was in Italy that the Roman people had their origin, and it was here that they began their great career. It was only when the Romans had conquered and organized Italy that they were able to conquer and govern the world.

FAVORABLE SITUATION OF THE ITALIAN PENINSULA

The position of the Italian peninsula was favorable to the growth of the Roman power. It was situated almost in the center of the Mediterranean Sea, on the shores of which had flourished the great nations of antiquity—Egypt, Phœnicia, Carthage and Greece. By conquering Italy, Rome thus obtained a commanding position among the nations of the ancient world. As the peninsula projects southward into the Mediterranean it bends toward the east, so that its southern coasts afforded an easy access to the civilized peoples of Greece. The eastern shores of the peninsula, washed by the Adriatic Sea, with few bays and harbors, were not favorable to the early progress of the people; while the western coasts, bordering upon the Tyrrhenian Sea, with their numerous indentations afforded greater opportunities for commerce and a civilized life.

THE MOUNTAINS AND RIVERS OF ITALY

There are two important mountain chains which belong to Italy, the Alps and the Apennines. The Alps form a semicircular boundary on the north and afford a formidable barrier against the neighboring countries of Europe. Starting from the sea at its western extremity, this chain stretches toward the north for about one hundred and fifty miles, when it rises in the lofty peak of Mt. Blanc, fifteen thousand feet in height; and then continues its course in an easterly direction for about three hundred and thirty miles, approaching the head of the Adriatic Sea, and disappearing along its coast. It is crossed by several passes, through which foreign peoples have sometimes found their way into the peninsula.

The Apennines, beginning at the western extremity of the Alps, extend through the whole length of the peninsula, forming the backbone of Italy.

IMPORTANT DIVISIONS OF THE PENINSULA

Central Italy comprised the northern part of the peninsula proper, that is, the territory between the line just drawn from the Macra to the Rubicon, and another line drawn from the Silarus on the west to the Frento on the east. This territory contained six countries, namely, three on the western coast,—Etruria, Latium (*la shi-um*), and Campania; and three on the eastern coast and along the Apennines,—Umbria, Picenum, and what we call the Sabellian country, which included many mountain tribes, chief among which were the Sabines and the Samnites.

Southern Italy comprised the rest of the peninsula and contained four countries, namely, two on the western coast, Lucania and Brutium, extending into the toe of Italy; and two on the eastern coast, Apulia and Calabria (or Iapygia), extending into the heel of Italy.

EARLY INHABITANTS OF SICILY

Sicily was inhabited in the west by a race of unknown origin called the Sikanians: the Sikels, who gave their name to the island, were closely connected in race with the Latins. Sicily was fought for by the Carthaginians, and Greek cities having been founded in Sicily, in the end the island became almost wholly Greek in speech and usages.

[386]

THE GAULS OF NORTHERN ITALY

If the Greeks in the extreme south were the most civilized people of Italy, the Gauls or Celts, in the extreme north, were the most barbarous. Crossing the Alps from western Europe, they had pushed back the Etruscans and occupied the plains of the Po; hence this region received the name which it long held, Cisalpine Gaul. From this land the Gauls made frequent incursions toward the south, and were for a long time a terror to the other peoples of Italy.

HISTORY OF THE ROMANS

I. MYTHICAL PERIOD.—The history of Rome extends through a space of more than twelve hundred years, which may be divided into *six* periods. The first period includes the time from the building of the city, B. C. 752, to the expulsion of Tarquin, B. C. 509. It may be called the period of the kings, or of *Regal Power*.

The Roman historians have left a particular account of this period, beginning with the very founders of the city, Romulus and Remus, whose descent is traced from Æneas the hero of Virgil. To review them briefly here will be all that is necessary.

Æneas, fleeing from Troy after the fall of that city, came, in the course of his wanderings and after many adventures, to the shores of Italy. Settling here, he married the daughter of the king Latinus, and after a fierce war with Turnus, his rival for the hand of Lavinia, he established himself in Latium. The capital of that country, Alba Longa, was founded by his son, Ascanius, and for three centuries the descendants of Æneas ruled the country.

In the eighth century B. C., Amulius usurped the throne but failed to kill his grand-nephews Romulus and Remus, who, by the fortuitous aid of the gods, were rescued from death. Growing to manhood, they destroyed the usurper and restored their grandfather, Numitor. Romulus then founded the city of Rome in 753 B. C., populated it by means of inviting all the discontented to come unto him, and gave them wives from the Sabine tribes, which incident has passed into history as the Rape of the Sabines. To this same incident in Roman mythology belongs the legend connected with the Tarpeian Rock. Romulus finally was taken to the gods by his father, Mars, and is henceforward worshiped by the Romans as the god Quirinus.

THE GOOD KING NUMA

The reign of the second king, Numa, is remembered, on account of his influence on the affairs of religion. He instituted many of the religious ceremonies and several classes of priests, and was regarded as the founder of the religious institutions of Rome.

During the reign of the third king, Tullus Hostilius, a war was carried on with Alba Longa. The issue of this war was decided, so the story goes, by a combat between the three Horatii, champions of the Romans, and the three Curiatii, champions of Alba—resulting in the triumph of the Romans and the submission of Alba to the Roman power.

The fourth king, Ancus Marcius, was a Sabine, the grandson of Numa. He too was a man of peace, but was drawn into a war with several of the Latin cities. Having subdued them, he transferred their inhabitants to the Aventine hill.

LEGENDS OF THE LATER KINGS

The three later kings of Rome are represented as having been Etruscans. The first of these was Tarquinius Priscus, who migrated to Rome from the Etruscan city of Tarquinii. He strengthened his position as king by adopting the royal insignia of the Etruscans—a crown of gold, a scepter, an ivory chair, a purple toga, etc. He carried on war with the Latins and Sabines, drained the city, laid out the forum, and dedicated a temple to Jupiter on the Capitoline hill.

The next of the later kings was Servius Tullius, the son of a slave woman of the king's household. He united Rome and the Latin cities in a league; reorganized the government, and erected a new wall inclosing the seven hills.

Tarquinius the Proud, the last king, was engaged in the siege of an enemy's city only sixteen miles from Rome, when his son committed the outrage upon the person of Lucretia, which led to the banishment of the family and the overthrow of the regal government.

II. PERIOD OF THE REPUBLIC, 510-264 B. C.—The second period extends from the expulsion of the kings to the beginning of the Punic wars. During this period the Plebeians were admitted to the offices of state, about 300 B. C. At the beginning of this period the government was a thorough aristocracy, but at the close of it has become a full democracy. It included about two hundred and fifty years, and may be designated the period of the Plebeian and Patrician contests, and the conquest of Italy.

When, at the close of the sixth century (509 B. C.), Rome ceased to be under kingly rule, it became a republic. Instead of a king, two magistrates called Consuls were elected every year. In other respects the constitution remained as before. The first consuls were Brutus and Collatinus.

As the city increased by immigration, and the admission of allies or incorporation of subjects, two principal classes of the citizens developed—the *Patricians* and *Plebeians*. The Patricians were probably those descended from the original citizens of the united Latin, Sabine, and Etruscan town, and the Plebeians the descendants of those afterwards admitted.

The internal history of Rome for several hundred years consists mainly of the account of struggles between these two orders. The Patricians alone were at first admissible to the great governing body, the Senate, and they kept in their hands all the high offices of state, the higher degrees of the priesthood, and the ownership of the public lands. The two orders were not allowed to intermarry, and the Plebeians, though they were free and personally independent (excepting compulsory service in war) had no political rights.

CAUSES OF STRUGGLES BETWEEN PATRICIANS AND PLEBEIANS

The struggles between the Patricians and Plebeians began about 500 B. C. The Plebeians fought the battles of Rome, and, in doing so, had to neglect the tillage of the soil by which they lived. Hence came poverty, made worse still by a severe law of debt, and by a high rate of interest extorted by the Patricians, who advanced money. The taxation of the state was paid solely by the Plebeians, as the Patricians had ceased to pay their rent to the treasury for the public lands which they held. At the same time, the Plebeians (which body included many men of birth and wealth) were entirely excluded from public offices. Such a state of things could only end in an outbreak, which occurred in 493 B. C.

FIRST WITHDRAWAL OF PLEBEIANS TO MONS SACER

The oppression of the debtors (who were imprisoned and flogged on failure to pay) caused a withdrawal of the Plebeians in a body to Mons Sacer (Holy Hill), outside the Roman territory, three miles from Rome. Their purpose was to erect a new town, and dwell apart, with equal rights. The Patricians, left helpless against foreign enemies, as usual in such cases, made concessions when forced to terms. It was agreed that two officials should be appointed (to offset the two consuls, who were Patrician magistrates) for the defense of the commoners against the cruel exercise of the law of debtor and creditor.

TRIBUNI PLEBIS

These new magistrates were called Tribuni Plebis (Tribunes of the Commons), and the title became very famous. They acted as champions of the subordinate class against all oppression, and pleaded in the law-courts on their behalf. The person of a Tribune was sacred and inviolable, and, in the exercise of his yearly office, he could forbid the execution of the order of any official, or of any decree of the senate; he could pardon offenses, and called to account all enemies of the commons under his charge.

FIRST OF THE AGRARIAN LAWS

In 486 B. C. Spurius Cassius (afterward tried for treason and put to death by the Patricians) carried the first of the famous Agrarian Laws, for limiting the amount of public land held by the Patricians, compelling them to pay tithes or rent for the land they held, and dividing surplus lands among the Plebeians. The law was not enforced, through the violence and injustice of the Patricians. The Plebeians exercised some check from time to time, by the refusal to serve as soldiers.

THE FAMOUS PUBLILIAN LAW

In 471 B. C. the Plebeians succeeded in carrying the famous Publilian Law (proposed by the tribune Publius Volero), that the tribunes should in future be chosen only at the (popular) Comitia Tributa, instead of in the (patrician) Comitia Centuriata. The Comitia Tributa also received the right of deliberating and deciding upon all matters that were open to discussion and settlement in the Comitia Centuriata. The struggle continued, and the commons found it a great disadvantage that there was no written law to control the chief Patrician magistrates (the consuls) in their dealings with the Plebeians.

FIRST GREAT CODE OF ROMAN LAW

After violent opposition, and the increase of the number of tribunes to ten, the Plebeians carried a law (about 452 B. C.) that ten commissioners (Decemviri) should draw up a code to bind all classes of Romans alike. The ultimate result was the compilation (and engraving on thick sheets of brass) of the first and only code of law in the Roman republic—the *Laws of the Twelve Tables*. These laws made the Comitia Tributa into a really national legislature, embodying Patricians and Plebeians alike. The Plebeians, however, were still kept out of a share in the lands which they conquered in war, and a time of trouble came in the usurpation and violence of the Decemviri.

SECOND WITHDRAWAL OF PLEBEIANS TO MONS SACER

In 448 B. C. the Plebs, for the second time, seceded to the Mons Sacer, and the Decemviri were obliged to give way. Tribunes were re-appointed, and the new consuls were Valerius and Horatius. By them, in the Comitia Centuriata the great Valerian and Horatian Laws were passed, the first great charter of Roman freedom, and the power of the Plebeians was much increased. The Comitia Tributa was now on a level with the Comitia Centuriata, so that a Plebs-citium, or decree of the people's assembly, had henceforth the same force as one passed by the Comitia Centuriata, and became law for the whole nation. The struggle between the two orders, Patricians and Plebeians, continued. In 445 B. C. the Lex Canuleia, proposed by the tribune Canuleius, was passed, sanctioning intermarriage between Patricians and Plebeians.

MILITARY TRIBUNES WITH CONSULAR POWER

The Patricians, foreseeing that the time would come when the Plebeians must be admitted to the high offices of the state, divided the powers of the consulship, and, in 444 B. C., caused the appointment of Military Tribunes with consular power, officers who might be elected from either order, as commanders of the army, while the civil powers of the consuls were kept by the Patricians in their own hands. In 443 B. C. the office of the Censors was established, with the proviso that they should be appointed only from the Patricians, and only by their assembly, the Comitia Curiata. In this the Patricians undoubtedly gained an accession of power.

FURTHER STRUGGLES BETWEEN PATRICIANS AND PLEBEIANS

The power of the Plebeians grew by degrees through the exertion of the prerogatives of the Tribunes, and about 400 B. C. the office of the Military Tribunes became open to the Plebeians, and four out of the six were chosen from that order. After the capture of Rome by the Gauls (390 B. C.), fresh troubles for the Plebeians arose. Their lands near Rome had been laid waste, cattle killed, and implements of agriculture destroyed. Heavy taxes were imposed to make up for the loss of public treasure carried off by the Gauls, and soon the old trouble of debt arose, and consequent oppression by the Patrician creditors.

EQUALITY AND FREEDOM ACHIEVED UNDER THE TRIBUNES LICINIUS AND SEXTIUS

The distress of the Commons increased until a great remedy was found by two patriotic tribunes of the Plebs, Caius Licinius Stolo and Lucius Sextius, the authors of the great Roman charter of equality and freedom. These able, determined men, after a tremendous struggle, fought with constitutional arms alone,—in which the Romans showed that respect for law and authority which, in their best days, so honorably distinguished them,—carried their point. The victory was won through the use of the power of the tribunes to stop the whole machinery of government. Year after year, for ten successive years, Licinius and Sextius were chosen tribunes, and, while the Patricians gained over the eight other tribunes, and prevented the popular bills being put to the vote in the Comitia Tributa, the two tribunes prevented the election of the Consular Tribunes (save in 371 B. C., for a war with the Latins), and other high officials, and would have no troops levied at all.

TERMS OF THE LICINIAN LAWS

At last, in 366 B. C., the famous Licinian Laws were carried, to-wit: (1) That the interest already paid by debtors should be deducted from the capital of the debt, and the remainder paid off in three equal annual instalments; (2) That no one should hold above five hundred jugera (about two hundred and eighty acres) of the public land, the surplus to be divided among the poorer Plebeians; (3) That the military tribunate with consular power should be abolished, and the consulship restored; but one Consul, at least, henceforward, should be a Plebeian. Sextius was himself elected, in 366 B. C., as the first Plebeian consul. All the other offices, dictatorship, censorship, prætorship, etc., were soon thrown open to the Commons,—so that at last, after the long struggle, perfect political equality was established.

FINAL ESTABLISHMENT OF DEMOCRACY

For a century and a half since the expulsion of the kings, Rome had been a republic, but an aristocratic republic; it was now truly a government of the people. From this time begins the golden age of Roman politics. Civil concord, to which a temple was dedicated, brought with it a period of civic virtue and heroic greatness.

THE CONQUEST OF ITALY

During this period, so harassed by internal contests, Rome was also engaged in frequent wars. These wars were with (1) their immediate relatives the Latins; with (2) their more distant relatives, the various other Italian nationalities; with (3) the Greek settlements in Southern Italy aided by Pyrrhus, king of Epirus; with (4) the Gauls in Northern Italy.

MEANING OF THESE WARS

These Roman wars meant a great deal to the future of this remarkable nation. Before Rome could play its grand part in the history of the world's civilization it was necessary, first of all, that it should become a great *Nation*. A great nation needs an extensive stage on which to play its part. Now the wars by which the Romans put down the various small and obstructive nationalities of Italy were the clearing of the stage, preliminary to the oncoming of that imperial figure, the "Mistress of the World."

WARS WITH THE SAMNITES IN SOUTHERN ITALY

The series of wars against Etruscans, Latins, Samnites, and Gauls, sometimes singly and sometimes in combination, is usually known in Roman history by the general designation of the "Latin wars" and the "Samnite wars." These wars filled the greater part of the half-century between 343 and 290 B. C.; and the Samnites were the leaders in this onset of the nations on Rome, the issue of which was to determine whether Rome or Samnium should govern Italy. The Romans were completely successful; and extricating themselves by their valor from this confused conflict of nations, the Romans found themselves masters of Central Italy (290 B. C.),—Samnites, Latins, etc., all their subjects.

WAR WITH THE GREEK KING PYRRHUS

The "Samnite wars" were succeeded by a short but brisk war, designated in Roman history "the war with Pyrrhus and the Greeks in Italy." Pyrrhus was an able and enterprising Greek prince whom the Greek towns of Southern Italy—fearful of being overwhelmed by what they called the "conquering barbarians of the Tiber"—had invited over from his native country to help them as champion of a Greek city.

Pyrrhus came over with a force of twenty-five thousand troops and twenty elephants. In the first battle (Pandusia, 280 B. C.) the Romans fought stoutly, until what they conceived to be gigantic gray oxen (the elephants) came thundering down upon them; so that the victory remained with Pyrrhus. In the next contest also (Asculum, 279 B. C.) Pyrrhus was successful; but the Romans made him pay so dearly for his triumph that he is said to have exclaimed, "Another such victory and I am undone!" Not having succeeded in his main object, Pyrrhus quitted Italy and went to Sicily; but soon after he returned, renewed the contest with the Romans, and was utterly overthrown at Beneventum, in 275 B. C.

The subjugation of Southern Italy—of all that part called Great Greece—soon followed, and at the close of the year B. C. 266 Rome reigned supreme over the length and breadth of the peninsula of Italy, from the southern boundary of Cisalpine Gaul to the Sicilian Straits, and from the Tyrrhenian, or Tuscan, Sea to the Adriatic.

NATURE OF THE ROMAN STATE UNDER THE REPUBLIC.

The real governing power in Rome was the Roman people,—*populus Romanus*,—that is to say, the body of free inhabitants of the thirty-three tribes or parishes north and south of the Tiber, which constituted the Roman territory proper, together with a considerable number of persons in other parts of Italy who, either from being colonists of Roman descent or from having had Roman citizenship conferred on them, had the privilege of going to Rome and voting at the Comitia, or Assembly. The possessors of the suffrage thus formed a comparatively small body of men, such as might be assembled with ease in any public square or park, and these by their votes decided on the affairs of the commonwealth, controlling thus the destinies of the whole population of Italy, estimated at this time at above five million.

In addition to the *populus Romanus* there were two other classes,—the Italians and the Latins. The Italians, or *socii*, were the inhabitants of the allied and dependent Italian states that had submitted to Rome. These communities were almost all permitted to retain their own laws, judges, municipal arrangements, etc.; but they did not possess the Roman franchise, and hence had no share in the political affairs of the republic. The Latins were those who belonged to cities having the "Latin franchise," as it was called, from its having first been given to the cities of Latium when conquered. This did not give full Roman citizenship, but made it easier to obtain it.

SUMMARY OF ROMAN GOVERNMENT

Rome wisely left self-government to all the dependent and allied states, while she secured her sovereignty by three rights which she reserved to herself: (1) She alone made peace or declared war; (2) She alone might receive embassies; (3) She alone might coin money. Altogether it was an admirable system, vastly superior to the loosely related Grecian states. It was a system that made possible for the first time in the world's history a great, as well as a free, nation.

It is a striking fact that there was not yet even a dawning Roman literature; in art, science, philosophy, Rome had done—absolutely nothing. But, in fact, it was in the art of governing mankind that Roman genius was to appear; and it was this that showed itself in these early years,—it was their valor, their probity, their patriotism, their political tact, and not speculation or literary culture, that distinguished them.

CONSTRUCTION OF THE GREAT ROMAN ROADS

The famous Roman roads are to be found not only throughout Italy, where they were constructed in various directions from the capital, but in every land once conquered by Rome and stamped by her, as she stamped all her conquests, with ineffaceable marks of her possession and her power. These great roads were first made with the military purpose of providing a way that should be solid at all seasons of the year, for the march of legions and their heavy baggage through districts subdued by Roman arms. They were wonderful pieces of determined practical engineering, and in order to carry them straight to the points aimed at, marshes and hollows were filled up, or spanned with viaducts; mountains were tunneled, streams were bridged; no labor, time, or money was spared.

THE APPIAN WAY AND OTHER FAMOUS ROADS

The first and greatest of the Italian roads was the famous Appian Way (*Via Appia*, called *Regina Viarum*, "Queen of Roads"), which was begun by Appius Claudius, Censor in 312 B. C. The struggle with the Samnites was at its height when this great causeway, built with large, square stones on a raised platform, was made direct from the gates of Rome to Capua, in Campania. The *Via Appia* was afterwards extended, through Samnium and Apulia, to Brundisium (on the lower Adriatic), the port of embarkment for Greece. Parts of the original stonework are existing at this day. Other great roads of Italy were the *Via Aurelia*—the great coast-road northward, by Genoa (Genoa), into Transalpine Gaul; the *Via Flaminia*, through Umbria to Ariminum; and the *Via Emilia*, from Ariminum, through Cisalpine Gaul to Placentia.

III. EPOCH OF THE PUNIC WARS, 264-146 B. C.—The third period in Roman history extends from the final triumph of the Plebeians to the capture of Carthage, B. C. 146. Rome had hitherto been distracted with intestine feuds and dissensions, and had extended her dominion over but a small extent of territory. The admission of Plebeians to all the high offices of trust and distinction promoted the consolidation and strength of the republic, and the career of conquest was soon begun.

We now see Rome engage in the greatest conflict of her history,—that with the powerful maritime state, Carthage,—a struggle which, when it was fully developed, became for Rome a fight for national existence, in which her enemy was at the height of her power and resources, with Spain and Africa at her back, and with the first general of the age to command her armies.

RACES OPPOSED IN THE PUNIC WARS

The interest of the Punic wars (as they are called from the word *Punicus*, the Latin equivalent of Phœnician, and, in a limited sense, Carthaginian) is great and enduring. These wars were fought out to determine which of the two races, the Indo-Germanic, or Aryan, or the Semitic, should have the dominion of the world. On the one side—the Aryan—was the genius for war, government, and legislation; on the other—the Semitic—the spirit of industry, navigation and commerce. The skill and valor, the determination and resource, displayed on both sides, have caused these wars of Rome and Carthage to remain most vividly impressed upon the memories of men.

[390]

CHARACTER OF THE CARTHAGINIAN STATE AND PEOPLE

Carthage had become, by the political and commercial energy of her citizens, the leading Phœnician state, ruling over Utica, Hippo, Leptis, and other cities of Phœnician origin in northern Africa. The Carthaginians paid also great attention to agriculture, and the whole of their territory was cultivated like a garden, supplying the population with abundance of food. This fact, taken with the wealth derived from her commerce, explains how it was that a city with no large extent of territory was enabled to hold out so long against the utmost efforts of Rome, and at one period to bring her, as it seemed, to the verge of ruin.

The political constitution of Carthage was that of an oligarchical republic, and her aristocracy is famed for the number of able men that came from its ranks. On the other hand, she was weakened by being dependent on mercenary troops in her wars, subject to revolts at home among the native populations whom she oppressed, and hampered by the factious spirit prevalent among her leading men.

She had a great commercial genius, but no gift for assimilating conquered peoples, or for establishing an empire on a solid and enduring basis, and therefore, in the end, she succumbed to Rome, whose aim it was to bring the nations under one wide, enduring sway. The struggle of Carthage against Rome became, in fact, the contest of a man of the greatest abilities—Hannibal—against a nation of the utmost energy and determination, and the nation, in the long run, won the day.

FIRST PUNIC WAR, 264-241 B. C.

The Carthaginians held Corsica, Sardinia, and various colonies in Spain and possessions in Sicily. It was in Sicily that the cause of quarrel between Rome and Carthage was found, and Rome picked the quarrel by interference in a local matter at Messana. Hiero, king of Syracuse, as we have seen, had come over to the Romans, who, after defeating the Carthaginian army and taking Agrigentum (262 B. C.), determined to make themselves masters of Sicily. For this a fleet was needed, and with Roman energy they soon built one. Twice their squadrons were destroyed, but in 260 B. C. the consul Duilius gained a great naval victory at Mylæ, on the northeast coast of Sicily, and, from this time, Rome became more and more nearly a match for Carthage on her element, the sea. The Romans invaded Africa without success (255 B. C.), but were generally victorious in Sicily.

In 247 B. C. the great Hamilcar Barca (father of Hannibal and Hasdrubal) was appointed to the Carthaginian command in Sicily, and maintained himself there with great patience and skill against all the Roman efforts. But, in 241 B. C., the Roman commander Lutatius Catulus utterly defeated the Carthaginian fleet off the Ægates Islands, on the west coast of Sicily, and the Carthaginians then gave in. All Sicily, except the territory of Rome's faithful ally, Hiero of Syracuse, thus became (241 B. C.) the first Roman province.

CONQUEST OF SARDINIA, CORSICA, AND CISALPINE GAUL

The Romans, with gross ill-faith and injustice, took advantage of a revolt against Carthage by her mercenary troops to deprive her of Sardinia and Corsica (238 B. C.), and Sardinia was made into a province. Their next exploit was the conquest of Cisalpine Gaul, which was completed 222 B. C., and the Roman hold upon the new territory was confirmed by the establishment of military colonies at Placentia and Cremona.

THE CARTHAGINIANS UNDER HAMILCAR IN SPAIN

Carthage had resolved upon revenge for past defeats and injuries from Rome, and intrusted her cause to the great Hamilcar Barca. He sought to create for his country a new empire in Spain, which might be used as a base of operations against the foe for whom he had a deadly hate. From 237 to 229 B. C. (when he fell in battle) he was engaged in reducing a large part of Spain to submission.

In 221 B. C. his son, the illustrious Hannibal, took the Spanish command, and he soon brought on a new conflict with Rome by his capture of her ally, the city of Saguntum, on the northeast coast of Spain.

HANNIBAL AND THE SECOND PUNIC WAR, 218-202 B. C.

The hero of the Second Punic War is Hannibal, one of the purest and noblest characters in history. In 218 B. C. the Carthaginian general crossed the Alps, after a five months' march from Spain, and descended with a storm of war upon the Romans. With a force of twenty thousand foot and six thousand horse he encountered the consular armies, and defeated them at the rivers Ticinus and Trebia (218 B. C.), in Cisalpine Gaul, the Trasimene Lake in Etruria (217 B. C.), and most decisively, and with immense slaughter, at Cannæ, in Apulia, in 216 B. C. For fifteen years (218 to 202 B. C.) Hannibal maintained his ground in Italy, defeating the Romans again and again, opposed by the cautious Fabius Maximus and the daring Marcellus (the conqueror of Syracuse), but unable to capture Rome, or to subdue Roman steadfastness and courage.

CAUSES OF HANNIBAL'S DEFEAT

The chief causes of the ultimate failure of Hannibal, besides the doggedness of Rome's resistance, were the faithfulness of many of Rome's allies, especially the Latins, in Italy, the success of Roman armies, under Publius Scipio, in Spain (temporarily subdued 205 B. C.), and the want of due support by Carthage to her great leader. The crisis came in 207 B. C., when Hannibal's brother, Hasdrubal, crossed the Alps into Italy with a powerful army which, joined with Hannibal's in Southern Italy, would probably have effected the conquest of Rome, now almost exhausted. This was not to be. Hasdrubal was defeated, and slain by the Romans at the decisive battle of the Metaurus (a river in Umbria), one of the great critical contests of history. The junction of the forces thus prevented, Rome was saved, and, in order to be rid of Hannibal, the war was carried now into the enemy's country.

[391]

DEFEAT OF HANNIBAL BY SCIPIO AFRICANUS AT ZAMA

Publius Scipio, so successful in Spain, crossed from Sicily to Africa in 204 B. C., and did so well for Rome that Hannibal was recalled. The Second Punic War ended with the defeat of Hannibal by Scipio at Zama (five days' journey from Carthage), in 202 B. C. The conqueror gained the surname of Africanus. Hannibal lost his army, but not his fame. Rome was certain now to rule the world. The terms of peace with Carthage made her for the time a mere dependency of Rome. All her foreign possessions were given up; her fleet was reduced to ten ships; she was to make no war without Rome's permission; and an enormous war indemnity was exacted.

SUBJUGATION OF MACEDON BY ROME

In 213 B. C. Rome attacked Philip V., king of Macedon, because he had made a treaty with Carthage, and, after making an alliance with the Ætoliens, the Romans gained some successes over Philip in the First Macedonian War, ending in 205. The Second Macedonian War (200-197 B. C.) put an end to Macedon's supremacy in Greece, by the victory of the ex-consul Flaminius at Cynoscephalæ, in Thessaly, 197 B. C.

ROMAN ARMS ARE CARRIED INTO ASIA

Antiochus the Great, of Syria, who had irritated Rome by meddling in the affairs of Greece, which he invaded in 192 B. C., was beaten by the Roman armies in Greece and Asia Minor, and in 188 B. C. made peace on terms that left Roman influence supreme in Asia Minor as far as Syria.

THE FINAL FATE OF HANNIBAL

The great Carthaginian, even after Zama, had not despaired of himself or of his country. He set vigorously to work at internal reforms in Carthage with a view to renewing the contest with Rome; but, being thwarted by jealous and unpatriotic rivals, who also intrigued for his surrender to the Romans, he fled to the court of Antiochus the Great, of Syria, in 194 B. C. In rejecting her greatest man, Carthage had lost her last chance of regaining any real power. Hannibal was driven from his shelter with Antiochus by the Roman demand for his surrender, and took refuge with Prusias, king of Bithynia, for some years; but Roman dread of his abilities pursued him, and hopeless of escape, he poisoned himself about 183 B. C., leaving Rome free at last to pursue her victorious career.

ROMAN CONQUEST OF THE GREEK STATES

A Third Macedonian War, begun in 171 B. C., was waged by the Romans against King Perseus, son of Philip V., and ended with a great Roman victory at Pydna, in 168 B. C., and the extinction of Macedon as a kingdom. After a revolt, called the Fourth Macedonian War, and a war against the forces of the Achæan League, Corinth was taken by Mummius, and Macedonia and Greece became Roman provinces (147 and 146 B. C.)

THIRD PUNIC WAR AND DESTRUCTION OF CARTHAGE

There was a powerful party in Rome (headed by the stern censor Porcius Cato) who relentlessly insisted on the destruction of Carthage. Her warlike neighbor, Masinissa, king of Numidia, was encouraged by the Romans in harassing attacks, and in 149 B. C. Rome found a pretext for war. Her forces could not be resisted, and Carthage offered a complete submission, seeking the preservation of her commerce and her capital by a surrender of arms, war-ships, and her internal independence.

When Rome insisted on the destruction of the city of Carthage itself, and the removal of the inhabitants to inland abodes, the Carthaginians took counsel of despair, and resolved to stand a siege within their strong fortifications. Scipio Africanus Minor conducted the three years' siege of the great commercial city and her citadel, and Roman determination, as usual, carried its point. After fearful house-to-house fighting the remnant of seven hundred thousand people surrendered; the place was set on fire, and

burned for seventeen days; the ruins were leveled with the ground, and Carthage the proud city, alike with Carthage the commercial state, ceased to exist, in 146 B. C., the year of the final conquest of Greece. Part of the territory was given to Masinissa of Numidia, Rome's ally; part became the Roman province of Africa.

GRANDEUR OF ROME AFTER HER FOREIGN CONQUESTS

At the beginning of the period of conquest (266-133 B. C.), the Roman dominion was confined to the peninsula of Italy; at its close it extended over the whole of southern Europe from the shores of the Atlantic to the straits of Constantinople, over the chief Mediterranean islands, and over a portion of North Africa, while farther east, in Egypt, Asia Minor, and Syria, its influence was paramount. At the beginning Rome was merely one of the "Great Powers" of the world as it then was,—that is, she ranked with Carthage, Macedonia, and the kingdom of the Seleucidæ; at its close she was clearly the sole Great Power left.

THE ORIGIN OF PROVINCIAL GOVERNMENT

The addition of the conquered countries resulted in a new feature of Roman rule called Provincial government. Retaining their native habits, religion, laws, etc., the inhabitants of every province were governed by a military president, sent from Rome, with a staff of officials. The provincials were required to pay taxes in money and kind; and these taxes were farmed out by the censors to Roman citizens, who, under the name of Publicans, settled in the various districts of the provinces. Thus, like a network proceeding from a center, the political system of the Romans pervaded the mass of millions of human beings inhabiting the shores of the Mediterranean; and a vast population of various races and languages were all bound together by the cohesive power of Roman rule.

SPLENDORS OF A FESTAL DAY IN ANCIENT ROME

The Coliseum (*kol-e-see'-um*), in the background, was dedicated by Titus, A. D. 80, in a grand festival of 100 days, at which 5,000 beasts were slaughtered in the games. The successive tiers of seats, receding from the arena to the summit, gave room for 90,000 spectators. Gladiatorial contests continued until abolished by Honorius, A. D. 405.

[392]

ROME AT THE HEIGHT OF ITS GRANDEUR

The luster of the Roman power and glory of the Roman name were now at their height. The eyes of all the world were now on Italy, the young republic of the West. Into Rome all talents, all riches, flowed. What a grand thing in those days to be a Roman citizen; so that, wherever one walked,—in Spain, in Africa, even in once proud Athens, he was followed, feasted, flattered! What a career was opened to those who wished for wealth or aspired to fame! But in the very sunburst of Rome's glory, the germs of decay were ripening.

On the Romans themselves the effect of their foreign conquests were both good and bad; but perhaps the evil outweighed the good.

ERA OF GREAT PUBLIC WORKS

The wealth poured into Rome by the conquest of Carthage, of Greece, and the East, and the considerable revenue derived from the permanent taxation of the provinces, enabled the Romans to carry out a great system of public works. Throughout Italy splendid military roads which remain to this day were built, the provinces were traversed by imperial highways, and fine stone bridges were thrown across the Tiber. In Rome splendid public buildings were erected, the city was sewered, the streets were paved (174 B. C.), two new aqueducts (the Marcian, built in 144 B. C., at a cost of ten million dollars) were constructed; and it may be noted that the Consul P. Scipio Nasica, in 159 B. C., set up in Rome a public clepsydra, or water clock, the citizens having for six centuries gone on without any accurate means of knowing the time by night as well as day.

INFLUENCE OF GREEK CULTURE ON ROME

The effect on Rome of the conquest of Greece and the Hellenized East was very marked. Greek rhetoricians, scholars, tragedians, musicians and philosophers in large numbers took up their abode in Rome. The city swarmed with Greek schoolmasters. Greek tutors and philosophers, who, even if they were not slaves, were as a rule accounted as servants, were now permanent inmates in the palaces of Rome; people speculated in them, and there is a statement that the sum of two hundred thousand sesterces (ten thousand dollars) was paid for a Greek literary slave of the first class.

RISE OF NATIVE ROMAN LITERATURE

The stimulus of Greek literary culture led to native production, and in the second century, B. C., we have the beginning of that Latin literature which we still read. Though the great period of Roman letters did not come till a century after this time (age of Augustus), yet there arose a number of writers of no ordinary power. Among these should be mentioned Ennius, the father of Roman poetry; Plautus, his contemporary, a man of rich poetic genius; the elder Cato, the first prose writer of note; and Terence, the most famous of the comic poets.

While the Romans were in some respects benefited by contact with the superior though decaying culture of Greece, they also learned a great deal that was debasing. They became effeminate, luxurious, and corrupt in morals; marriage was not respected; the old Roman faith waned, and it was said that two augurs could not meet in the street without laughing in each other's face.

GROWTH OF POLITICAL AND SOCIAL CORRUPTION

The political system of Rome now began to lead to a dreadful state of public corruption. The Roman government was devised for the rule of a city: all power was in the hands of the civic voters, and when there came to be great prizes, in the way of great offices at home and abroad, the voters began to find that their votes were worth something, and unblushing bribery and corruption became common.

The demands of the large planters and merchants led to a great extension of the slave-trade. All lands and all nations were laid under contribution for slaves, but the places where they were chiefly captured were Syria and the interior of Asia Minor. It is probable that at the period at which we have now arrived (middle of the second century B. C.) there were twelve million slaves against five million free inhabitants in the Italian peninsula,—a most lamentable state of things!

In addition to the slaves, Italy became filled up with a motley parasitic population from Asia and Africa and all the conquered lands,—and the result of this intermixture soon appeared in a marked degeneracy in the Roman race itself.

THE NEW ROMAN CONTRASTED WITH THE OLD

The decay of old Roman virtue became at the same time apparent in the great increase of luxury. This displayed itself in houses, villas, pleasure gardens, fish ponds, dress, food and drink. Extravagant prices—as much as one hundred thousand sesterces (five thousand dollars)—were paid for an exquisite cook. Costly foreign delicacies and wines were affected, and the Romans in their banquets vied with one another in displaying their hosts of slaves ministering to luxury, their bands of musicians, their dancing girls, their purple hangings, their carpets glittering with gold or pictorially embroidered, and their rich silver plate.

In the midst of the system there were not wanting some noble patterns of the old Roman type, among whom should be named Cato, who kept up a constant protest all his life against the growing luxury of his countrymen, and died declaring that they were a degenerate race. Such men were, however, rare exceptions; and we shall hereafter see that the evil system already operative in the second century went on increasing, till finally, a century afterwards, it resulted in the total subversion of the republic.

The picture just given of the state of Roman society in the last half of the second century B. C. prepares us for the period of civil strife on which we now enter.

IV. EPOCH OF THE CIVIL WARS, 146-31 B. C.—The fourth period extends from the capture of Carthage and Corinth to the establishment of the Imperial Government by the battle of Actium, B. C. 31. During this whole time the Roman history is a continued tale of domestic disturbances. From the fall of Carthage to the battle of Actium, it presents but a melancholy picture, a blood-stained record of sedition, conspiracy, and civil war.

A number of causes had resulted in the growth of an aristocracy founded purely on wealth; the old division of society into patricians and plebeians had ceased, and there arose a still worse division into classes,—the rich and the poor.

THE GRACCHI ESPOUSE THE CAUSE OF THE POOR

The cause of the poor against the rich was taken up by a noble young tribune of the people named Tiberius Gracchus. Tiberius and his afterwards distinguished younger brother Caius (the two being known in history as the Gracchi) were sons of a noble Roman matron, Cornelia, daughter of the great Scipio Africanus.

Tiberius Gracchus proposed a land-law (agrarian law), which would limit the amount of public land that could be held by any one individual and provided for the distribution of the rest in small homesteads. The aristocracy immediately raised a storm, and induced another tribune to veto the measure. Now, according to the Roman code, no proposal could become law unless all the tribunes were unanimous. Gracchus then secured a popular vote expelling his colleague from the tribuneship, and the land-law was passed by the people, 133 B. C. In the meantime, however, Gracchus's year of office expired, and he came up for re-election. The nobles resolved to prevent this by violence.

MURDER OF THE TRIBUNE, TIBERIUS GRACCHUS

Gracchus, learning this, bade his friends arm themselves with staves; and when the people began to inquire the cause of this, he put his hand to his head, intimating that his life was in danger. Some of his enemies ran to the senate and reported that Tiberius openly demanded a crown. A body of the aristocrats with their clients and dependents then

[394]

rushed among the unarmed crowd, and murdered Gracchus with three hundred of his adherents,—133 B. C.

Tiberius Gracchus was dead, but his work remained; that is to say, the measure which he had proposed was law, and the commissioners intrusted with the task of allotting the lands prosecuted their labors for two or three years. The nobles, however, obstructed the work as much as possible, so that between them and the champions of the people there was a continuous struggle.

THE STRUGGLES AND DEATH OF THE YOUNGER GRACCHUS

This struggle became still more fierce when Caius Gracchus, ten years after the death of his brother, claimed and obtained the tribuneship, and then took up that brother's work. The agitation for the agrarian law was renewed, an enactment was made for a monthly distribution of corn to the city poor, and various other reforms were proposed by him. After holding the tribuneship for two years, however, he lost the office through the intrigues of his opponents. The nobles were determined to crush Gracchus; accordingly, at one of the public assemblies they attacked the partisans of the popular leader, and there ensued a bloody combat (121 B. C.) in which three thousand of his adherents were slain. Gracchus himself fled into a wood across the Tiber; but, being pursued, he chose to die by the hands of a faithful slave rather than fall into the power of his enemies.

RISE OF MARIUS AND SULLA

The ill-will between the nobles and the people continued just as bitter after the death of Gracchus; and matters finally shaped themselves in such a way that the nobles, or senatorial party, came to be represented by a leader named Sulla, and the democracy, or Commons, by another, called Marius. These men came to prominence in the course of two or three wars in which Rome was engaged for twenty-five or thirty years after the time of which we have been speaking; and finally they acquired such power as to bring on a civil strife that deluged Italy with blood.

The wars just referred to were: the Jugurthine war (111-106 B. C.), the war against the Cimbri (113-101 B. C.), and the Social war (90-89 B. C.), with the details of which we need not concern ourselves; but the fourth contest was of more moment, and needs notice here. This was the Mithridatic war.

BOLD DESIGN OF MITHRIDATES AGAINST ROME

Mithridates, king of Pontus, a bold and able soldier, formed the design of uniting the Asiatic states and Greece in a vast confederacy against the Roman dominion. He began by causing about eighty thousand Romans who dwelt in the cities of Asia Minor to be massacred in one day (88 B. C.). He then invaded Greece.

The command in this important war was eagerly sought by both Marius and Sulla. Sulla prevailed; he was elected consul and put in command. Marius, being chagrined at this, succeeded in having the popular party set aside Sulla. But the aristocratic general marched to Rome and compelled Marius to flee into Africa. Sulla then set out for Greece, all of which submitted to him, the army of Mithridates being defeated (86-84 B. C.)

HORRIBLE MASSACRES ATTEND THE STRUGGLE BETWEEN MARIUS AND SULLA

During the absence of Sulla, Marius returned to Italy. Entering Rome in 86 B. C., he filled the entire city with slaughter, and in particular he caused the murder of the leading senators that had supported his rival. Marius then caused himself to be proclaimed consul without going through an election; but a fortnight later he died.

Notwithstanding the death of Marius, the Marian party still continued in power. Sulla, hearing of their successes, hastily concluded a peace with Mithridates, and hurried to Italy (83 B. C.). After a severe struggle, Sulla utterly overthrew the Marians. The blood of massacre then flowed a second time,—in a yet greater stream. Lists of proscribed persons, embracing all who belonged to the people's party, were published every day, and the porch of Sulla's house was full of heads.

Having put down all his enemies, Sulla caused himself to be proclaimed dictator for an unlimited time (81 B. C.). He then proceeded to re-organize the government wholly in the interest of the aristocratic party; but to the great surprise of every one he three years afterward resigned his power and retired to private life. Sulla died in 78 B. C.; he was honored with a magnificent funeral, and a monument with the following epitaph written by himself:

"I am Sulla the Fortunate, who in the course of my life have surpassed both friends and enemies; the former by the good, the latter by the evil, I have done them."

RISE OF POMPEY THE GREAT

After the death of Sulla, the most prominent figure among all the men of the aristocratic party was Cneius Pompey, who had distinguished himself as a lieutenant of Sulla, and afterwards won renown by his management of several important matters in which Rome was engaged—especially in the suppression of a formidable revolution in Spain under a very able leader named Sertorius (77-72 B. C.), and in stamping out a fire of revolt kindled by Spartacus, the leader of a band of gladiators, who, joined by a large force of discontented spirits, kept Italy in alarm for two or three years (73-71 B. C.). These exploits made Pompey a popular favorite, and in the year 70 B. C. he was rewarded by being made consul along with a rich senator named Crassus.

HIS MILITARY EXPLOITS IN THE EAST

At the expiration of his year of office he retired to private life, but was soon called upon to suppress a formidable combination of pirates who infested the Mediterranean Sea and had their headquarters in Cilicia (in Asia Minor). This task he accomplished in three months. These triumphs, aided by his political influence, enabled Pompey to procure the command in the war against Mithridates, who had renewed his scheme of conquering the Eastern Roman provinces. He was given powers such as never had been delegated to any Roman general. This war lasted for two years (66-64 B. C.), and was marked by a series of brilliant triumphs for Pompey. He utterly crushed Mithridates (who died by self-administered poison), as well as his son-in-law Tigranes, subdued Phœnicia, made Syria a Roman province, and took Jerusalem. Thus with the glory of having subjugated and settled the East he returned to Rome (62 B. C.), where a magnificent triumph awaited him.

FAMOUS STRUGGLES OF THE FOUR FACTIONS

Meanwhile there seem to have grown up, after the death of Sulla, four factions in Rome: the "oligarchical faction," consisting of the small number of families the chiefs of which directed the senate, and in fact governed the republic; the "aristocratic faction," comprising the mass of the senators anxious to obtain the power usurped by a few of their colleagues; the "Marian party," including all those whose families had been prosecuted by Sulla, and who now began to rally, and aspire to power; the "military faction," embracing a crowd of old officers of Sulla, who, having squandered the fortunes they had gained under him, were eager for some revolution that might give them the opportunity to improve their condition.

THE GREAT LEADERS OF THE FACTIONS—POMPEY, CICERO, CRASSUS, CAESAR AND CATILINE

At the head of the oligarchical faction was Pompey; but during his absence in Asia its representative was Marcus Tullius Cicero (born 106 B. C.), who had established his reputation as the first orator in Rome. He had risen through various offices to the praetorship, and at the time Pompey left for the East aspired to be consul. He did not himself belong to a noble family, but still he made himself the champion of the oligarchy. Though vain and boastful, he was a virtuous and patriotic man.

The leader of the aristocratic faction was Crassus, formerly the colleague of Pompey in the consulship, now his personal rival. He was a man of no great ability, but his position and his immense wealth made him influential. (After prodigious expenditures, he died worth ten million dollars.)

The leader of the third, or Marian party, was a man six years younger than Pompey or Cicero, who, distinguished in youth for his accomplishments and his extravagance, rose in the year 65 B. C. to the office of edile. This was Caius Julius Cæsar,—a man of pre-eminent ability, one of the greatest that ever lived. He was the nephew of Marius, and now stood forward as the leader of the Marian party. He was of an old patrician family, and took up the cause of the people to serve his own ends.

CONSPIRACY OF CATILINE

The leader of the military faction was Catiline, who had been one of the ablest and most ferocious of Sulla's officers. He had a large following of debauched young patricians and ruined military men, who thought they would better their fortunes by making Catiline consul. Cicero was his rival, and, receiving the support of the senators, was elected. Enraged at his defeat, Catiline formed a conspiracy of which the murder of Cicero and the burning of Rome were parts. A woman betrayed the plot to Cicero, who denounced Catiline with such fiery eloquence that he had to flee from Rome. With a band of confederates he attempted to reach Gaul; but he was overtaken in Etruria and slain, 62 B. C.

THE FIRST TRIUMVIRATE: CAESAR, POMPEY AND CRASSUS

Cæsar and Pompey, now finding that they agreed in many of their views, resolved to unite their forces. To cement their union more closely, Cæsar gave his only daughter, Julia, in marriage to Pompey. For various reasons it was found desirable to admit Crassus to their political partnership, and thus was formed (60 B. C.) that famous coalition known in Roman history as the "First Triumvirate." The object of Cæsar and Pompey was to thwart the senatorial party in every way, and wield all the power themselves.

The formation of the triumvirate was followed by the election of Cæsar to the consulship (59 B. C.); and when his year of office expired he obtained for himself the government of Gaul for five years, and then for another five. This was probably the great object of Cæsar's desires. No doubt he was already brooding over the design of making himself master of Rome; and for this purpose he would need an army.

During the years 58-50 B. C. Cæsar made eight campaigns in Gaul, forming the remarkable series of operations which he afterwards described with such pointed style in his *Commentaries*.

The result of his eight years' campaigning was that, in the spring of 50 B. C., Cæsar was able to take up his residence in Cisalpine Gaul, leaving the three hundred tribes beyond the Alps, which he had conquered by such bloody means, not only pacified, but even attached to himself personally. His army, which included many Gauls and Germans, was so devoted to him that it would have marched to the end of the world in his service.

DOWNFALL OF CRASSUS AND RIVALRY OF CAESAR AND POMPEY

During Cæsar's campaigns in Gaul (where his government was prolonged for a second five-year term), Crassus disappeared from the triumvirate. After holding the consulship with Pompey, in 55 B. C., he went as proconsul to the province of Syria, in 54 B. C. His greed of wealth, and desire for the military fame which he envied in Cæsar and Pompey, brought him to ruin, by inducing him to attack the kingdom of Parthia,^[5] where he was soon afterward murdered. So that the triumvirate became a duumvirate, or league of two men,—Cæsar and Pompey.

[5] Parthia had the rare distinction of being a country the prowess of whose warriors baffled the efforts of Rome for her subjection. The Parthian kingdom, southeast of the Caspian Sea, came into existence about 250 B. C., by revolt from the Seleucids, the monarchs of Syria, and became a powerful realm after the death of Alexander the Great. It included Parthia proper, Hyrcania, and afterwards (130 B. C.) Bactria, so that at last its dominions stretched from the Euphrates to the Indus, and from the river Oxus to the Indian Ocean. The Parthians adopted the Greek religion, manners, and customs, which had been introduced into that part of Asia by Alexander's conquests.

The renowned cavalry of Parthia seem to have been all-powerful only on their own soil, for their invasions of the Roman province of Syria in 39 and 38 B.C. were utterly defeated, while the invasion of Parthia by the great Roman general and triumvir, Mark Antony, in 36, was repulsed with loss of a great part of his army. In 20 B. C. the Parthian king Phraates restored, chiefly as a friendly concession, the standards and prisoners taken from Crassus and Antonius, and this is the event commemorated by the Roman poets of the day as equivalent to a submission by Parthia. Under the Roman emperors the Parthians sometimes courted and were sometimes at war with Rome, and were partially conquered for a time under Trajan. The Parthian kings encouraged Christianity. In A. D. 226 a revolt of the Persians put an end to the Parthian kingdom, revived the religion of Zoroaster, stopped the eastward progress of Christianity in Asia, and began modern history in Persia.

Now between these two men there had for some time been a growing coldness. It was said that Cæsar was a man who could brook no equal, and Pompey a man who could suffer no superior. A feeling of rivalry having once arisen, naturally grew till Cæsar and Pompey became the bitterest enemies. Pompey went over to the aristocratic party to which he had originally belonged, and having been made sole consul for the year 52 B. C., he began to exert his great influence against Cæsar. In this he was supported by the nobles, who dreaded Cæsar's immense power.

FINAL STRUGGLE BETWEEN CAESAR AND POMPEY

As the period of Cæsar's command would expire in the year 49 B. C., he had determined to obtain the consulship for the year 48 B. C., since otherwise he would become a private citizen. Accordingly he demanded, though absent, to be permitted to put himself in the lists for the consulate. But it was proposed, through the influence of Pompey, that Cæsar should lay down his command by the thirteenth of November, 50 B. C. This was an unreasonable demand; for his term of government over Gaul had another year to run, and if he had gone to Rome as a private citizen to sue for the consulship, there can be no doubt that his life would have been sacrificed. Cæsar, still anxious to keep the peace, offered, at the beginning of the year 49 B. C., to lay down his command if Pompey would do the same; but this the senate refused to accede to, and a motion was passed that Cæsar should disband his army by a certain day, and that if he did not do so, he should be regarded as an enemy of the state.

THE CROSSING OF THE RUBICON

Cæsar promptly took his resolve: he would appeal to the arbitration of arms. He had the enthusiastic devotion of his soldiers, the great mass of whom, being provincials or foreigners, cared very little for the country whose name they bore. Accordingly, in January, 49 B. C., he advanced from his headquarters at Ravenna to the little stream, the

[395]

[396]

Rubicon, which separated his own province and command from Italy. The crossing of this river was in reality a declaration of war against the republic; and it is related that, upon arriving at the Rubicon, Cæsar long hesitated whether he should take this irrevocable step. After pondering many hours he at length exclaimed, "The die is cast!" and plunged into the river.

Pompey concluded not to attempt to defend Italy, but to retire upon the East, where he would gather a great army and then return to overwhelm the "usurper." Accordingly he retreated to Greece.

CÆSAR MASTER OF ITALY AND DICTATOR OF ROME

In sixty days Cæsar made himself master of all Italy. Then marching to Rome he had himself appointed dictator and consul for the year 48 B. C. He showed masterly statesmanship, and soon brought the general current of opinion completely over to his side.

BATTLE OF PHARSALIA AND DEATH OF POMPEY

Meantime, Pompey had gathered a powerful army in Thessaly, and thither Cæsar with his legions proceeded against him. The decisive battle between the two mighty rivals was fought at Pharsalia, in 48 B. C. It resulted in the utter defeat of Pompey; and as it left Cæsar the foremost man in the Roman world, it must be regarded as one of the great decisive battles of history.

Pompey, after his defeat, sought refuge in Egypt; but he was assassinated by the orders of Ptolemy, when seeking to land on the coast of that country. Cæsar, who followed in pursuit, did not hear of his death until his arrival in Alexandria, where messengers from Ptolemy brought him Pompey's head. Cæsar, who was both a generous man and a compassionate foe, turned with horror from the spectacle, and with tears in his eyes gave orders that the head should be consumed with the costliest spices.

CÆSAR, CLEOPATRA AND THE CONQUEST OF THE EAST

At Alexandria Cæsar became enamored of Cleopatra, the young, beautiful, and fascinating queen of Egypt. He even mixed himself up with a quarrel that was going on between her and her younger brother Ptolemy, to whom, according to the custom of the country, she was married, and with whom she shared the throne. This intermeddling led Cæsar, who had but a small force with him, into conflict with the troops of the king. A fierce battle was fought in the city. Cæsar succeeded in firing the Egyptian fleet; but unfortunately the flames extended to the celebrated Library of the city of Alexandria, and the greater part of the magnificent collection of manuscripts was burnt. Cæsar was finally successful: Ptolemy was killed, and Cleopatra was made queen of Egypt. From Alexandria Cæsar marched into Pontus to attack Pharnaces, son of Mithridates, whom he subdued so quickly that he described the campaign in the most laconic dispatch ever penned: *Veni, vidi, vici*.—"I came, I saw, I conquered."

CÆSAR'S FINAL VICTORY AND TRIUMPHANT RETURN TO ROME

Pompey's forces that escaped from Pharsalia had established themselves in the Roman province of Africa. They were commanded by Scipio and Cato. Cæsar having settled matters in the East, now proceeded against this force, which he utterly destroyed at Thapsus, early in the year 46 B. C. Scipio and Cato killed themselves. One more rally the Pompeians made in Spain, but they were defeated by Cæsar in the decisive battle of Munda (March, 45 B. C.).

Cæsar returned to Rome after the battle of Thapsus, the master of the Roman dominion. The republic went out when Cato fell upon his sword at Utica; the monarchy came in with the triumphal entry of Cæsar into Rome in the summer of 46 B. C. It is true Cæsar was not king (*rex*) in name, but he was so in substance. His position as chief of the state was this: he was invested with the dictatorship for ten years,—an arrangement changed soon afterwards to perpetual dictator,—and was hailed with the title of Imperator for life. The latter title, Imperator (meaning commander), was one which belonged under the republic to the victorious general; but it was a temporary title, always laid aside with the surrender of military command. Cæsar was allowed to use it in a special way and permanently, and in his case it had much the meaning of the term Emperor,—a word which is simply Imperator cut short.

FEELINGS OF THE ROMANS TOWARD CÆSAR

There can be no doubt that the Romans were well satisfied to be under the rule of Cæsar. The republic was a mere name, for liberty had expired when the Gracchi were murdered, and subsequent dissensions were merely contests for power between different factions. Hence the Roman people, weary of revolution, were quite content to find peace under the just though absolute rule of one master.

It is important to recognize this as the real state of public feeling, because we shall now have to see that Cæsar fell a victim to assassination, and it might be thought that his overthrow was the people's revolt from monarchical rule. But it was the act of a small knot of conspirators who, with the cry of "Liberty and the Republic" in their mouths, did away with the Imperator to serve their own ends.

THE CONSPIRACY AGAINST CÆSAR AND HIS ASSASSINATION

The chiefs of the conspiracy were Caius Cassius and Marcus Junius Brutus. Both had received great favors from Cæsar; but they thought they had not been honored enough, and they were intensely jealous of the dictator's greatness. These were joined by other malcontents, and the plotters swelled their ranks by representing that Cæsar designed to assume the diadem and the title of king; so that the conspiracy finally included about sixty senators.

It is not certainly known whether or not Cæsar thought of taking the name of king. It is known, however, that the consul, Mark Antony, entered in the public acts, "that by the command of the people, he, as consul, had offered the name of king to Cæsar, perpetual dictator; and that Cæsar would not accept of it."

The plot ripened into a determination to assassinate Cæsar, and the conspirators fixed on the Ides (i. e. 15th) of March as the time of putting the design into execution. Rumors of the plot got abroad, and Cæsar was strongly urged not to attend the senate. But he disregarded the warnings which were given him. As soon as Cæsar had taken his place, he was surrounded by the senatorial conspirators, one of whom, pretending to urge some request, seized his toga with both hands and pulled it violently over his arms. Then Casca, who was behind, drew a weapon and grazed his shoulder with an ill-directed stroke. Cæsar disengaged one hand and snatched at the hilt, exclaiming, "Cursed Casca, what means this?" "Help!" cried Casca, and at the same moment the conspirators aimed each his dagger at the victim. Cæsar for an instant defended himself; but when he perceived the steel flashing in the hand of Brutus (Marcus Junius), he exclaimed "What! thou too, Brutus!" (*Et tu Brute!*) and drawing his robe over his face he made no further resistance. The assassins stabbed him through and through; and, pierced with twenty-three wounds, Cæsar fell dead at the foot of the statue of his great rival, Pompey. Julius Cæsar was in his fifty-sixth year, when, on the fifteenth of March, B. C. 44, he was stricken down.

EFFECT OF CÆSAR'S DEATH AND THE ORATION OF ANTONY

It is said that "revolutions never go backwards." Brutus and his fellow-conspirators struck down Cæsar in the name of liberty; but the blow that leveled the master of Rome did not bring back the republic,—it only insured the appearance of new claimants for supreme power, and consequently new civil wars.

On the occasion of Cæsar's funeral the consul, Mark Antony, delivered an oration over the dictator's body, and to such a height did the feeling of the Romans against the plotters rise, that Brutus and Cassius were obliged to escape forthwith from the city to avoid destruction.

The condition of affairs left Mark Antony in some respect the representative of Cæsarean principles; but a more direct claimant to the succession appeared in Cæsar's great-nephew, Caius Octavius, then a youth nineteen years old. The dictator had adopted Octavius as his son; so his name became Caius Julius Cæsar Octavianus. Octavius had all the old soldiers on his side, and raised the standard of Cæsar's vengeance.

TRIUMVIRATE OF ANTONY, OCTAVIUS AND LEPIDUS

At first Antony and Octavius were at strife; but finally they became reconciled, and associating with them Lepidus, the "master of the horse," the three formed the Second Triumvirate (43 B. C.), and concerted a plan to divide among themselves the supreme authority. In order to do this it was necessary utterly to crush both their personal enemies and the forces of the republic.

To accomplish the first object, they began a system of proscription more ruthless and bloody than that of Marius and Sulla. It is recorded that three hundred senators, two thousand knights, and many thousands of citizens were sacrificed. The most illustrious of the victims was the famous orator Cicero, whose severe invectives against Antony had procured him the relentless hatred of the triumvir. The aged patriot, while escaping from Rome in a litter, was assassinated.

BATTLE OF PHILIPPI AND DIVISION OF THE ROMAN WORLD

The second object was the destruction of the republican forces. Now Brutus and Cassius, finding their position in Italy to be desperate, had retired to the East, where in Thrace they gathered an army of about one hundred thousand men. Antony and Octavius pursued them with a still larger force, and the two armies met at Philippi. The republican army was totally defeated (November, 42 B. C.); both Brutus and Cassius killed themselves.

The victors now divided the Roman world among themselves,—Antony taking the East, Octavius the West, and Lepidus the province of Africa. But the Roman world was scarcely theirs before they began to quarrel over it. The feeble Lepidus never possessed much influence, and was soon robbed of his share. After this it was quite certain that a contest between Antony and Octavius could not long be delayed, and each began to intrigue against the other.

ANTONY'S TRAGIC ASSOCIATION WITH CLEOPATRA

Antony made the headquarters of his half of the Roman dominion at Alexandria. Here he came under the fascinations of Cleopatra, and he lost all regard to his character or his interests in her company. He even went so far as to divorce his wife Octavia, the sister of Octavius, and, having married the voluptuous Egyptian queen, he bestowed Roman provinces on her.

This conduct was treasonable, and furnished Octavius with a decent pretext for declaring war. The young Cæsar had been gaining great popularity in Italy; he had consolidated his power and had his legions in fine training. The fleets and armies of the rivals assembled at the opposite sides of the Gulf of Ambracia. After considerable delay, Antony, instigated by Cleopatra, who was present with her Egyptian fleet, determined to decide the contest by a naval battle. The contest took place off the promontory of Actium (on the west coast of Greece), while the hostile armies, drawn up on the shore, were simple spectators. In the midst of the conflict Cleopatra tacked about, and with the Egyptian squadron of sixty sail drew out of the fight. Antony, regardless of his honor, followed after her, and the pair fled to Alexandria. Both the fleet and the force of Antony surrendered to Octavius, 31 B. C.

Some months afterwards Octavius advanced to besiege Alexandria. Antony attempted to defend it; but he was abandoned by his troops. Cleopatra retired to a monument she had erected, and caused a report to be spread of her death. Upon this news Antony attempted to commit suicide, and inflicted on himself a mortal wound; hearing, however, in the midst of his agonies, that Cleopatra still lived, he caused himself to be carried to her monument, and expired in her presence (30 B. C.).

DEATH OF CLEOPATRA BY SUICIDE AND FALL OF EGYPT

The end of Cleopatra was even more tragic. The Egyptian queen seems at first to have thought that she would be able to bewitch the young Cæsar; but having in vain essayed her arts on the cold, calculating Octavius, she, sooner than be led in chains to adorn the triumph of the victor, and glut the eyes of the populace of Rome with the sight of the daughter and last of the Ptolemies, preceding the chariot of the adopted son of him who had done homage to her charms, gave herself voluntary death by the bite of an asp, or the scratch of a poisoned needle. Egypt now became a Roman province in 30 B. C., and Rome's dominion in the Mediterranean basin became formally, as it had long been virtually, complete.

The Roman Empire, replacing the Roman Republic, founded by Julius Cæsar, after the battle of Pharsalia, was consolidated by Octavianus in the following year.

V. PERIOD OF THE ROMAN EMPIRE TO CONSTANTINE, 31 B.C.-306 A.D.—The *fifth* period begins with the establishment of the Imperial Government under Augustus Cæsar to the reign of Constantine, A.D. 306. As Christianity was introduced into the world in this period, and was opposed until the end of it by the Roman government, it is often designated as the period of Pagan Emperors.

The reign of Augustus, the name taken by the first Emperor Octavius, has become proverbial for an age flourishing in peace, literature, and the arts. It is distinguished, also, for the birth of Jesus Christ; as the next reign, that of Tiberius, is, for his crucifixion and death.—The four reigns succeeding, viz.: those of Tiberius, Caligula, Claudius, and Nero, are chiefly memorable for the tyranny of the Emperors, and the profligacy of their families and favorites.

On the death of Nero, A.D. 69, follows a year of dissension and bloodshed, in which Galba, Otho, and Vitellius successively gained the empire and lost their lives.—The Flavian family, Vespasian and his two sons, Titus and Domitian, next in order receive the supreme power. Titus is celebrated as the final conqueror of the Jews, whose obstinacy provoked him to destroy the city of Jerusalem. Domitian, the last emperor of the family, provokes his own assassination, A.D. 96.

Passing the reigns of the feeble Nerva, the martial Trajan, and the peaceful Hadrian, we arrive at a brilliant age in the imperial history, the age of Antonines, extending from A.D. 138 to 180, a space of about forty years. Literature and the arts of peace revived under their benign influence.

After the death of Marcus Aurelius, A.D. 180, there follows a whole century of disorder, profligacy, conspiracy and assassination. The army assumes the absolute disposal of the imperial crown, which is even sold at public auction to the highest bidder. Within the last fifty years of the time, nearly fifty emperors are successively proclaimed, and deposed or murdered.—In the year 284, Diocletian began to reign,

and attempted a new system of administration.

Ten special persecutions of Christians are recorded and described, the first under Nero, A.D. 64, and the last under Diocletian, commencing A.D. 303, and continuing ten years, unto A.D. 313. But, notwithstanding these repeated efforts to hinder the progress of Christianity, it was spread during this period throughout the whole Roman Empire.

ROME IN THE AUGUSTAN PERIOD

When Augustus Cæsar at the age of thirty-six became master of the Roman world, there was no open establishment of a monarchical government. On the contrary, most of the old republican forms were kept up; but they were mere forms. The Senate still sat, but it did little more than vote what Augustus wished; the people still met in their assemblies and elected consuls and magistrates, but only such persons were elected as had been proposed or recommended by the Emperor. Augustus, however, assumed nothing of the outward pomp of a monarch: he was satisfied with the substance of supreme rule.

THE THREE CIVILIZATIONS WITHIN THE EMPIRE

Within the circuit of the Roman dominion there were what we may call three civilizations: the Latin, the Greek, and the Oriental. Latin civilization took in the countries from the Atlantic Ocean to the Adriatic; Greek civilization, from the Adriatic to Mount Taurus; Oriental civilization, the lands beyond to the Euphrates.

THE LATIN.—The area of Latin civilization embraced the peninsula of Italy (its native seat) and all western Europe, where the Romans appeared not only as a conquering but also as a civilizing people. Thus in the three provinces of Spain (Hispania), in the four provinces of Transalpine Gaul (corresponding nearly with the modern France), as well as in the North African provinces, especially Carthage (which was restored by Cæsar as a Roman colony), the Latin language took firm root, and the manners and customs, and indeed the whole civilization, of those lands became Roman.

THE GREEK.—Greek civilization was spread over Greece and all those parts of Europe and Asia that had been Hellenized by Grecian colonists or by the Macedonian conquerors. In manners, customs, language, and culture these lands remained Greek, while politically they were Roman.

THE ORIENTAL.—Oriental civilization was diffused over the Eastern provinces, especially Egypt and Syria. These countries had, under the rule of Alexander's successors, become to some degree Hellenized; but this influence was on the whole superficial. The peoples of those Oriental lands had never given up their own languages or religious ideas or ways of thinking. Now these peoples, it should be said, did not become Latinized either,—they did not adopt the language and civilization of Rome.

HOW ROME WAS GOVERNED UNDER THE EMPIRE

Within the limits of the Roman Empire under Augustus there may have been in all one hundred millions of human beings. Not less than one-half were in a condition of slavery; and of the rest, only that small proportion who, under the envied name of Roman citizen (*civis Romanus*), inhabited Italy, enjoyed political independence, or had the smallest share in the government. The various lands and peoples were under Roman legates (half of these appointed by Augustus and the other half by the Senate), who held supreme military command. To the provinces were left, however, their independent municipal constitutions and officers. In Rome and Italy the public peace was preserved by the pretorian cohorts,—bodies of soldiers of tried valor, to whom Augustus gave double pay. Throughout the provinces the people were kept in check by the regular troops,—numbering three hundred and fifty thousand men.

THE CAPITAL CITY OF THE ROMAN EMPIRE

Of this vast empire Rome was the metropolis, now a city of innumerable streets and buildings, and containing, it is calculated, a population of about two millions and a half. It was in this period that Rome became truly a splendid city. Augustus was able to boast that "he found the city brick and left it marble."

ITS EXTENT AND CHIEF BUILDINGS.—In the days of its greatest prosperity the circumference of Rome enclosed by walls was about twenty miles; but there were also very extensive suburbs. The walls were pierced by thirty gates. The most remarkable objects were the Coliseum, the Capitol with its temples, the Senate-House, and the Forum.

The great circus, or Circus Maximus, a place reserved for public games, races and shows, was one of the most magnificent structures of Rome. It was capable of containing two hundred thousand spectators.

The Flavian Amphitheater, whose massive ruins are known as the Coliseum, could seat from eighty to one hundred thousand persons. In the arena were exhibited the fights of gladiators, in which the Romans took such savage delight, together with races, combats of wild beasts, etc. Theaters, public baths, etc., were erected by the emperors, who seemed anxious to compensate the people for their loss of liberty by the magnificence of their public shows and entertainments.

THE ANCIENT ROMAN FORUM.—In the valley between the Palatine and Capitoline hills was the Forum, or place of public assembly, and the great market. It was surrounded with temples, halls for the administration of justice (called *basilicæ*), and public offices; it was also adorned with statues erected in honor of eminent warriors and statesmen, and with various trophies from conquered nations.

TEMPLE OF JANUS.—In the Forum was the celebrated Temple of Janus, built entirely of bronze and dating back to the early kingly period. From some early circumstance the custom was established of closing the gates of this temple during peace; but so incessant were the wars of the Romans, that during eight centuries the gates of the Temple of Janus were closed only three times.

CAMPUS MARTIUS.—The elections of magistrates, reviews of troops, and the census or registration of citizens, were held in the Campus Martius, which was also the favorite exercise-ground of the young nobles. It was surrounded by several splendid edifices; ornamental trees and shrubs were planted in different parts, and porticoes erected under which the citizens might continue their exercise in rainy weather. Nearby was the celebrated Pantheon, or Temple of All the Gods (erected in the reign of Augustus), the most perfect and splendid monument of ancient Rome that has survived the ravages of time.

THE ROMAN AQUEDUCTS.—The Aqueducts were among the most remarkable Roman structures. Pure streams were sought at a great distance, and conveyed in these artificial channels, supported by arches, many of which were more than a hundred feet high. Under the emperors, not fewer than twenty of these stupendous and useful structures were raised; and they brought such an abundant supply of water to the metropolis, that rivers seemed to flow through the streets and sewers.

COMPARED WITH ATHENS.—Rome was inferior to Athens in architectural beauty, but it far surpassed the Grecian city in works of public utility. To enumerate all the notable edifices would be impossible here; but the "Eternal City" in the zenith of its glory contained four hundred and twenty temples, five regular theaters, two amphitheaters, and seven circuses of vast extent. There were sixteen public baths, built of marble, and furnished with every convenience that could be desired. From the aqueducts a prodigious number of fountains was supplied, many of which were remarkable for their architectural beauty. The palaces, public halls, columns, porticoes, and obelisks were without number, and to these must be added the triumphal arches erected by the later emperors.

AS A CENTER OF LITERATURE

As the peace of the Roman world was maintained by the strong hand of power, it was at this time that many of those arts that grow best during seasons of national order and prosperity made their greatest progress. Thus many of the best-known Latin writers lived at this time.

Augustus himself was a great patron of literary men and artists, and so was his minister, Caius Cilinius Mæcenas. They honored and rewarded eminent writers; and though we must not forget that many of the distinguished men whose writings add luster to the "Augustan Age" had grown up under the republic, still Augustus deserves credit for fostering letters. Nothing will make up for the loss of political freedom; but it is something that in Rome, when liberty was lost, literature at least flourished.

Among the distinguished writers of this age or the times immediately preceding it are the poets Virgil, Horace, Lucretina and Catullus; and the historian, Sallust.

THE BIRTH OF CHRIST AND THE CHRISTIAN ERA

Under the rule of Augustus the greatest event of the world's spiritual history occurred in Bethlehem of Judæa—the birth of Jesus Christ. This really took place in the year 4 B.C., but the erroneous calculation has, for the sake of convenience, been allowed to stand, and the chronology passes from B.C. to A.D., when Augustus had held sway, according to the wrong reckoning, for twenty-seven years.

GREAT IMPORTANCE OF THE ROMAN DEFEAT BY THE GERMANS

The great secular fact of Rome's history under Augustus Cæsar was the destruction of the Roman general Varus and his legions in Germany by the celebrated Arminius,—the great national hero Herman,—in whose honor a colossal statue has been erected in the northwest of Germany, near the scene of his patriotic and momentous achievement. He was the chief of the Cherusci, a powerful tribe dwelling on both sides of the river Visurgis (Weser), and closely akin to the Angles and Saxons who conquered the island of Britain.

If Arminius had not done what he did against Rome, Germany might have been thoroughly subdued; the Latin language might have extinguished the Teutonic; the Teutonic tribes might have been overwhelmed; the Teutonic influence over modern Europe, and as an element of the English race, might never have been exerted, and Europe and the world would have had a widely different development from that which they have actually undergone.

LEGIONS OF VARUS VANQUISHED BY ARMINIUS

Arminius, as chief of the Cherusci, headed a confederacy of German tribes to expel from northern Germany the invaders and partial conquerors of the fatherland. The Roman governor, Quintilius Varus, and his officers and troops, had provoked the German outbreak by their licentious behavior, and the vengeance wreaked on the offenders was complete in itself, and effectual for the preservation of German freedom.

The German hero, when his plans were formed, tempted Varus and his three legions, by a revolt of the tribes near the Weser and the Ems, to march into the difficult country now called the Teutoburger Wald, a woody and hilly region near the sources of the Lippe and the Ems. When the Roman force was thoroughly entangled amidst the forests and hills, and had been further imperiled by the rashness of the incompetent tyrant Varus in the order of his march, then Arminius and the Germans fell on the hated foe; the Roman column was broken, and its cavalry fled, but was pursued and utterly destroyed.

Varus slew himself in despair. His infantry was overpowered and slain almost to the last man. All the efforts of Rome thereafter never secured her a permanent foothold on German soil. This great deliverance of Germany, so full of chagrin to Augustus and so momentous in European history, occurred in A.D. 9.

DEATH OF AUGUSTUS.—Augustus died in 14 A.D.; so that, counting from his formal accession to title, 27 B.C., he ruled over the Roman dominion for forty-one years.

The following table gives a list of the Roman Emperors, with the dates of their reigns and other facts. Many of them were quite insignificant in personality and in their influence upon history. The greater rulers call for more extended notice in their proper historical place in the [Outline of Universal History](#), as well as in the Dictionary of Biography.

THE EMPERORS OF ROME

Name, Lineage or Basis of Accession and Cause of Death	Period of Rule	Birth	Death
THE CÆSARS			
Octavianus Cæsar, "Augustus" (majesty).—A title conferred by the Senate; died August 19	B.C.27-A.D.14	B.C.63	A.D.19
Tiberius (Claudius Nero).—Stepson of Augustus; murdered by a tribune	A.D.14-37	42	37
Caius Caligula.—Youngest son of Germanicus, nephew of Tiberius; poisoned by his wife, Agrippina, to make way for	37- 41	12	41
Claudius I. (Tiberius Drusus).—Grandson of Tiberius	41- 54	10	54
Claudius Nero.—Son of Domitius Ahenobarbus; deposed; kills himself	54- 68	A.D.37	68
Servius Sulpicius Galba.—Proclaimed Emperor; slain by the prætorians	68- 69	B.C. 3	69
M. Salvius Otho.—Proclaimed Emperor; stabbed himself	69-	A.D.32	69
Aulus Vitellius.—Proclaimed Emperor; deposed by Vespasian, and put to death	69- 69	15	69
Titus Flavius Vespasian.—Proclaimed Emperor	70- 79	9	79
Titus (Vespasian).—Son of Vespasian	79- 81	41	81
Titus Flavius Domitian.—Brother of Titus, second son of Vespasian; last of the <i>twelve</i> Cæsars	81- 96	51	96
THE FIVE GOOD EMPERORS			
Cocceius Nerva.—Proclaimed Emperor	96- 98	32	98
Trajan (M. Ulpius Crinitus).—Adopted son of Nerva	98-117	53	117
Hadrian (Publius Ælius).—Nephew of Trajan	117-138	76	138
Antoninus Titus, surnamed Pius.—Adopted son of Hadrian	138-161	86	161
Marcus Aurelius Antoninus.—Nephew of Antoninus Pius	161-180	121	180
THE PERIOD OF MILITARY DESPOTISM			

[400]

[401]

Commodus (L. Aurelius Antoninus).—Son of Marcus Aurelius; poisoned by his favorite mistress, Martia, December 31	180-193	161	192		
Publius Helvius Pertinax.—Proclaimed Emperor; killed by praetorian band	193-	126	193		
Didius Julianus.—Proclaimed Emperor	193-	...	193		
Lucius Septimus Severus.—Proclaimed Emperor; died at York, in Britain	193-212 ?	146	211		
M. Aurelius Caracalla and Septimius Geta.—Son of Septimius Severus; Caracalla murders Geta, 212; is slain by his successors	212-217	188	217		
M. Opilius Macrinus, prefect of the guards; beheaded in a mutiny	217-218	164	218		
Heliogabalus (M. Aurelius Antoninus), a youth (Elagabalus).—First cousin of Caracalla; put to death for enormities	218-222	205?	222		
Alexander Severus.—Cousin of Heliogabalus, by whom he was adopted; assassinated by soldiers corrupted by Maximinus	222-235	205	235		
Caius Julius Verus Maximinus.—Elevated by soldiers; assassinated in his tent	235-238	173	238		
M. Antonius Gordianus and his son; the latter falling in battle with partisans of Maximinus, the father strangled himself in despair, at Carthage, in his eightieth year.—Appointed by the Senate	238-238	...	(238)		
Gordian II.—Grandson of Gordian I.; assassinated by guards, instigated by Philip the Arabian	238-244	224	244		
Philip the Arabian.—Murdered Gordian and usurped the throne; assassinated by his soldiers	244-249	...	249		
Metius Decius.—Proclaimed Emperor by the army; he perished in battle with Goths	249-251	...	251		
Gallus Hostilius, and his son Volusianus.—Elected Emperor by Senate and soldiers; both slain by soldiers	251-254	...	254		
Æmilianus.—Elected Emperor by Senate and soldiers; put to death after reign of four months	254-	208?	254?		
Valerian.—Elected Emperor by Senate and soldiers; taken prisoner by Sapor, king of Persia, and flayed alive	254-260	...	260		
Gallienus	260-268	...	268		
Flavius Claudius	268-270	214	270		
Aurelian.—Designated by Claudius; assassinated by soldiers on march against Persia	270-275	212	275		
Tacitus.—Elected by Senate and soldiers; died at Tarsus, in Cilicia	275-276	200	276		
Florian.—Proclaimed Emperor; not recognized by Senate	276-276	...	?		
M. Aurelius Probus.—Choice of the army; assassinated by troops at Sirmium	277-282	...	282		
M. Aurelius Carus.—Elevated to throne by soldiers; killed at Ctesiphon by lightning	282-283	222	283		
Carinus—Elder son of Carus	} both assassinated	284-284	...	285	
and					
Numerian.—Son of Carus	} Created Cæsar	284-305	...	245	313
Diocletian.—Proclaimed Emperor by the army					
and	} Created Cæsar	305-306	...	250	306
Maximian.—Made Cæsar by Diocletian					
Constantianus	} Created Cæsar	306-336	272	337	
and					
Galerius	} Created Cæsar	336-361	317	361	
Constantine the Great.—Eldest son of Augustus Constantius Chlorus					
Constantius II.—Third son of Constantine the Great	} Created Cæsar	361-363	331	363	
Julian the Apostate.—Son of Julius Constantius; mortally wounded in battle with Persians					
Jovian.—Elevated to the throne by the army	} Created Cæsar	363-364	332	364	
and					
ROMAN EMPERORS OF THE WEST					
Tacitus.—Elected by Senate and soldiers; died at Tarsus, in Cilicia	275-276	200	276		
Valentinian I.—Proclaimed Emperor by the army	364-375	321	375		
Gratian.—Son of Valentinian I	375-383	359	383		
Maximus—Made Emperor by the legions in Britain	383?	?	398		
Valentinian II.—Son of Valentinian I	383?-388	371	392		
Eugenius.—Proclaimed Emperor	388-394		
Theodosius the Great.—Son of Theodosius, a Roman general	394-395	346	395		
Honorius.—Second son of Theodosius	395-423	384	423		
Valentinian III.—Son of Constantius	423-455	419	455		
Maximus Petronius.—Proclaimed Emperor	455-	395?	455		
Avitus.—Assumed the purple	455-457	...	457		
Majorian or Majorien.—Elected by Ricimer	457-461	...	?		
Severus.—Raised to imperial dignity by Ricimer	461-467	...	465-?		
Anthemius.—Son-in-law of Emperor Marcian	467-472	...	?		
Olybrius.—Made Emperor through influence of Ricimer	472-473	...	?		
Glycerus.—Proclaimed Emperor (or Genserich)	473-	...	?		
Nepos.—Proclaimed Emperor by order of Leo X.	473-475	...	480		
Romulus Augustulus.—Son of Orestes	475-476	...	476		

(See Chronology of the more important events under [Rome](#) in [Comparative Outlines of Universal History](#).)

VI. FROM CONSTANTINE TO THE FALL OF ROME, 306-476 A.D.—The *sixth* period includes the remainder of Roman history, extending from the reign of Constantine to the Fall of Rome, when captured by the Heruli, A.D. 476. The reign of Constantine the Great imparts splendor to the commencement of this period. He embraced the Christian faith himself, and patronized it in the Empire, as did also most of his successors; on which account this may be called the period of the Christian Emperors.

One of the most important events of his reign, and one which had a great influence on the subsequent affairs of Rome, was the removal of the Government to a new seat. He selected Byzantium for his capital, and removed there with his court, giving it the name of Constantinople, which it still bears. He left his empire to five princes, three sons and two nephews; the youngest son, Constantius, soon grasps the whole, A.D. 360. By the death of Constantius, his cousin Julian received the purple, which he was already on his march from Gaul to seize by force. The reign of Julian, styled the Apostate, is memorable for his artful and persevering attempts to destroy the Christian religion, and his unsuccessful efforts to rebuild the Temple of Jerusalem, with the express purpose of casting discredit on the predictions of the Bible.

From the death of Julian, A.D. 363, to the reign of Theodosius the Great, A.D. 379, the history presents little that is important to be noticed, except the jealousies between the eastern and western portions of the Empire, which grew out of the removal of the court to Constantinople. Theodosius was the last emperor who ruled over both. In 395 he died, leaving to his sons Arcadius and Honorius separately the east and west. From this time the Eastern portion remained distinct, and its history no longer belongs to that of Rome.

The western portion languishes under ten successive emperors, who are scarcely able to defend themselves against the repeated attacks of barbarian invaders. At length, under Augustulus, the eleventh from Theodosius, Rome is taken by Odoacer, leader of the Heruli, and the history of ancient Rome is terminated, A. D. 476.

The whole of the period from Constantine to Augustulus is marked by the continued inroads of barbarous hordes from the north and the east. But the greatest annoyance was suffered in the latter part of the time, from three tribes, under three celebrated leaders; the Goths, under Alaric; the Vandals, under Genserich; and the Huns, under Attila. The two former actually carried their victorious arms to Rome itself (A. D. 410 and 455), and laid prostrate at their feet the haughty mistress of the world; and the latter was persuaded to turn back his forces (A. D. 453) only by ignoble concessions and immense gifts.

By A.D. 300 great changes had passed over the empire. Its population had become largely barbarized; the armies contained great numbers of Goths, Vandals, and Sarmathians (from territory now the west and south of Russia). Germans were spread through the empire more than any other nationality. The former distinction as to Roman citizenship having been lost, the distinction between the "Roman legions" and the "allies" was now effaced, and the last visible record of Rome's conquest was obliterated.

PERIOD OF CONSTANTINE THE GREAT

Diocletian's resignation in A.D. 305 was followed by a period of confusion and civil war, which ended in the establishment of Constantine as sole emperor in A.D. 323. He was son of one of the co-emperors and the Empress Helena. Constantine made an important change in the government by separating the military power from the civil authority. The influence of the *Legati* (provincial viceroys) was thus reduced, and the fact that the emperor alone held both the civil and military power gave him a great predominance.

CONSTANTINE MAKES BYZANTIUM THE CAPITAL

In A.D. 324 Christianity was established by Constantine as the religion of the State, and in 330 he made Byzantium the capital of the empire. This city on the Thracian Bosphorus, founded by Greek colonists in 658 B.C., had early become a great commercial center. After being held successively by the Athenians, Lacedæmonians, and Macedonians, it came into Roman possession, and the new or reconstructed city Byzantium was afterwards called *Constantinópolis* ("City of Constantine") and remained the capital of the Eastern Empire of Rome till A. D. 1453.

CONSTANTINE GIVES A NEW IMPETUS TO CHRISTIANITY

In religion, Constantine showed marks of his former Paganism even after his conversion to Christianity. He was an able general and statesman, whose real character has been obscured by historical excesses, both of panegyric and of detraction, and around whose name, in connection with Christianity, interesting and picturesque legends are associated, like that of the apparition of the Cross and the words (in Greek), "By this sign, conquer." He died in 337, leaving the empire to confusion and civil war under his sons.

Apart from its effects upon the morals, the new religion greatly and beneficially stirred the mind of the age. Political speculation and discussion were impossible under a despotism, and active minds turned to theology, and soon showed that the intellectual power of the time was to be found within the ranks of Christianity.

Among these early writers and rules of the church, known as the "Christian Fathers," the following are the chief, Tertullian, Ambrose, Cyprian, Lactantius, Jerome, and Augustine being Latin Fathers; Origen, Gregory, Basil, Chrysostom, and Athanasius being Greek Fathers.

THE IGNOBLE END OF THE WESTERN EMPIRE

The last Roman Emperor of the West was a child, called, as if in derision, Romulus Augustulus, the one name being that of the city's mythical founder, the other ("Augustus the little") a parody of the style of him who organized the empire. Augustulus became nominal ruler in A.D. 475, and in 476 was overthrown by the invasion of some German tribes, of which the chief were the Heruli. Their leader, Odoacer, took the title of "King of Italy," and the Western Empire came thus ignobly to an end.

CONTRIBUTIONS OF ROMAN SWAY TO THE WORLD

The chief benefits derived by the world from Rome's imperial sway were the spread of the Greek culture, the transmission of the greatest productions of the Greek mind, and the clear course made for the progress of Christianity.

Modern history, in a comprehensive sense, begins with the downfall of the Western Roman Empire; for with that event the volume of ancient history was closed: new actors then appeared on the stage, and a new civilization arose.

THE ROMAN WORLD SUCCEEDED BY THE GERMANIC

The development of the German world begins, kindled by foreign culture, religion, polity, and legislation. These new elements were taken up by the Teutonic tribes, and amalgamated with their own national life.

THE HISTORIC DARK AGES

In many respects this period seemed a relapse into barbarism, and the interval from the fifth to the eleventh century is sometimes called specifically the Dark Ages. But in a juster view it was the germinating season: the seeds of modern civilization, cast into the soil, were quickening in new institutions and new nations; so that when we see modern society in the fifteenth and sixteenth nations; so that when we see modern society in the fifteenth and sixteenth centuries assuming the fixed shape which it still wears, we must remember that it grew into that shape in the antecedent thousand years. [404]

REAL NATURE OF THIS PERIOD

The most important historic features of the Middle Ages were certain peculiar forms of society, rather than the development of great nations. Indeed, the modern nations as such were only in their beginnings, and these characteristic social peculiarities were common to all of them. Thus, all the nations of Europe were under that peculiar form of society called *feudalism*; all bore certain relations to the *papal power*; all participated in the *Crusades* and in the spirit of *Chivalry*; and all passed through the period named the *Dark Ages*, and shared in the intellectual revival which marked the latter part of the Middle Ages.

THE EASTERN OR BYZANTINE EMPIRE.—This Empire, called also the Greek Empire, was sustained under various fortunes, for a period of almost one thousand years after the overthrow of the Western or Roman Empire. After the fall of Rome nearly sixty different emperors had occupied the throne at Constantinople, when, A.D. 1202, that city was taken by the crusaders from France and Venice. By this event the Greek emperors were forced to establish their court at Nicæa in Asia Minor. After the lapse of sixty years, their former capital was recovered; and, subsequent to this, eight different emperors held the scepter there, until the empire was gradually reduced in strength and extent, and it consisted of but a little corner of Europe. Its existence was prolonged to A.D. 1453, when Constantinople fell into the hands of the Turks, who have retained it to the present day.

While the new nationalities and the new civilization of Western Europe were being developed under the influence of German vigor, the emperors at Constantinople, though they ruled dominions where the language and civilization were mainly Greek, still claimed to be Roman emperors, and under their sway the laws and official forms of imperial Rome were maintained.

The Patriarch of Constantinople was the head of the Christian Church in the East, as the Bishop of Rome was in the West, while the latter, as the successor of St. Peter, was the head of the universal Church.

NOTABLE REIGN AND SERVICE OF JUSTINIAN

The Eastern Empire attained its acme in the sixth century, during the reign of Justinian, A.D. 527-565. It was he who built the great Church of Saint Sophia at Constantinople, now a Mohammedan mosque. His chief service to mankind, however, was the codification of the laws in the great system of Roman jurisprudence called the Civil Law, forming the basis of the law in European states at the present day.

CONQUESTS OF THE FAMOUS GENERAL BELISARIUS

In the East, the famous Belisarius, an Illyrian of plebeian birth, fought for Justinian against the Persian king Chosroes I. (or Nushirvan), who reigned A.D. 531-579. Justinian purchased peace by payment of tribute to this Oriental despot, whose empire extended from the Red Sea to the Indus.

In the West, Justinian's arms had great success. In 534 the Vandal kingdom in Africa was brought to an end by the victories of Belisarius. In 535 Belisarius conquered Sicily, and from 535-540, and again from 541-544, fought the Goths in Italy, until the jealousy of his master recalled him.

His successor in command, Narses, completed the overthrow of the Ostrogothic kingdom in Italy by his campaigns in 552-553. Under Justinian, the Visigoths were driven out of the south of Spain, so that there was for a time a revived Roman Empire of the West, embracing nearly the whole of the Mediterranean coasts. Justinian died in 565, and a speedy change came in Italy.

LOMBARDS CONQUER AND CONTROL ITALY UNTIL TIME OF CHARLEMAGNE

The warlike Germans called Lombards had settled in Pannonia (south of the present Austrian Empire), by Justinian's invitation, about 540. They fought to extermination the Gepidæ (Goths), and in 568 passed over the Alps into the fertile plain of northern Italy.

Under their king Albin, the Lombards subdued the north and much of the south of Italy (the central part, including Rome and Ravenna, on the Adriatic, with Sicily, Corsica, and Sardinia, remaining still Roman), and the Lombard kingdom of Italy thus formed continued for two centuries, until conquered by Charlemagne.

The growth of Venice dates from this Lombard conquest, when the victims took refuge in the islands and lagoons at the head of the Adriatic Sea, where a town had been founded by fugitives from the Huns.

THE EMPIRE OVERRUN BY PERSIANS AND GREEKS

The flourishing period of the Eastern Empire closes for a long time with Heraclius, who died in A.D. 641. The Persians and the Turks (Mongolians from Asia), with their kinsmen the Avars attacked the empire with formidable strength. Between 611 and 615 the Persians overran Egypt, Syria and Asia Minor, remaining encamped for ten years within sight of Constantinople. Heraclius, between 620 and 628, recovered the Persian conquests.

DECLINE OF THE EASTERN EMPIRE AND CONQUEST BY THE TURKS

For the next four hundred years the Empire enjoyed a period of comparative prosperity, marked by successful defense against Saracens and Bulgarians. From 1204 to 1261 it fell under the sway of the French and Venetians, who jointly established the so-called Latin dynasty. From this period on for almost a hundred years its decline was steady, and, in 1453, the empire was brought to a close with the capture of Constantinople by Mohammed II. [405]

MOSQUE NEAR BAGDAD, THE EASTERN CAPITAL OF THE SARACEN EMPIRE

THE SARACEN EMPIRE: ITS FANATICISM, ART AND LEARNING

Saracen (Arab. *Sharkiin*, the eastern people, from *Sharq*, the East), is a term applied to the first followers of Mohammed or Mahomet who within forty years after his death, 632 A.D., had subdued a part of Asia and Africa. The Saracens conquered Spain in 711 and following, but were defeated at Tours, France, by Charles Martel in 732. Under Abd-el-rahman they established the caliphate of Cordova in 755, which gave way to the Moors in 1237. The empire of the Saracens closed with the capture of Bagdad by the Tartars, 1258.

We now come to a remarkable chapter in European history,—the invasion of Europe, the land of the Aryans, by a Semitic race, the followers of the famous Mohammed. Connected with this is the rise of the new religion and of a vast dominion that played a great part in the history of the Middle Ages. The latter only can be touched on here.

THE "KORAN" BECAME THE BASIS OF BOTH RELIGION AND EMPIRE

The doctrines of Mohammed, written down from time to time, received the name of the Koran,—that is, the "Reading"; and the religion itself was called *Islam*, or Mohammedanism—that is, "Salvation."

THE HEGIRA OR FLIGHT OF MOHAMMED

His wife and a few other immediate relatives were the prophet's first disciples, and these did not increase very rapidly. The people of Mecca denounced him as a madman or an impostor, and in a little time he was forced to flee from Mecca to save his life. He betook himself, with his disciples, to what is now Medina. The date of this flight, or *Hegira*, as the Arabians call it,—July 15, 622 A.D.,—has been adopted ever since as the chronological era in Mohammedan countries. At Medina he was received with open arms,—his doctrines having already made a number of converts in that place; and here he built his first mosque.

HIS RELIGION SPREAD BY THE SWORD

A complete change now came over Mohammed,—the dreamer became a red-handed soldier. "The sword," cried he, "is the key of heaven and hell," and by the sword Islam was to be forced upon all men. Tribe after tribe was subdued; and before the lapse of ten years the whole Arabian peninsula acknowledged the sovereignty of Mohammed, and could boast of an unmixed population of *Moslems*, or True Believers. The prophet was preparing to carry the new religion beyond the bounds of Arabia, when he was cut off by a fever at Medina in A.D. 632. [406]

EMPIRE EXTENDED BY CONQUESTS OF THE CALIPHS

Mohammed was succeeded in his power by rulers called his *Caliphs*, or Successors, the first of whom was his father-in-law, Abu-beker. They were at once spiritual and

temporal rulers. The proselyting spirit of Mohammed had been communicated to his successors, and they began a long series of invasions, wars, and conquests. They everywhere gave men the choice of three things,—Koran, tribute, or sword. By these means the religion of Mohammed was spread over a large part of Asia and Africa, and made its way into Europe also.

SARACEN CONQUESTS IN THE EAST

The first countries assailed were the Oriental possessions of the Byzantine Empire. In the reign of Abu-beker, Syria and Mesopotamia were subdued by Arabian armies. Under the next caliph, Omar, Egypt was conquered and Northern Africa overrun. The Arabs, or Saracens, as they were also called, met with comparatively little resistance in the Oriental countries, the countries beyond Mount Taurus; and this may be accounted for by the fact that these were the parts of the Roman Empire in which both Roman law and Christianity had taken least hold.

Thus the Eastern Empire was shorn of all its Oriental possessions; and even the farther East—Persia and the lands beyond, to India—was added to the Moslem dominion.

THE FURY OF CONQUEST IN THE WEST

In the West, however, a stout resistance was encountered. The Saracens besieged Constantinople, against which they carried on a siege of eight years (A.D. 668-675); but every assault was repelled by torrents of terrible Greek fire. A second siege, forty years afterward, met a like result. In North Africa, too, they encountered long and obstinate resistance; but finally the whole northern coast—Cyrene, Tripoli, Carthage—was subdued; and in A. D. 710 a host of turbaned Arabs, with unsheathed scimitars, under Tarik-ben-Zaid, crossed the narrow strait into Spain and landed on the rock which commemorates the name of their leader ("Gibraltar," i. e., *Jebel Tarik*, the Mountain of Tarik).

SUBJUGATION OF SPAIN AND SOUTHERN GAUL

It will be remembered that a Visigothic kingdom had been established in Spain; but Roderick, the "last of the Goths," was defeated on the field of Xeres, and the Saracens established themselves firmly in Spain. In the course of a few years they had possession of the whole peninsula, with the exception of the mountainous districts in the north, where the little Christian kingdom of the Asturias maintained itself.

The ambition of the Saracens now overleaped the Pyrenees. They obtained a foothold in Southern Gaul; and after a time an able Saracen commander, Abd-el-rahman, led a powerful Mohammedan army northward to subdue the land of the Franks. As far as the Loire everything fell before him, and it seemed that all Europe would come under Moslem sway.

THEIR DEFEAT BY CHARLES MARTEL

It was in the hour of need that Charles Martel appeared as a champion for Christendom. Gathering a powerful army, he met the Saracens between Tours and Poitiers (*pwät-yea*). A desperate battle, which lasted for seven days, ensued; but on the seventh day the Saracens were defeated with great slaughter, A.D. 732.

This victory arrested forever the progress of the Mohammedan arms in Europe, and procured for Charles the expressive surname of "the Hammer" (*Martel*), by which he is known in history.

While the Saracens were stopped from pushing their conquests farther into Europe, they firmly established themselves in Spain, where they founded a kingdom that lasted for seven hundred years,—that is, till the very close of the Middle Ages.

DIVISION OF SARACENIC EMPIRE

For a short time the vast dominion which the Saracens had conquered held together, and a single caliph was obeyed in Spain and in India. But soon disputes arose as to the right of succession to the caliphate: wars and secessions took place, and in A.D. 755 the Saracenic empire was divided,—one caliph reigning in Spain and another in Bagdad.

In the East, the most distinguished of the Saracenic rulers was Haroun-al-Raschid (Aaron the Just), who became caliph in A.D. 786, and was a contemporary of Charlemagne. In the *Arabian Nights* we find a vivid picture of the city he ruled and the life he led. After the death of Haroun, the Eastern dominion of the Saracens was rent by civil strife; one province after another broke off from the caliphate, till in the eleventh and twelfth centuries it fell a prey to the Turks.

SARACENS SUCCEEDED BY THE MOORS IN SPAIN

In Spain, on the division of the Saracenic power, the rule was in the hands of the Ommyiad line, and the capital was at Cordova. From this city the scepter of the Ommyyades ruled during 283 years (from A.D. 755-1038); but in the eleventh century the supremacy of the Saracens gave place to the Moorish empire in Spain.

SARACEN CONTRIBUTIONS TO LEARNING AND ART

In the intellectual history of the Middle Ages the Saracens played a remarkable part. When Europe was sunk in the grossest ignorance, this clever people were actively engaged in the cultivation of science, learning, and the arts. The schools of Cordova vied with those of Bagdad in the collection of books and the encouragement of science, and from them proceeded nearly all that was original in the medicine, physics, and metaphysics of Europe during the Middle Ages.

GERMANIC EMPIRE OF CHARLEMAGNE

Charlemagne may be regarded as the chief regenerator of Western Europe after the dissolution of the Roman Empire. At the date of his coronation, 800 A.D., his empire was not inferior in extent to that of the old Roman Empire. He was master of all Germany and Gaul, the greater part of Italy, and part of Spain. Under him the Frankish dominion reached its highest point, and marks the formal termination of an antiquated state of society. It was also the introduction to another totally different form itself and from its predecessor. It was not barbarism, it was not feudalism; but it was the bridge which united the two.

The most important chapter in the history of the Middle Ages is that informing us how the ruins of the dilapidated Western Empire were for a time rebuilt into an imposing structure by the genius of a great man, the grandest figure of the Middle Ages,—Charlemagne. The real name of this great man was Karl, that is, Charles. Though best known by his French name of Charlemagne (Charles the Great), we must remember that he was not a Frenchman in our sense of the term, but a thorough Teuton, or German, in birth, instinct, speech, and residence.

WHAT THE DOMINIONS OF CHARLEMAGNE COMPRISED

The kingdom of the Franks, to which Charlemagne fell heir on the death of his father, formed an extensive dominion comprising portions of the two countries we now call France and Germany,—for it must be remembered that the specific countries, France and Germany, did not yet exist at all.

At this time—the latter half of the eighth century—Italy was divided between the Lombards and the Eastern emperors, England had come into existence, but only as a number of feeble and warring states, Spain was under the rule of the Moslems. In the meantime the land of the Franks was lifting itself from out the surrounding barbarism of the new races, and was the center of that Germanic civilization which was struggling into existence.

It is important to bear in mind the actual condition of the European world at the time Charlemagne came on the stage, for it will help us to understand the work he did, how far he succeeded and how far he failed.

THE CENTRAL PLAN OF CHARLEMAGNE'S EMPIRE

The ruling idea of Charlemagne was the re-establishment of the Roman Empire,—the building up on German soil of that colossal power which had toppled over because it rested on the too narrow basis of Latin nationality. In executing this design he aimed to use all the elements of civilization that the times presented, and especially these two great elements,—the political ideas and instincts of the Teutons, and the adhesive power of the Christian Church. Hence we find him, throughout his whole career, carefully cherishing all those old German institutions upon which the mass of his people looked with deep reverence, while at the same time we behold him the protector of the Pope and the loyal and ardent champion of the Church.

OBJECT OF HIS WARS AND HIS CHIEF FOES

It was in the effort to realize his grand idea that Charlemagne undertook the numerous wars and expeditions that filled the forty-six years of his reign. We shall not enter into the details of these wars; but it is needful to understand their object and their result.

The most important of Charlemagne's military enterprises were directed against the fierce pagan nations of Germany and the wild Scythians in the outlying lands beyond. To appreciate the importance of these we must try to realize that the eastern frontier of the Frankish land, that is, the eastern boundary of Charlemagne's kingdom, on the German side of the Rhine, ran into and abutted on the extensive stretch of country in Middle Europe that was still in the hands of the various uncivilized tribes. As long as these peoples remained in their warlike, savage, and pagan condition, they would press heavily on the struggling civilization of the Frankish kingdom, and would endanger, if not utterly destroy, its progress. Hence to subdue and especially to Christianize these tribes—to extend the domain of organized and law-governed society into the desert waste of Teutonic barbarism—was a main object with Charlemagne.

HE SUBDUES THE SAXONS AND BAVARIANS

With the Saxon confederation, formed by various pagan tribes on the Weser and the Elbe (the same tribes from among which the Saxons and Angles, who conquered Britain three centuries before this, had gone forth), Charlemagne had the greatest trouble. He repeatedly marched into their country and subdued them; but they constantly rose up again, and it was only after some terrible acts of vengeance,—for example, he one day had forty-two hundred prisoners hanged,—that they at length submitted to be baptized and to become peaceable subjects.

Soon after this the Bavarians attempted to render themselves independent of the Frankish power by the assistance of the Avars, a Tartar race living in what we now call Hungary (then *Pannonia*). Charlemagne overpowered the Bavarians, incorporating Bavaria with his German territory; and then revenged himself on the Avars by conquering them, taking their treasures, and annexing Hungary to his dominion.

THE FIRST UNION OF THE GERMANS UNDER ONE HEAD

The result of Charlemagne's conquests on the east side of the Rhine was that Germany was for the first time all united under one head, and on that side the Frankish kingdom was extended to the confluence of the Danube with the Theiss and the Save.

Against the Saracens in Spain Charlemagne made an important expedition. The capture of Saragossa laid Aragon and Navarre at his feet, and he united the whole country as far as the Ebro to his own kingdom as a Spanish province. During his return the rear-guard under Roland, suffered a defeat in the valley of Roncesvalles, in which the bravest champions of the Franks were destroyed. This somewhat tarnished the laurels Charlemagne had won in Spain, but did not undo the substantial results of the campaign.

NORTHERN ITALY UNITED TO HIS EMPIRE

We must now see what Charlemagne did in Italy. At this period the Lombards were very troublesome to the Pope, and frequently assailed the Roman territory. Accordingly, when Pope Adrian I. called on Charlemagne for aid, the Frankish monarch crossed the Alps, defeated the Lombards, shut up their king in a monastery, and himself assuming the famous "iron crown" of Lombardy, united the whole of Upper Italy to the kingdom of the Franks (A.D. 773). At the same time he confirmed the gifts made by Pepin to the Pope.

The general result of all the wars and conquests which we have described was that by the year 800 Charlemagne, who had inherited from Pepin a kingdom scarcely equal to all Gaul, found himself lord of a dominion as large as the ancient Roman Empire of the West, and extending from the Ebro (in Spain) on the west to the Elbe in the northeast, the Theiss (Hungary) in the southeast, and including half of Italy, with Corsica, Sardinia, and the Balearic Isles. He fell heir to a kingdom; he was now master of an empire.

CROWNED BY THE POPE AS EMPEROR OF THE WEST

The year A.D. 800 forms the climax of Charlemagne's reign. The sovereign had gone in splendid state to visit Italy. On Christmas day Charlemagne and his court were attending divine service in the church of St. Peter's, at Rome. Suddenly, while the monarch was kneeling on the steps of the altar in prayer, the Pope, Leo III., placed a crown upon his head and solemnly saluted him as "Emperor of the West," with the title of Charles I., Cæsar Augustus.

CHARLEMAGNE'S CONTRIBUTIONS TO THE CIVILIZATION OF HIS TIME

The latter years of Charlemagne's life were spent in labors for the consolidation of his empire and the elevation of his people. He was a great patron of

[407]

[408]

[409]

learning and learned men. He was himself a good Latin scholar, and he knew something of Greek. Wherever he was he was usually surrounded by learned churchmen, whom he drew to his court from all quarters, and with whom he delighted to hold conversations on literary and other subjects. The emperor, his family, and all attached to his household formed what was called the "School of the Palace." Fond of literary pursuits, Charlemagne studied grammar, rhetoric, music, logic, astronomy, and natural history under his learned friends; and even after he was considerably advanced in years he took the pains to acquire the art of writing,—an accomplishment then very unusual except among churchmen.

HIS EFFORTS FOR EDUCATION OF HIS PEOPLE

Nor was the emperor's interest in education confined to his own household. Each of the numerous monasteries that he endowed was bound to maintain a school. He had copies of the writings of the ancient Romans made and distributed among the convents, he formed a collection of old German heroic ballads, and under his patronage church music was greatly improved.

CAPITAL AND FAVORITE RESIDENCE OF CHARLEMAGNE

Charlemagne's favorite place of residence was at Aix-la-Chapelle (in German, *Aachen*). He made this the northern capital of his empire, as Rome was the southern, and built a magnificent palace there. When his power was confirmed by his coronation as Emperor of the West, all the world hastened to pay him homage. The Saracen caliph, the famous Haroun-al-Raschid, who ruled the Eastern dominion of the Saracens, at Bagdad, exchanged courtesies with his great brother of the West, sending him, among other presents, an ape, an elephant, and a curious clock which struck the hours.

THE END OF CHARLEMAGNE'S GREAT EMPIRE

Charlemagne died at the age of seventy-two, at Aix-la-Chapelle, in A.D. 814. The year before, he had caused his only living son, Louis, to assume the imperial crown. But the vast structure that Charlemagne had raised during his lifetime tottered and fell almost immediately after his death. Louis, known as the Gentle (*le Debonnaire*), was better fitted for the repose of a cloister than for the government of a warlike kingdom. His sons, among whom he divided the empire, turned their arms first against himself and then against one another. Finally, in A.D. 843, a treaty was made at Verdun, by which France, Germany and Italy became separate and independent states; so that, in less than thirty years after the death of Charlemagne, the history of the FRANKS came to an end, and the history of FRANCE and of GERMANY began.

[410-413]

COMPARATIVE HISTORY OF NATIONS--Continued

IX. FROM THE TREATY OF VERDUN TO THE SIGNING OF MAGNA CHARTA BY KING JOHN, 843-1215 A. D.

GREAT EVENTS OF PERIOD. 900-1000: Norse ravages and conquests continue; also private wars. 1000-1100: Increasing and beneficent power of the church exerted in the direction of order. Normans in Italy and Sicily. The Norman conquest of England; which as regards good government far surpasses all other countries. Quarrels between popes and emperors begin. 1100-1200: Quarrels between popes and emperors continue; zenith of papal power; Criticism revived. Private wars lessen; advance in power of kings and of towns at expense of the feudal baronage. The Crusades. 1200-1300: Rise of universities and of mendicant Friars. Quarrels between popes and emperors still continue. Last Crusades. English liberties recognized by the crown. Magna Charta.

A. D.	Spain	Britain	France	Germany	Italy	Church	Scandinavia and Slavs	Eastern Empire	Saracens	China, Japan, India	A. D.
850			855. Kingdom divided. Louis II., Emperor, obtains Italy and Rhaetia till 875. Charles, Provence, till 863.			860. Separation of the Greek and Latin Churches.	862. Russia: Rurik, first grand prince. 863-1030. Norway: Harold Harfargar to St. Olaf.			859. Japan: Powerful Seiwa family arises.	850
	864-1131. Kingdom of Barcelona.	866. Invasion of the Danes.				867. Pope Hadrian II., Photius, Patriarch of Constantinople, deposed.		867-1057. Eastern emperors of the Macedonian line.	870-892. Muattemed re-establishes the capital at Bagdad.		
875		871-900. ALFRED THE GREAT.	876. Kingdom divided: Charles the Fat obtains Suabia and Alsace till 887.	Louis the Younger, Saxony and Thuringia till 882.	Carloman, Bavaria, etc. till 879; becomes King of Italy, 877.	872. Pope John VIII.					875

Greatest European War in History begins with the British Empire, France, Russia, Belgium, Japan, Servia, Italy, Portugal and Roumania on one side, and Germany, Austria-Hungary, Turkey and Bulgaria on the other.					
	1914. Germany's new fiscal policy lays a tax on royalty. Declares war on the Triple Entente.		1914. Austria adopts a strong policy against Balkan expansion. Joins Germany in a declaration of war on the Triple Entente.	1914. Russian Premier Kokovtsov resigns. As a member of the Triple Entente joins in war on the Teutonic Alliance.	1914. Greece retains the Aegean islands wrested from Turkey.
	1915. Italy joins the Triple Entente in the war. Declares war on Bulgaria.	1915. Wages a ruthless submarine war on allied shipping and neutral vessels carrying contraband of war. Shows astonishing efficiency in the conduct of the war against the Entente Allies.	1915. At the suggestion of the United States, its Ambassador, Dr. Dumba, is recalled from Washington.	1915. Russia declares war on Bulgaria. Loses Poland and its capital, Warsaw, to the Teutonic Allies.	1915. King Constantine of Greece refuses to support Venizelos' pro-allies policy. Latter resigns as premier. Turkey successfully repulsed the attempt of the Entente Allies to force the Dardanelles. Bulgaria enters the war on behalf of the Teutonic Allies. Yoshohito crowned emperor of Japan.
	1916. Italian military movements ineffective on the Austrian frontier. A change of ministry forecasted.	1916. German military operations and conquests stand out in marked contrast with those of the Entente Allies. Belgium, Servia, Montenegro, Poland, Lithuania, Albania and Roumania are held under Teutonic rule. Poland is declared independent by Germany and Austria.	1916. Austria-Hungary proves a powerful aid to the Teutonic Allies in the Balkans. Emperor Francis Joseph dies and is succeeded on the throne by Emperor Charles I.	1916. Premier Sturmer resigns and is succeeded by M. Trepoff. Russian and Roumanian armies are defeated and driven back with frightful losses in the Balkans.	1916. Roumania enters the war on side of the Entente, and is conquered by the Teutonic-Bulgar forces with the loss of its capital, Bucharest. President Yuan of China assassinated. Li Yuan-hung becomes president. Premier Okuma of Japan resigns, and is succeeded by Count Terauchi, an aggressive champion of both Japan and China.
	1917. Conference of Entente Allies held in Rome. Much discontent in Italy over the war.	1917. The German government sends peace overtures to belligerent and neutral nations. Germany declares a rigid blockade of the Entente Powers.	1917. Austro-Bulgarian army makes a strong drive against Roumania, and Russia. Emperor Charles crowned King of Hungary.	1917. The Russian government supports France and Great Britain in rejecting peace overtures of the Central Powers. Russian monarchy overthrown; Czar abdicates and a republic is established.	1917. Great political unrest in India. Turkey revokes all treaties limiting her absolute independence as a nation.

The world as it is known to-day comprises six great divisions or parts, namely, Europe, Asia, Africa, North America, South America, and Oceania or Australasia. The most dependable statistics estimate their *area* and *population* as follows:

AREA AND POPULATION OF THE EARTH BY CONTINENTS

CONTINENTAL DIVISIONS	AREA IN SQUARE MILES	INHABITANTS	
		NUMBER	PER SQUARE MILE
Africa	11,632,000	127,312,000	10.9
America, N.	7,146,641	136,939,000	19.1
America, S.	7,344,508	55,444,000	7.55
Asia	17,470,282	842,100,000	48.20
Australasia	3,456,290	8,000,000	2.31
Europe	3,671,624	458,795,000	124.9
Polar Reg.	6,970,000	300,000	.04
Total	57,691,345	1,628,890,000	28.2

POPULATION OF THE EARTH ACCORDING TO RACE

RACE	LOCATION	NUMBER
Indo-Germanic or Aryan (white)	Europe	
	America	
	Persia	
	India	
Mongolian or Turanian (yellow and brown)	Australia	775,000,000
	Asia	600,000,000
Semitic (white)	Africa	
	Arabia, etc.	65,000,000
Negro and Bantu (black)	Africa	130,000,000
Malay and Polynesian (brown)	Australasia	33,000,000
American Indian, North and South (red and half breeds)		25,000,000
Total		1,628,000,000

At the opening of the European war in 1914 the human race was subject to fifty-four independent and five quasi-independent governments. The British Empire and Russia are the largest two, while Monaco with its eight square miles and San Marino with its thirty-eight square miles of territory are the smallest two. The *absolute monarchies* are Abyssinia, Afghanistan, Morocco, Siam, Oman, and Monaco; the *limited monarchies* are Albania, Austria-Hungary, Belgium, Bhutan, British Empire, Bulgaria, Denmark, German Empire, Greece, Italy, Japan, Liechtenstein, Luxemburg, Montenegro, Nepal, Netherlands, Norway, Persia, Roumania, Russia, Servia, Spain, Sweden, and Turkey; the *republics* are Andorra, Argentina, Bolivia, Brazil, Chile, China, Colombia, Costa Rica, Cuba, Ecuador, Guatemala, Haiti, Honduras, Liberia, Mexico, Nicaragua, Panama, Paraguay, Peru, Portugal, Salvador, San Marino, Santo Domingo, Switzerland, United States, Uruguay, Venezuela.

PRINCIPAL LANGUAGES SPOKEN

There are said to be 3,424 spoken languages or dialects in the world, distributed as follows: America, 1,624; Asia, 937; Europe, 587; Africa, 276.

LANGUAGES	NUMBER OF PERSONS SPOKEN BY		PROPORTION OF THE WHOLE	
	1801	1916	1801	1916
English	20,520,000	160,000,000	12.7	27.3
French	20,520,000	160,000,000	12.7	27.3
German	30,320,000	130,000,000	18.7	22.2
Italian	15,070,000	50,000,000	9.3	8.6
Spanish	26,190,000	50,000,000	16.2	8.6
Portuguese	7,480,000	25,000,000	4.7	4.3
Russian	30,770,000	100,000,000	19.0	17.1
Total	161,800,000	585,000,000	100.0	100.0

WEALTH OF NATIONS

These are the latest estimates: United States, \$188,000,000,000; Great Britain and Ireland \$85,000,000,000; Canada, \$7,000,000,000; India, \$15,000,000,000; total British Empire (including possessions not here stated), \$130,000,000,000; Germany, \$80,000,000,000; France, \$50,000,000,000; Russia, \$40,000,000,000; Austria-Hungary, \$25,000,000,000; Italy, \$20,000,000,000; Belgium, \$9,000,000,000; Spain, \$5,400,000,000; Netherlands, \$5,000,000,000; Switzerland, \$4,000,000,000; Portugal, \$2,500,000,000.

[444]

THE CONTINENT OF EUROPE

From its political and historical importance Europe has always been regarded as one of the great divisions of the earth's surface though it is not a separate and independent mass. It is, rather, a great peninsula of what is sometimes called *Eurasia*—i.e. the continent of Europe and Asia combined—that extends westward its many arms between the Arctic Ocean on the north, the Atlantic on the west, and the Mediterranean Sea on the south.

Its name seems to have been derived from the Semitic word *ereb*, meaning "the land of the setting sun," and came into use among the Greeks and Latins in very early times as *Europa*.

Outline and Extent. The most striking feature of its outline is that of its great irregularity, the deep inlets and gulfs of the ocean which penetrate its mass, and the peninsulas which run from it.

The greatest distance between its extreme north and south points—the North Cape of Norway and Cape Matapan in Greece—is about twenty-four hundred miles; and from east to west—from Cape La Roca, or the "Rock of Lisbon," to Cape Apsheron, the eastern extremity of the Caucasus range, on the Caspian—about three thousand miles.

EUROPEAN GULFS AND INLETS

On the north the *White Sea*, so called from the ice and snow which bind it up for more than half the year, reaches in from the Arctic Ocean. From the Atlantic, the shallow *North Sea*, or German Ocean, and the *English Channel* (called *La Manche*, or "The Sleeve," by the French) break in to separate the British Isles from the mainland; and from the former the *Skager Rak*, "the crooked and boisterous strait," leads through the *Kattegat*, the "Cat's Throat," and the "Belts" of the Danish islands, to the *Baltic*, or the "East Sea" of the Germans, and its continuations, the Gulfs of Bothnia, Finland, and Riga.

Farther southward, the stormy *Bay of Biscay*, named from the Basque province of Vizcaya, sweeps in along the northern coast of Spain, and beyond the Peninsula the narrow *Strait of Gibraltar* leads into the great *Mediterranean*, which stretches eastward for twenty-three hundred miles.

THE MEDITERRANEAN AND ITS ARMS

Among the many branches of this great basin are the *Galic Sea*, running north toward Gaul, between Spain and the islands of Sardinia and Corsica, forming the stormy Gulf of the Lion and that of Genoa; the *Tyrrhenian Sea*, between Sardinia and Italy; the *Ionian Sea* and the *Adriatic* running north from it, between Italy and the Balkan peninsula, towards the ancient seaport of Adria, perhaps the oldest in Europe.

Beyond Greece, the island-studded *Egean* leads north to the narrow inlet of the *Dardanelles*, opening into the little Sea of Marmora, named from its marble-yielding islands, and from that by the *Bosporus* or Oxford (the canal of Constantinople), into the second great Mediterranean basin, the *Black Sea* or Euxine, with its offshoot the shallow *Sea of Azof*. The Caspian Sea, forms part of the natural frontier between Europe and Asia.

The indented seaboard of Europe measures not less than sixty thousand miles.

PENINSULAS OF EUROPE

Between each of these branches of the sea there run out corresponding promontories and peninsulas of the mainland. These are most numerous on the south side, where we find the *Crimea*, *Turkey* and *Greece*, *Italy* and *Spain*, bordered by the islands of the Archipelago, by Sicily, Sardinia and Corsica, and the Balears.

The western or Atlantic side presents the greatest peninsula, that of *Scandinavia*, and the most important island group, that of the British Isles. The Danish peninsula is remarkable as the only one in Europe, and indeed in almost any part of the world, that points northward.

SURFACE CHARACTERISTICS

The great lowland of Europe lies toward the east, embracing the vast continental area of Russia, and sending out arms westward round the Gulf of Bothnia and the Swedish side of the Baltic, and through North Germany and Denmark, to form the lowlands of Holland and Belgium and of Western France, along the shores of the Bay of Biscay, as far as the rise of the Pyrenees.

The vast central area of the Russian lowland has almost everywhere the same character, *woods and marshes* alternating with cultivated land, affording a superfluity of grain, which is sent down by the rivers to the seaports of the Baltic and the Black Sea; but along its northern border, next the icy Arctic Sea, lie the moss-covered swamps called the *Tundras*, the soil of which is never thawed for more than a yard's depth; all its southern margin toward the Black Sea and the Caspian is a treeless *steppe*, over which at some seasons the grasses shoot up above a man's height, concealing the pasturing herds.

REMARKABLE SURFACE OF FINLAND

Finland is one of the most remarkable regions of the great European plain; its granite floor, elevated above the sea-level probably in a recent geological period, is worn into thousands of angular lake-basins, which form a perfect network over its surface; to the sailor on the Baltic its margin presents a girdle of steep cliffs guarded by a fringe of rocky islets or skerries. The cliffy Aland Islands are detached fragments of this remarkable formation.

LOWLANDS OF WESTERN EUROPE

The eastern portions of the North German plain, as far as the Oder, have the same character, the same corn-yielding clay soil, as the adjoining lowlands in Russia; but farther west, round the capital city of Berlin, the plain becomes less fertile, in some parts sandy and bare. Beyond the Elbe, in Hanover, the *Lüneburg heath* covers a large part of the plain; next it lie the moors, marshes, and fens of Oldenburg and the borders of Holland, where cattle and horses are the wealth of the land; and beyond these the highly cultivated lowlands on each side of the Rhine delta, separated by the heaths and moors of Brabant, which run out toward the lower Scheldt like a dividing wedge between Holland and Belgium.

Passing into France, and across the broad river basins of its lowlands which open to the English Channel and the Bay of Biscay, we come upon the great wine-yielding lands, such as *Champagne* and the vineyards of the Gironde, with the corn country of Brie northeast of Paris, and of Touraine, on the Loire between these; and lastly, at the extremity of this branch of the European plain, to the *Landes* along the coast between the mouth of the Gironde and the Pyrenees, composed of sandy heaths and marshes.

ISOLATED LOWLANDS OF EUROPE

Of these, two of large extent occur in the basin of the river Danube, separated by the gorge of the "Iron Gate," formed where the Balkan and Carpathian ranges approach most closely. The upper plain, circled about on all sides by mountains, is that of *Hungary*, over which corn fields interchange with pastoral steppes well stocked with horses and cattle, sheep and swine, merging in some parts into marsh lands or into dusty sand flats. Where the plain begins to rise to the sunny hills, the Hungarian grape ripens to yield its famous wines. The lower plain of the Danube, which might be called a branch of the vast Russian lowland, is that of *Roumania*, with its far-stretching treeless heaths and pasture lands supporting great herds of cattle and horses, passing into wide reed swamps which characterize the delta of the Danube.

Corresponding to the Roumanian plain is that of *Lombardy*, perhaps the most productive region of Europe, in which the irrigated meadows may be six times mowed in the year, and where wheat, maize, and rice, and wine and dairy produce, are yielded in vast quantity.

MOUNTAINS AND HIGHLANDS

Europe presents two great mountain regions; a southern, extending along the northern border of the Mediterranean from Turkey to Spain, in continuation of the chief line of the heights of Asia; and a northern, appearing in Scandinavia and Britain, separated from the former by the western branch of the great lowland that we have been noticing.

[445]

THE ALPINE REGION

The *Alps* rise as the central mass of the southern mountain region of Europe. The many groups comprised in this series of heights which curve round the plain of Lombardy arrange themselves into three generally recognized divisions:—The Western Alps, the groups lying between the Gulf of Genoa and the Little St. Bernard Pass; the Central Alps, extending from the St. Bernard to the pass named the Stilfer Joch; and the Eastern Alps beyond this. The central mass is the highest, rising with majestic forms from deep valleys up to sharp risen peaks, high above the line of permanent snow; its wings to east and west decrease in elevation towards the Gallic Sea and the plain of the Danube on either side. All the less jagged heights are mantled in snows, from which glacier streams descend. The largest of these ice streams are the Aletsch glacier from the group of the Finsteraarhorn, and those of the frequented valley of Chamounix, descending from Mont Blanc, the monarch of the Alps.

FAMOUS ALPINE PASSES

The passes of the Alps have always had importance as the gates of traffic from North Italy to the rest of Europe; some of them, such as the two St. Bernard Passes, are under the protection of friendly monks; but railroads have now been constructed to pass the great barrier by the tunnels of Mont Cenis in the west, of St. Gothard in the center, and the Simplon farther east (opened 1906), by a line over the Brenner Pass from Innsbruck to Bozen, and by an eastern road over the Semmering from Vienna to Graz.

Southward the Alps fall steeply to the low plain of Lombardy, but a mass of lesser highlands and plateaus extends northward from them over central Europe to the border of the plain of Northern Germany.

OUTLYING SPURS OF THE ALPS

The first division is the long limestone range of the *Jura*, with its magnificent pine forests. Beyond, bordering the Rhine valley, rises the *Schwarzwald*, or Black Forest, then the *Odenwald* and the *Rhön* mountains, leading into the *Vogelsberg* and *Taunus*, and to the outlying *Harz*, the farthest north of the central European heights. Turning eastward, we reach the *Thüringerwald*, the *Fichtel Gebirge*, and the metalliferous or *Erz Gebirge*; then across the Elbe, in Saxon Switzerland, come the *Riesen Gebirge* (the Giant Range), and the *Sudetic Mountains*, extending to the Oder. Turning south again towards the Alps, the *Mährische Höhen* (the Mavorian heights) are reached, and joining with these to close in the high valley of the Upper Elbe, the high *Böhmerwald*, the forest mountain of Bohemia. Almost all the area of South Germany, including Würtemberg, Bavaria, and Bohemia, enclosed by these heights, which extend northward from the Alpine mass, is high plateau land.

HIGHLANDS OF FRANCE

Westward of these central European heights, beyond the Rhone, rises the range of the *Cevennes* in France, extending from near the Pyrenees northward through the *Forez* and *Côte d'Or* to the plateau of *Langres*, to the *Vosges* and *Hardt*, the undulating plateau of *Ardennes* covered with beech and oak wood, and the volcanic group of the *Eifel*, skirting the Rhine valley. More centrally in France, contrasting with the adjoining long range of the Cevennes, the volcanic cones and domes of *Auvergne* rise from bare lava-covered plateaus.

[446]

PYRENEES AND SPANISH PENINSULA

Shut off from the rest of Europe by the *Pyrenees* whose high and close barrier admits easy passage only round its flanks, is the Spanish Peninsula, which, excepting in its river valleys, and along some parts of the seaboard, is a continuous highland. A number of mountain ranges, supporting broad plateaus between, traverse it from east to west. Along its northern edge the *Cantabrian* mountains prolong the high line of the Pyrenees; centrally rise the *Sierras of Guadarrama* and *Estrella*; farther south the *Sierra Morena*, and along the Mediterranean border the *Sierra Nevada* of Granada. Throughout the summer the table-lands of *Castile*, bare and treeless, are burned up by the hot sun, but through the chilly winter they are swept by violent winds. The herdsman who wears a broad-brimmed hat for protection against the excessive heat during the day, a few hours later puts on his thick warm cloak; in the same way, after the almost rainless summer, follows a cold winter with ice and snow.

MOUNTAINS OF ITALY AND THE BALKANS

The *Apennines* prolong the Maritime Alps, and run like a backbone through the peninsula of Italy. Cleared of its natural wood, and scorched by the southern sun, this range is generally dreary and barren in aspect, like a long wall, with few peaks or salient points to recall the magnificent forms of the Alps. The volcano of *Vesuvius*, the only active one in all the continental part of Europe, rises over the coast plain of Campania.

The lines of the eastern wing of the Alps are prolonged north-eastward across the Danube by the grand curve of the wooded *Carpathians* and *Transylvania Alps*, circling round the plain of Hungary. Southeastward they branch into the many ranges which support between them the confused mass of highlands of Bosnia, Herzegovina, and Montenegro, of Serbia and Albania. Farther on these heights take more definite shape in the range of the *Balkan* which runs east to the Black Sea, in the mass of the *Rhodope* mountains extending south-eastward to the *Ægean* Sea, and in the *Pindus* range, which gives shape to Greece, and runs out into the Mediterranean in the peninsulas of the Morea.

MASS OF THE CAUCASUS

Distinct from all the rest of the southern highlands of Europe stands the huge mass of the *Caucasus*, the natural frontier of Europe on the southeast, rising like a wall from the flat isthmus between the Black Sea and the Caspian. Its close parallel chains are united by high plateaus cut into by deep narrow transverse gorges of extreme depth. Though attaining far greater heights than the Alps and reaching several thousand feet above the limit of perennial snows, the glaciers and snow-fields of the Caucasus are small and insignificant in comparison with those of the Alps. This is owing to the dryness of the region in which they stand, and the small snowfall over them.

SCANDINAVIAN MOUNTAIN GROUPS

In the north European mountain region the mass of heights which form the Scandinavian peninsula are by far the most important. These present no definite range, but are rather a collection of broad plateaus topped with moor or snow-field, cut into by long steep-walled "fiords" on the Atlantic side, and resembling the Alps in the pine woods of their slopes, in their lakes and extensive glaciers, though they are nowhere of very great altitude.

The main *field*, which is applied to most of the Scandinavian mountain groups, suggests their plateau form; the *Hardanger Field*, *Ymes Field*, and *Dovre Field*, with the *Jostedal Brae* (or ice-brae—glacier), are the most prominent of the southern heights of Norway; in the north the broken heights which run along the Atlantic and Arctic borders of the peninsula have the general name of the *Kjölen*. The heather-covered hills of Scotland—the *Grampians* and west coast mountains—as well as those of Cumberland and Wales farther south in Great Britain, belong to the same system as that of the Scandinavian heights.

SURFACE OF EUROPEAN ISLANDS

We have formerly noticed that almost all the European islands are high. In the Mediterranean we find the island of Crete reaching to upwards of eight thousand feet in *Mount Ida*; Sicily, with its volcano of *Etna* nine thousand six hundred and fifty-two feet; Sardinia with *Mount Gennargentu* (six thousand two hundred and ninety feet); Corsica, with *Monte Rotondo* (nine thousand and sixty-five feet); Iceland, on the border of the Arctic seas, recalling Norway in its grand fiords, rises high in its mass of volcanic jökulls (*Oraefa*, six thousand four hundred and eight feet; *Hecla*, five thousand one hundred and ten feet), covered in between with accumulated snows and glaciers; *Spitzbergen's* black peaks, which give its name, also rise high from its white glacier fields.

CHAIN OF THE URAL

Separate and distinct in character and direction from the mountains of the rest of Europe, is the long chain of the *Ural*, rich in gold, platinum, iron, and copper. It takes its name probably from the Tartar word meaning "belt," which well expresses the length and continuity of this remarkable line of heights, stretching along the eastern border of the great European plain for more than twelve hundred miles. In height, however, the Ural is insignificant. Another separated height, that of the forest-covered Valдай hills in Western Russia, would scarcely be worthy of mention among the European highlands if it did not form the water-parting of the greatest of European rivers, the Volga.

For the height of the chief mountain peaks and ranges, consult the tables on [page 74](#) and following.

[447]

RIVERS OF EUROPE

European rivers flow in part to the Atlantic and its Mediterranean branches, partly to the Arctic Sea, and partly to the Caspian, which last belongs to the "continental" system of drainage, or the area from which no rivers escape to the open ocean.

The *Volga*, the largest European river, is the principal feeder of the Caspian, and the great highway of commerce of Central and South Russia. The *Don*, *Dnieper*, *Dniester*, and *Danube* all flow into the Black Sea. The last-named is the second of European rivers, and forms, with its navigable tributaries, the route for traffic between Central Europe and the East.

The *Po*, the *Rhone* (the most rapid European river, though of little value for navigation), and the *Ebro* flow into the Mediterranean.

The chief rivers (all of immense importance) draining into the Atlantic, are: the *Tagus* (with its port of Lisbon), the *Douro* (Oporto), the *Gironde* (Bordeaux), the *Loire* (Nantes), and the *Mersey* (Liverpool); while of less importance are the *Guadalquivir*, *Guadiana*, *Tagus*, and *Douro* in Spain; the *Garonne*, *Loire*, and *Seine* in France. Into the North Sea flow the *Thames* (London), the *Meuse* (Rotterdam), the *Rhine* and the *Elbe*, giving uninterrupted water-way to Switzerland and into the heart of Bohemia; and into the Baltic, the rivers *Oder*, *Vistula*, *Niemen*, and *Dwina*, more or less important for purposes of transport.

On account of the great historic, political and scenic importance that attaches to the Rhine and the Danube, in addition to the fact that their courses are not confined strictly to any one country, these rivers call for more detailed descriptions. The other European rivers of importance are described in connection with the country to which they either wholly or in great part belong.

THE RHINE (*Ger.* Rhein), is probably the most famous river in the world, and, except the period between 1697 and 1871, always a purely German possession. It is usually divided into the upper, middle, and lower parts, the first lying within and along part of the boundary line of Switzerland, the second between Basel and Cologne, and the third between Cologne and the sea.

THE UPPER RHINE AND ITS SOURCE

A large number of rivulets, issuing from Swiss glaciers, unite to form the upper Rhine; but two are recognized as the principal sources—the Nearer and the Farther Rhine. The former emerges on the northeast slope of the St. Gothard pass (seven thousand six hundred and ninety feet above sea-level), the other side of which is the cradle of the Rhone; the Farther Rhine has its origin on the flank of the Rheinwaldhorn, seven thousand two hundred and seventy feet high, not far from the Pass of Bernardino. The two mountain torrents meet at Reichenau, six miles southwest of Coire (Chur), in the Grisons canton, Switzerland, after they have descended the Nearer Rhine five thousand seven hundred and sixty-seven feet in twenty-eight miles, the Farther Rhine five thousand three hundred and forty-seven feet in twenty-seven miles.

LAKE CONSTANCE AND THE FALLS OF SCHAFFHAUSEN

After plowing its way north for forty-five miles between Switzerland and Austrian Vorarlberg, the river enters the Lake of Constance, soon after leaving which, its water a deep transparent green, it plunges down the falls of Schaffhausen, nearly seventy feet, in three leaps, and flows westward to Basel, separating Baden from Switzerland. In this stretch the river (four hundred and ninety feet wide), receives from the left the waters of the Aar. At Basel (seven hundred and forty-two feet), now two hundred and twenty-five yards wide, it wheels round to the north, and traversing an open shallow valley that separates Alsace and the Bavarian Palatinate from Baden, reaches Mainz, split into many side arms and studded with green islands. Navigation begins at Basel.

THE MIDDLE RHINE FROM BASEL TO COLOGNE

Of the numerous affluents here the largest are the navigable Neckar and the Main from the right, and the navigable Ill from the left. A little below Mainz, the Rhine (six hundred and eighty-five yards wide) is turned west by the Taunus range; but at Bingen it forces a passage through, and pursues a northwesterly direction across Rhenish Prussia, past Coblenz, Bonn, Cologne, Düsseldorf, Ruhrort, and Wesel as far as the Dutch frontier; here it is one thousand and eighty-five yards wide and thirty-six feet above sea-level.

THE FAMOUS STRETCH FROM BINGEN TO BONN

The first half of this portion of the river from Bingen to Bonn is the Rhine of song and legend, the Rhine of romance, the Rhine of German patriotism. Its banks are clothed with vineyards that yield wine esteemed the world over; the rugged and fantastic crags that hem in its channel are crowned by ruined castles; the treasure of the Nibelungs rests at the bottom of the river (higher up, at Worms); the Bingerloch and the Mouse Tower of Bishop Hatto, the fortress of Ehrenbreitstein, the rock of the siren Lorelei, the commanding statue of Germania (the trophy of German victory in 1870), and innumerable other features lend interest to this, the middle course of "Father Rhine." Between Bingen and Bonn the steep rocky walls that fence in the river approach so close that road and railway have to find their way through tunnels. The Nahe enters the Rhine at Bingen, the Moselle at Coblenz; from the right side the Lahn enters above Coblenz. Gigantic rafts are floated down from the Black Forest to Dordrecht in Holland. Below Bonn the Rhine is joined by the Sieg, Wupper, Ruhr, and Lippe from the right.

PANORAMIC VIEW OF THE RIVER RHINE, THE MOST HISTORIC RIVER IN THE WORLD

Starting from the important city of Cologne and ascending the river. These pages and those immediately following give an almost photographic panorama of the entire Rhine valley as far as Mainz—the course of the river, its confluents, bridges, cities, villages, castles, fortresses, historic ruins and museums, and the general topography of the region through which river flows.

[Top left] **COLOGNE CATHEDRAL**, the grandest Gothic church in the world. Begun in 1248, consecrated 1880. It has seven wonderful chapels.
 [Bottom left] University Bldgs.
 [Top right] **KÖLN, OR COLOGNE**, sixth city in size in the German Empire, was originally an ancient Teutonic town and later an important Roman garrison. Its greatest ornament is the Cathedral. The city is encircled by a boulevard of great beauty. The Hahnenort Museum contains a famous collection of armor and weapon.
 [Center right] Hahnenort in Köln
 [Center right] **BONN** is 21 miles from Cologne, has a beautiful location, and is chiefly noted for its University, housed in the Electoral Palace built 1717-1730. It was a great Roman fortress and suffered many sieges. The Cathedral was founded by the mother of Constantine. In its cemetery are buried Niebuhr, the historian, Schlegel, Schumann, Arndt and Bunsen.
 [Bottom right] **BEEHOVEN'S** birthplace in Bonn was at 20 Bonngasse. There is a bronze statue of the great composer in Münsterplatz.

[Large image \(567 kB\)](#)

[Top left] **GODESBURG CASTLE**. A fine mediæval castle on a hill overlooking the Rhine. Splendid view.
 [Top left] **ROLANDECK** is half an hour's sail above Königswinter on the right; and high on the hill above is the fragment of the castle said to have been built by Roland, paladin of Charlemagne, and rich in legends. See Bulwer's "Pilgrims of the Rhine" for the story, which doubtless suggested Schiller's ballad of "Ritter Toggenburg."
 [Center left] Rolandseck
 [Center left] **REMACEN** is renowned for its beautiful Gothic church on a hill just below the village. It was erected under the direction of Zwirner, the architect of the superb south portal of the Cologne cathedral and is adorned with large frescoes, which are masterpieces of Modern German art.
 [Top right] Königswinter is beautifully situated at the foot of the Siebengebirge, or Seven Mountains, and nearest the castles crag of Drachenfels (Dragon's rock). The Siebengebirge form a picturesque volcanic group, 1,000 to 1,500 ft. high, about 5m. square, covered with forests and ruins. The prospect from Drachenfels and from the Petersberg are among the finest on the Rhine. A funicular railway reaches the top of the Drachenfels and the Petersberg. See story of "Nibelungenlied."
 [Center right] A massive tower and ruined castle at Andernach memorialized in Longfellow's "Hyperion."
HAMMERSTEIN is a 10th century castle where Henry IV. took refuge. It was held during the Thirty Years' war by Swedes, Spaniards and Germans.
 [Bottom right] **ANDERNACH**, with its ruined castle, ancient walls, and lofty watch tower is one of the most interesting towns on the Rhine. It was one of the 50 forts of Drusus; recaptured from the Alemanni by Julian in 339; a royal Franconian residence in the 6th century; an imperial town later; stormed by Cologne troops in 1496; and burned by the French in 1688. Nearby is the Benedictine Abbey of Laach, founded in 1093, with magnificent Romanesque church, on the vast crater-lake of the Laacher See.

[Large image \(549 kB\)](#)

[TOP LEFT] **KOBLENZ**, the capital of Rhenish Prussia, is at the confluence of the Rhine and Moselle, whence the Romans called it Confluentia. It is a powerful fortress, with heights crossed with enormous fortifications. The Palace contains interesting Electoral Hall and Festival Hall. The Rhine is crossed by a bridge of boats and by a very fine railway bridge. Across the Rhine is Ehrenbreitstein, ("Honor's Broad Stone"), "The Gibraltar of the Rhine," a vast fortress on a precipitous rock, 387 ft. above the river, and commanding a wonderful view. It has often been beleaguered but yielded only twice.
 [Bottom left] **STOLZENFELS**.
 [Top right] **STOLZENFELS** ("Proud rock"), a fine castle of the middle ages, on a projecting rock overlooking the Rhine, belongs to the Royal Family of Prussia. It was presented by the city of Koblenz to King William IV. Here they say treasures are buried which Archbishop Werner acquired by his knowledge of alchemy. Fine view of the Lahn Valley and Koblenz.
 [Center right] Ehrenbreitstein
 [Bottom right] **BRAUBACH**, an ancient little town, at the entrance of the valley that winds round the Marksburg, with a fine old Castle, the Marksburg, a fortress of the middle ages, one of the few ancient Rhine castles which escaped destruction.

[Large image \(524 kB\)](#)

[Top left] **ST. GOARSHAUSEN** is under the castle called The Cat, built in 1393, and blown up by the French in 1804. Above is the Lurlei rock, a precipice 433 ft. high, rising over whirlpools in the deepest and narrowest part of the Rhine, and the fabled seat of a siren who lured sailors to a tragic death.

[Bottom left] **RHEINSTADT**
 [Top right] St. Goar
ST. GOAR'S overlooked by the grandest ruin on the river, the famous Rheinfels, dating from 1245; besieged often; now royal property.
 [Center right] Die „Lurlei“
OBERWESEL is charmingly situated in the midst of the finest scenery of the Rhine. The Church of Notre Dame, south of the town, is a fine specimen of 14th century Gothic, with curious old pictures and monuments. The Chapel of St. Werner, erected in the 13th century, commemorates one of the old stories of child-murder by the Jews. Above the town are the ruins of Schönburg, built about the 12th century.
CAUB (left) is a little town with a big castle, Gutenfels, towering above it, and not far above, in the midst of the river is the Pfalz, built by Louis of Bavaria early in the 14th century.
 [Bottom right] The Niederwald.

[Top left] Mouse tower.

THE MOUSE TOWER (Mäuserturm) is situated on a rock in the middle of the Rhine, near Bingen. It is notable from the legend of Bishop Hatto's tragic fate.

[TOP RIGHT] THE NIEDERWALD, opposite Bingen, is the great National Monument commemorating the restoration of the German Empire in 1870-71. It stands 740 feet above the river, and consists of a colossal statue of Germania, 33 feet high, upon a sculptured pedestal 78 feet high.

[Center right] Bingen

[Center right] BINGEN is at the junction of the Rhine and the Nahe. The river scenery above Bingen is less interesting, though it is here the fertile and beautiful wine region begins. Rüdesheim, just across the river, has rich wines, far-viewing heights, wild legends, and a Roman fortress. On the heights is the Castle of Johannisberg, where Prince Metternich once lived. It is amid the best vineyards on the Rhine and commands a superb view. At Riebrich, opposite Mainz, is the beautiful palace of the Duke of Nassau.

[Bottom right] Mainz. MAINZ, or Mayence, with its magnificent cathedral, has been both a German and a French town. Thorwaldsen's statue of Gutenberg, the inventor of printing, stands near the Cathedral. The Electoral Palace is a rich museum of Roman relics and an important picture gallery. The city is a noted wine center and trade emporium.

[Large image \(592 kB\)](#)

THE LOWER RHINE FROM COLOGNE TO THE SEA

At Bonn the river enters the plains, and almost immediately after passing the Netherlands frontier its delta begins. The principal arm, carrying two-thirds of the volume, flows under the name of the Waal, and later the Mermede, to Dordrecht, picking up the Maas (Meuse) from the left. At Dordrecht the river again divides for a bit, one branch, the old Maas, running out to sea; the other, the Noord, forming a loop by way of Rotterdam. The northern arm sends one branch, the Yssel, due north to the Zuider Zee; the other branch is the Lek, which runs into the Waal-Maas arm above Rotterdam.

A thin stream, called the "Winding Rhine," leaves the Lek and splits at Utrecht into two channels, of which the Old Rhine, a mere ditch, manages with the help of a canal and locks to struggle into the North Sea at Katwyk, northwest of Leyden, while the Vecht flows due north from Utrecht to the Zuider Zee near Amsterdam. In the delta the streams have to be bordered by dykes.

[453]

THE RHINE IN EARLY EUROPEAN HISTORY

The Rhine was the Romans' bulwark against the Teutonic invaders and was long a boundary between the province of Gaul and the German tribes. Under Charlemagne the Rhine valley became the focus of civilization. Except between 1697 and 1871 the Rhine was always a purely German river; at the peace of Ryswick, Alsace-Lorraine was appropriated by France, and the Rhine became part of the dividing line between France and Germany. In 1801 Napoleon incorporated the whole of the left bank with France; in 1815 the arrangement in force before 1801 was restored; and after 1871 the Rhine became once more wholly German. It has often been crossed by armies; twice by Julius Cæsar; again in the Thirty Years' war, and in the wars of Louis XIV., the Revolution, and Napoleon. Its navigation was declared free in 1868.

The Rhine is connected by the rivers Danube, Rhone and Marne. There is a railway along both its banks, but a steamboat is greatly preferable for viewing the incomparable course between Cologne (Köln) and Mainz (Fr., Mayence) as shown in panoramic form on preceding page. Its beauties are better displayed, also, at most points, in ascending the river than in descending it.

THE DANUBE (*Ger.*, Donau), one of the most important rivers of Europe, and next to the Volga the largest, originates in two small streams rising in the Schwarzwald, or Black Forest, in Baden, Germany, and uniting at Donaueschingen, two thousand two hundred and sixty-four feet above sea level. The Germans occupy the entire upper basin, and portions of the middle and lower; the Slavs parts of both banks of the middle course; the Magyars the central portion of the valley; and the Roumanians the lower regions.

GENERAL COURSE OF THE GERMAN DANUBE

The river flows first southeast and then northeast to Ulm, one thousand, five hundred and nineteen feet above sea level. At Regensburg it reaches its most northerly point, and from thence its course is generally southeast. Between Regensburg and Vienna the banks of the river are frequently remarkable for their romantic beauty. At Tuttingen it contracts and the hills crowd close to the banks, while ruins of castles crown almost every possible summit. The scenery is wild and beautiful until the river passes Sigmaringen.

THE AUSTRIAN DANUBE, FAMED IN HISTORY AND SONG

From Passau the Danube flows through Austria for a distance of two hundred and thirty-three miles. Closed in by mountains it flows past Linz in an unbroken stream; below, it expands and divides into many arms until it reaches the famous whirlpool near Grein, where its waters unite and flow on in one channel for forty miles through mountains and narrow passes. Between Linz and Vienna it is renowned not only for its picturesque beauty, but for the numerous historic buildings and ruins which crown its banks. The splendid Benedictine monastery of Melk, the ruins of Durrenstein, and the prison of Richard the Lion-hearted are among the most interesting.

Vienna, to defend the city against risk of inundation, the course of the Danube skirting it was, in 1868-81, diverted into an artificial channel. Similar works have been undertaken near Budapest, in Hungary.

FROM VIENNA TO THE IRON GATE

After passing Vienna and Marchfeld, the river cuts through a defile formed by the lower spurs of the Alps and Carpathians and enters Hungary at the ruined castle of Theben, a little above Pressburg, the old Magyar capital. Here, again, it gives off a number of branches, forming a labyrinth of islands known as Schütten, but on emerging it flows uninterruptedly southward through wide plains interspersed with pools, marshes, and sandy wastes. The principal affluents here are the Save, the Drave, and the Theiss.

Sixty miles before entering Roumania the river passes through a succession of rapids or cataracts which it has made in cutting a passage for itself through the cross chain of hills which connect the Carpathian Mountains with the Alps. The last of these cataracts, at Old Orsova, is called the Iron Gate. Between 1878 and 1898, the Hungarian government carried through, at a cost of seven million five hundred thousand dollars, extensive engineering works at the gorges of the Iron Gates for deepening the channel and cutting a canal.

ITS JOURNEY THROUGH THE BALKAN COUNTRIES

The lower course of the Danube, in Roumania and Bulgaria, is through a flat and marshy tract, fertile but badly cultivated and thinly peopled. It forms the northern boundary of Bulgaria as far as Silistria; and from here it turns northward, skirting the Dobruja, and flows between marshy banks to Galatz, receiving on the way the Jalomitza and the Sereth. From Galatz it flows east, and, after being joined by the Pruth from the north, it continues southeast to the Black Sea.

The delta is a vast wilderness (one thousand square miles) cut up by channels and lagoons; the farthest mouths are sixty miles apart. Two-thirds of the Danube's volume passes through the Kilia, which, like the southern or St. George branch, forms a double channel near the outlet; and so ships enter by the middle or Sulina mouth, deepened to twenty feet and straightened in 1858-1903. The steel cantilever bridge across the river at Tchernavoda is one of the great railway bridges of the world.

[454]

ITS CHIEF TOWNS AND COMMERCIAL IMPORTANCE

The principal towns on the Danube are Ratisbon, Vienna, Pressburg, Budapest, Belgrade, and Galatz. The width of the river varies considerably, and at some points the opposite shore is hardly discernible. It is first navigable at Ulm, and, thanks to various improvements, is now navigable continuously from that point to its mouth. Engineering work to this end, undertaken at Vienna, Budapest, and the Iron Gates has already been referred to. The International Danube Navigation Commission, appointed in 1856, controls the lower portion of the river, and has done much to improve navigation at the delta. Sea-going vessels of six hundred tons can now go nearly as far as the Iron Gates, while vessels of twenty-five hundred tons can go above Galatz. By means of canals the Danube is connected with the Rhine and the Elbe.

ITS PART IN HISTORY AND INTERNATIONAL POLITICS

This mighty river is exceedingly rich in historical and political associations. For a long period it formed the frontier of the Roman Empire, and along its course are still found many notable Roman remains. Traces of the great wall erected by the Emperor Trajan are to be seen on the south side of the Hungarian Danube. At Turn Severin, east of the Carpathians, a tower and several piers of Trajan's Roman bridge, a splendid piece of ancient engineering, are still standing; while his more marvelous road in the rocky Kazan defile is marked by a Roman tablet still visible.

The struggles of races and peoples in the lands bordering the Danube have been among the fiercest and strongest in all history. Finns, Kelts, Germans, Slavs, Greeks, Italians and Turks have all vied with one another in the race of conquest and possession; and even today the Balkan countries are still in the seething cauldron of new struggles for

domination or independence.

The Lake Region of Europe lies round the Baltic. *Ladoga*, in Russia, is the largest fresh-water lake in Europe, as wide across as the English Channel, between Portsmouth and Cherbourg. *Onega*, and *Peipus* (Russia) are also of great size, as well as the lakes of Finland and Sweden, and some of those of the Alps. Chief of these are *Wetter* and *Mølar* in Sweden; the myriad lakes of Finland; the beautiful lakes of the folds of the Alps, Geneva, Neuchatel, and Constance on the north side; and *Maggiore*, *Como*, and *Garda* in the Italian valleys. They will be noticed further under the countries to which they belong.

THE NATIONS OF EUROPE—THE GREAT POWERS

Of the nations of Europe it may be said that in point of rank Great Britain, Germany, France, Austria, and Russia stand first as the "five great powers." These include within their limits more than two-thirds of the entire population of Europe, and have for a long time controlled all continental questions. Second come Italy, Spain, and Sweden; in third rank are Turkey, Belgium, Holland, Denmark, and Portugal.

Another grouping on the basis of race stocks is frequently made beginning with the highest in culture, the *Germanic*; passing thence to the *Romanic*; concluding with the *Slavonic*, and the lands under the rule of the *Turks*, lowest in the scale, which are most closely connected with the Mongols of Asia. The Germanic, or Teutonic nations, include Great Britain; the German Empire; Austria-Hungary; Scandinavia (Norway, Sweden, Denmark); Holland, or the Netherlands; Switzerland, and Belgium. The Romanic nations include France; Italy; Spain; Portugal; Greece, and Roumania. The Slavonic nations, Russia in Europe; Servia, and Montenegro. The Turkish or Mongol nations, Turkey in Europe; Bulgaria.

For various reasons the first grouping is adopted in the pages following.

GREAT BRITAIN

The British Empire, Great Britain and England are often erroneously used in the popular mind for one and the same nation. In strict accuracy the British Empire consists of (1) The United Kingdom of Great Britain and Ireland; (2) India, and the British Colonies, Protectorates, and Dependencies. Great Britain proper includes only England, Scotland and Wales. What is really meant is the geographical group of the British Isles, including England, Scotland, Wales, Ireland and the adjacent islands. For here is the source of power and authority that holds together and controls this greatest of modern empires.

Geographical Features.—The British Isles belong distinctly to the mainland of Europe. If we imagine the sea level between England and Holland to fall sixty feet—the height of an ordinary house—the broad *Dogger Bank*, midway between England and Denmark, would begin to show its sands, and if a fall of two hundred feet took place one might walk dry shod across to the continent, to Belgium, Holland, or Denmark. From its shallows and banks, its stormy cross seas and frequent fogs, the navigation of the *North Sea* is dangerous; yet the traffic over it is enormous, for it is surrounded by countries, the inhabitants of which have been famous on the seas from the earliest times.

The great highways of commerce from it are *Dover Strait*, leading to the English Channel, in the south, and the stormy *Pentland Firth*, which separates Scotland from the Orkney Islands, in the north. The *English Channel*, though deeper than the North Sea, is also shallow; the enclosed *Irish Sea*, between England and Ireland, with *St. George's Channel* and the *North Channel* leading out from it to the ocean, has been scooped deeper in its central lines; but there is a width of about fifty miles of shallow sea, or "soundings," all round the islands, in the west, where they face the broad Atlantic.

Chief Islands and Divisions.—The main island of Great Britain, roughly triangular in shape, measures about six hundred miles in a straight line from its southwest corner, where the granite walls of *Land's End* and the dark serpentine cliffs of the *Lizard* run out into the Atlantic, to the northern apex, the high red sandstone rocks of *Dunnet Head*, or its companion *Duncansby Head*, where John o'Groat's House stood, on the beach of the Pentland Firth.

The base of the island, forming the north coast of the English Channel, measures only about half this distance, or three hundred and twenty miles; and the eastern side, from the chalk cliffs of the *South Foreland*, on the Strait of Dover, to the Pentland Firth, is about five hundred and forty miles long. No part of the interior of Great Britain is more distant than three or four days' walk from the sea on one side or other. In the narrower parts of the north of Scotland, indeed, where the Moray Firth runs into the land, it is an easy day's journey from the head of this inlet of the North Sea to that of one or other of the opposite sea lochs running in from the Atlantic.

The second island, *Ireland*, more rounded in general outline, measures three hundred miles from *Malin Head*, its northernmost point, to *Mizen Head*, its most southerly extremity, and two hundred miles from *Carnsore Point*, its southeastern corner nearest England, to *Erris Head*, its northwestern promontory on the Atlantic.

Smaller Islands.—The most extensive of the many island groups and islets are those which lie off the broken west coast of Scotland, the wild and rugged Outer and Inner Hebrides, of which *Lewis*, separated by the channel called the Minch, and *Skye*, *Mull*, *Islay* and *Arran*, in the inner group, are the largest. The *Orkney* group, separated from the north of Scotland by the turbulent Pentland Firth, consist of no fewer than fifty-nine rocky islets; and the *Shetlands*, forty miles farther north, comprise upwards of a hundred separate points. The high *Isle of Man*, in the middle of the Irish Sea; *Anglesey*, close to the Welsh coast; and now united to it by the famous railway tubes across the Menai Strait; and the *Isle of Wight*, "the garden of England," in the English Channel, separated from the mainland by the busy Solent, are the others of importance. The Channel Islands, of which *Jersey* and *Guernsey* are the largest, belong politically to Britain, but are physically parts of France.

Surface: Mountains and Lowlands.—In the island of Great Britain the highest portions lie generally to north and west, the lowlands to south and east.

The heather-covered Highlands, which fill the north of Scotland, are divided by the great natural passage of *Glen More*, which runs in a straight line across the island from northeast to southwest into two chief groups, the northern and central.

The northern group consists of irregularly-distributed and often almost isolated masses, separated, it may be, by deep sea-fiords, and presenting every variety of contour, from that of the round mass of *Ben Wyvis* to the steep, wall-like sides of *Suilvein* or the sharp peak of *Ben Stack*. The Central Highlands or the *Grampians*, extending from the peninsula of Cantyre northeastward to the precipitous coast of Buchan on the North Sea, are far more massive and continuous.

Ben Nevis, a huge round mass ascending abruptly from the shores of Loch Eil at the mouth of the Great Glen, is the highest mountain of the British Isles.

The Southern Highlands of Scotland are more broken, and separated by river valleys. *Mount Merrick*, in the southwest, is their highest point; the *Lowther Hills* form their central group; the *Pentlands*, *Moorfoot*, and *Lammermoor* hills their more detached portions, on the northeast.

With the Cheviot Hills, the boundary range between Scotland and England, begins the long *Pennine chain*, which reaches due south into the heart of England. *Cheviot Hill*, in the north, *Crossfell*, and *Whernside*, and the *Peak of Derby*, in the south, mark the summits and direction of the chain. To the west of the Pennine chain rises the compact circular knob of slate mountains of Cumberland, of which *Scawfell* is the summit of England proper. And corresponding to this mass, near the opposite coast, are the eastern moorlands and *wolds* of Yorkshire.

Separated from the Pennine heights by the plain of Cheshire (west of England) rise the highlands of Wales, collectively called the *Cambrian Mountains*.

Across the Bristol Channel we come to the heights of the southwestern peninsula of England, with its three groups of *Exmoor*, *Dartmoor*, with its rugged granite tors, and the *Cornish Heights*. These are the more important mountain groups of Great Britain.

Over all the south and east of England the elevations are comparatively insignificant; broad, undulating, grassy uplands, called the *South Downs* and the *Chiltern Hills*, rarely attaining more than eight hundred feet of elevation, follow the chalk formation across Southern England as far as Beachy Head on the Channel and the Foreland Cliffs on the Strait of Dover. The limestone *Cotswold Hills* between these and the Welsh Highlands rise somewhat higher.

Almost all the lowlands of Great Britain lie to the east and south. Here we find the plain of the "*New Forest*" in Hampshire and the treeless *Salisbury Plain*, the broad open *Valley of the Thames*, the "*Eastern Plain*" of Essex, Suffolk, and Norfolk, extending with rounded shores towards the North Sea; the low "*Fen District*" behind the shallow estuary of "*The Wash*," from which many tracts have been reclaimed; the long "*Plain of York*" beyond; the valleys of the Tees and Tweed, the latter including the cultivated "*Merse*," the march or border land of Berwickshire; the Scottish "*Lowlands*" between the Central and Southern Highlands; the "*Carse*" or alluvial plain of Gowrie, north of the Tay; "*Strathmore*," the broad valley which extends between the Grampians and their southern outliers; the *plain of Cromarty* and the level moors of eastern Caithness farthest north of all. The only extensive lowlands on the western side of the island are the "*Vale of Severn*," the "*Plain of Cheshire*," between the Pennine chain and the Welsh Highlands, the lowlands round the estuary of the Solway, those of Ayrshire, and the *Valley of the Clyde*.

Crossing over to Ireland, though we find the lines of elevation running generally in the same direction as those of Great Britain, or from northeast to southwest, as shown in the peninsulas of the southwest coast, the mountains appear rather in detached clusters than in definite ranges, with shapes rather rounded than abrupt, forming a fringe round the coasts. The plateau of Antrim, which forms the precipice of *Fair Head*, the nearest point to the Scottish coast, contains the remarkable basaltic scenery of the *Giants' Causeway*.

Giants' Causeway.—This extensive and extraordinary assemblage of basaltic columns is in the county of Antrim, between Bengore Head and Port Rush. The name is sometimes given to the whole range of basalt cliffs along the coast, some of which reach the height of four or five hundred feet; but it is more properly restricted to a small portion of it where a platform of closely-ranged basalt columns from fifteen to thirty-six feet in height runs down into the sea in three divisions, known as the Little, the Middle, and the Grand Causeway. The last is from twenty to thirty feet wide, and stretches some nine hundred feet into the sea.

The *Giants' Causeway* derives its name from the legend that it was built by giants as a road which was to stretch across the sea to Scotland. There are similar formations on the west coast of Scotland, on the island of Staffa.

In the southwest are the *Mountains of Kerry*, containing *Cam Tual*, the summit of all Ireland. The only important groups that lie centrally in the island are the mountains of western Tipperary.

Within the circle of these heights, and branching out between them at many points to the sea-coast, lies the *Great Plain of Ireland*, averaging perhaps two hundred feet in elevation above the sea. The highest point between Dublin and Galway, east to west across its center, is only three hundred and twenty feet above the sea-level. Many parts of it, such as that which surrounds Lough Neagh in the north, are scarcely fifty feet in elevation.

Rivers.—England and Ireland are very bountifully watered; Scotland rather less so, as the higher mountains of Great Britain rise in the west of the island, so the water-parting line following the greatest general height lies nearer the west than the east. The longer and gentler slope of the island is to the North Sea; the shorter and steeper to the Atlantic side. Hence most of the larger rivers belong to the North Sea drainage.

THE THAMES (*Temz*), the most important river of Great Britain, flows southeast by east across the southern portion of the country. It rises in the Cotswold Hills and follows a course of some one hundred and ninety miles to Gravesend, the head of the estuary, where it has a width of half a mile, gradually increasing then to ten miles at the Nore lightship about thirty miles farther. By the addition of its tributaries the Colne, Leach, and Churn, it becomes navigable for barge traffic at Lechlade, where the canal to the Severn leaves. Above Oxford the stream is frequently called the Isis. At Oxford the navigability improves, and river steamers ply between Oxford and points below it as far as London. Until the Tower Bridge, in London, was built, London Bridge was the lowest in the course, and ocean-going vessels still reach the latter.

Gravesend, twenty miles lower, grew up at the spot where vessels waited the turn of the tide; a little farther the Medway, by virtue of its estuary the most important tributary, enters; just inside this is Chatham, an important naval depot. Opposite Gravesend and on the north bank is Tilbury, the terminus of modern liners. The waters from the Tilbury docks to the Nore lightship are of great strategic importance, hence there is here a station for destroyers, torpedo-boats, and gun-boats. Sheerness and Shoreham as land defenses add to this.

From London Bridge downward the Thames is lined with docks and wharves, the former being now under the Port of London authority. At Woolwich, on the south bank, eight miles below London Bridge, is the arsenal, and a little farther up the river Greenwich Observatory.

Historically, the Thames is unsurpassed by any river of the world. A slight rise surrounded by marsh on the left bank formed the first point suitable for bridging a strategic site for London, the tide giving facilities to it as a port, while yet placed well up the river for defensive purposes. Still farther up, a dominating site in the lower valley was found at Windsor for the mediaeval kings. In Anglo-Saxon times the kingdoms were divided by the river, and the break in the Chiltern Hills at Goring was a check in the line of aggression.

Above London the scenery is rich and beautiful, though not romantic, the numerous islands lending a peculiar charm. The Thames is the best beloved of English rivers for those who boat for pleasure. During the summer the Thames is a favorite holiday resort, house-boats being frequently the temporary homes of pleasure-seekers; and regattas are held at Henley, Kingston, and other places. For boat-racing, it divides the honors with the Tyne. The Thames watermen are renowned in song and story. Since Spencer's days "the silver-streaming Thames" has been sung by England's poets; Herrick calls it "Silver-footed Thamesis;" Denham's apostrophe is famous; and Pope has word-painted much of the scenery of its banks.

OTHER BRITISH RIVERS.—The next longest river to northward is the *Great Ouse*, navigable from the west for ninety miles to Bedford; then we come to the group of rivers which water the long plain of York, and unite in the estuary of the Humber, including the *Trent* from the south, navigable one hundred and five miles to Burton; the *Yorkshire Ouse*, navigable forty-five miles to the city of York, with its main tributary the *Derwent*. Farther north are the *Tees* and *Wear*, and the busy *Tyne*. Passing into Scotland, we reach the *Tweed*, valuable for its fisheries, but unnavigable; the *Forth*, winding in links through the fertile lowland, navigable to Stirling; the *Tay*, navigable to Perth; the rapid *Dee* and *Spey* from the Grampians, and the *Ness* from the lakes of Glenmore.

On the western or Atlantic side of Britain, the largest river, the second in drainage area in the island, is the *Severn*, drawing its upper tributaries from the Welsh mountains, and its chief lower affluent, the navigable *Avon*, from England, curving round to the British Channel; it is navigable to Welshpool, one hundred and twenty miles from its mouth. The *Mersey*, though a short river, forms one of the most important estuaries of the island, the "Liverpool Channel." Scarcely less valuable in this respect is the lower *Clyde*, the most important commercial river of Scotland, navigable to Glasgow, and forming in its upper valley the largest falls in the island.

Almost all the river estuaries of Britain are great highways of commerce; the Solway Firth, between England and Scotland on the west coast, is the most important exception, its swift and strong tides, rushing in over the sands so fast that a galloping horseman can scarcely escape from them, being exceedingly dangerous to shipping. Besides these estuaries many natural harbors lie round the coast. Such are the sheltered Solent and Portsmouth harbor behind the Isle of Wight, Plymouth Sound farther west, and Milford Haven on the south coast of Wales, unsurpassed perhaps in the world as a deep and spacious harbor thoroughly sheltered from all winds.

British Lakes.—The lakes of South Britain are comparatively few and small. *Bala Lake*, only four miles long, is the largest in the Welsh Highlands; in England the only considerable group is that which clusters round the knot of mountains in Cumberland, known through the rare interest that has been added to this district by the group of illustrious poets who made it their home about the beginning of the nineteenth century.

English Lake District.—Within this area are grouped as many as sixteen lakes or *meres*, besides innumerable mountain *tarns* and streams. The district extends about thirty

[455]

[456]

[457]

miles from north to south by about twenty-five from east to west, and contains within its compass the utmost variety and wealth of natural scenery, soft and graceful beauty ever alternating closely with grandeur and sublimity.

Windermere, the largest of the lakes (ten and one-half miles by one mile), lies in the southeast corner of the district and is connected with Rydal Water, Grasmere, Elther Water, and Esthwaite. To the west rises the Scawfell range, terminating in the Old Man of Coniston, which rises above Coniston Water, and to the east of the Scawfell range lies Wastwater (three miles long), the deepest of all the lakes. In the northeast is Ullswater, with the sequestered Hawes Water to the southeast. To the west of Helvellyn is Thirlmere, which is the reservoir for the water supply of Manchester, dammed in 1890-1894. The river Derwent, rising in the Scawfell range, flows north through Borrowdale and forms Bassenthwaite and Derwentwater, the most beautiful of the lakes. Westward from Borrowdale opens a valley in which lie Buttermere and Crummock Water, and between these and the Derwent valley is Ennerdale Water. There are several waterfalls, the chief, perhaps, being Lodore, near Derwentwater. Near Derwentwater lies Keswick, the chief town of the district, while Ambleside and Bowness (Windermere) and Hawkshead (Esthwaite) are other places of importance.

Of the lake school of poets, Wordsworth was the acknowledged head and founder, and his home for sixty years was in the Lake District. Southey, Samuel Taylor Coleridge, and De Quincey were the chief of the group, and Shelley, Scott, Carlyle, Mrs. Hemans, Matthew Arnold, Edward Fitzgerald, Tennyson, Gray, and Charles Lamb, although not directly associated with the school, were connected with the district.

Scotch Lakes.—Scotland abounds in lakes in all three Highland districts, and their number increases towards the north. *Loch Lomond*, twenty-four miles long, in the largest in Britain, *Loch Awe*, *Loch Tay*, *Loch Rannoch*, and *Loch Erich*, may be mentioned as the largest of those in the Grampian valleys. *Loch Ness*, twenty-four miles long and eight hundred feet deep, with *Loch Oich* and *Loch Lochy*, fills the deep trench of the Great Glen between the Grampians and the Northern Highlands; *Loch Shin*, twenty miles long and only one mile broad, and *Loch Maree*, are the largest of the Northern Highland region. On the western watershed of the Northern Highlands, however, lakes are so thickly sown that hundreds may be counted from a mountain top, and the Outer Hebrides are covered with a perfect network of them.

Irish Rivers and Lakes.—In Ireland, in contrast to Britain, the watersheds are more evenly divided toward all points of the compass; the greatest drainage, however, is westward to the Atlantic. On this side we find the largest river, the *Shannon*, one hundred and sixty miles long, draining an area second only to that of the Thames in extent, and affording a navigable highway over the central plain almost up to its source. The *Erne* is another large river of the western drainage of Ireland. Flowing northward we find the *Foyle*, and the *Bann* passing through Lough Neagh, and navigable for fifty-five miles. On the eastern watershed the *Liffey*, from the Wicklow Mountains, is the most important stream; the *Barrow*, navigable to Athy, seventy miles from its fine estuary of Waterford Harbor, receiving near its mouth the almost equally important *Nore* and *Suir*, is the chief river of the southern drainage; the *Blackwater*, affording twenty-two miles of navigation, and the *Lee*, flowing to Cork (Queenstown) Harbor, are the other notable rivers of this slope.

The lakes of Ireland, in contrast to those of Britain, belong rather to the plain than to the mountain regions. *Lough Neagh*, in the basin of the Bann in the north, is the largest of all in the British Islands, one hundred and fifty-four square miles in area, twenty miles in length. The lakes of the *Erne*, upper and lower, stand next in size; *Loughs Corrib* and *Mask* in Connaught, joined by a subterranean channel, are the largest in the west. The Shannon has three large expansions, *Loughs Allen*, *Ree*, and *Derg*. Most famous for their scenery, however, are the much smaller highland *Lakes of Killarney*, embosomed in the southwestern mountains of Kerry, and considered the finest in Great Britain.

Climate.—Their maritime situation has a favorable effect on the climate of the British Isles, making it milder and more equable than that of continental countries in the same latitude.

Peoples of the British Isles.—During the four centuries in which the Romans held the lowlands of South Britain, many of the native British tribes became Romanized, but the Celtic peoples of the mountain regions of Wales, the Scottish Highlands, and of the west of Ireland, have retained their language and more or less pure blood to the present day. After the fall of the Roman power the invading Anglo-Saxons and Jutes conquered the island, and to their strong Germanic element followed that of the brilliant Normans, or Northmen who had settled in Normandy, and who had there adopted the religion, language, and manners of the French.

Thus the population of these islands is a mixed Celtic, Germanic, and Romanic one, all its elements being more thoroughly amalgamated in the populous lowlands of Britain, the Celtic remaining purer in the highland regions, which are more difficult of access. In Ireland the Teutonic element prevails along the eastern margin; thence towards the western mountains the transition is gradual to the pure Celtic.

Religion.—In religion, rather more than half the population of England claims membership in the Church of England; the most prominent other bodies being the Wesleyan Methodists, the Independents, and Baptists. About a twentieth part of the population is Roman Catholic.

Cities.—The three largest cities in Wales are Cardiff, Rhondda, and Merthyr Tydfil. The capital of England and of the British Empire is London. The cities next in size (in order of population) are Liverpool, Manchester and Salford, Birmingham, Leeds, Sheffield, Bristol, Bradford, Nottingham, and Hull.

The capital of Scotland is Edinburgh. Glasgow is the industrial metropolis, followed by Dundee, and Aberdeen. After these come, in order of population, Paisley, Leith, Greenock, Coatbridge, Kilmarnock, Kirkcaldy, Perth, Hamilton, Motherwell, and Falkirk.

The capital of Ireland is Dublin; the other chief towns are Belfast, Cork, Limerick, and Londonderry.
